THE AVTHORS EPISTLE DEDICATORIE

To Henry the third, the moſt Chriſtian King of France and Poland

Even as (moſt Chriſtian King) we ſee the members of mans body by a friendly conſent are alwayes buſied, and ſtand ready to performe thoſe functions for which they are appointed by nature, for the preſervation of the whole, of which they are parts: ſo it is convenient that we, which are, as it were, Citizens of this earthly Common-weale ſhould be diligent in the following of that calling which (by Gods appointment) we have once taken upon us: and content with our preſent eſtate, not caried away with raſhnes and envy, deſire different and divers things whereof we have no knowledge. He which doth otherwiſe, perverts and defiles with hated confuſion the order and beauty, on which this Univers conſiſts. Wherfore when I conſidered with my ſelfe, that I was a member of this great Mundane body, and that not altogether unprofitable, I endeavored earneſtly, that all men ſhould be acquainted with my duty, and that it might be knowne how much I could profit euery man. For God is my witnes, and all good men know, that I have now laboured fifty yeares with all care and paines in the illuſtration and amplification of Chirurgery; and that I have ſo certainly touched the marke whereat I aimed, that Antiquity may ſeeme to have nothing wherein it may exceed us, beſide the glory of invention; nor poſterity any thing left but a certaine ſmall hope to adde ſome things, as it is eaſie to adde to former inventions. In performance whereof, I have beene ſo prodigall of my ſelfe, my watchings, faculties and meanes, that I ſpared neither time, labour, nor coſt, wherby I might ſatisfie and accompliſh my own deſires, this my great work, and the deſires of the ſtudious. Neither may we doubt but their ſtudies would at the length waxe cold, if they only furniſhed with the Theoricke and Precepts in Schooles and that with much laboure, ſhould ſee no manuall operation, nor manifeſt way of performing the Arte. For which cauſe I ſeeking the praiſe and profit of the French *Nation, even with the hinderance of my particular eſtate, have endeavored to illuſtrate and increaſe Chyrurgerie hitherto obſcure either by the infelicity of the* *former ages, or the envy of the Profeſſors; and not onely with precepts and rules, but being a lover of carved workes I beautified it with 300. formes, or graven figures and apt deliniations, in which whoſoever ſhall attentively looke ſhall finde five hundred anatomicall, or organicall figures belonging to the Arte, (if they be reckoned particularly). To every of theſe I have given their names and ſhewed their uſe, leaſt they ſhould ſeeme to have beene put in vainly for oſtentation or delight. But although there be few men of this profeſſion which can bring ſo much authority to their writings either with reaſon, or experience as I can; notwithſtanding I have not beene ſo arrogant, but intending to publiſh my worke, I firſt communicated it with men the moſt excellent in the Arte of Phiſicke, who gave me greater incouragement to perfect and publiſh it, that it might be in common uſe: profeſsing they wiſhed nothing more, than that it might be turned into Latine, ſo by which meanes it ſhould be knowne to forraigne Nations, that there is no kind of Learning which is not delivered with great dexterity of wit in this kingdome over which you rule. And thus much I dare boldly affirme, that there is ſcarce any, be he never ſo ſtately or ſupercilious, but that he may here find ſomething which may delight him, and by which he may better his knowledge. Therefore I doubted not to conſecrate this booke unto your Majeſtie both as a Patterne and treaſury of my labours aſwell in reſpect of my duty, who am yours by nature and education, as that I might manifeſt to all, your Highnes exceeding bounty towards me, in placing me, (having heretofore enjoyed the office of principall Chirurgeon under 3 Kings your Majeſties predeceſſors) in the ſame dignity, and that of your owne accord. And moreover I did conjecture that it would fall out, as now it doth, that this my worke caried through the world by the fame of your Majeſtie name, ſhould neither feare the face nor veiw of any, ſupported by the favour and Majeſtie of a moſt invincible Monarch and moſt excellent and renowned Prince. Neither did King* Charles *the ninth of happy memory, incited by the relation of the moſt gracious Queene his Mother, refuſe to reade it, being he underſtood it proceeded from him, who having happily paſſed all his time in private and publik employments, and converſed with all men of all ſorts, was judged moſt worthy to obtaine this favoure, as to have the front of this worke adorned and beautified with the ſplendor of his prefixed name. I encouraged by this hope, deſired that my requeſt ſhould paſſe as by a certaine continuation and ſucceſſion from a moſt powerfull, to a moſt Invincible King; and doe wholy conſecrate theſe my labours taken for my Countryes good unto your ſacred Majeſtie. God grant that your Majeſtie may have happy ſucceſſe of all your enterpriſes aboundantly added to* Neſtors *yeares.*

Paris. 8. Feb. Anno Dom. 1579.

Your moſt Chriſtian Majeſties
faithfull Servant

Ambroſe Parey.

The Preface.

Moſt men derive the Original of Phiſicke from heaven; for thoſe who hold the beſt opinion of the Creation of the world, affirme, the Elements being created and ſeparated each from other, man being not as yet made; incontinently by the divine decree, all herbes and plants with infinite variety of floures, endewed with various ſents, taſtes, colours and formes, grew and ſprung forth of the bowells of the Earth, enriched with ſo many and great vertues, that it may be thought a great offence to attribute to any other than the Deity, the benefit of ſo great a bleſſing ſo neceſſary for ſo many uſes: Neither could Mans Capacity ever have attained to the knowledge of thoſe things without the guidance of the divine power. For God the great Creator & faſhioner of the world, when firſt he inſpired *Adam* by the breath of his mouth into a living and breathing man, he taught him the nature, the proper operations, faculties and vertues of all things contained in the circuit of this Vniverſe. So that if there be any who would aſcribe the glory of this invention to man, he is condemned of ingratitude even by the judgment of *Pliny*. But this knowledge was not buryed in oblivion with *Adam*: but by the ſame guiſt of God was given to thoſe whom he had choſen and ordained for Phiſicke, to put their helping hands to others that ſtood in need thereof. Which opinion was not only received in the common manner and by the tacite conſent of al Nations, but confirmed by *Moſes* in the Scripture. *Geneſ.* 1. Which thing *Ieſus* the ſonne of *Sirach* the wiſeſt amongſt the Iewes, hath confirmed ſaying; *Ecclesiaſt.* 38. 1. *Honnor the Phyſition with the honnor due unto him, for the moſt High hath created him because of neceſſity: and of the Lord commeth the gift of healing. The Lord hath created Medicines of the Earth and he that is wiſe will not abhorre them. Give place and honnor to the Phiſition, for God hath created him, let him not goe from thee, for thou haſt need of him.* The *Græcians* who firſt ſeeme more fully and with greater fame to have profeſſed the Arte of Phiſicke, doe in a manner conſent with this opinion, in acknowledging *Apollo* to have beene the Inventor thereof, neither did they it without a reaſonable cauſe. For whether by *Apollo* they may underſtand the Sun who by its gentle and vitall heat doth bring forth, temper and cheriſh all things; or els ſome *Heros*, who incited by an excellent and almoſt divine vnderſtanding firſt taught and put in practiſe the Medicinall vertues of Herbs; in which ſenſe *Ovid* brings him in ſpeaking thus:

> *Herbs are of mine invention, and through all*
> *The world, they me the firſt Phiſitian call.*

The originall of Phiſicke ariſing from thoſe beginnings ſhall alwayes be celebrated, as celeſtiall, and was increaſed principally after this manner. After *Apollo*, *Æſculapius* his ſonne inſtructed by his father reduced this Arte being as yet rude and vulgar into a litle better and more exquiſite forme, for which cauſe he was reputed worthy to be accounted as one of the Gods. At the ſame time flouriſhed *Chiron* the *Centaure* who for that he excelled in knowledge of Plants, and taught *Æſculapius*, (as many report) their faculties, is thought by *Pliny* and ſome others to have bin the inventor of Phiſicke. Plin.l.7,c.2. *Æſculapius* had two ſons *Podalirius* and *Machaon* who following their fathers ſteps & profeſſing Phiſicke, did principally beautifie and practiſe that part thereof which is called Chirurgery, and for that cauſe were accounted the Inventers thereof. After thoſe *Aſclepiades* left this Arte much enlarged as hereditary to his poſterity: by whoſe ſtudy and diligence, that part of the Arte was invented and annexed, which by a more curious skill ſearcheth out and cureth thoſe diſeaſes which lye hid within the body. *Hippocrates* the *Coan* the ſon of *Heraclidas*, borne of the noble race of *Aſclepiades*, Prince of the Phiſitians that were before him, perfected Phiſicke and reduced it into an Arte and wrote divers bookes thereof in Greeke. *Galen* ſucceeded him ſix hundred yeares after, who was a man moſt famous not only for his knowledge in Phiſicke, but alſo in all other ſciences, who faithfully interpreting every thing that was obſcure and difficult in the writings of *Hippocrates*, enlarged the ſcience with many volumes. Thus therfore was the beginning, thus the encreaſe and perfecting the Arte of Phiſicke, as much as can be hoped for from mans induſtry. Although indeed we cannot deny but that Experience hath much profited this Arte, as it hath and doth many other. For as men perceived that ſome things were profitable, ſome unprofitable for this or that diſeaſe, they ſet it downe, and ſo by diligent obſervation and marking of ſingularities, they eſtabliſhed univerſall and certaine precepts and ſo brought it into an Arte. For ſo we find it recorded in ancient Hiſtories, before the invention of Phiſicke, that the *Babilonians* & *Aſſyrians* had a cuſtome amongſt them, to lay their ſicke and diſeaſed perſons in the porches and entries of their houſes, or to carry them into the ſtreets and market places, that ſuch as paſſed by and ſaw them, might give them counſell to take thoſe things to cure their diſeaſes, which they had formerly found profitable in themſelves or any other in the like affects, neither might any paſſe by a ſicke man in ſilence. Alſo *Strabo* writes that it was a cuſtome in *Græce* that thoſe which were ſicke ſhould reſort to *Æſculapius* his Temple in *Epidaurum*, that there as they ſlept, by their dreames they might be admoniſhed by the God what meanes they ſhould uſe to be cured; and when they were freed from their diſeaſes, they writ the manner of their infirmities and the means by which they were cured in tables & faſtned them to the pillars of the Temple, not only for the glory of the God, but alſo for the profit of ſuch, as ſhould afterwards be affected with the like maladies. All which tables (as fame reports) *Hippocrates* tranſcribed, & ſo frō thoſe drew the Arte of Phiſicke. Beaſts alſo have added much to this Arte. For one man was not only inſtructed by another, but learned alſo much from brute beaſts, for they by the onely inſtinct of nature have found out divers herbs, & remedies, by which they freed & preſerved themſelves from infirmities, which might preſently be transferred to mans uſe. Wherfore cōſidering that ſuch & ſo many have cōcurred to bring this Arte to perfection, who hereafter dare call in queſtion the excellency therof? cheifly if he reſpect the ſubject therof, Mans body, a thing more noble than all other Mundane thing, and for which the reſt were created. Which thing moved *Herophilus* in times paſt to call Phiſitions *The hands of the Gods*. For as we by putting forth our hand, do helpe any man out of the water or mud into which he is fallen: even ſo we doe ſuſtaine thoſe that are throwne downe from the top of health to the gates of death by violence of diſeaſes, with happy medicines, & as it were by ſome ſpeciall & divine gift deliver them out of the jawes of death. *Homer* the prince of Greek Poets affirmes that one Phiſition is far more worthy than many other men. All Antiquity gave Phiſitions ſuch honor, that they worſhipped them with great veneration as Gods, or the ſons of their Gods. For who is it which is not much delighted with the divine force of healthfull medicines, with which (we ſee by dayly experience) Phiſitiōs, as armed with *Mercuries* rod, do bring back thoſe languiſhing ſoules which are even entring the gates of death? Hence it cometh to paſſe that the divine Poets of ancient times, as *Orpheus*, and *Muſæus* & *Heſiode*; & the moſt renowned Philoſophers, *Pythagoras*, *Plato*, *Ariſtotle*, *Theophraſtus*, *Chryſippus*, *Cato Cenſorius*, & *Varro* eſteemed nothing more excellent than to excell in the knowledge of Medicines, & to teſtifie the ſame by written monuments to Poſterity. For what can be more noble or worthy of a generous diſpoſition than to attaine to that by the benefit of Phiſicke, that adorned with the ornaments of dignity thou maieſt have power over other men, & favoured of Princes, Kings & Emperours, mayeſt appoint & preſcribe to them thoſe things which are profitable to preſerve health, & cure their diſeaſes? But if you look for benefit by ſciences; then know that the Profeſſors hereof have beſides ſufficient gain, acquired much honor & many friends. *Hippocrates* comming to *Abdera* to cure *Democritus* of his madnes, not only the men of the City, but alſo the women, children & people of every age, ſexe & ranck went forth to meet him, giving him with a common conſent & loud voice the title of a *Tutelary* Deity and father of their Country. But the *Athenians*, for freeing their Country from the plague, with trium-

In what eſteeme Phiſitions have formerly beene.

phant pompe celebrated playes to his honor, & bountifully ſet upon his head as if he had beene a king, a Crowne of gold weighing a 1000. peices of their golden coine, & erected his ſtatue, for a perpetuall monument of his piety and Learning. *Eraſiſtratus* the Nephew of *Ariſtotle* by his daughter, received, freely given him by *Ptolomy* king of Egypt, for the cure of his ſon, 100. Talents of gold. The Emperour *Auguſtus* honoured *Antonius Muſa* with a golden ſtatue. *Quintus Stertinius* yearly received out of the Emperours Treaſury 12000.500. peices of gold. In the time of our Grandfathers *Petrus Aponenſis* called *Conciliator* was ſo famous through all *Italy* for his knowledge in Phiſicke, that he could ſcarſe be intreated to come to any man of faſhiō that was ſick, unles he gave him 50. crownes, for every day he was abſent from home: but when he went to cure *Honorius* the Biſhop of *Rome*, he received 400. crownes for every day he was abſent, Our French Chronicles relate in what credit & eſtimation *James Cotterius* the Phiſition was with *Lewis* the 11. King of *France*; for they report he gave him monethly out of his Treaſury 10000. crownes. Phiſick in times paſt hath bin in ſuch eſteem with many famous & noble perſonages, that divers Kings & Princes delighted with the ſtudy therof, & deſirous to attaine glory & credite therby, called ſundry herbs after their own names. For ſo *Gentian* took its name of *Gentius* king of *Jllyria*; the herb *Lyſimachia* of *Lyſimachus* the king of *Macedon*, the *Mithridatick* herb or *Scordium*, of *Mithridates* the king of *Pontus* & *Bithinia*; *Achillea* of *Achilles*; *Centorie* of *Chiron* the *Centaure*; *Arthemiſia* of *Arthemiſia* the Queen of *Caria*. *Attalus* king of *Pergamus*, *Salomon* of *Judea*, *Evax* of *Arabia*, and *Juba* the king of *Mauritania*, were not only inflamed with a deſire of the knowledge of plants; but either they have writtē books of it, or for the great cõmodity of poſterity, invented by their skil many choiſe Antidots compounded of divers ſimples; neither the deſire of learning this noble ſcience is yet altogether extinct. As may appear by that *indiā* plant *Tobaco*, called by ſome the noble herb, *Catherines* herb & *Medices* herb, but commonly the Queens herb, becauſe *Catherine Medices* the mother of our kings, by her ſingular ſtudy and induſtry made manifeſt the excellent vertue it hath in curing maligne ulcers & wounds, which before was unknown to the *French*. For theſe worthy men underſtood that their glory, thus faſtened & ingrafted into the deepe, & as it were everliving roots of plants, would never decay; but ſhold be propagated to al poſterity in many ſucceeding ages, growing up with their ſprouting & budding ſhouts, ſtalks, floures & fruits. Neither did theſe famous men whil'ſt they adorned this part of phiſick ſuffer the other, which treats of the diſſectiō of mans body, be buried in oblivion, & without their knowledge; as inſtructed with the precepts & learning of the wiſeſt men, how artificiall & unimitable by mortall hand this fabrick of our body is. Neither is it probable that *Apis*, *Oſiris* and *Ptolomy* kings of Egypt, *Solomon*, *Alexander* the great, *Mithridates*, *Attalus*, ſeeing they dedicated themſelves wholy to the cōtemplation of

Names given to Plants.

nature

natural things, neglected the uſe of Anatomie, & being men moſt deſirous to know themſelves, to have beene ignorant of the ſtructure of there own bodyes being the habitations of their ſoules immortall & made to the Image of God: ſeeing they obſerved with certaine judgment the different lights of the Sun, Moone and ſtars; and paſſed over ſo many lands, ſo many ſeas, ſo many regions ſo far remote one from another, by waies ſo terrible by reaſon of cold, uncouthnes, darknes, by rocks, by fire & ſword, with great labour, charge & danger of life, only that they might ſatisfie their minds thirſting after the knowledge of things; and to have left untouched a thing truly noble, admirable, and moſt worthy of knowledge, eaſie to be attained by any, and to be acquired without any danger of life, or fortunes.

Phiſicke is devided into 3 parts.

Seeing there be 3 parts of that Phiſicke which at this time we profeſſe, *Chirurgery* which by the uſe of the hand, *Diet* which with a convenient manner of feeding & ordering the body, & *Pharmacy* that by medicines attempt to expell diſeaſes, & preſerve health; The prime Phiſitions do not without reaſon contend which of theſe may be accounted the cheife. Certainly *Herophilus* had *Pharmacy* in ſuch eſteem, that he thought medicines were firſt mixed & admniſtred to the ſicke by *Apollo* (whom Antiquity thought a great Deity.) And *Pliny* had ſo good an opinion of Diet, that he exclaimes; The true remedies & Antidotes againſt diſeaſes are put into the pot & eaten every day by the poore people. Verily al learned men confeſſe that the manner of curing which is performed by diet, is much more facile & proſperous, than that which is done by medicines; as thoſe things which ſought with much labour and coſt, are taken with much loathing, and taken are ſcarſe retained, but retained they oft work with much labour & paine: Which things long ago moved *Aſclepiades* to exclude the uſe of medicines, as hurtfull to the ſtomack. Yet if we will beleeve *Celſus* neither of theſe parts merit the preheminēce, but both of them give place to Chirurgery. For ſeing that fortune is very powerfull in diſeaſes, & the ſame Meats & Medicines are often good & often vaine, truly it is hard to ſay, whether the health is recovered by the benefit of Diet and *Pharmacy*, or by the ſtrength of the body. Moreover in thoſe caſes, in which we moſt prevaile with medicines; although the profit be more manifeſt, yet it is evident that health is often ſought in vaine even by theſe things, & often recovered without them. As it may be perceived by ſome troubled with ſore eies, & others with Quartaine feavers, who having bin long troubled by Phiſitiōs are ſometimes healed without them. But the effect of Chirurgery as it is very neceſſary, ſo it is the moſt evident amongſt all the parts of phiſicke. For who without Chirgery can hope to cure broken, or luxated parts, who wounds & ulcers, who the falling of the Matrix, the ſtone in the bladder, a member infeſted with a Gangrene, or Sphacele? Beſides, this part alſo is the moſt ancient; for *Podalirius* & *Machaon* following their Generall *Agamemnon* to the Trojane wars, yeelded no

ſmall

ſmal comfort to their fellow Soldiers. Whom notwithſtanding *Homer* affirmes not to have given any helpe in the peſtilence, nor in divers other diſeaſes, but onely were accuſtomed to heale wounds by inſtruments and medicines. And if the difficulty of learning it argue the excellency of the Arte, who can doubt but Chirurgery muſt be the moſt excellent, ſeeing that none ought to be accounted a Chirurgeon or which can performe his duty, without the knowledge of Diet & *Pharmacy?* But both the other can performe their parts without Chirurgery if we may beleeve *Galen*. But if we conſider the matter more neerly according to truth; we ſhall underſtand thoſe three parts have a certaine common bond, and are very neere of kinred, ſo that the one implores the ayde of the other; neither can the Phiſition doe any thing praiſe worthy without the conſpiracy and joynt conſent of theſe three; therfore in ancient times there was but one performer and uſer of all the three parts. But the multitude of men dayly encreaſing, and on the contrary mans life decreaſing, ſo that it did not ſeeme able to ſuffiſe for to learne and exerciſe all the three, the workmen devided themſelves. Wherfore that which happens to any man either by lot, or counſell, that let him follow, maintaine and onely uſe, as mindful how ſhort his life is, and how long the Arte.

The excellency of Chirurgery.

A Catalogue of the VVorkes of AMBROSE PAREY, the King of France his Chiefe *Chyrurgion*, which were ſet forth in Latine, by *James Guillemeau*.

1. *AN Introduction, or compendious way to Chirurgery.*

2. *Of living creatures and mans excellency.*

3. *Of the Anatomy of mans body.*

4 *Of the vitall parts contained in the Cheſt.*

5. *Of the Animall parts placed in the head.*

6. *Of the Muſcles and Bones, and other extreme parts of the body.*

7. *Of Tumors contrary to nature in generall.*

8. *Of Tumors contrary to nature in particular.*

9. *Of wounds in generall.*

10. *Of the greene and bloudy wounds of each ſeverall part.*

11 *Of wounds made by Gun-ſhot, and other fiery Engins, and all ſorts of weapons.*

12. *Of Contuſions and Gangreenes.*

13. *Of Vlcers, Fiſtulae, and Hæmorroides.*

14. *Of Ligatures, or Bandages.*

15. *Of Fractures.*

16. *Of Luxations, and Straines.*

17. *Of diverſe affects of the parts not agreeable to nature, whoſe cure commonly is performed by the hand.*

18. *Of the Gout.*

19. *Of the* Lues Venerea, *and thoſe Symptomes that happen by reaſon thereof.*

20. *Of the ſmall Poxes and Meaſels and alſo of Wormes, and the Leproſie.*

21. *Of Poyſons, and of the biting of mad dogges, and the ſtinging and biting of venemous creatures.*

22. *Of the Plague.*

23. *Of the Arts to repaire thoſe things which are defective, either by nature or accident.*

24. *Of the generation of Man.*

25. *Of Monſters and Prodigies.*

26. *Of the Faculties of ſimple medicines, together with their compoſition and uſe.*

27. *Of Diſtillations.*

28. *A Treatiſe of reports, and the embalming of dead bodies.*

29. *An Apologie, and Voyages*; being not in the Latine, but tranſlated out of the laſt French Edition, whom alſo I have followed in the number of the Bookes, leaſt any ſhould thinke ſome wanting, finding but 26. in the Latine, and 29. in the French.

AN INTRODVCTION OR COMPENDIOVS VVay to Chyrurgerie.

CHAP. I.

What Chyrurgerie is.

CHYRVRGERIE is an Art, which teacheth the way by reaſon, how by the operation of the hand we may cure prevent and mitigate diſeaſes, which accidentally happen uuto us. Others have thought good to deſcribe it otherwiſe, as that; it is that part of Phyſicke which undertaketh the cure of diſeaſes by the ſole induſtry of the hand; as by cutting, burning, ſawing off, uniting fractures, reſtoring diſlocations, and performing other workes, of which we ſhall hereafter treate. Chyrurgery alſo is thus defined by the Author of the medicinall Definitions; The quicke motion of an intrepide hand joyned with experience: or an artificiall action by the hands uſed in Phyſicke, for ſome convenient intent. Yet none muſt thinke to attaine to any great perfection in this Art, without the helpe of the other two parts of Phyſicke; I ſay of Diet and Pharmacie, and the divers application of proper medicines, reſpecting the condition of the cauſes, diſeaſes, ſypmtomes, and the like circumſtances, which comprehended under the names of things naturall, not naturall, and beſides nature (as they commonly call them) wee intend to deſcribe in their proper place. But if any reply, that there be many which doe the workes of Chirurgery, without any knowledge of ſuch like things, who notwithſtanding have cured deſperate diſeaſes with happy ſucceſſe; let them take this for an anſwer, that ſuch things happen rather by chance, than by the induſtry of the Art, and that they are not provident that commit themſelves to ſuch. Becauſe that for ſome one happy chance, a thouſand dangerous errors happen afterwards, as *Galen* (in divers places of his Method) ſpeakes againſt the Emperickes. Wherefore ſeeing wee have ſet downe Chirurgery to be a diligent operation of the hands, ſtrengthened by the aſſiſtance of Diet and Pharmacie, wee will now ſhew, what, and of what nature the operations it are.

The definition of Chirurgerie.

What neceſſary for a Chirurgion.

CHAP. II.

Of Chirurgicall operations.

The nature of a Chirurgion.

Experience more neceſſary for a Chirurgion, than Art.

FIve things are proper to the dutie of a Chirurgian; To take away that which is ſuperfluous; to reſtore to their places, ſuch things as are diſplaced; to ſeparate thoſe things which are joyned together; to joyne thoſe which are ſeparated; and to ſupply the defects of nature. Thou ſhalt fare more eaſily and happily attaine to the knowledge of theſe things by long uſe and much exerciſe, than by much reading of Bookes, or daily hearing of Teachers. For ſpeech how perſpicuous and elegant ſoever it be, cannot ſo vively expreſſe any thing, as that which is ſubjected to the faithfull eyes and hands.

Examples of taking away that which is ſuperfluous.

Wee have examples of taking away that which abounds, in the amputation, or cutting off a finger, if any have ſixe on one hand, or any other monſtrous member that may grow out: in the lopping off a putrified part inwardly corrupted; in the extraction of a dead child, the ſecondine, mole or ſuch like bodies out of a womans wombe; in taking downe of all Tumors, as Wens, Warts, Polypus, Cancers, and fleſhy excreſcenſes of the like nature; in the pulling forth of bullets, of peeces of maile, of darts, arrowes, ſhells, ſplinters, and of all kind of weapons in what part of the body ſoever they be. And hee taketh away that which redounds, which plucks away the haires of the eye-lids which trouble the eye by their turning in towards it: who cuts away the web, poſſeſſing all the * *Adnata*, and part of the * *Cornea*: who letteth forth ſuppurated matter; who taketh out ſtones in what part ſoever of the body they grow; who puls out a rotten or otherwiſe hurtfull tooth, or cuts a naile that runs into the fleſh; who cuts away part of the *uvula*, or haires that grow on the eyelids; who taketh off a Cataract; who cuts the navill or fore-skinne of a child newly borne, or the skinnie caruncles of womens privities.

* Two tunicles of the eyes.

Examples of replacing.

Examples of placing thoſe things which are out of their naturall ſite, are manifeſt in reſtoring diſlocated bones; in replacing of the guts and kall fallen into the cods, or out of the navill or belly by a wound, or of the falling downe of the wombe, fundament, or great gut, or the eye hanging out of its circle, or proper place.

Example of ſeparating things joyned together.

But wee may take examples of diſioyning thoſe things which are continued from the fingers growing together, either by ſome chance, as burning, or by the imbecilitie of the forming facultie: by the diſiunction of the membrane called *Hymen*, or any other troubling the necke of the wombe, by the diſſection of the ligament of the tongue, which hinders children from ſucking and ſpeaking, and of that which hinders the *Glans* from being uncovered of the foreskinne; by the deviſion of a varicous veine, or of a halfe cut nerve or tendon, cauſing convulſion: by the diviſion of the membrane ſtopping the auditory paſſage, the noſe, mouth, or fundament, or the ſtubborne ſticking together of the haires of the eye-lids. Referre to this place all the workes done by Cauſticks, the Saw, Trepan, Lancet, Cuppingglaſſes, Inciſion Knife, Leaches, either for evacuation, derivation or revulſion ſake.

Examples of uniting things diſioyned.

The Chirurgion drawes together things ſeparated, which healeth wounds by ſtitching them, by bolſtering, binding, giving reſt to, and fit placing the part: which repaires fractures; reſtores luxated parts; who by binding the veſſell, ſtaieth the violent effuſion of bloud: who cicatriſeth cloven lips, commonly called hare-lips; who reduces to equalitie the cavities of Vlcers, and Fiſtula's.

Examples of ſuplying defects.

But hee repaires thoſe things which are defective, either from the infancy, or afterwards by accident, as much as Art and Nature will ſuffer, who ſets on an eare, an eye, a noſe, one or more teeth; who fils the hollowneſſe of the palat eaten by the Poxe, with a thinne plate of gold or ſilver, or ſuch like; who ſupplies the defect of the tongue in part cut off, by ſome new addition; who faſtens to a hand, an arme or legge with fit ligaments workemanlike: who fits a doublet bumbaſted, or made with iron plates to make the body ſtraight; who fills a ſhooe too big with corke, or faſtens a ſtocking or ſocke to a lame mans girdle to helpe his gate. We will treate more fully of all theſe in our following Worke. But in performing thoſe things with the hands, we cannot but cauſe paine: (for who can without paine cut off an arme, or legge, devide and teare aſunder the necke of the bladder, reſtore bones put out of their places, open ulcers, bind up wounds, and appply cauteries, and doe ſuch like?) notwithſtanding the matter often comes to that paſſe, that unleſſe wee uſe a judicious hand, wee muſt either die, or leade the remnant of our lives in perpetuall miſery. Who therefore can iuſtly abhorre a Chirurgion for this, or accuſe him of crueltie? or deſire they may be ſerved, as in ancient times the Romanes ſerved *Archagatus*, who at the firſt made him free of the Citie, but preſently after, becauſe he did ſomwhat too cruelly burne, cut and performe the other workes of a good Chirurgion, they drew him from his houſe into the Campus Martius and there ſtoned him to death, as wee have read it recorded by *Sextus Cheroneus Plutarche's* Neece by his daughter. Truly it was an inhumane kind of ingratitude, ſo cruelly to murder a man intent to the workes of ſo neceſſary an Art. But the Senate could not approve the act, wherefore to expiate the crime as well as then they could, they made his Statue in gold, placed it in *Æſculapius* his Temple, and dedicated it to his perpetuall memorie. For my part I very well like that ſaying of *Celſus*; A Chirurgeon muſt have a ſtrong, ſtable, and intrepide hand, and a minde reſolute and mercileſſe, ſo that to heale him he taketh in hand, he be not moved to make more haſte than the thing requires; or to cut leſſe than is needfull; but which doth all things as if he were nothing affected with their cries; not giving heed to the judgement of the vaine common people, who ſpeake ill of Chirurgions becauſe of their ignorance.

Archagatus the Chirurgion.

In præfat. lib. 7.

The properties of a good Chirurgion.

CHAP. III.

Of things Naturall.

WHat the Chirurgion may rightly and according to Art, performe the foreſaid workes, he muſt ſet before his eyes certaine Indications of working: Otherwiſe he is like to become an Empericke, whom no Art, no certaine reaſon, but onely a blind temerity of fortune moves to boldneſſe and action. Theſe Indications of actions are drawne from things (as they call them) naturall, not naturall, and beſides nature, and their adjuncts, as it is ſingularly delivered of the Ancients, being men of an excellent underſtanding. Wherefore we will proſecute according to that order, all the ſpeculation of this Art of ours. Firſt therefore things naturall are ſo termed, becauſe they conſtitute and containe the nature of mans body, which wholy depends of the mixture and temperament of the 4. firſt bodies, as it is ſhewed by *Hippocrates* in his Booke *de Natura humana*: wherefore the conſideration thereof belongs to that part of Phyſicke which is named *Phyſiologia*; as the examination of things not naturall to *Diatetice*, or Diet, becauſe by the uſe of ſuch things it indeavours to retaine and keepe health: but *Therapeutice* or the part which cures the diſeaſes, and all the affects beſides nature, challenges the contemplation of thoſe things which are not agreeable to nature. But the things which are called naturall may be reduced to ſeven heads: beſides which there comes into their fellowſhip, thoſe which wee terme annexed.

From whence we muſt draw Indications.

What things are called naturall.

To what part of Phiſicke things not natural pertaine. To what things beſides nature.

The ſeven principall heads of things naturall are,	Elements. Temperaments. Humors. Parts or members. Faculties. Actions. Spirits.	To theſe are annexed and ſomewhat neere,	Age. Sexe. Colour. Compoſure. Time or ſeaſon. Region. Vocation of life.

CHAP. IIII.

Of Elements.

What an Element is.

AN Element (by the definition which is commonly received amongſt Phyſitians) is the leaſt and moſt ſimple portion of that thing which it compoſeth: or that my ſpeech may be the more plaine: the foure firſt and ſimple bodies are called Elements; Fire, Aire, Water, and Earth; which accommodate and ſubject themſelves as matter to the promiſcuous generation of all things which the Heavens engirt, whether you underſtand things perfectly, or unperfectly mixed. Such Elements are onely to be conceived in your minde, being it is not granted to any externall ſenſe to handle them in their pure and abſolute nature. Which was the cauſe that *Hippocrates* expreſſed them not by the names of ſubſtances, but of proper qualities; ſaying, Hot, Cold, Moiſt, Drie; becauſe ſome one of theſe qualities is inherent in every Element, as his proper and eſſentiall forme, not onely according to the exceſſe of latitude, but alſo of the active facultie; to which is adjoyned another ſimple qualitie, and by that reaſon principall, but which notwithſtanding attaines not to the higheſt degree of his kinde, as you may underſtand by *Galen* in his firſt Booke of Elements. So, for example ſake, in the Aire wee obſerve two qualities, Heat, and Moiſture, both principall, and not remitted by the commixture of any contrary quality, for otherwiſe they were not ſimple. Therefore thou maiſt ſay, what hinders that the principall effects of heat ſhew not themſelves as well in the Aire, as in the Fire? becauſe as we ſaid before, although the Aire have as great a heat according to his nature, extent and degree, no otherwiſe than Fire hath, yet it is not ſo great in its active qualitie. The reaſon is, becauſe that the calfactorie force in the Aire is hindered, and dulled by ſocietie of his companion and adjoyned qualitie, that is, Humidity which abateth the force of heat, as on the contrary, drineſſe quickneth it. The Elements therefore are endewed with theſe qualities.

Elements are underſtood by reaſon, not by ſenſe.

Why he expreſſed the Elements by theſe names of qualities.

Two principall qualities are in each Element.

Why the Aire heats not ſo vehemently, as the Fire.

Names of the ſubſtances;		is		Names of the qualities.
	Fire		Hot and drie.	
	Aire		Moiſt and hot.	
	Water		Cold and moiſt.	
	Earth		Cold and drie.	

How the Elements may be underſtood to be mixed in compound bodies.

Theſe foure Elements in the compoſition of naturall bodies, retaine the qualities they formerly had, but that by their mixture and meeting together of contraries, they are ſomewhat tempered and abated. But the Elements are ſo mutually mixed one with another, and all with all, that no ſimple part may be found; no more than in a maſſe of the Emplaiſter *Diacalcitheos* you can ſhew any *Axungia*, oyle, or litharge by it ſelfe; all things are ſo confuſed and united by the power of heate, mixing the ſmalleſt particulars with the ſmalleſt, and the whole with the whole, in all parts. You may know and perceive this concretion of the foure Elementary ſubſtances in one compound body, by the power of mixture, in their diſſolution by burning a pile or heape of greene wood. For the flame expreſſes the Fire, the ſmoke the Aire, the moiſture that ſweats out at the ends, the Water, and the aſhes, the Earth: You may eaſily perceive by this example ſo familiar and obvious to the ſenſes what diſſolution is, which is ſucceeded by the decay of the compound body; on the contrary, you may know that the coagmentation, or uniting and ioyning into one of the firſt mixed bodies is ſuch, that there is no part ſinceere, or without mixture. For if the heat which is predominant in the fire, ſhould remaine in the mixture in its perfect vigor, it would conſume the reſt by its pernitious neighbourhood; the like may be ſaid of Coldneſſe, Moiſture, and Drineſſe; although of theſe qualities, two have the title of Active, that is, Heat, and Coldneſſe, becauſe they are the more powerfull; the other two Paſſive, becauſe they may ſeeme more dull and ſlow, being compared to the former. The temperaments of all ſublunarie bodies ariſe from the commixture of theſe ſubſtances & elementary qualities, which hath bin the principall cauſe that moved me to treate of the Elements. But I leave the force and effects of the Elementary

Why of the firſt qualities, two are accounted active, and two paſſive.

qualities to ſome higher contemplation, content to have noted this, that of theſe firſt qualities, (ſo called, becauſe they are primarily and naturally in the foure firſt bodies) others ariſe and proceed, which are therefore called the ſecond qualities: as of many theſe, Heauineſſe, Lightneſſe, variouſly diſtributed by the foure Elements, as the Heat, or Coldneſſe, Moiſtneſſe or Drineſſe, have more power over them. For of the Elements, two are called light, becauſe they naturally affect to move upwards: the other two heavy, by reaſon they are carried downeward by their owne weight. So we thinke the fire the lighteſt, becauſe it holds the higheſt place of this lower world; the Aire which is next to it in ſite, wee account light; for the water which lies next to the Aire, we judge heavy; and the earth the center of the reſt we judge to be the heavieſt of them all. Hereupon it is, that light bodies, and the light parts in bodies, have moſt of the lighter Elements; as on the contrary heavy bodies have more of the heavier. This is a briefe deſcription of the Elements of this fraile world, which are onely to be diſcerned by the underſtanding, to which I thinke good to adjoyne another deſcription of other Elements, as it were ariſing or flowing from the commixture of the firſt; for beſides theſe, there are ſaid to be Elements of generation and Elements of mans body. Which as they are more corporall, ſo alſo are they more manifeſt to the ſenſe. By which reaſon *Hippocrates* being moved, in his Booke *de Natura humana*, after he had deſcribed the nature of Hot, Cold, Moiſt and Drie, he comes to take notice of theſe by the order of compoſition. Wherefore the Elements of our generation, as alſo of all creatures which have bloud, are ſeed and menſtruous bloud. But the Elements of our bodies are the ſolid and ſimilar parts ariſing from thoſe Elements of generation. Of this kind are bones, membranes, ligaments, veines, arteries, and many others manifeſt to the eyes, which wee will deſcribe at large in our Treatiſe of Anatomie.

Why the firſt qualities are ſo called.

What the ſecond qualities are.

What Elements light, what heavy.

What the Elements of generation are.

What the Elements of mixt bodies.

CHAP. V.

Of Temperaments.

A Temperament is defined a proportionable mixture of hot, cold, moiſt and drie; or, it is a concord of the firſt diſagreeing faculties. That harmony ſprings from the mixture of the foure firſt bodies of the world. This whether Temperamēt or concord is given to Plants and brute beaſts for the beginning of their life, and ſo conſequently for their * life and forme. But as Plants are inferior in order and dignitie to beaſts, ſo their * life is more baſe and infirme, for they have onely a growing facultie by which they may draw an Alimentarie juyce from the Earth, as from their mothers breaſts, to preſerve them and their life, by which they may grow to a certaine bigneſſe; and laſtly, by which they may bring forth their like for the perpetuall continuance of their kind. But the * life of beaſts have to the three former the gift of ſence annexed; by benefit whereof, as by a certaine inward knowledge, they ſhun thoſe things that are hurtfull, and follow thoſe which profit them, and by the power of their will, they move themſelves whither they pleaſe. But the ſoule of man farre more perfect and noble than the reſt, ariſeth not from that earthly mixture and temper of the Elements, but acknowledgeth and hath a farre more divine ofſpring, as we ſhall teach hereafter.

What a Temperament is.

* *Anima.* What the life performes in Plants.

* *Anima.* What in beaſts.

Mans ſoule comes from above.

They devide a Temperament at the firſt diviſion into two kindes; as one a temperate, another an untemperate. The untemperate is of two ſorts; the one wholy vicious, which hath altogether exceeded the bounds of mediocritie: the other which hath ſomewhat ſtraied from the mediocritie of temper, but notwithſtanding is yet contained within the limits of health: as that which brings no ſuch evident harme to the actions, but that it ſomewhat hinders them, ſo that they cannot ſo well and perfectly performe their duties. But the vicious Temperament doth three manner of wayes corrupt the functions, either by weakning, depraving or aboliſhing them. For ſo ſtupor, or aſtoniſhment, diminiſheth and ſloweth the quickneſſe of motion; convulſion depraves it; the Palſie aboliſheth it, and taketh it away. The temperate Temperament

The manifold diviſion of a Temperament.

A Temperament, *ad Pondus.*

perament

* Ad pondus, vel ad juſtitiam.

A temperament ad juſtitiam.

The temperament of a bone.

perament is alſo devided into two kinds; which is either to equallity of weight, or Iuſtice. It is called a temperature to weight which ariſeth from the equall force of exactly concurring qualities, and as placed in a perfect ballance, drawes downe neither to this nor that part. They thinke the example of this Temperament to appeare in the inner skinne of the fingers ends of a man tempered to Iuſtice. For ſeeing the moſt exquiſite touch reſides there, they ought to be farre from all exceſſe of contrariety; for otherwiſe being corrupted by too much heat or cold, moiſture or drineſſe, they could give no certaine judgement of the tangible qualities. For which thing nature hath excellently provided in the fabricke and coagmentation of the parts of which the skinne conſiſts. For it is compoſed of hot and moiſt fleſh, and therefore ſoft, and of a tendon and nerve cold and drie, and therefore hard, which are not onely equally fitted and conjoyned, but wholy confuſed and mixed together, by which it comes that removed from all extremes of oppoſition, it is placed in the midſt, as a rule to judge of all the exceſſes that happen to the touch. So it was fit the eye, which was to be the inſtrument of ſight, ſhould be tinctured with no certaine colour, that it might be the leſſe deceived in the judgement of colours. So it was convenient the hearing ſhould not be troubled with any diſtinct ſound, whereby it might more certainly judge of equall and unequall ſounds, not diſtinguiſhed by a ratable proportion; neither was it fit the tongue ſhould have any certaine taſte, leſt the acceſſe of that taſte ſhould deceive it in knowing and judging of ſo many different taſtes. The Temperature tempered to juſtice is that, which although it is a little abſent from the exact and ſevere parility of mixed qualities, yet hath that equalitie which doth fully and aboundantly ſuffice for to performe all the functions fitly and perfectly which nature doth require, wherefore we can judge no otherwiſe of it than by the integritie of the Actions. For hence it tooke its name, for as diſtributive Iuſtice equally gives to every one rewards, or puniſhment according to their deſerts; ſo nature having regard to all the parts of the bodie, gives them all that temper which may ſuffice to performe thoſe duties, for which they are ordained. Let us for an example conſider a Bone; no man doubts but that, like as the other ſimilar parts of the body proceeds from the mixture of the foure Elements: but neverthele ſſe nature waighing the uſe of it, and ordaining it to ſupport the reſt of the body, would have more of the terrene and drie Element infuſed into it, that it might be the ſtronger and firmer to ſuſtaine weight. But a Ligament, ſeeing it was made for other uſes, hath leſſe of that earthly drieneſſe than the bone, but more than the fleſh, altogether fitted to its nature. So it hath ſeemed good to nature to endue all the parts of the body, not onely with an equall portion, but alſo proportion of Elements and qualities; wee call that a temperament to Iuſtice: and wee ſay that it is in Plants, Brute beaſts, and all naturall bodies, which enjoy that temper and mediocritie, which may be agreeable to their nature. Hereupon by compariſon ariſe eight kindes of intemperate tempers, as

The kindes of untemperate tempers.

- Foure ſimple
  - Hot
    Cold
    temperate in
    - Drineſſe and Moiſture.
  - Moiſt
    Drie
    temperate in
    - Heat and Cold.
- Foure compounds
  - Hot and moiſt.
  - Hot and drie.
  - Cold and moiſt.
  - Cold and drie.

But theſe temperaments are either of the whole body, or of ſome part thereof

- and that either
  - principall, as
    - the Braine.
    - the Heart.
    - the Liver.
    - the Stones.
  - or of the reſt of the parts compoſed of other which have no principality in the body.

Againe, ſuch temperaments are either healthfull, which ſuffice perfectly to performe their actions; or unhealthfull, which manifeſtly hurt them, the ſignes whereof may be read deſcribed by *Galen*. And you muſt obſerve that when we ſay the body, or any part of it is hot, wee underſtand more hot than is fit for one of that kinde which is tempered to juſtice; as when we ſay a man hath a hot liver, wee meane his liver is hotter, than a man juſtly tempered ſhould have; for all other tempers, whether of the whole body, or any of the parts thereof, are to be referred to this; and in the cure of diſeaſes we muſt looke upon it, as the marke, and labour to preſerve it by the uſe of convenient things, as much as lies in our power. Wherefore becauſe it is very neceſſary to know the diſtinction of temperaments, I have thought good in this place, briefly to handle the temperaments of the parts of the body, ages, ſeaſons of the yeare, humors, and medicines. Therefore the temperaments of the parts of our body are of this nature, not onely by the judgement of the touch of a mans hand which is juſtly tempered (who is often deceived by flowing heate, which ſpread from the heart into all the body, imparts a certaine kinde of heate to all the parts,) but alſo by the rule of their reaſon, compoſure and ſubſtance, as

Lib.2.de Temper. & in Arte medica.

What the temperaments of mans body are.

A Bone is the moſt drie and cold.
A Griſtle leſſe than it.
A Ligament leſſe than a Griſtle.

A Tendon is ſo much drier and colder than the membrane, by how much it in the ſame temper exceedes a Veine and Arterie. Then follow the harder veines, for the ſofter are in a middle temper of drineſſe and moiſture, like as the skinne; although all both ſoft and hard, are of a cold temper. Wherefore all theſe parts of their owne nature are cold and without bloud: although the veines and arteries waxe hot, by reaſon of the heate of the bloud they containe, which notwithſtanding alſo borroweth that heat from the heart, as a part moſt hot, and ſofter than the skinne; the liver next followeth the heart, in the order of the hotter parts, which is far ſofter than the skinne it ſelfe: for if, according to *Galens* opinion, the heart is ſomewhat leſſe hard than the skinne, and that is farre harder than the liver, as appeares by touching them, it muſt neceſſarily follow that the liver much exceedes the skinne in ſoftneſſe; I underſtand the skinne ſimple, and ſeparated from the fleſh lying under it, to which it firmely cleaves. The fleſh is more moiſt and hot than the skinne, by reaſon of the bloud diſperſed in it. The ſpinall marrow is colder and moiſter than the skinne; but the braine ſo much exceeds it in moiſture, as it is exceeded by the fat. The lungs are not ſo moiſt as the fat, and the ſpleene, and kidnies, are of the like nature, and nevertheleſſe they are all moiſter than the skinne.

Ad finem lib. de temper.

According to the diverſities of ages, the temperaments both of the whole body, and all its parts, undergoe great mutations; for the bones are farre harder in old men than in children, becauſe our life is, as it were a certaine progreſſe to drineſſe, which when it comes to the height conſequently cauſeth death. Wherefore in this place we muſt ſpeake of the Temperaments of ages, when firſt we ſhall have defined what an age is. Therefore an age is defined, a ſpace of life in which the conſtitution of the bodie of its ſelfe and owne accord, undergoeth manifeſt changes; the whole courſe of life hath foure ſuch ages. The firſt is childhood, which extends from the birth to the eighteenth yeare of age, and hath a hot and moiſt temper, becauſe it is next to the hot and moiſt beginnings of life, ſeed and bloud: Youth followeth this which is prolonged from the eighteenth, to the twentie fift yeare, and is temperate, and in the midſt of all exceſſes; Mans eſtate ſucceedeth youth, which they deny to extend beyond the thirtie fift yeare of age, in its proper temper it is hot and drie: whereby it commeth to paſſe that then the heate is felt more acride and biting, which in childhood ſeemed milde; becauſe the progreſſe of the life to drineſſe hath much waſted the native humiditie.

The temperaments of ages.

What an age is.

Then ſuccedes old age ever devided into two parts; the firſt whereof extends from the thirtie fift, to the fortie ninth yeare; thoſe of this age are called old men (* *but we commonly call them middle aged men.*) The latter is as it were devided by *Galen* into three degrees; the firſt whereof are thoſe, who having their ſtrength ſound and firme undergoe civill affaires and buſineſſes: which things thoſe which are in the ſecond degree

Old age devided into two parts.

* Three degrees of the ſecond part of old age.

gree of old age cannot doe, becauſe of the debilitie of their now decaying ſtrength: but thoſe which are in the laſt degree are afflicted with moſt extreme weakeneſſe and miſerie, and are as much deprived of their ſences and underſtanding, as of the ſtrength of their bodies; whereof aroſe this Proverbe, *Old men twice children*. Thoſe old men of the firſt ranke are pleaſant, and courteous, and thoſe we ſay are beginning to grow old, or in their greene old-age; thoſe of the ſecond ſort delight in nothing but the boord and bed; but old decreepit men of the laſt order, thinke of nothing elſe, than their graves and monuments. Their firme and ſolid parts are of a cold and drie temperature, by reaſon of the decay of the radicall moiſture, which the inbred heate cauſeth in the continuance of ſo many years. Which thing may happen in a ſhort ſpace, by the vehement flame of the ſame natural heate, turned by feavours into a fiery heate. But if any to prove old men moiſt, will object, that they cough up, and ſpit much, I will anſwer him, as an old Doctor once ſaid; That a pitcher filled with water may powre forth much moiſture; yet no man will deny but that ſuch a veſſell of its owne terrene nature and matter is moſt drie; ſo old men may plainely be affirmed to be moiſt, by reaſon of their defect of heate, and aboundance of excrements. But this deſcription of ages, is not to be taken ſo ſtrictly, as alwayes to be meaſured by the ſpaces and diſtances of yeares, for there are many which by their owne miſdemeanour, ſeeme elder at fortie, than others doe as [illegible]tie.

Old men have their ſolid parts drie.

A compariſon of the foure ages to the foure ſeaſons of the yeare.

Laſtly, the famous Philoſopher *Pythagoras*, devided man life into foure ages, and by a certaine proportion compared the whole courſe thereof to the foure ſeaſons of the yeare; as childhood to the Spring, in which all things grow and ſprout out, by reaſon of plenty and aboundance of moiſture. And youth to the Summer, becauſe of the vigour and ſtrength which men enjoy at that age. And mans eſtate, or conſtant age to Autumne, for that then after all the dangers of the forepaſſed life, the gifts of diſcretion and wit acquire a ſeaſonableneſſe, or ripeneſſe, like as the fruits of the earth enjoy at that ſeaſon. And laſtly, he compares old age to the ſterile and fruitleſſe Winter, which can eaſe and conſolate its tediouſneſſe by no other meanes, than the uſe of fruits gathered and ſtored up before, which then are of a cold and troubleſome condition. But for extreme old age, which extends to eightie, or a hundred yeares, it is ſo cold and drie, that thoſe which arrive at that decrepit age are troubleſome, harſh, touchy, froward, crabby, and often complaining, untill at the length deprived of all their ſenſes, tongue, feet, and underſtanding, they doting, returne againe to childiſhneſſe, as from the ſtaffe to the ſtart. And thus much of the Temperaments of ages.

The tempers of the ſeaſons of the yeare.

But now in like manner we will explaine the temperatures of the ſeaſons of the yeare, which are foure, the Spring, Summer, Autumne, Winter. The Spring continues almoſt from the twelth or thirteenth day of March, to the midſt of May, *Hippocrates* ſeemeth to make it hot and moiſt; which opinion ſeemeth not to have ſprung from the thing it ſelfe, but from an inveterate error of the ancient Philoſophers, who would fit the temperaments of the foure ſeaſons of the yeare, as anſwering in proportion to the temperatures of the foure ages.

How the Spring is temperate.

For if the matter come to a juſt triall, all men will ſay the Spring is temperate, as that which is in the midſt of the exceſſe of heate, cold, moiſture and drineſſe; not onely by compariſon becauſe it is hotter than Summer, and colder than Winter; but becauſe it hath that qualitie of its owne proper nature. Wherefore it is ſaid of *Hippocrates*: The Spring is moſt holeſome and leaſt deadly; if ſo be that it keepe its native temper, from which if it decline, or ſucceed a former untemperate ſeaſon, as Autumne, or Winter, it will give occaſion to many diſeaſes deſcribed by *Hippocrates*; not that it breeds them, but becauſe it brings them to ſight, which before lay hid in the body. Summer is comprehended in the ſpace of almoſt foure moneths; it is of a hot and drie temper, a breeder of ſuch diſeaſes as proceed from choler, becauſe that humor at this time is heaped up in many bodies by aduſtion of bloud bred in the Spring; but all ſuch diſeaſes doe ſpeedily runne their courſe. The beginning of Autumne, is from the time the Sunne enters into Libra, and endures the like ſpace of time as the Spring. But when it is dry, it hath great inequalitie of heate and cold; for the mornings and evening being very cold, the noondayes on the contrary are exceeding

Aphor.9.ſect.3

Aphor.20.ſect.3

Autumne unequall.

ding hot. Wherefore many diſeaſes are in Autumne, and then long and deadly eſpecially if they incline towards winter: becauſe all dayly and ſodaine changes to heat and cold are dangerous. The winter poſſeſſes the remnant of the yeare, and is cold and moiſt, it encreaſes naturall heat, ſtirs up the appetite, and augments Phlegme. It encreaſes heat by *Antiperiſtaſis*, or contrariety of the encompaſſing aire, which being then cold prohibites the breathing out of heate: whereby it happens that the heat being driven in and hindered from diſſipation, is ſtrengthened by couniting its forces. But it augments Phlegme, for that men are more greedy, the Appetite being encreaſed by the ſtrengthened heat: from whence proceeds much crudity and a large ſtore of diſeaſes, eſpecially Chronicke or Long which ſpread and encreaſe rather in this winter ſeaſon than in any other part of the yeare. To this diſcourſe of the temper, of the ſeaſons of the yeares, is to be revoked the variety of tempers which happens very day, which certainly is not to be neglected, that there may be place of election, eſpecially if nothing urge. For hither belongs that ſaying of *Hippocrates*; When in the ſame day it is one while hot, another cold, Autumnall diſeaſes are to be expected. Therefore an Indication taken from hence is of great conſequence to the judgement of diſeaſes; for if it agree with the diſeaſe, the diſeaſe is made more contumacious, and difficult to cure. Whereupon the Patient and Phiſition will have much trouble; but if on the contrary it reclame and diſſent, the health of the Patient is ſooner to be expected. Neither is it a thing of leſſe conſequence to know the cuſtomes and habits of the places and Countries in which we live, as alſo the inclination of the Heavens and temperature of the Aire; but let vs leave theſe things to be conſidered by Naturall Philoſophers, that we may deliver our judgment of the temperaments of *Humors*. blood, as that which anſwers to the Aire in proportion, is of a hot and moiſt nature, or rather temperate, as *Galen* teſtifies; for, ſaith he, it is certaine and ſure that the The blood is neither hot, nor moiſt, but temperate as in its firſt compoſure none of the 4 firſt qualities exceeds other by any manifeſt exceſſe, as he repeats it upon the 39. ſentence. Phlegme, as that which is of a wateriſh nature, is cold and moiſt; no otherwiſe than Choler being of a fiery temper, is hot and dry. But Melancholy aſſimulated to Earth, is cold and dry. This which we have ſpoken in generall of Phlegme and Melancholy, is not alwayes true in every kind of the ſaid humors. For ſalte Phlegme is of a hot and dry temperature, as alſo all kinds of Melancholy which have aroſe, or ſprung by aduſtion from the native and Alimentary, as we will teach in the following Chapter. Now the Temperaments of Medicins have not the ſame forme of judgment, as thoſe things which we have before ſpoken of; as, not from the Elementary quality which conquering in the contention and mixture, obtaines the dominion; but plainly from the effects which taken or applyed they imprint in a temperate body. For ſo we pronounce thoſe things hot, cold, moiſt, or dry, which produce the effects of Heate, Coldnes, Moiſture or Drynes. But we will defer the larger explication of theſe things to that place, where we have peculiarly appointed to treat of Medicines; where we will not ſimply enquire whether they be hot or cold, but what degree of heate and cold, or the like other quallity: in which ſame place we will touch the temperature and all the Nature of taſts, becauſe the certaineſt judgment of medicines is drawne from their taſts. Hitherto of Temperaments, now we muſt ſpeake of Humors whoſe uſe in Phyſicall ſpeculation is no leſſe than that of Temperaments.

How Winter increaſes the native heat.

The temperature of the blood.

From whence we judge of the temperature of medicines.

CHAP. VI.

Of Humors.

TO know the nature of *Humors* is a thing not onely neceſſary for Phiſitions, but alſo for Chirurgeons, becauſe there is no diſeaſe with matter which ariſeth not from ſome one, or the mixture of more *Humors*. Which thing *Hippocrates* underſtanding, writ, every Creature to be either ſicke or well according to the Condition

The knowledge of the Humors is neceſſary.

Lib. de natura Hum.

dition of the *Humors* in the body. And certainly all putride feavers proceed from the putrifaction of *Humors*. Neither doe any acknowledge any other originall or diſtinction of the differences of Abſceſſes or Tumors: neither do ulcerated, brokē or otherwiſe wounded members hope for the reſtauration of continuity, from other than from the ſweet falling downe of humors to the wounded part. Which is the cauſe that often in the cure of theſe affects, the Phiſitions are neceſſarily buſied in tempering the Blood, that is, bringing to a mediocrity the 4 humors compoſing the maſſe of blood, if they at any time offend in quantity, or quality. For whether if any thing abound, or digreſſe from the wonted temper in any exceſſe of heat, cold, viſcoſity, groſſenes, thinnes, or any ſuch like quality, none of the accuſtomed functions will be well performed. For which cauſe thoſe cheife helpes to preſerve and reſtore health have beene divinely invented; *Phelebotomy*, or bloodletting which amends the quantity of too much blood; and purging which corrects and drawes away the vicious quality. But now let us begin to ſpeak of the Humors, taking our beginning from the definition.

The helpes of Health.

What an humor is.

The manifold diviſion of Humors.

The materiall and efficient cauſes of blood

What the *Chylus* is.

* *Vena porta*

Where the blood is perfected.

The receptacles of Choler and Melancholy.

Foure unlike Humors in the Bloody.

A compariſon of blood and new wine.

An Humor (is called by Phiſitions) what thing ſo ever is Liquide and flowing in the body of living Creatures endued with Blood, & that is either natural, or againſt nature. The naturall is ſo called becauſe it is fit to defend, preſerve and ſuſtaine the life of a Creature. Quite different is the nature & reaſon of that which is againſt nature. Again the former is either Alimentary, or Excrementitious; The Alimentary which is fit to nouriſh the body, is that Humor which is contained in the veines and arteries of a man which is tēperate & perfectly wel; & which is underſtood by the general name of blood which is let out at the opening of a veine. For blood otherwiſe taken is an Humor of a certaine kind, diſtinguiſhed by heate and warmneſſe from the other Humors comprehended together with it, in the whole maſſe of the blood. Which thing that it may the better be underſtood, I have thought good in this place to declare the generation of Blood by the efficient and materiall cauſes. All things which we eate or drink, are the materialls of blood, which things drawne into the bottome of the ventricle by its attractive force, and there detained, are turned by the force of concoction implanted in it, into a ſubſtance like to Almond Butter. Which thing although it appeare one and like it ſelfe, yet it conſiſts of parts of a different nature, which not only the variety of meats, but one & the ſame meate yeelds of it ſelf. We terme this *Chylus* (when it is perfectly concocted in the ſtomacke). But the * Gate-veine receives it driven from thence into the ſmall guts, and ſucked in by the Meſeraicke veins, and now having gotten a litle rudiment of Change in the way, carries it to the Liver, where by the blood-making faculty which is proper and naturall to this part, it acquires the abſolute and perfect forme of blood. But with that blood at one and the ſame time and action all the humors are made whether Alimentary or excrementitious. Therefore the blood that it may performe its office, that is, the faculty of nutrition, muſt neceſſarily be purged and clenſed from the two excrementitious humors. Of which the bladder of Gall drawes one which we call Yellow Choler, and the Spleen the other which we terme Melancholy. Theſe two humors are naturall, but not Alimentary, or nouriſhing, but of another uſe in the body, as afterwards we will ſhew more at large. The blood freed from theſe 2. kinds of excrements is ſent by the veines and Arteries into all parts of the body for their nouriſhment. Which although then it ſeeme to be of one ſimple nature, yet notwithſtanding it is truly ſuch, that foure different and vnlike ſubſtances may be obſerved in it, as blood properly ſo named, Phlegme, Choler and Melancholy, not only diſtinct in colour, but alſo in taſte, effects and qualities. For as *Galen* notes in his booke *De Natura humana*, Melancholy is acide or ſoure, choler bitter, Blood ſweet, Phlegme unſavory. But you may know the variety of their effects, both by the different temper of the nouriſhed parts, as alſo by the various condition of the diſeaſes ſpringing from thence. For therefore ſuch ſubſtances ought to be tempered and mixed amongſt themſelves in a certaine proportion, which remaining, health remaines, but violated, diſeaſes follow. For all acknowledge that an *Oëdema* is cauſed by Phlegmatick, a *Scirrhus* by Melancholike, an *Eryſipelas* by Cholericke, and a *Phlegmone* by pure and laudable blood. *Galen* teaches by a familiar example of new wine preſently taken from the preſſe, that theſe 4 ſubſtances are contained in that one Maſſe, and mixture of the blood. In which every one obſerves 4. diſtinct Eſſences; for the flower of the wine working up ſwims at the top, the dregs fall downe to the bottome, but the crude and watery moiſture mixed together with the ſweet and vinous liquor, is every where diffuſed through the body of the wine; the flower of the wine repreſents Choler, which bubling up on the ſuperficies of blood, as it concretes and growes cold, ſhineth with a golden colour; the dregs Melancholy, which by reaſon of its heavines ever ſinketh downward, as it were the Mudd of the blood; the crude and watery portion Phlegme: for as that crude humor, except it be rebellious in quantity, or ſtubborne by its quality, there is hope it may be changed into wine, by the naturall heate of the wine; ſo Phlegme which is blood halfe concocted, may by the force of native heat be changed into good and laudable blood. Which is the cauſe that nature decreed, or ordained no peculiar place, as to the other 2. humours, whereby it might be ſevered from the blood; But the true and perfect liquor of the wine repreſents the pure blood, which is the more laudable and perfect portion of both the humors of the confuſed Maſſe. It may eaſily appeare by the following ſcheme, of what kind they all are, and alſo what the diſtinction of theſe foure humors may be.

Phlegme is blood halfe concocted. Why it hath no proper receptacle.

	NATVRE	CONSISTANCE	COLOVR	TASTE	VSE.
Blood is	*Of Nature aery, hot and moyſt, or rather temperate,*	*Of indifferent conſiſtance, neither too thicke nor too thin,*	*Of Colour red, roſy or Crimſon,*	*Of Taſte ſweete,*	*Of ſuch uſe, that it cheifly ſerves for the nouriſhment of the fleſhy parts, and caried by the veſſels imparts heate to the whole body.*
Phlegme is	*Of Nature watery, cold and moiſt,*	*Of Conſiſtance liquid,*	*Of Colour white*	*Of Taſte ſweet, or rather unſavory, for we commend that water which is unſavory*	*Fit to nouriſh the braine and al the other cold and moiſt parts, to temper the heate of the blood, and by its ſlipperines to helpe the motion of the ioynts.*
Choler is	*Of Nature fiery, hot and drie,*	*Of Conſiſtance Thin,*	*Of Colour yeallow, or pale,*	*Of Taſte bitter,*	*It provoketh the expulſive faculty of the guts, attenuates the Phlegme cleaving to them, but the Almentary is fit to nourith the parts of like temper with it.*
Melancholy is.	*Of Nature earthly, cold and dry.*	*Of Conſiſtance groſſe and muddy,*	*Of Colour blackiſh*	*Of taſte acide, ſoure or biting.*	*Stirs up the Appetite, nouriſhes the ſpleene and all the parts of like temper to it, as the Bones.*

Bloud hath its neereſt matter from the better portion of the *Chylus*: and being begunne to be laboured in the veines, at length gets forme and perfection in the liver; but it hath its remote matter from meates of good digeſtion and quality, ſeaſonably eaten after moderate exerciſe; but for that, one age is better than another, and one time of the yeare more convenient than another. For bloud is made more copiouſly in the Spring, becauſe that ſeaſon of the yeare comes neereſt to the temper of the bloud, by reaſon of which the bloud is rather to be thought temperate, than hot and moiſt, for that *Galen* makes the Spring temperate, and beſides, at that time bloud-letting is performed with the beſt ſucceſſe: youth is an age very fit for the generation of bloud; or by *Galens* opinion, rather that part of life, that continues from the 25. to the 35. yeare of our age. Thoſe in whom this humor hath the dominion, are beautified with a freſh and roſie colour, gentle and well natured, pleaſant, merry, and facetious. The generation of Phlegme is not by the imbecillity of heat, as ſome of the ancients thought; who were perſwaded that choler was cauſed by a raging, bloud by a moderate, and phlegme and melancholy, by a remiſſe heate. But that opinion is full of maniſeſt errour: for if it be true that the *Chylus* is laboured and made into bloud in the ſame part, and by the ſame fire, that is, the liver; from whence in the ſame moment of time ſhould proceed that ſtrong and weake heate, ſeeinge the whole maſſe of the bloud different in its foure eſſentiall parts, is perfected and made at the ſame time, and by the ſame equall temper of the ſame part, action, and bloud-making facultie; therefore from whence have we this varietie of humors? From hence, for that thoſe meates by which wee are nouriſhed, enjoy the like condition that our bodies doe, from the foure Elements, and the foure firſt qualities; for it is certaine, and wee may often obſerve in what kind ſoever they be united or joyned together, they retaine a certain hot portion imitating the Fire, another cold, the water; another dry, the earth, and laſtly, another moiſt like to the Aire. Neither can you name any kinde of nouriſhment, how cold ſoever it be, not Lettuce it ſelfe, in which there is not ſome fiery force of heate. Therefore it is no marvell, if one and the ſame heate working upon the ſame matter of *Chylus*, varying with ſo great diſſimilitude of ſubſtances, doe by its power produce ſo unlike humors, as from the hot, Choler; from the cold, Phlegme; and of the others, ſuch as their affinity of temper will permit.

Lib.1.de temp.

One and the ſame heate is the efficient cauſe of all humors at the ſame time.

The heate of the Sunne alone doth melt waxe and harden clay.

There is no cauſe that any one ſhould thinke that varietie of humors to be cauſed in us, rather by the diverſity of the active heate, than waxe and a flint placed at the ſame time, and in the ſame ſituation of climate and ſoile, this to melt by the heat of the Sunne, and that ſcarſe to waxe warme. Therefore that diverſitie of effects is not to be attributed to the force of the efficient cauſe, that is, of heate, which is one and of one kinde in all of us; but rather to the materiall cauſe, ſeeing it is compoſed of the conflux, or meeting together of various ſubſtances, gives the heate leave to worke, as it were out of its ſtore, which may make and produce from the hotter part thereof Choler, and of the colder, and more rebellious Phlegme. Yet I will not deny but that more Phlegme, or Choler may be bred in one and the ſame body, according to the quicker, or ſlower provocation of the heate; yet neverthleſſe it is not conſequent, that the originall of Choler ſhould be from a more acride, and of Phlegme from a more dull heat in the ſame man. Every one of us naturally have a ſimple heate, and of one kinde, which is the worker of diverſe operations, not of it ſelfe, ſeeing it is alwayes the ſame, and like it ſelfe, but by the different fitneſſe, pliableneſſe, or reſiſtance of the matter on which it workes. Wherefore phlegme is generated in the ſame moment of time, in the fire of the ſame part, by the efficiency of the ſame heate, with the reſt of the bloud, of the more cold, liquide, crude, and watery portion of the *Chylus*. Wher by it comes to paſſe, that it ſhewes an expreſſe figure of a certaine rude or unperfect bloud, for which occaſion nature hath made it no peculiar receptacle, but would have it to run friendly with the bloud in the ſame paſſages of the veines, that any neceſſitie happening by famin, or indigency, and in defect of better nouriſhment, it may by a perfecter elaboration quickly aſſume the forme of bloud. Cold & rude nouriſhmēt make this humor to abound, principally in winter, and in thoſe which incline to old age, by reaſon of the ſimilitude which phlegme hath with that ſeaſon and age. It makes a man drowſie, dull, fat, and ſwollen up, and haſteneth gray haires. Choler

The divers condition of the matter alone, is the cauſe of varietie.

The effects of Phlegme.

is as it were a certaine heate and fury of humors, which generated in the liver, together with the bloud is carried by the veines and arteries through the whole body. That of it which abounds, is ſent, partly into the guts, and partly into the bladder of the gall; or is conſumed by tranſpiration, or ſweates; It is ſomewhat probable that the Arteriall bloud is made more thinne, hot, quicke and pallid, than the bloud of the veines, by the commixture of this Alementarie choler. This humor is chiefely bred and expeld in youth, and acrid and bitter meates give matter to it: but great labours of bodie and minde give the occaſion. It maketh a man nimble, quicke, ready for all performance, leane, and quicke to anger, and alſo to concoct meates. The Melancholicke humor, or Melancholy, being the groſſer portion of the bloud, is partly ſent from the Liver to the Spleene to nouriſh it, and partly carried by the veſſels into the reſt of the body, and ſpent in the nouriſhment of the parts endued with an earthly drineſſe; it is made of meates of groſſe juyce, and by the perturbations of the minde, turned to feare and ſadneſſe. It is augmented in Autumne, and in the firſt and crude old age; it makes men ſad, harſh, conſtant, froward, envious and fearefull. All men ought to thinke, that ſuch humors are wont to move at ſet houres of the day, as by a certaine peculiar motion or tide. Therefore the bloud flowes from the ninth houre of the night, to the third houre of the day; then Choler to the ninth of the day; then Melancholy to the third of the night, the reſt of the night that remaines, is under the dominion of Phlegme. Manifeſt examples hereof appeares in the French-Poxe. From the elaborate and abſolute maſſe of the bloud (as we ſaid before) two kindes of humors, as excrements of the ſecond concoction, are commonly and naturally ſeparated, the one more groſſe, the other more thinne. This is called either abſolutely choler, or with an adjunct, yellow choler. That is called Melancholy; which drawne by the Spleene in a thinner portion, and elaborate by the heate of the Arteries, which in that part are both many and large, becomes nouriſhment to the part; the remnant thereof is carried by the veiny veſſell into the orifice of the ventricle, whereby it may not cauſe, but whet the appetite, and by its aſtriction ſtrengthen the actions thereof. But yellow Choler drawne into the bladder of the gall, remaines there ſo long, till being troubleſome, either in quantitie or qualitie, it is excluded into the guts, whereby it may caſt forth the excrements reſiding in them; the expulſive facultie being provoked by its acrimony, and by its bitterneſſe kills the wormes that are bred there. This ſame humor is accuſtomed to die the urine of a yellow colour. There is another ſerous humor, which truly is not fit to nouriſh, but profitable for many other things, which is not an excrement of the ſecond, but of the firſt concoction. Therefore nature would that mixed with the *Chylus*, it ſhould come to the Liver, and not be voided with the excrements, whereby it might alay the groſſeneſſe of the bloud, and ſerve it for a vehicle; for otherwiſe the bloud could ſcarſe paſſe through the capillary veines of the Liver, and paſſing the ſimous and gibbous parts thereof, come to the hollow veine. Part of this ſerous humor ſeparated together with the bloud which ſerves for the nouriſhment of the Reines, and ſtraight carried into the bladder, is turned into that urine which we daily make; the other part therefore carried through all the body together with the bloud, performing the like duty of tranſportation, is excluded by ſweats into which it degenerates. Beſides the forenamed, the Arabians have mentioned foure other humors, which they terme Alimentary and ſecondary, as being the next matter of nouriſhment, as thoſe foure the bloud containes, the remote. They have given no name to the firſt kinde, but imagine it to be that humor, which hangs ready to fall like to little drops in the utmoſt orifices of the veines. They call the ſecond kinde, * Dew; being that humor, which entred already into the ſubſtance of the part, doth moiſten it. The third they call by a Barbarous name *Cambium*, which already put to the part to be nouriſhed, is there faſtened. The fourth named *Gluten*, or Glew, is onely the proper and ſubſtance-making humidity of the ſimular parts, not their ſubſtance. The diſtinction of the degrees of nutrition recited by *Galen* in his Bookes of Naturall faculties, anſwer in proportion to this diſtinction of humors. The firſt is, that the bloud flow to the part that requires nouriſhment; then that being there arrived, it may be agglutinated; then laſtly, that having loſt its former forme of nouriſhment, it may be aſſimulated.

The effects of Choler.

The effects of Melancholy.

What motions are in each quarter of the body.

The Melancholy humor doth not cauſe, but whet the appetite.

A Serous or wheyiſh humor.

Secundary humors.

* Ros.

Humors againſt nature.

Thoſe humors are againſt nature, which being corrupted, infect the body and the parts in which they are contained by the contagion of their corruption, retaining the names and titles of the humors, from whoſe perfection and nature they have revolted, they all grow hot by putrifaction, although they were formerly by their owne nature cold. And they are corrupted, either in the veines onely, or within and without the veines; In the veines Bloud and Melancholy; but both without and within the veines, Choler and Phlegme. When bloud is corrupted in its thinner portion, it turnes into choler, when in its thicker, into Melancholy; for the bloud becomes faultie two maner of waies, either by the corruption of its proper ſubſtance by putrifactiō, or by admixtion of another ſubſtance by infection. The Melancholy humor which is corrupted in the veines, is of three ſorts: the 1. is of a Melancholy juice putrifying, and by the force of a ſtrange heate, turned as it were into aſhes, by which it becomes aduſt, acride and biting. The other ariſeth from that Choler which reſembles the yolkes of egges, which by aduſtion becomes leeke-coloured, then æruginous, or of a blewiſh greene, then red, and laſtly blacke, which is the very worſt kinde of Melancholy, hot, maligne, eating and exulcerating, and which is never ſeene or voided with ſafetie. The third comes from Phlegme putrifying in the veines, which firſt degenerates into ſalte Phlegme, but ſtraight by the ſtrength of extraneous heate degenerates into Melancholy.

Into what humors the bloud when it corrupts doth degenerate.

The Melancholy humor corrupted, is of three kinds.

- Phlegme not naturall is bred, either
  - In the veines, and is either
    - Acide and very crude, as which hath had none or very litle impreſſion of heate, but that which it firſt had in the ſtomacke.
    - Salt, which is bred by the ſweet, putrifying and aduſt, or mixture of aduſt and ſalt particles.
  - or without the veines, and is of 4. ſorts, either
    - Wateriſh, as is that thinne moiſture which diſtils from the braine by the noſtrills.
    - Mucous, as when that wateriſh is thickened into filth by the helpe of ſome accidentall or ſmall heate.
    - Glaſſie, or * ***Albuminous***, reſembling molten glaſſe, or rather the white of an egge, and is moſt cold.
    - *Gypſea*, or Plaiſter-like, which is concrete into the hardneſſe and forme of chalke, as you may ſee in the joints of the fingers in a knotty goute, or in inveterate diſtillations upon the Lungs.

* *Albuminea.*

* *Vitellina.*

- Choler not naturall is bred, either
  - In the veines, as the * vitelline (like in conſiſtance to the yolke of a raw egge) which the acrimony of ſtrange heate breeds of yellow choler, which ſame in diſeaſes altogether deadly, degenerates into greene, æruginous, and laſtly into a blue, or colourlike that which is dried by woad.
  - Or in the capacitie of the upper belly as the ventricle, and this is of five kinds
    - The firſt is called *Porracea* or leek-coloured, reſembling the juyce of a leeke in greeneneſſe.
    - The 2. *ægruginoſa*, or æruginous, like in colour to verdigreaſſe.
    - The 3. blewiſh, or woad-coloured, like the colour died by woad.
    - The 4. red, differing in this from bloud, whoſe colour it imitates, that it never cōmeth into knots, or clods like bloud.
    - The 5. very red, generated by the exceſſe of the former, which cauſeth burning feavers.

The kinds of ſuch choler, are often caſt forth by vomit in diſeaſes, the ſtrength of the diſeaſe being paſt; being troubleſome to the parts through which they are evacuated, by their bitterneſſe, acrimony and biting.

The Signes of a Sanguine Perſon.

I Thinke it manifeſt, becauſe the matter and generation of fleſh is principally from bloud, that a man of a fleſhy, denſe, and ſolid habite of body, and full of a ſweete and vaporous juice, is of a Sanguine complexion. And the ſame party hath a flouriſhing and roaſie colour in his face, tempered as with an equall mixture of white and red; of white, by reaſon of the ſkinne lying utmoſt; of red, becauſe of the bloud ſpred underneath the ſkinne; for alwayes ſuch as the humor is, ſuch is the colour in the face. In manners hee is courteous, gentle, eaſie to be ſpoken to, not altogether eſtranged from the love of women, of a lovely countenance and ſmoothe forehead, ſeldome angry, but taking all things in good part; for as the inclination of humors is, ſo alſo is the diſpoſition of manners. But bloud is thought the mildeſt of all humors; but the ſtrong heate of the inward parts maketh him to eate and drinke freely. Their dreames are pleaſant, they are troubled with diſeaſes ariſing from bloud, as frequent Phlegmons, and many Sanguine puſtles breaking through the ſkinne, much bleeding, and menſtruous fluxes. Wherefore they can well endure bloud-letting, and delight in the moderate uſe of cold and drie things; and laſtly, are offended by hot and moiſt things. They have a great and ſtrong Pulſe, and much urine in quantitie, but milde of qualitie, of an indifferent colour and ſubſtance.

Such as the humor is, ſuch is the colour.

The manners and diſeaſes of Sanguine perſons.

The Signes of a Cholericke Perſon.

Cholericke men are of a pale or yellowiſh colour, of a leane, ſlender and rough habit of body, with faire veines and large Arteries, and a ſtrong and quicke Pulſe: their ſkinne being touched, feeles hot, dry, hard, rough and harſh, with a pricking and acred exhalation which breathes forth of their whole body. They caſt forth much choler by ſtoole, vomite and urine. They are of a quicke and nimble wit, ſtout, hardy and ſharpe vindicaters of received injuries, liberall even to prodigalitie, and ſomewhat too deſirous of glory. Their ſleepe is light, and from which they are quickly waked; their dreames are fiery, burning, quicke and full of furie; they are delighted with meates and drinkes which are ſomewhat more cold and moiſt, and are ſubject to Tertian and burning feavers, the Phrenſie, Iaundiſe, Inflammations, and other cholericke puſtules, the Laske, Bloudy fluxe, and bitterneſſe of the mouth.

Cholericks are not commonly fat.

The manners and diſeaſes of Cholericke perſons.

The Signes of a Phlegmaticke Perſon.

Thoſe in whom Phlegme hath the dominion, are of a whitiſh coloured face, and ſometimes livide and ſwollen, with their body fat, ſoft and cold to touch.

They are moleſted with Phlegmaticke diſeaſes, as *oedematous* tumors, the Dropſie, Quotidians feavers, falling away of the haires, and catarrhes falling downe upon the Lungs, and the *Aſpera Arteria*, or Weaſon; they are of a ſlow capacitie, dull, ſlothfull, drouſie, they doe dreame of raines, ſnowes, floods, ſwimming, and ſuch like, that they often imagine themſelves overwhelmed with waters; they vomite up much waterie, and Phlegmaticke matter, or otherwiſe ſpit and evacuate it, and have a ſoft and moiſt tongue.

The manners and diſeaſes of Phlegmaticke perſons.

And they are troubled with a dogge-like hunger, if it at any time ſhould happen that their inſipide Phlegme become acide; and they are ſlow of digeſtion, by reaſon of which they have great ſtore of cold and Phlegmaticke humors, which if they be carried downe into the windings of the cholicke-gut, they cauſe murmuring and noiſe, and ſometimes the Cholicke.

From whence noiſe, or rumbling in the belly proceedes.

For much wind is eaſily cauſed of ſuch like Phlegmatick excrements wrought upon by a ſmall and weake heate, ſuch as Phlegmaticke perſons have, which by its naturall lightneſſe is diverſly carried through the turnings of the guts, and diſtends and ſwells them up, and whiles it ſtrives for paſſage out, it cauſeth murmurings and noiſes in the belly, like winde breaking through narrow paſſages.

Signes of a Melancholike perſon.

Diſeaſes familiar to Melancholy perſons.

THe face of Melancholy perſons is ſwart, their countenance cloudy and often cruell, their aſpect is ſad and froward; frequent Schirrhous, or hard ſwellings, tumors of the ſpleene, Hæmorroids, *Varices (or ſwollen veines) Quartaine* feavers, whether continuall or intermitting, *Quintaine, Sextaine*, and *Septimane* feavours; and to conclude, all ſuch wandering feavers or agues ſet upon them. But when it happens the Melancholy humor is ſharpened, either by aduſtion, or commixture of Choler, then Tetters, the blacke Morphew, the Cancer ſimple and ulcerated, the Leprous and filthy ſcabbe, ſending forth certaine ſcaly and branlike excreſcenſes, (being vulgarly called Saint *Manis* his evill) and the Leproſie it ſelfe invades them: They have ſmall veines and arteries, becauſe coldneſſe hath dominion over them, whoſe propertie is to ſtraiten, as the qualitie of heate is to dilate.

From or by what their veines are ſwollen.

But if at any time their veines ſeeme bigge, that largeneſſe is not by reaſon of the laudable bloud, contained in them, but from much windineſſe; by occaſion whereof it is ſomewhat difficult to let them bloud; not onely becauſe that when the veine is opened, the bloud flowes ſlowly forth, by reaſon of the cold ſlowneſſe of the humors; but much the rather, for that the veine doth not receive the impreſſion of the Lancet, ſliding this way and that way, by reaſon of the windineſſe contained in it, and becauſe that the harſh drineſſe of the upper skinne, reſiſts the edge of the inſtrument. Their bodies ſeeme cold and hard to the touch,

Their dreames

and they are troubled with terrible dreames, for they are obſerved to ſeeme to ſee in the night Devils, Serpents, darke dens and caves, ſepulchers, dead corpſes, and many other ſuch things full of horror, by reaſon of a blacke vapour, deverſly moving and diſturbing the Braine, which alſo wee ſee happens to thoſe, *who feare the water, by reaſon of the biting of a mad dogge.

**Hydrophobi.*

Their manners.

You ſhall finde them froward, fraudulent, parſimonious, and covetous, even to baſeneſſe, ſlow ſpeakers, fearefull, ſad, complainers, carefull, ingenious, lovers of ſolitarineſſe, man-haters, obſtinate maintainers of opinions once conceived, ſlow to anger, but angered not be pacified. But when Melancholy hath exceeded natures and its owne bounds, then by reaſon of putrefaction and inflammation all things appeare full of extreme fury and madneſſe, ſo that they often caſt themſelves headlong downe from ſome high place, or are otherwiſe guilty of their owne death, with feare of which notwithſtanding they are terrified.

From whence the change of the native temper.

But we muſt note that changes of the native temperament, doe often happen in the courſe of a mans life, ſo that hee which a while agone was Sanguine, may now bee Cholericke, Melancholick, or Phlegmatick; not truly by the changing of the bloud into ſuch humors, but by the mutation of Diet, and the courſe or vocation of life.

How one may become cholericke.

For none of a Sanguine complexion but will prove Cholericke if he eate hot and drie meates, (as all like things are cheriſhed and preſerved by the uſe of their like, and contraries are deſtroyed by their contraries) and weary his body by violent exerciſes, and continuall labours; and if there be a ſuppreſſion of Cholericke excrements, which before did freely flow, either by nature, or art.

How melancholick.

But whoſoever feeds upon meates generating groſſe bloud, as Beefe, Veniſon, Hare, old Cheeſe, and all ſalt meates, he without all doubt ſliding from his nature, will fall into a Melancholy temper; eſpecially if to that manner of diet, he ſhall have a vocation full of cares, turmoiles, miſeries, ſtrong and much ſtudy, carefull thoughts and feares; and alſo if he ſit much, wanting exerciſe, for ſo the inward heate as it were defrauded of its nouriſhment, faints, and growes dull, whereupon groſſe and droſſie humors abound in the body. To this alſo the cold and drie condition of the place, in which we live, doth conduce, and the ſuppreſſion of the Malancholy humor accuſtomed to be evacuated by the Hæmorrhoides, courſes, and ſtooles.

How Phlegmaticke.

But he acquires a Phlegmaticke temper whoſoever uſeth cold & moiſt nouriſhment, much feeding, who before the former meate is gone out of the belly, ſhall ſtuffe his paunch with more, who preſently after meate runs into violent exerciſes, who inhabite cold and moiſt places, who leade their life at eaſe in all idleneſſe; and laſtly, who ſuffer a ſuppreſſion of the Phlegmaticke humour accuſtomely evacuated by vomite, cough, or blowing the noſe, or any other way either by nature or arte. Certainely it is very convenient to know theſe things, that we may diſcerne if any at the preſent be Phlegmaticke, Melancholicke or of any other temper, whether he be ſuch by nature, or neceſſity. Having declared thoſe things which concerne the nature of Temperaments, and deferred the deſcription of the parts of the body to our Anatomy, we will begin to ſpeake of the faculties governing this our life, when firſt we ſhall have ſhowen by a practicall demonſtration of examples, the uſe and certainty of the aforeſaid rules of Temperaments.

CHAP. VII.

Of the Practice of the aforeſaid rules of Temperaments.

Foure bounds or Regions of the world.

THat we may draw the Theoricke of the Temperaments into practiſe, it hath ſeemed good for avoyding of confuſion, which might make this our Introduction ſeeme obſcure, if we would proſecute the differences of the Tempers of all men of all Nations, to take thoſe Limits, which nature hath placed in the world; as South, North, Eaſt and Weſt, and as it were the Center of thoſe bounds, that the deſcribed variety of Tempers, in colour, habit, manners, ſtudyes, actions, and forme of life of men that inhabit thoſe Regions ſcituated ſo farre diſtant one from another, may be as a ſure rule, by which we may certainely judge of every mans temperature in particuler, as he ſhall appeare to be nearer, or further off from this, or that region. Thoſe which inhabite the South as the Affricans, Æthiopians, Arabians and Egyptians, are for the moſt part deformed, leane, dusky coloured and pale, with blacke eyes and great lippes, curled haire, and a ſmall and ſhrill voyce. Thoſe which inhabite the Northren parts as the Scythians, Muſcovites, Polonians and Germaines, have their faces of colour white, mixed with a convenient quantity of blood, their skin ſoft and delicate, their haire long, hanging downe and ſpreading abroad, and of a yellowiſh, or reddiſh colour; of ſtature they are commonly tall, & of a well proportioned, fat and compact habite of body, their eyes gray; their voyce ſtrong, loud and bigge. But thoſe who are ſcituated betweene theſe two former, as the Italians and French, have their faces ſomewhat ſwart, are well favoured, nimble, ſtrong, hairy, ſlender, well in fleſh, with their eyes reſembling the colour of Goates-eyes, and often hollow eyed, having a cleere ſhrill and pleaſing voyce.

The forces of temperatures in particulars, The temperature of the Southerene people. Of the Northerne.

The Southern people prevails in wit, the Northerne in ſtrenght.

The Southerne people are exceeded ſo much by the Northerne in ſtrength and abillity of body, as they ſurpaſſe them in witt and the faculties of the minde. Hence is it you may reade in Hiſtories, that the Scythians, Gothes and Vandals vexed Affricke and Spaine with infinite incurſions, and moſt large and famous Empires have beene founded from the North to the South; but few or none from the South to the North. Therefore the Northren people thinking all right and law to conſiſt in Armes, did by Duell onely determine all cauſes and controverſies ariſing amongſt the inhabitants, as wee may gather by the ancient lawes, and cuſtomes of the Lumbards, Engliſh, Burgonians, Danes and Germaines; and we may ſee in *Saxo* the Grammarian that ſuch a law was once made by *Fronto* king of Denmarke. The which cuſtome at this day is every where in force amongſt the Muskovits. But the Southerne people have alwayes much abhorred that faſhion, and have thought it more agreeable to Beaſts than Men. Wherefore we never heard of any ſuch thing uſed by the Aſſyrians, Egyptians, Perſians or Iewes. But moved by the goodnes of their wit, they erected Kingdomes and Empires by the onely helpe of Learning and hidden ſciences. For ſeeing by nature they are Melancholicke by reaſon of the dryneſſe of their temperature, they willingly addict themſelves to

ſolitarineſſe

The Southern people learned and religious.

ſolitarineſſe and contemplation, being endued with a ſingular ſharpneſſe of wit. Wherefore the Æthiopians, Egyptians, Africans, Iewes, Phænicians, Perſians, Aſſyrians, and Indians, have invented many curious ſciences, revealed the Myſteries and ſecrets of Nature, digeſted the Mathematiques into order, obſerved the motions of the heavens, and firſt brought in the worſhip and religious ſacrifices of the gods: Even ſo farre that the Arabians who live onely by ſtealth, and have onely a Waggon for their houſe, do boaſt that they have many things diligently and accurately obſerved in Aſtrology by their Anceſtors, which every day made more accurate and copious, they, as by an hereditary right, commend to poſterity, as it is recorded by *Leo* the Africane.

The Northern famous Warriours, and Artificers.

But the Northerne people, as the Germaines, by reaſon of the aboundance of humours and blood, by which the minde is as it were oppreſt, apply themſelves to workes obvious to the ſenſes, and which may be done by the hand. For their minds oppreſt with the earthly maſſe of their bodies, are eaſily drawne from heaven and the contemplation of Celeſtiall things, to theſe inferior things, as to find out Mines by digging, to buy and caſt mettals, to draw and hammer out workes of Iron, ſteele and braſſe. In which things they have proved ſo excellent, that the glory of the Invention of Guns and Printing belongs to them.

The endowments of ſuch as inhabite betweene them.

The people who inhabite the middle regions betweene theſe, are neither naturally fit for the more abſtruſe ſciences, as the Southerne people are, nor for Mechanicke workes, as the Northerne, but intermeddle with civil affaires, commerce and Merchandizing. But are endued with ſuch ſtrength of body as may ſuffiſe to avoid and delude the crafts and arts of the Southerne Inhabitants; and with ſuch wiſdome as may be ſufficient to reſtraine the fury and violence of the Northern. How true this is, any one may underſtand by the example of the *Carthaginians* and *Africans*, who when they had held *Italy* for ſome yeares by their ſubtile counſels, crafty ſleights and devices; yet could not eſcape but at the length their Arts being deluded, and they ſpoiled of all their fortunes, were brought in ſubjection to the Romans.

The Northren know how to overcome, but not how to uſe the victory

The *Gothes*, *Hunnes* and other Northerne people have ſpoiled & overrun the Romane Empire by many incurſions and inroades, but deſtitute of counſell & providence, they could not keepe thoſe things which they had gotten by Armes and valour. Therefore the opinion of all Hiſtorians is agreeing in this, that good lawes, the forme of governing a Commonwealth, all politicke ordinances, the Arts of diſputing and ſpeaking, have had their beginning from the Greeks, Romanes and French.

The aboundance of counſellors and Lawyers from France and Italy.

And from hence in times paſt and at this day a greater number of Writers, Lawyers and Counſellors of State have ſprung up, than in all the world beſides. Therefore that we may attribute their gifts to each Region, we affirme that, The Southerne people are borne and fit for the ſtudies of learning; the Northerne for warres, and thoſe which be betweene them both for Empire and rule. The Italian is naturally wiſe, the Spaniard grave and conſtant; the French quicke and diligent, for you would ſay he runs when he goes, being compared to the ſlow and womaniſh pace of the Spaniard, which is the cauſe that Spaniards are delighted with French ſervants for their quicke agillity in diſpatching buſines.

The manners of the Eaſtern people

The Eaſterne people are ſpecially endued with a good, firme and well tempered wit, not keeping their counſels ſecret and hid. For the haſte is of the nature of the Sunne, and that part of the day which is next to the riſing of the Sunne is counted the right-ſide and ſtronger; and verily in all living things the right ſide is alwayes the more ſtrong and vigorous.

The manners of the Weſtern people.

But the Weſterne people are more tender and effeminate, and more cloſe in their cariage and minde, not eaſily making any one partaker of their ſecrets. For the Weſt is, as it were ſubject to the Moone, becauſe at the change it alwaies inclines to the Weſt, wherby it happens, that it is reputed as nocturnall, ſiniſter and oppoſite to the Eaſt; and the Weſt is leſſe temperate and wholſome.

The Eaſt winde healthfull.

Therefore of the windes none is more wholſome than the Eaſtwinde which blowes from the weſt with a moſt freſh and healthfull gale, yet it ſeldome blowes, and but onely at Sun-ſet.

The Northern people great eaters and drinkers.

The Northerne people are good eaters, but much better drinkers, witty when they are a litle moiſtened with wine, and talkers of things both to be ſpoken and concealed, not very conſtant in their promiſes and agreements, but principall keepers and preſervers of ſhamefaſtnes and chaſtity, farre different from the inhabitants of the South, who are to be counted Barbarous.

The Northerne and Southerne have each their Crueltie.

Valer. Max. lib.9.cap.2.

who are wonderfull ſparing,ſober,ſecret and ſubtle,and much addicted to all ſorts of wicked Luſt. *Ariſtotle* in his Problemes ſaith that thoſe nations are barbarous and cruell,both which are burnt with immoderate heate, and which are oppreſt with exceſſive cold,becauſe a ſoft temper of the Heavens ſoftens the Manners and the minde. Wherfore both,as well the Northerne,as Scythians and Germans;and the Southerne, as Africans are cruell;but theſe have this of a certaine naturall ſtoutnes,and ſouldierlike boldnes,and rather of anger,than a wilfull deſire of revenge; becauſe they cannot reſtraine by the power of reaſon the firſt violent motions of their anger by reaſon of the heat of their blood. But thoſe of a certaine inbred and inhumane pravity of manners, wilfully and willingly premeditating they performe the workes of cruelty, becauſe they are of a ſad and melancholy nature. You may have an example of the Northerne cruelty from the Tranſilvanians againſt their ſeditious Captaine *George*, whom they gave to be torne in peeces alive and devoured by his Soldiers, (being kept faſting for three dayes before for that purpoſe) who was then unbowelled, and roſted, and ſo by them eaten up. The Cruelty of *Hannibal* the Captaine of the Carthaginians may ſuffiſe for an inſtance of the Southerne cruelty. He left the Romane Captives wearied with burdens and the lenght of the way, with the ſoles of their feet cut off; But thoſe he brought into his tents, joyning brethren and kinſmen together he cauſed to fight, neither was ſatisfied with blood before he brought all the victors to one man. Alſo we may ſee the cruell nature of the Southerne Americans, who dip their children in the blood of their ſlaine enemies, then ſucke their blood, and banquet with their broken and ſqueaſed Limbs.

The diſeaſes of the Southerne people.

And as the Inhabitants of the South are free from divers Plethoricke diſeaſes, which are cauſed by aboundance of blood, to which the Northerne people are ſubject, as Feavers, Defluxions, Tumors, Madneſſe with laughter which cauſeth thoſe which have it to leape and dance (The people commonly terme it *S. vittus his Evill*) which admits of no remedy but Muſicke: So they are often moleſted with the Frenſie invading with madneſſe and fury; by the heat whereof they are often ſo raviſhed and carried beſides themſelves that they foretell things to come; they are terrified with horrible dreames, and in their fits they ſpeake in ſtrange and forraigne tongues, but they are ſo ſubject to the ſcurfe and all kind of ſcabbs and to the Leproſie as their homebread diſeaſe, that no houſes are ſo frequently mett withall by ſuch as travell through either of the Mauritania's, as Hoſpitalls provided for the Lodging of Lepers.

Mountainers.

Thoſe who inhabit rough and Mountainous places, are more brutiſh, tough & able to endure labour: but ſuch as dwell in plaines, eſpecially if they be mooriſh, or fenniſh are of a tender body, and ſweate much with a litle labour; the truth of which is confirmed by the Hollanders and Frizlanders. But if the plaine be ſuch as is ſcortched by the heate of the Sunne, and blowne upon by much contrariety of windes, it breeds men who are turbulent, not to be tamed, deſirous of ſedition and novelty, ſtubborne, impatient of ſervitude, as may be perceived by the ſole example of the inhabitants of Narbon a province of France.

Thoſe who dwell in poore and barren places are commonly more witty and diligent and moſt patient of labours; the truth of which the famous witts of the Athenians, Ligurians and Romanes, and the plaine country of the Bœotians in Greece, of the Campanians in Italy, and of the reſt of the inhabiters adjoyning to the Ligurian ſea, approves.

CHAP. VIII.

Of the Faculties.

What a facultie is.

3. Faculties.

A Faculty is a certaine power, and efficient cauſe, proceeding from the temperament of the part, and the performer of ſome actions of the body. There are three principall Faculties governing mans body as long as it enjoyes its integrity;

tegrity; the Animall, Vitall and Naturall. The Animall is ſeated in the proper temperament of the Braine, from whence it is diſtributed by the Nerves into all parts of the body which have ſenſe and motion. This is of three kinds, for one is Moving, another ſenſative; the third principall The ſenſative conſiſts in the five externall ſenſes, ſight, hearing, taſte, ſmell and touch. The Moving principally remaines in the Muſcles and nerves, as the fit inſtruments of voluntary motion. The Principall comprehends the Reaſoning faculty, the Memory and Fantaſie. *Galen* would have the Common or inward ſenſe to be comprehended within the compaſſe of the Fantaſie, although *Ariſtotle* diſtinguiſheth betweene them.

The triple uſe of the Pulſe.

The Vitall abides in the Hart, from whence heat and life is diſtributed by the Arteryes to the whole body: this is principally hindered in the diſeaſes of the Breſt; as the Principall is, when any diſeaſe aſſailes the Braine; the prime action of the vitall faculty is Pulſation, and that continued agitation of the Heart and Arteryes, which is of threefold uſe to the body: for by the dilatation of the Heart and Arteryes the vitall ſpirit is cheriſhed by the benefit of the Aire which is drawne in; by the contraction thereof the vapours of it are purged and ſent forth, and the native heat of the whole body is tempered by them both.

The naturall faculty is threefold.

What Nutrition is.

Foure other faculties attend upon the nouriſhing faculty

The neceſſity of the retentive faculty.

Two excrements of every concoction.

The laſt is the Naturall faculty which hath choſen its principall ſeate in the Liver, it ſpreads or carries the nouriſhment over the whole body; but it is diſtinguiſhed into 3. other faculties; The Generative which ſerves for the generation and forming of the Iſſue in the wombe; the Growing or increaſing facultie which flouriſheth from the time the Iſſue is formed, untill the perfect growth of the ſolid parts into their full dimenſions of Length, height and bredth. The nouriſhing facultie which as ſervant to both the other repaires and repayes the continuall effluxe, and waſte of the threefold ſubſtance; for Nutrition is nothing elſe but a repleniſhing, or repairing whatſoever is waſted or emptied This nouriſhing facultie endures from that time the Infant is formed in the wombe untill the end of life. It is a matter of great conſequence in Phiſicke to know the 4 other faculties, which as ſervants attend upon the nouriſhing faculty; which are the Attractive, Retentive, Digeſtive, and Expulſive faculty. The Attractive drawes that juice which is fit to nouriſh the body, that I ſay which by application may be aſſimulated to the part. This is that faculty which in ſuch as are hungry drawes downe the meat ſcarſe chawed, and the drinke ſcarſe taſted, into the gnawing and empty ſtromacke. The Rententive faculty is that which retaines the nouriſhment once attracted untill it be fully laboured and perfectly concocted; And by that meanes it yeelds no ſmall aſſiſtance to the Digeſtive faculty. For the naturall heat cannot performe the office of concoction, unleſſe the meat be embraced by the part, and make ſome ſtay therein. For otherwiſe the meate carryed into the ſtomacke never acquires the forme of *Chylus*, unleſſe it ſtay detained in the wrincles thereof, as in a rough paſſage, untill the full time of *Chylification*. The Digeſtive faculty aſſimulates the nouriſhment, being attracted and detained, into the ſubſtance of that part whoſe Faculty it is, by the force of the inbred heate & proper diſpoſition or temper of the part. So the ſtomacke plainely changes all things which are eat and drunke into *Chylus*, & the Liver turnes the *Chylus* into blood. But the Bones & Nerves convert the red and liquid blood which is brought down unto them by the capillary or ſmall veins, into a white & ſolid ſubſtance. Such concoction is far more laborious in a Bone and nerve, than in the Muſculous fleſh. For the blood being not much different from its nature, by a light change and concretion turnes into fleſh. But this Concoction will never ſatisfie the deſire of Nature and the parts, unleſſe the nouriſhment purged from its excrements, put away the filth and droſſe, which muſt never enter into the ſubſtance of the part. Wherefore there do not onely two ſorts of excrements remaine of the firſt and ſecond Concoction, the one thicke, the other thin, as we have ſaid before; but alſo from the third Concoction which is performed in every part. The one of which we conceive onely by reaſon, being that which vaniſheth into Aire by inſenſible Tranſpiration. The other is knowne ſometimes by ſweats, ſometimes by a thicke fatty ſubſtance ſtayning the ſhirt; ſometimes by the generation of haire and nailes, whoſe matter is from fuliginous and earthly excrements of the third Concoction. Wherfore the fourth Faculty was neceſſary which might yeeld no ſmall helpe to nouriſhment;it is called the Expulſive,appointed to expell thoſe ſuperfluous excrements which by no action of heate can obtaine the forme of the part. Such faculties ſerving for nutrition are in ſome parts two-fold; as ſome common, the benefit of which redounds to the whole body,as in the ventricle,liver & veines; Others onely attending the ſervice of thoſe parts in which they remaine, and in ſome parts all theſe 4.aſwell common as proper,are abiding and reſident, as in thoſe parts we now mentioned:ſome with the 4. proper have onely two cōmon,as the Gall,Spleene, Kidneies and Bladder.Others are content onely with the proper, as the ſimular and Muſculous parts, who if they want any of theſe 4.faculties, their health is decayed either by want of nouriſhment,an ulcer,or otherwiſe.The like unnatural affects happen by the deficiency of juſt and laudable nouriſhment. But if it happen thoſe faculties do rightly performe their duty,the nouriſhment is changed into the proper ſubſtance of the part,and is truly aſſimulated,as by theſe degrees.Firſt it muſt flow to the part,then be joyned to it,then agglutinated, and laſtly as we have ſaid, aſſimulated. Now we muſt ſpeake of the Actions which ariſe from the faculties.

The worke of the expulſiue faculty.

By what degrees the nouriſhment is aſſimulated.

Chap. IX.

Of the Actions.

AN Action or Function is an active motion proceeding from a faculty; for as the facultie depends on the Temperament, ſo the Action on the faculty, and the Act or worke depends upon the Action by a certaine order of conſequence. But although that the words Actions and Act or worke are often confounded,yet there is this difference betweene them, as that the Action ſignifies the motion uſed in the performance of any thing; but the Act or worke, the thing already done and performed: for example, Nutrition and the Generating of fleſh are naturall Actions; but the parts nouriſhed,and a hollow ulcer filled with fleſh are the workes of that motion,or action. Wherfore the Act ariſeth from the Action, as the Action ariſeth from the faculty, the integrity or perfection of the inſtruments concurring in both. For as,if the facultie be either defective,or hurt,no Action will be well performed: ſo unleſſe the Inſtruments keepe their native and due conformitie (which is their perfect health, the operator of the Action proper to the inſtrument) none of thoſe things,which ought to be, will be well performed. Therefore for the performance of blameleſſe and perfect actions, it is fit a due conformity of the Inſtrument concurre with the faculty. But Actions are two fold; for they are either Naturall, or Voluntary. They are termed Naturall, becauſe they are performed not by our will, but by their owne accord and againſt our will: As are that continuall motion of the Heart,the beating of the Arteryes,the expulſion of the Excrements, and ſuch other like which are done in us by the Law of Nature whether we will, or no. Theſe Actions flow either from the Liver and veines,or from the Heart and Arteries. Wherfore we may comprehend them under the names of Naturall and Vitall Actions.For we muſt attribute his Action to each faculty, leſt we may ſeeme to conſtitute an idle faculty, and no way profitable for uſe.The unvoluntary vitall actions are the dilatation & contraction of the Heart and Arteryes,the which we comprehend under the ſole name of the Pulſe: by that they draw in, and by this they expell, or drive forth.The unvoluntary vitall actions be,

What an Action is,

An Action and an Act are different,

Natural Actions,

Generation Growth and Nutrition	which proceed from the	Generative, Growing,and Nouriſhing	facultie,

Generation is nothing elſe than a certaine producing,or acquiring of matter, and an introducing of a ſubſtantiall forme into that matter; this is performed by the aſſiſtance of 2.faculties; of the Altering which doth diverſly prepare and diſpoſe the ſeed and menſtruous blood to put on the forme of a Bone, nerve, ſpleene, fleſh and ſuch

Generation what it is,

ſuch like: of the Forming faculty which adornes with figure, ſite and compoſition, the matter ordered by ſo various a preparation.

What Growth is.

Growth is an inlarging of the ſolide parts into all the dimenſions, the priſtine and ancient forme remaining ſafe and ſound in figure and ſolidity. For the perfection of every growth is judged onely by the ſolid parts; for if the body ſwell into a maſſe of fleſh, or fat, it ſhall not therefore be ſaid to be growne: but then onely when the ſolid parts doe in like manner increaſe, eſpecially the bones, becauſe the growth of the whole body followes their increaſe, even although at the ſame time it waxe leane, and pine away.

What Nutrition is.

Nutrition is a perfect aſſimulation of that nouriſhment which is digeſted, into the nature of the part which digeſts. It is performed by the aſſiſtance of 4. ſubſidiary or helping actions, Attractive, Retentive, Digeſtive and Expulſive.

Action voluntary.

* *Anima ſentiens.*

The voluntary actions which we willingly performe, are ſo called, becauſe we can at our pleaſure hinder, ſtir up, ſlow or quicken them. They are three in generall, the ſenſitive, mooving, and principall Action. The ſenſative * Soule comprehends all things in fine ſenſes, in Sight, Hearing, Smell, Taſte and Touch. Three things muſt neceſſarily concurre to the performance of them, the Organe, the *Medium* or meane, and the Object. The principall Organe, or Inſtrument, is the Animall ſpirit diffuſed by the nerves into each ſeverall part of the body, by which ſuch actions are performed. Wherefore for the preſent we will uſe the Parts themſelves for their Organes. The Meane is a body, which carryes the Object to the Inſtrument. The Object is a certaine externall quality, which hath power by a fit *Medium* or Meane to ſtirre up and alter the Organe. This will be more manifeſt by relating the particular functions of the ſenſes by the neceſſary concurring of theſe three.

How ſight is performed.

Sight, is an action of the ſeeing facultie, which is done by the Eye fitly compoſed of its coates and humors, and ſo conſequently the Organicall body of this Action. The Object is a viſible quality brought to the Eye. But ſuch an Object is two-fold; for either it is abſolutely viſible of its ſelfe, and by its owne Nature, as the Sun, the fire, the Moone and Starres: or deſires as it were the helpe of another that it may be actually ſuch, for ſo by the commiſing of light the colours, which were viſible in power onely, being brought to the Eye doe ſeeme and appeare ſuch as they actually are. But ſuch Objects cannot arrive at the Eye, but thorough a cleere and illuminate *Medium*, as the Aire, Water, Glaſſe and all ſorts of Cryſtall.

How hearing.

The Hearing hath for its Organe the Eare and Auditory paſſage, which goes to the ſtony bone furniſhed with a Membrane inveſting it, an Auditory Nerve, and a certaine inward ſpirit there conteined. The Object is every ſound ariſing from the ſmitten or broken Aire, and the Colliſion of two bodyes meeting together. The *Medium* is the encompaſſing Aire which carryes the ſound to the Eare.

How ſmelling

Smelling (according to *Galens* opinion) is performed in the Mamillary proceſſes produced from the proper ſubſtance of the braine, and ſeated in the upper part of the noſe: although others had rather ſmelling ſhould be made in the very foremoſt ventricles of the braine. This Action is weake in man in compariſon of other Creatures: the Object thereof is every ſmell, or fumide exhalation breathing out of bodyes. The *Medium* by which the Object is carried to the noſes of Men, Beaſts and Birds, is the Aire, but to Fiſhes the Water it ſelfe. The Action of taſte is performed by the tongue being tempered well and according to nature, and furniſhed with a nerve ſpred over its upper part from the third and fourth conjugation of the Braine. The Object is * Taſte, of whoſe nature and kindes we will treate more at large in our Antidotary. The *Medium* by which the Object is ſo carried to the Organ, that it may affect it, is either externall, or internall: The externall is that ſpattle which doth as it were anoynt and ſupple the tongue; the internall is the Spongy fleſh of the tongue it ſelfe, which affected with the quality of the Object doth preſently ſo poſſeſſe the nerve that is implanted in it, that the kinde and quality thereof by the force of the ſpirit may be carryed into the common ſenſe. All parts endued with a nerve enjoy the ſenſe of touching, which is cheifly done, when a tractable quality doth

How the taſte

* *Sapor.*

How touching.

penetrate even to the true and nervous skinne, which lyeth under the Cuticle, or ſcarfe-skinne; we have formerly noted, that it is moſt exquiſite in the skinne which inveſts the ends of the fingers. The Object is every tractable qualitie, whether it be of the firſt ranke of qualities, as Heate, Cold, Moiſture, Dryneſſe, or of the ſecond, as Roughneſſe, Smoothneſſe, Heavineſſe, Lightneſſe, Hardneſſe, Softneſſe, Rarity, Denſity, Friability, Vnctuoſity, Groſſeneſſe, Thinneſſe. The *Medium* by whoſe procurement the inſtrument is affected, is either the skinne or the fleſh interwoven with many Nerves.

Of motion.

The next Action, is that Motion, which by a peculiar name wee call voluntary; this is performed and accompliſhed by a Muſcle, being the proper Inſtrument of voluntary Motion. Furthermore every motion of a member poſſeſſing a Muſcle is made either by bending and contraction, or by extention. Although generally there be ſo many differences of voluntary motion, as there are kinds of ſite in place; therefore Motion is ſaid to be made upward, downeward, to the righthand, to the left, forward and backward; Hither are referred the many kinds of motions, which the infinite variety of Muſcles produce in the body. Into this ranke of Voluntary Actions, comes Reſpiration, or breathing becauſe it is done by the helpe of the Muſcles; although it be cheifly to temper the heate of the Heart. For wee can make it more quicke, or ſlow as wee pleaſe, which are the conditions of a voluntary Motion.

How Reſpiration may be a voluntary motion.

Laſtly, that wee may have ſomewhat in which wee may ſafely reſt and defend our ſelves againſt the many queſtions which are commonly moved concerning this thing, we muſt hold, that Reſpiration is undergone and performed by the Animall faculty, but cheifly inſtituted for the vitall.

The Principall Action and prime amongſt the Voluntary is abſolutely divided in three; Imagination, Reaſoning and Memory.

The third principall Action.

Imagination is a certaine expreſſing, and apprehenſion which diſcernes and diſtinguiſheth betweene the formes and ſhapes of things ſenſible, or which are knowne by the ſenſes.

Reaſoning is a certaine judiciall æſtimation of conceived or apprehended formes or figures, by a mutuall collating, or comparing them together.

Memory is the ſure ſtorer of all things, and as it were the Treaſurie which the minde often unfolds and opens, the other faculties of the minde being idle and not imployed. But becauſe all the forementioned Actions whether they be Naturall, or Animall and voluntary, are done and performed by the helpe and aſſiſtance of the Spirits; Therefore now wee muſt ſpeake of the Spirits.

CHAP. X.

Of the Spirits.

What a ſpirit is.

THe ſpirit is a ſubtile and Aery ſubſtance, raiſed from the purer blood that it might be a vehicle for the faculties (by whoſe power the whole body is governed,) to all the parts, and the prime inſtrument for the performance of their office. For they being deſtitute of its ſweet approch doe preſently ceaſe from action, and as dead do reſt from their accuſtomed labours. From hence it is that making a variety of Spirits according to the number of the faculties, they have divided them into three; as one Animall, another Vitall, another Naturall.

Spirits threefold.

The Animall ſpirit.

The Animall hath taken his ſeate in the braine; for there it is prepared and made, that from thence conveyed by the Nerves is may impart the power of ſence and Motion to all the reſt of the members. An argument heereof is, that in the great Cold of Winter, whether by the intercepting them in their way, or by the concretion, or as it were freezing of thoſe ſpirits, the

Why ſo called *Anima.*

the joynts grow ſtiffe, the hands numme, and all the other parts are dull, deſtitute of their accuſtomed agillity of motion, and quickneſſe of ſenſe. It is called Animall not becauſe it is the * Life, but the cheife and prime inſtrument thereof; wherfore it hath a moſt ſubtile and Aery ſubſtance: and enjoyes divers names according to the various condition of the Senſoryes or ſeates of the ſenſes into which it enters; for that which cauſeth the ſight, is named the Viſive: you may ſee this by night, rubbing your eyes, as ſparkling like fire. That which is conveyed to the Auditorie paſſage, is called the Auditive or Hearing; That which is carried to the Inſtruments of Touching, is termed the Tactive; and ſo of the reſt.

How it is made.

This Animall ſpirit is made and laboured in the windings and foldings of the veines and Arteryes of the braine, of an exquiſite ſubtile portion of the vitall brought thither by the *Carotide Arteria*, or ſleepy Arteryes, and ſometimes alſo of the pure aire, or ſweete vapour drawne in by the Noſe in breathing. Hence it is, that with Ligatures we ſtoppe the paſſage of this ſpirit, from the parts we intend to cut off. An Humor which obſtructs or ſtopps its paſſage, doth the like in Apoplexies and Palſies, whereby it happens that the members ſcituate under that place doe languiſh and ſeeme dead, ſometimes deſtitute of motion, ſometimes wanting both ſence and motion.

The Vitall ſpirit.

The Vitall ſpirit is next to it in dignitie and excellency, which hath its cheife manſion in the left ventricle of the Heart, from whence through the Channells of the Arteryes it flowes into the whole body, to nouriſh the heate which reſides fixed in the ſubſtance of each part, which would periſh in ſhort time unleſſe it ſhould be refreſhed by heat flowing thither together with the ſpirit. And becauſe it is the moſt ſubtile next to the Animall, Nature (leſt it ſhould vaniſh away) would have it conteined in the Nervous coat of an Artery, which is five time more thicke, than the Coate of the veines, as *Galen*, out of *Herophilus*, hath recorded.

What the matter of it is.

It is furniſhed with matter from the ſubtile exhalation of the blood, and that aire which we draw in breathing. Wherefore it doth eaſily and quickly periſh by immoderate diſſipations of the ſpirituous ſubſtance, and great evacuations; ſo it is eaſily corrupted by the putrifaction of Humors, or breathing in of peſtilent aire and filthy vapours, which thing is the cauſe of the ſo ſuddaine death of thoſe which are infected with the Plague. This ſpirit is often hindred from entring into ſome part by reaſon of obſtruction, fulneſſe, or great inflammations, whereby it followes that in a ſhort ſpace, by reaſon of the decay of the fixed and inbred heat, the parts doe eaſily fall into a Gangrene and become mortified.

There is ſome doubt of the Naturall ſpirit.

The Naturall ſpirit (if ſuch there be any) hath its ſtation in the Liver and Veines. It is more groſſe and dull than the other, and inferior to them in the dignitie of the Action, and the excellencie of the uſe. The uſe thereof is to helpe the concoction both of the whole body, as alſo of each ſeverall part, and to carry blood and heate to them.

Fixed ſpirits.

Beſides thoſe already mentioned, there are other ſpirits fixed and implanted in the ſimular and prime parts of the body, which alſo are naturall, and Natives of the ſame place in which they are ſeated and placed. And becauſe they are alſo of an Aery and fiery nature, they are ſo joyned or rather united to the Native heate, that they can no more be ſeparated from it, than flame from heate; wherefore they with theſe that flow to them are the principall Inſtruments of the Actions, which are performed in each ſeverall part; And theſe fixed ſpirits have their nouriſhment and maintenance from the radicall and firſt-bred moiſture, which is of an Aery and oyly ſubſtance and is as it were the foundation of theſe Spirits and the inbred heat. Therefore without this moiſture no man can live a moment. But alſo the Cheife Inſtruments of life are theſe Spirits together with the native heate. Wherefore this radicall Moiſture being diſſipated and waſted, (which is the ſeate, fodder and nouriſhment of the Spirits and heate) how can they any longer ſubſiſt and remaine? Therefore the conſumption of the naturall heate followeth the decay of this ſweet and ſubſtance-making moiſture, and conſequently death, which happens by the diſſipating and reſolving of naturall heate.

The radicall moiſture.

Naturall death

But ſince then theſe kinde of Spirits with the naturall heate, is conteined in the ſubſtance of each ſimular part of our body (for otherwiſe it could not perſiſt) it muſt neceſſarily follow, that there be as many kinds of fixed Spirits, as of ſimular parts. For becauſe each part hath its proper temper and encreaſe, it hath alſo its proper ſpirit, and alſo its owne proper fixed and implanted heat, which heere hath its abode, as well as its Originall. Wherefore the ſpirit and heate which is ſeated in the bone, is different from that, which is impact into the ſubſtance of a Nerve, Veine or ſuch other ſimular part; becauſe the temper of theſe parts is different, as alſo the mixture of the Elements from which they firſt aroſe and ſprung up. Neither is this contemplation of ſpirits of ſmall account, for in theſe conſiſt all the force and efficacy of our Nature.

The vſe and neceſſity of the Spirits.

Theſe being by any chance diſſipated or waſted, wee languiſh, neither is any health to be hoped for, the floure of life withering and decaying by litle and litle. Which thing ought to make us more diligent, to defend them againſt the continuall effluxe of the threefold ſubſtance. For if they be decayed, there is left no proper Indication of curing the diſeaſe, ſo that we are often conſtrained, all other care laid aſide, to betake our ſelves to the reſtoring and repayring the decayed powers. Which is done by meats of good juyce, eaſie to be concocted and diſtributed, good Wines and fragrant ſmells.

What the remedy for the diſſipation of the ſpirits.

What the remedy for oppreſſion of the ſpirits is.

But ſometimes theſe Spirits are not diſſipated, but driven in and returned to their fountaines, and ſo both oppreſſe and are oppreſt; whereupon it happens we are often forced to dilate and ſpread them abroad by binding and rubbing the parts. Hitherto wee have ſpoke of theſe things which are called Naturall, becauſe we naturally conſiſt of them; it remaines that we now ſay ſomewhat of their Adjuncts and aſſociates by familiarity of Condition.

The Adjuncts and Aſſociates to things Naturall, are
- Age: of which, by reaſon of the ſimilitude of the Argument, wee were conſtrained to ſpeake when we handled the Temperatures.
- Sexe.
- Colour; of which we have already ſpoken.
- The Conformation of the inſtrumentall parts.
- Time, whoſe force we have alſo conſidered.
- Region.
- Order of Diet and Condition of life.

CHAP. XI.

Of the Adjuncts of things Naturall.

What ſexe is.

The nature of weomen.

SExe is no other thing than the diſtinction of Male and Female, in which this is moſt obſervable, that for the parts of the body, and the ſite of theſe parts, their is litle difference betweene them; but the Female is colder than the Male. Wherefore their ſpermaticall parts are more cold, ſoft and moyſt, and all there naturall actions leſſe vigorous, and more depraved.

Of Eunuches.

The Nature of Eunuches is to be referred to that of weomen, as who may ſeeme to have degenerated into a womaniſh nature, by deficiency of heate; their ſmooth body and ſoft and ſhirle voyce doe very much aſſimulate weomen. Notwithſtanding you muſt conſider that there be ſome Manly weomen, which their manly voyce and chinne covered with a litle hairineſſe doe argue; and on the contrary, there are ſome womanizing, or womaniſh men, which therefore we terme dainty and effeminate.

Of Hermaphrodites. The Hermaphrodite as of a doubtfull nature and in the middle of both ſexes ſeemes to participate of both Male and Female.

Colour the bewrayer of the Temperament The Colour which is predominante in the habite and ſuperficies of the body and lyes next under the ſkinne, ſhewes the temperament of what kinde ſoever it be; for as *Galen* notes *in Comment. ad Aphor.* 2. *ſect.* 1. Such a colour appeares in us, as the contained humor hath. Wherefore if a roſie hew coloure the cheekes, it is a ſigne the body abounds with blood, and that it is carryed abroad by the plenty of Spirits. But if the ſkinne be dyed with a yellow colour, it argues Choler, is predominante; if with a whitiſh and pallide hew, Phlegme; with a ſable and duſky, Melancholy. So the colour of the excrements which are according to Nature is not of the leaſt conſideration. For thus, if an ulcer being broken ſend forth white matter, it argues the ſoundneſſe of the part from whence it flowes; but if ſanious or bloody, greene, blackiſh, or of divers colours, it ſhewes the weaknes of the ſolide part, which could not aſſimulate by concoction the colour of the excrementitious humor. The like reaſon is of unnaturall Tumors; For, as the colour, ſo the Dominion of the Humor cauſing or accompanying the ſwelling commonly is.

The perfection of the organicall parts conſiſts in 4. things. The Conformitie, and integrity of the Organicall parts is conſidered by their figure, greatneſſe, number, ſituation and mutuall connexion. Wee conſider the figure, when wee ſay almoſt all the externall parts of the body are naturally round, not onely for ſhew, but for neceſſitie, that being ſmooth, and no way cornered, they ſhould be leſſe obnoxious to externall injuries; wee ſpeake of Greatneſſe, when wee ſay, ſome are large and thicke, ſome lancke and leane. But wee conſider their number, when we obſerve ſome parts to abound, ſome to want, or nothing to be defective or wanting. Wee inſinuate ſite and connexion when wee ſearch, whether every thing be in its proper place, and whether they be decently fitted, and well joyned together.

We have handled the varyeties of the foure ſeaſons of the yeare, when we treated of Temperaments. But the conſideration of Region (becauſe it hath the ſame judgment that the Aire) ſhall be referred to that diſquiſition, or enquiry which we entend to make of the Aire, amongſt the Things not naturall.

Diet. The Manner of life and order of Diet are to be diligently obſerved by us, becauſe they have great power either to alter, or preſerve the Temperament. But becauſe they are of almoſt infinite variety, therefore they ſcarſe ſeeme poſſible to fall into Arte, which may proſequute all the differences of Diet and vocations of life. Wherefore if the Calling of Life be laborious, as that of huſbandmen, Marriners, and other ſuch trades, it ſtrengthens and dryes the parts of the body. Although thoſe which labour much about Waters, are moſt commonly troubled with cold and moyſt diſeaſes although they almoſt kill themſelves with labour.

Againe, thoſe which deale with Mettalls, as all ſorts of Smithes, and thoſe which caſt and worke braſſe, are more troubled with hotte diſeaſes, as feavers. But if their Calling be ſuch as they ſit much, and worke all the day long ſitting at home, as ſhooemakers; it makes the body tender, the fleſh effeminate and cauſeth great quantity of excrements. A life as well idle and negligent in body, as quiet in minde, in all riotouſnes and exceſſes of Dyet, doth the ſame. For from hence the body is made ſubject to the ſtone, gravell and Gout.

The commodities of an indifferent Diet. That calling of life which is performed with moderate labour, clothing and dyet, ſeemes very fit and convenient to preſerve the naturall temper of the body. The Ingenious Chirurgeon may frame more of himſelfe that may more particularly conduce to the examination of theſe things. Therefore, the things naturall, and thoſe which are neere or Neighbouring to them being thus briefly declared, the Order ſeemes to require that wee make enquiry of Things not Naturall.

CHAP. XII.

Of things not Naturall.

THe things which wee muſt now treate of, have by the latter Phyſitions beene termed, Not naturall; becauſe they are not of the number of thoſe which enter into the conſtitution, or compoſure of mans body; as the Elements, Humors, and all ſuch things which we formerly comprehended vnder the name of Naturall : Although they be ſuch as are neceſſary to preſerue and defend the body already made and compoſed. Wherefore they were called by *Galen* Preſervers, becauſe by the due uſe of them the body is preſerved in health. Alſo they may be called doubtfull; and Neuters, for that rightly and fitly uſed they keepe the body healthfull; but inconſiderately, they cauſe diſeaſes. Whereby it comes to paſſe that they may be thought to pertaine to that part of Phiſicke which is of preſerving health, not becauſe ſome of theſe things ſhould be abſolutely and of their owne nature wholſome, and others unwholſome, but onely by this, that they are, or prove ſo by their convenient, or prepoſterous uſe. Therefore we conſider the uſe of ſuch like things from 4 conditions, quantitie, quality, occaſion, and manner of uſing; if thou ſhalt obſerve theſe, thou ſhalt attaine and effect this, that thoſe things which of themſelves are as it were, doubtfull, ſhall bring certaine and undoubted health. For theſe 4. Circumſtances doe ſo farre extend, that in them as in the perfection of Arte, the Rules which may be preſcribed to preſerve health are contained. But *Galen* in another place hath in 4. words comprehended theſe things not Naturall; as things Taken, Applyed, Expelled, and to be Done. Things Taken are thoſe which are put into the body, either by the mouth or any other way, as the Aire, meate and drinke. Things Applyed are theſe which muſt touch the body, as the Aire now mentioned, affecting the body with a diverſe touch of its qualityes of heat, cold, moyſture or dryneſſe. Expelled are, what things ſoever being unprofitable are generated in the body and require to be expelled. To be Done are labour, reſt, ſleepe, watching and the like. We may more diſtinctly and by expreſſion of proper names revoke all theſe things to ſixe; which are

Why they are called things not naturall.

Galen. 1. *ad Glauconem.*

1. *de ſanitat. tuenda.*

Aire,
Meat and Drinke,
Labour and Reſt,
Sleepe and Watching,
Repletion and Inanition, or things to be expelled, or retained and kept,
Perturbations of the Minde.

CHAP. XIII.

Of the Aire.

AIre is ſo neceſſary to life, that we cannot live a moment without it, if ſo be that breathing, and much more tranſpiration, be not to be ſeparated from life. Wherefore it much conduceth to know, what Aire is wholſome, what unwholſome, and which by contrariety of qualities fights for the Patient againſt the diſeaſe; or on the contrary by a ſimilitude of qualities ſhall nouriſh the diſeaſe, that if it may ſeeme to burden the Patient by increaſing or adding to the diſeaſe, we may correct it by Arte. So in curing the wounds of the head, eſpecially in Winter, we labour by all the means we may to make the aire warme. For cold is hurtfull to the Braine, Bones, and the wounds of theſe parts; and heat is comfortable and friendly. But alſo the aire being drawne into the body by breathing when it is

How neceſſary for life the aire is.

is hotter than ordinarie, doth with a new warmth overheate the heart, lungs and ſpirits, and weaken the ſtrength by the diſſipation of the ſpirits too much attenuated; ſo being too cold, in like manner the ſtrength of the faculties faints and growes dull, either by ſuppreſſion of the vapours, or by the inſpiſſation, or thickning of the ſpirits.

What Aire is hurtfull,

Therefore to conclude, that Aire is to be eſteemed healthfull, which is cleere, ſubtile, and pure, free and open on every ſide, and which is farre remote from all carrion-like ſmells of dead carkaſſes, or the ſtench of any putrifying thing whatſoever: the which is farre diſtant from ſtanding pooles, and fennes and caves, ſending forth ſtrong and ill vapours; neither too cloudy nor moiſt by the neareneſſe of ſome river.

Such an Aire, I ſay, if it have a vernall temper, is good againſt all diſeaſes. That aire which is contrary to this is altogether unhealthfull, as that which is putrid, ſhut up, and preſt, by the ſtraitneſſe of neighbouring mountaines, infected with ſome noyſome vapour. And becauſe I cannot proſecute all the conditions of aires, fit for the expelling of all diſeaſes, as which are almoſt infinite, it ſhall ſuffice here to have ſet downe, what we muſt underſtand by this word Aire.

Three things are underſtood by the name of the aires

Phyſitions commonly uſe to underſtand three things, by the name of Aire; The preſent ſtate of the Aire; The Region in which wee live; and the ſeaſon of the yeare. Wee ſpoke of this laſt, when wee treated of Temperaments. Wherefore wee will now ſpeake of the two former. The preſent ſtate of the Aire, one while for ſome ſmall time, is like the Spring, that is temperate; otherwhiles like the Summer, that is hot and drie; otherwhiles like the Winter, that is cold and moiſt; and ſometimes like the Autumne which is unequall; and this laſt conſtitution of the Aire, is the cauſe of many diſeaſes. When upon the ſame day, it is one while hot, another cold, we muſt expect Autumnall diſeaſes. Theſe tempers and varieties of conſtitutions of the Aire, are chiefely and principally ſtirred up by the windes; as which being diffuſed over all the Aire, ſhew no ſmall force by their ſodaine change. Wherefore we will briefly touch their natures: That which blowes from the Eaſt, is called the Eaſt-winde, and is of a hot and drie nature, and therefore healthfull. But the Weſterne winde is cold and moiſt, and therefore ſickly. The South winde is hot and moiſt, the Author of putrifaction and putride diſeaſes. The North winde is cold and drie, therefore healthy: wherefore it is thought, if it happen to blow in the dogge-dayes, that it makes the whole yeare healthfull, and purges and takes away the ſeedes of putrifaction, if any chance to be in the aire. But this deſcription of the foure windes, is then onely thought to be true, if we conſider the windes in their owne proper nature, which they borrow from theſe Regions, from which they firſt proceede. For otherwiſe they affect the aire quite contrarie, according to the diſpoſition of the places over which they came, as ſnowie places, Seaes, Lakes, Rivers, Woods, or ſandy plaines, from whence they may borrow new qualities, with which they may afterwards poſſeſſe the aire, and ſo conſequently our bodies.

Aphor. 4. ſect. 3.
The force of the windes.

How the windes acquire other faculties, than they naturally have.

The Weſt-winde of it ſelfe unwholſome.

Hence it is we have noted the Weſterne winde unwholſome, and breeding diſeaſes, by reaſon of the proper condition of the Region from whence it came; and ſuch, that is cold and moiſt; the *Gaſconies* finde it, truly to their ſo great harme, that it ſeldome blowes with them, but it brings ſome manifeſt and great harme, either to their bodies, or fruits of the earth. And yet the *Greekes*, and *Latines* are wont to commend it for healthfulneſſe, more than the reſt. But alſo the riſing and ſetting of ſome more eminent ſtars, doe often cauſe ſuch cold windes, that the whole aire is cooled, or infected with ſome other maligne qualitie. For vapours and exhalations are often raiſed by the force of the ſtars, from whence windes, cloudes, ſtormes, whirlewindes, lightnings, thunders, haile, ſnow, raine, earthquakes, inundations, and violent raging of the ſea, have their original. The exact contemplation of which things, although it be proper to Aſtronomers, Coſmographers, and Geographers, yet *Hippocrates* could not omit it, but that he muſt ſpeake ſomthing in his book *De aëre & aquis*, where he touches by the way, the deſcription of the neighbouring Regions, and ſuch as hee knew.

What force ſtars have upon the aire.

From this force of the aire, either hurtfull, or helping in diſeaſes, came that famous obſervation of *Gnido* of Caulias, That wounds of the head are more difficult to cure at Paris, than at Avignion, and the plaine contrarie of wounds of the legges; for the aire of Paris compared to that of Avignion is cold and moiſt, wherefore hurtfull and offenſive to the wounds of the head. On the contrary, the ſame aire, becauſe it obſcures the ſpirits, incraſſates the bloud, condenſates the humors, and makes them leſſe fit for defluxions, makes the wounds of the legges more eaſie to be healed, by reaſon it hinders the courſe of the humors, by whoſe defluxion the cure is hindered. But it is manifeſt, that hot and drie places make a greater diſſipation of the naturall heate, from whence the weakeneſſe of the powers; by which ſame reaſon the Inhabitants of ſuch places doe not ſo well endure bloudletting; but more eaſily ſuffer purgations, though vehement, by reaſon of the contumacie of the humor, cauſed by drineſſe. To conclude, the aire changes the conſtitutions of our bodies, either by its qualities, as if it be hotter, colder, moiſter, or drier; or by its matter, as if it be groſſer, or more ſubtile than is fit, or corrupted by exhalations from the earth; or by a ſodaine and unaccuſtomed alteration, which any man may prove, who makes a ſodaine change out of a quiet aire into a ſtormy and troubled with many windes. But becauſe, next to the aire, nothing is ſo neceſſary to nouriſh mans body, as meate and drinke, I will now beginne to ſpeake of them both.

How the aire of Paris comes to be ill for wounds of the head, and good for thoſe of the legge.

By what meanes the aire changes our bodies.

Chap. XIIII.

Of Meate and Drinke.

THat this our Treatiſe of meate and drinke may be more briefe and plaine, I have thought good to part it into theſe heads, as to conſider the goodneſſe and illneſſe of both of them, their quantitie, qualitie, cuſtome, delight, order, time, and to accommodate them all to the ages and ſeaſons of the yeare. We judge of the goodneſſe and pravity of meates and drinkes, from the condition of the good or vicious humors, or juyce which they beget in us. For evill juyce cauſeth many diſeaſes. As on the contrary, good juice drives away all diſeaſes from the body, except the fault happen from ſome other occaſion, as from quantity, or too much exceſſe. Wherefore it is principally neceſſary, that thoſe who will preſerve their preſent health, and hinder the acceſſe of diſeaſes, feede upon things of good nouriſhment and digeſtion, as are good wine, the yolkes of egges, good milke, wheaten bread well baked, the fleſh of Capons, Pertridge, Thruſhes, Larkes, Veale, Mutton, Kid, and ſuch like other, which you may finde mentioned in the Bookes which *Galen* writ *de Alimentorum facultatibus*; where alſo he examines thoſe which are of evill juice by their manifeſt qualities, as acrimony, bitterneſſe, ſaltneſſe, aciditie, harſhneſſe and ſuch like.

The goodneſſe of nouriſhments.

But unleſſe we uſe a convenient quantitie and meaſure in our meates, howſoever laudable they be, we ſhal never reape theſe fruits of health we hoped for. For they yeild matter of diſeaſes, by the onely exceſſe of their quantity; but wee may by this know the force of quantitie on both parts, becauſe often the poiſonous quality of meates of ill nouriſhment doth not hurt, by reaſon they were not taken into the body into a great quantitie. That meaſure of quantitie is chiefely to be regarded in diſeaſes: for as *Hippocrates* ſaith, if any give meate to one ſick of a feaver, he gives ſtrength to the well, and increaſes the diſeaſe to the ſicke, eſpecially if he doe not uſe a meane. Wherefore it is a thing of no ſmall conſequence, to know what diſeaſes require a ſlender and what a large diet; of which thing there is large relation made in the 1 Section of the Aphoriſmes of *Hippocrates*; where he teacheth, the ſicke muſt feed more largely in the beginnings of long diſeaſes, wherby they may be inabled to indure the length of the diſeaſe, and laſt to the ſtate thereof. But in ſharpe and violent diſeaſes, which preſently come to their height, wee muſt uſe a ſlender diet; but moſt ſlender, when the diſeaſe is in the height; and beſides, all our conſultations in this kinde, muſt be referred to the ſtrength of the patients. But thoſe who enjoy their perfect health, muſt uſe a quantitie of meate, agreable to their evacuation and tranſpiration; for men by reaſon of the ſtrength of their heate, and the more copious diſſipation of the triple ſubſtance, have greater appetite, than women; altogether by the ſame reaſon, that young people, and

Their quantitie.

The quantitie of meates muſt be eſteemed, according to the nature of the diſeaſe, and ſtrength of the Patient.

ſuch

The qualities of meate.

Old age is a diſeaſe.

Aphor. 16. ſect. 1.

ſuch as grow, need more frequent and plentifull nouriſhment, than old men; and alſo amongſt young men of the like age, ſome doe rightly require more copious nouriſhment than other ſome, that is, according to the quantitie of their evacuations and cuſtome. Certainly for gluttony, it is ſuch as may be extended to all; but we all ſhould take ſo much meate and drinke, that our powers may be refreſhed and not oppreſſed: for by the decree of *Hippocrates*, theſe be the two compendiary wayes of preſerving health; not to be over-filled with meate, and to be quicke to worke; and thus much of the quantity of meates. Neither muſt theſe who are either ſound, or ſicke, have leſſe regard to the qualities of their meates; and thoſe are either the firſt, as heating, cooling, moiſtening, drying; or the ſecond, attenuating, incraſſating, obſtructing, opening, or ſome other like, working according to the condition of their nature. The manner of our diet is not onely to be framed according to theſe, but alſo to be varied; for the preſent ſtate of ſuch as be in health, requires to be preſerved by the uſe of like things. As hot and moiſt nouriſhment is to be preſcribed to children, as to thoſe which are hot and moiſt: and cold, and drie, to old men, as to thoſe who are cold and drie; if ſo be that vulgar ſaying be true, that, Health delights in the uſe of like things. Yet becauſe old age how greene and new begun howſoever it be, is of it ſelfe as it were, a diſeaſe, it ſeemes to be more convenient, both to truth and for health, that old people ſhould eate meats contrary to their nature, that is, hot, and moiſt, that ſo wee may deferre as much as we can, the cauſes of death, cold and drineſſe, which haſten the deſtruction of that age. For wee muſt reſiſt diſeaſes by the uſe of their contraries, as thoſe things which are contrary to nature. For otherwiſe, as much meate as you give to the ſicke, you adde ſo much ſtrength to the diſeaſe. And the ſame is the cauſe why *Hippocrates* ſaid, that a moiſt diet is convenient for all ſuch as are ſicke of feavers, becauſe a feaver is a drie diſtemperature. Therefore wee muſt diligently prie into the nature of the diſeaſe, that knowing it, wee may endeavour to abate its fury by the uſe of contraries.

The force of Cuſtome.

Aphor. 91. ſect. 2.

Aphor. 38. ſect. 2.

Accuſtomed meates are more gratefull, and ſo by that meanes more nouriſhing.

2

But if cuſtome (as they ſay) be another nature, the Phyſition muſt have a great care of it, both in ſound and ſicke. For this ſometimes by little and little and inſenſibely, changes our naturall temperament, and inſtead thereof gives us a borrowed temper. Wherefore if any would preſently or ſodainely change a cuſtome which is ſometimes ill, into a better, truly hee will bring more harme, than good; becauſe all ſodaine changes (according the opinion of *Hipocrates*) are dangerous. Wherefore if neceſſitie require, that we ſhould withdraw any thing from our cuſtome, we muſt doe it by little and little, that ſo nature may by degrees be accuſtomed to contraries without violence, or the diſturbance of its uſuall government. For that meate and drinke which is ſomewhat worſe, but more pleaſant and familiar by cuſtome, is to be preferred (in *Hippocrates* opinion) before better, but leſſe pleaſant and accuſtomed. Hence is it, that Countrie-men doe very well digeſt Beefe and Bacon, which commonly they uſe; but will turne into nidorulent vapours, Partridge, Capons, and other meate of good nouriſhment, ſooner than change them into good and laudable *Chylus*. The cauſe of which thing is not onely to be attributed unto the propertie of their ſtronger, and as it were burning heate, but much more to cuſtome, which by a certaine kinde of familiarity, cauſeth that meates of hard digeſtion are eaſily turned into laudable bloud. For the force of cuſtome is ſo great, that accuſtomed meates are more acceptable; whereby it comes to paſſe, that while the ſtomacke delights in them, it more ſtreightly embraces them, and happily digeſts them, without any trouble of loathing, vomiting, or heavineſſe. All the contrary meete and happen in the uſe of meates which are unpleaſant to the taſte and ſtomacke. For the ventricle abhorring thoſe things, makes manifeſt how it is troubled by its acide and nidorulent belchings, loathing, nauſeouſneſſe, vomite, heavineſſe, paine of the head, and trouble of the whole body.

Wherefore we muſt diligently enquire, what meates the Patient chiefely delighted in, that by offering them, his appetite languiſhing by reaſon of ſome great evacuation, vomit, or the like, may be ſtirred up. For it will be better and more readily reſtored by things acceptable, though they be ſomewhat worſe, as we noted a little before out of *Hippocrates*. By which words hee plainely taught, that it is the part of a good and prudent Phyſition to ſubſcribe to, and pleaſe the palate of his patient.

The order of eating our meats.

But ſeeing that order is moſt beautifull in all things, it is truly very neceſſary in eating our meate: for how laudable ſoever the meates bee in their quantity and qualitie, howſoever familiar by uſe, and gratefull by cuſtome, yet unleſſe they be eaten in due order, they will either trouble or moleſt the ſtomacke, or be ill, or ſlowly and difficultly concocted; wherefore we muſt diligently obſerve, what meates muſt be eaten at the firſt, and what at the ſecond courſe; for thoſe meates which be hard to concoct, are not to be eaten before thoſe which are eaſy of digeſtion; neither drie and aſtringent things, before moiſtening and looſing.

We muſt begin our meales with moiſt or liquid meat.

But on the contrary, all ſlippery, fat, and liquid things, and which are quickly changed ought to goe before, that ſo the belly may be moiſtened; and then aſtringent things muſt follow, that the ſtomacke, by their helpe, being ſhut, and drawne together, may more ſtraitly comprehend the meate on every ſide, and better performe the Chylification by its proper heate united and joyned together.

For this cauſe *Hippocrates Lib. de victu in acutis*, commands thoſe things to be alwayes eaten in the morning, which are fit to looſen the belly, and in the evenings ſuch as nouriſh the body. Yet notwithſtanding drinke ought not to preceede, or goe before meate, but on the contrary meate muſt preceede drinke, by the order preſcribed by him.

The time of eating.

The profit of labour before meate.

Whether ought wee in our eating to have leſſe care of the time, than wee have of the order: for the time of eating of ſuch as are healthfull, ought to be certaine and fixt; for at the accuſtomed houre, and when hunger preſſes, any ſound man, and which is at his owne diſpoſure may eate, but exerciſe and accuſtomed laboures ought to goe before; for it is fit, according to the precept of *Hippocrates*, that labour preceed meate, whereby the excrements of the third concoction may be evacuated, the native heate encreaſed, and the ſolid parts confirmed and ſtrengthened, which are three commodities of exerciſe very neceſſary to the convenient taking of meate. But in ſicke perſons we can ſcarſe attend, and give heed to theſe circumſtance of time, and accuſtomed houre of feeding; for that Indication of giving meate to the ſicke, is the beſt of all, which is drawne from the motion of the diſeaſe, and the declining of the fit: for if you give meate in feavers, ſpecially the fit then taking the Patient, you nouriſh not him, but the diſeaſe. For the meate then eaten, is corrupted in the ſtomacke, and yeelds fit matter for the diſeaſe. For meate (as we noted before out of *Hippocrates*) is ſtrength to the ſound, and a diſeaſe to the ſicke, unleſſe it be eaten at convenient time, and diligent care be had of the ſtrength of the Patient, and greatneſſe of the diſeaſe.

We muſt not give meat in a fit of a Fever.

But neither is it convenient that the meate ſhould be ſimple, and of one kinde, but of many ſorts, and of divers diſhes dreſſed after different formes, leſt nature by the continuall and hatefull feeding upon the ſame meate, may at the length loath it, and ſo neither ſtraitly containe it, nor well digeſt it; or the ſtomacke accuſtomed to one meate, taking any loathing thereat, may abhorre all other: and as there is no deſire of that we doe not know, ſo the dejected appetite cannot be delighted and ſtirred up, with the pleaſure of any meate which can be offered. For wee muſt not credit thoſe ſuperſtitious, or too nice Phyſitions, who thinke the digeſtion is hindered by the much varietie of meates.

Variety of meats.

The matter is farre otherwiſe, for by the pleaſure of what things ſoever the ſtomacke allured doth require, it embraces them more ſtraitly, and concocts them more perfectly. And our nature is deſirous of varietie.

Why variety of meats is good.

Moreover, ſeeing our body is compoſed of a ſolid, moiſt, and airy ſubſtance, and it may happen, that by ſo many laboures, which we are compelled to undergoe, and ſuſtaine in this life, one of theſe may ſuffer a greater diſſipation and loſſe than another; therefore the ſtomacke is neceſſarily compelled to ſeeke more variety, leſt any thing ſhould be wanting to repaire that which is waſted. But alſo the age and ſeaſon of the yeare, yeeld Indications of feeding, for ſome things are convenient for a young man, ſome for an old, ſome in Summer, ſome in Winter. Whereſore wee ought to know what befits each age and ſeaſon. Children need hot, moiſt, and much nouriſhment, which may not onely ſuffice to nouriſh, but encreaſe the body. Where-

Indications of feeding, taken from the age.

fore we ought to know what befits each age and ſeaſon. Children need hot, moiſt,and much nouriſhment, which may not onely ſuffice to nouriſh, but encreaſe the body. Wherefore they worſt endure faſting, and of them, eſpecially thoſe who are the moſt lively and ſpiritfull. With old men it is otherwiſe, for becauſe their heate is ſmall,they neede little nouriſhment, and are extinguiſhed by much. Wherefore old men eaſily endure to faſt, they ought to be nouriſhed with hot and moiſt meates, by which their ſolid parts, now growing cold and drie, may be heated and moiſtened, as by the ſweet nouriſhment of ſuch like meates. Middle aged men delight in the moderate uſe of contraries to temper the exceſſe of their too acride heate. Young people as temperate are to be preſerved by the uſe of like things.

Indication from the time of the yeare.

The manner of diet in Winter muſt be hot and inclining to drineſſe. Wherefore then we may more plentifully uſe roſt-meates, ſtrong wines and ſpices; becauſe in the Winter ſeaſon we are troubled with the cold and moiſt aire, and at the ſame time, have much heate inwardly; for the inner parts, according to *Hippocrates*, are naturally moſt hot in the Winter and the Spring, but feaveriſh in Summer; ſo the heat of Summer is to be tempered by the uſe of cold and moiſt things, and much drinke. In the temperate Spring all things muſt be moderate; but in Autumne, by little and little, we muſt paſſe from our Summer, to our Winter diet.

CHAP. XV.

Of Motion and Reſt.

What motion ſignifies.

Three kinds of frictions.

Hard.

Gentle.

Indifferent.

HEre Phyſitians admoniſh us, that by the name of Motion, we muſt underſtand all ſorts of exerciſes, as walking, leaping, running, riding, playing at tennis, carrying a burden, and the like. Friction or rubbing is of this kinde, which in times paſt was in great uſe and eſteeme, neither at this day is it altogether neglected by Phyſitians. They mention many kinds of it, but they may be all reduced to three, as one gentle, another hard, a third indifferent; and that of the whole body, or onely of ſome part thereof. The friction is called hard, which is made by the rough, or ſtrong preſſure of the hands, ſpunges, or a courſe and new linnen cloth: it drawes together, condenſates, bindes and hardens the fleſh, yet if it bee often and long uſed,at length it rarifies,diſſolves,attenuates and diminiſhes the fleſh, and any other ſubſtance of the body; and alſo it cauſeth revulſion, and drawes the defluxion of humors from one part to another. The gentle friction which is performed by the light rubbing of the hand, and ſuch like, doth the contrarie, as ſoftens, relaxes, and makes the skinne ſmooth and unwrinckled, yet unleſſe it be long continued it doth none of theſe, worthy to be ſpoken of. The indifferent kinds conſiſting in the meane betwixt the other two, increaſeth the fleſh, ſwells or puffes up the habite of the body, becauſe it retaines the bloud and ſpirits which it drawes and ſuffers them not to be diſſipated.

The uſe of exerciſes.

The benefit of exerciſe is great, for it increaſes naturall heate, whereby better digeſtion followes, and by that meanes nouriſhment, and the expulſion of the excrements, and laſtly, a quicker motion of the ſpirits, to performe their offices in the bodie, all the wayes and paſſages being cleanſed. Beſides, it ſtrengthens the reſpiration, and the other actions of the body, confirmes the habite, and all the limbes of the body, by the mutuall attrition of the one with the other; whereby it comes to paſſe they are not ſo quickly wearied with labour. Hence we ſee that Country people are not to be tired with labour.

What the fitteſt time for exerciſe.

If any will reape theſe benefits by exerciſe, it is neceſſary that he take opportunity to beginne his exerciſe, and that he ſeaſonably deſiſt from it, not exerciſing himſelfe violently and without diſcretion; but at certaine times according to reaſon.

Wherefore the beſt time for exerciſe will be before meate (that the appetite may be encreaſed by augmenting the naturall heate) all the excrements being evacuated, leſt nature being hungry and empty, doe draw and infuſe the ill humors contained in the guts, and other parts of the body, into the whole habite, the liver, and other noble parts. Neither is it fit preſently, after meate, to runne into exerciſe, leſt the crude humors and meats not well concocted be carried into the veines. The meaſure and bounds of exerciſe muſt be, when the body appeares more full, the face lookes red, ſweat beginnes to breake forth, we breathe more ſtrongly and quicke, and begin to grow weary; if any continue exerciſe longer, ſtifneſſe, and wearineſſe aſſayles his joints, and the body flowing with ſweate ſuffers a loſſe of the ſpirituous and humid ſubſtance which is not eaſily repaired; by which it becomes more cold, and leane even to deformitie.

The qualitie of exerciſe.

The qualitie of exerciſe which we require, is in the midſt of exerciſe, ſo that the exerciſe muſt be neither too ſlow and idle, neither too ſtrong, nor too weake, neither too haſty, nor remiſſe, but which may move all the members alike. Such exerciſe is very fit for ſound bodies. But if they be diſtempered, that ſort of exerciſe is to be made choiſe of, which by the qualitie of its exceſſe, may correct the diſtemper of the body, and reduce it to a certaine mediocritie. Wherefore ſuch men as are ſtuffed with cold, groſſe, and viſcous humors, ſhall hold that kinde of exerciſe moſt fit for them, which is more laborious, vehement, ſtrong, and longer continued. Yet ſo, that they doe not enter into it before the firſt and ſecond concoction, which they may know by the yellowneſſe of their urine. But let ſuch as abound with thinne and cholericke humors chuſe gentle exerciſes, and ſuch as are free from contention, not expecting the finiſhing of the ſecond concoction, for the more acride heate of the ſolid parts delights in ſuch halfe concocted juices, which otherwiſe it would ſo burne up, all the glutinous ſubſtance thereof being waſted, that they could not be adjoyned, or faſtened to the parts. For the repeating, or renewing of exerciſe, the body ſhould bee ſo often exerciſed, as there is a deſire to eate. For exerciſe ſtirres up and revives the heate which lies buried and hid in the body: For digeſtion cannot be well performed by a ſluggiſh heate; neither have we any benefit by the meate we eate, unleſſe wee uſe exerciſe before.

For whom ſtrong exerciſes are convenient.

The laſt part of exerciſe begun and performed according to reaſon, is named * *the ordering of the body*, which is performed by an indifferent rubbing, and drying of the members; that ſo the ſweat breaking forth, the filth of the body, and ſuch excrements lying under the skinne, may be allured and drawne out; and alſo that the members may be freed from ſtifneſſe and wearineſſe. At this time it is commonly uſed by ſuch as play at tennis.

* Ἀποθεραπεία.

But, as many and great commodities ariſe from exerciſe conveniently begunne and performed, ſo great harme proceeds of idleneſſe; for groſſe and vicious juyces heaped up in the body commonly produce crudities, obſtructions, ſtones both in the reines and bladder, the Goute, Apoplexie, and a thouſand other diſeaſes.

What diſcommodities proceed from idleneſſe.

Chap. XVI.

Of Sleepe and Watching.

That this our ſpeech of Sleepe and Watching, which we now intend, may be more plaine, we will briefely declare, what commoditie or diſcommoditie they bring, what time and what houre is convenient for both, what the manner of lying muſt bee, and the choiſe thereof; what the dreames in ſleeping, and what paines or heavineſſe and cheerefulneſſe after ſleepe may portend.

What ſleepe is.

Sleepe is nothing elſe than the reſt of the whole body, and the ceſſation of the Animall facultie from ſenſe and motion. Sleepe is cauſed, when the ſubſtance of the braine is poſſeſſed, and after ſome ſort overcome and dulled by a certaine vaporous, ſweete and delightſome humidity; or when the ſpirits almoſt exhauſt by performance of ſome labour, cannot any longer ſuſtaine the weight of the body, but cauſe reſt by a neceſſary conſequence, by which meanes nature may produce other from the meate by concoction turned into bloud.

The uſe of ſleepe.

Sleepe fitly taken much helpes the digeſtion of the parts, becauſe in the time of reſt, the heat, being the worker of all concoction, is carryed backe to them, together with the ſpirits. Neither doth ſleepe only give eaſe to the wearyed members, but alſo leſſens our cares and makes us to forget our labours.

Fit time for ſleepe and the nature of the night.

Sleepe on the day-time.

There ought to be a moderation of our nights ſleepe.

How to be knowne.

The night is a fit time to ſleepe and to take our reſt in, as inviting ſleepe by its moiſture, ſilence and darkneſſe. For the Heat and Spirits in the thick obſcurity of night, are driven in and retained in the center of the body; as on the contrary by the daily and as it were friendly and familiar light of the Sun, they are allured & drawne forth into the ſuperficies, and outward part of the body; from whence they leave ſleeping and begin to wake. Beſides alſo, which makes not a litle, to that opportunity and benefit which wee looke for from ſleepe, the night ſeaſon ſuffices for the worke of juſt and perfect concoction. Which is one reaſon amongſt many that ſleep on the day time may be hurtfull. For wee are wakened from our ſleepe by the heat and ſpirits called forth to the skinne either by the light, or noiſe on the day time, before that the concoction which was begun be finiſhed. But that ſleepe cannot but be light which comes without neceſſity of ſleeping. Wherefore the concoction being attempted, but not perfected, the ſtomacke is filled with crudities, diſtended with acide or ſoure belchings, and the braine troubled with groſſe vapours and excrementitious humidities. From whence proceeds paine and heavines of the head, and ſtore of cold diſeaſes. But although ſleepe on the night time be wholſome, yet it is fit, that it be reſtrained within the limits of an indifferent time. For that which exceeds hinders the evacuation of excrements both upwards and downewards: but in the meane time the heate which is neuer idle, drawes from them ſome portion or vapour into the veines, principall parts and habite of the body, to become matter for ſome diſeaſe. We muſt meaſure this time, not by the ſpace of houres, but by the finiſhing the worke of concoction, which is performed in ſome, ſooner than in other ſome. Yet that which is longeſt is perfected and done in ſeaven, or eight houres. The ventricle ſubſiding and falling into its ſelfe and its proper coats, and the urine tinctured yeallow, gives perfect judgment thereof. For on the contrary the extenſion of the ſtomacke, acide belching, paine of the head, and heavines of the whole body, ſhew that the concoction is unperfect.

What the forme and ſite of our body ought to be while we ſleep

The harme of lying on our backes.

Vpon our bellies.

In ſleeping we muſt have ſpeciall care of our lying downe, for firſt we muſt lye on our right ſide, that ſo the meat may fall into the bottome of our ſtomacke, which being fleſhy and leſſe membranous, is the hotter, and more powerfull to aſſimulate. Then a litle after we muſt turne upon our left ſide, that ſo the Liver with its Lobes, as with hands may on every ſide embrace the ventricle, and as fire put vnder a Kettle, haſten the concoction. Laſtly, towards morning it will not be unprofitable to turne againe upon our right ſide, that by this ſcituation the mouth of the ſtomacke being opened, the vapoures which ariſe from the elixation of the *Chylus* may have freer paſſage. Lying upon the backe is wholy to be avoided; for from hence the Reines are inflamed, the Stone is bred, Palſies, Convulſion, and all diſeaſes which have their originall from the defluxion into the ſpinall marrow, and to the Nerves taking beginning from thence. To lye upon the belly is not unprofitable for ſuch as have uſed to lye ſo, if they be not troubled with defluxions into the eyes; for ſo the humor will more eaſily flow into the part affected. But thus the worke of concoction is not a litle furthered, becauſe by that forme of lying, not onely the inward heate is contained and gathered together about the ventricle, but the encompaſſing warmeneſſe of the ſoft feathers of the bed, aides and aſſiſts it.

The conſideration of dreames.

Neither are the Dreames which we have in our ſleepe to be neglected, for by the diligent conſideration of theſe, the affections and ſuperfluous humors which have cheiſe power in the body are marvailouſly knowne. For thoſe who have raging Choler running up and downe their bodyes while they ſleepe, all things to them appeare bright, ſhining, fiery, burning, full of noyſe and contention. Thoſe who abound with Phlegme dreame of floods, ſnowes, ſhowers and inundations and falling from high places. Thoſe who are Melancholy dreame of gapings and gulfes in the earth, thicke and obſcure darkneſſe, ſmokes, caves, and all blacke and diſmall things. But thoſe whoſe bodyes abound in blood dreame of mariages, dances, embracings of women, feaſts, jeſts, laughter, of orchards and gardens; and to conclude, of all things pleaſant and ſplendent.

Alſo we muſt obſerve how the Patient doth after ſleepe, whether more lively and cheerefull, or more heavy, for by the opinion of ***Hippocrates,***

Cum labor à ſommo eſt, læthalem collige morbum:
Sin proſit ſomnus, nihil hinc læthale timendum eſt.

Aphor. 1. ſect. 2.

Paine ſleepe enſuing, an ill diſeaſe doth ſhow:
But if ſleepe profit bring, no harme from thence will flow.

And as ſleepe ſo watching, if it exceede meaſure, is hurtfull; for it hurts the temperature of the braine, weakens the ſenſes, waſtes the ſpirits, breeds crudities, heavineſſe of the head, falling away of the fleſh, and leaneneſſe over all the body, and to conclude, it makes ulcers more dry, and ſo conſequently rebellious, difficult to heale, and maligne. There are many other things may be ſpoken of ſleepe and watching, but theſe may ſuffice a Chirurgion.

CHAP. XVII.

Of Repletion, and Inanition, or Emptineſſe.

The kinds of Repletions or rather of Exceſſes.

THere are, to bee ſhort, two ſorts of Repletion, or of all exceſſe; one is of a ſimple qualitie, without any defluxion, or ſocietie of any humor, as appeares in diſtempers without matter: the other is of quantitie and maſſe, the body being diſtended with too much meate, or too great quantitie of humors; from whence proceed an infinite number of diſeaſes. They call the Repletion of meates, ſatietie or fulneſſe, and it is of two kinds; the one which is called * Repletion or Fulneſſe to the veſſels; the other * Repletion to the ſtrength.

*Repletio { ad vaſa / ad vires

Wee judge of ſatietie to the veſſels, by the diſtention and ſwelling of the veines and intrailes, as the ſtomacke. Wee call ſatietie to the ſtrength, when the body is loaded with more meates, than it can well beare. But alſo there is a double Repletion of humors. For either it is of ſome one humor, or of all the humors; they call this by a peculiar name *Plethora.* For *Galen* defines *Plethora* an equall exceſſe of all the humors. For if at any time he define a *Plethora* to be an exceſſe of bloud onely, then verily by the name of bloud, he underſtands an equall comprehenſion of the foure humors; as it is taught in Phyſicke ſchooles.

Gal. Meth. 13. *cap.* 6.

The Repletion which is cauſed by ſome one humor, is termed by *Galen* in the place before mentioned, *Cacochymia,* (that is, an evill juyce) whether the Repletion proceede of a Cholericke, Melancholicke, Phlegmaticke, or ſerous humor.

What *Cacochymia.*

Now Inanition, or evacuation is no other thing than the expulſion, or effuſion, of humors which are troubleſome, either in quantitie, or qualitie. Of evacuations, ſome are univerſall, which expell ſuperfluous humors from the whole body; ſuch are purging, vomiting, tranſpiration, ſweats, phlebotomie. Some particular which are performed onely to evacuate ſome part, as the braine by the noſe, palate, eyes, eares; the lungs by the weazon; the ſtomacke by vomite and ſtoole, the guts by ſtoole, the liver and the ſpleene by urine and ordure. Theſe evacuations are ſometimes performed by nature, freeing it ſelfe of that which is troubleſome to it; otherwhiles by the Art of the Phyſirion in imitation of nature.

The kinds of evacuation.

And againe, one of theſe is good and requiſite, when onely the humor which is hurtfull, either in quantitie or qualitie, is evacuated; The other not requiſite, or immoderate, when the profitable humors together with the unprofitable, are expelled.

The commodities of moderate ſcratching.

But what evacuations ſoever theſe be, they are performed and done, either by the ſcratching and rubbing of the skinne, as when a cholericke, ſalt, or ſerous humor, or ſome windineſſe lying betweene the skinne and the fleſh, cauſe itching. For by ſcratching the skinne, it gets paſſage out, which is manifeſt by the effluxe of a ſerous matter burning, or cauſing ſcabbs and ulcers, if the humor be ſomewhat groſſe, but inſenſible and not ſo manifeſt, if it be windineſſe, the skinne by that rubbing being rarefied, and the groſſe flatulency attenuated. Wherefore they doe ill who hinder their Patients from ſcratching, unleſſe they ſcratch ſo cruelly and hard, that there may bee danger, (by reaſon of the great heate and paine thereby cauſed) of ſome defluxion or falling downe of humors into the part.

The force of vomits.

Salivation.

The whole body is alſo purged by urines.

Or theſe evacuations are performed by much matter evacuated from an opened Bile, or running ulcer, a Fiſtula, or ſuch like ſores. Or by ſweats which are very good and healthfull, eſpecially in ſharpe diſeaſes, if they proceede from the whole body, and happen on the criticall dayes. By vomit, which often violently drawes theſe humors from the whole body, even from the utmoſt joints, which purging medicins could not evacuate, as wee may ſee in the Palſie, and Sciatica, or Hipgoute. By ſpitting, as in all who are ſuppurated either in the ſides or lungs. By Salivation, or a Flegmaticke fluxe by the mouth, as in thoſe who are troubled with the French Pockes. By ſneeſing and blowing the noſe; for by theſe the braine oppreſt with moiſture, diſburdeneth its ſelfe, whether it be done without, or with the helpe of ſternutatories and errhines; wherefore children, and ſuch as have ſomewhat moiſt braines purge themſelves often this way. By hicket and belching; for by theſe the windineſſe contained in the ſtomacke, is often expelled. By urine, for by this not onely Feavers, but which is more to bee admired, the French-Pockes hath often beene terminated and cured.

For there have beene ſome troubled with the Pockes, in whom a fluxe of the vicious and venenate humor could not by unctions of quickſilver be procured, either from the mouth, or belly; yet have beene wonderfully freed by aboundance of urine, both from danger of death and their diſeaſe. By bleeding; for nature hath often found a way for grievous diſeaſes, eſpecially in young bodies, by bleeding at the noſe, and by their courſes in women. By a fluxe, or laske, purgation, ſweats, inſenſible evacuation and tranſpiration; for ſo tumors, the matter being brought to ſuppuration, doe ſometimes vaniſh away and are diſſolved, both of their owne accord, as alſo by diſſolving, or diſcuſſing medicins. We doe the ſame by exerciſe, diet, hot-houſes, long ſleepe, waking, and ſhedding of teares. By ſucking, as with cupping glaſſes and horſe-leaches in wounds made by venemous bitings.

We muſt obſerve three things in every evacuation.

In all ſuch kinds of evacuations, wee muſt conſider three things, the quantity, quality, and manner of evacuation. As for an example, when an ***Empyema*** is opened, the matter which runnes out, ought to bee anſwerable in proportion to the purulent matter, which was contained in the capacity of the breaſts; otherwiſe, unleſſe all the matter bee emptied, there may happen a relapſe; the matter ſhould be white, ſoft, equall, and nothing ſtinking: Laſtly, you muſt let it forth not altogether, and at one time, but by little and little, and at ſeverall times, otherwiſe not a little quantitie of the ſpirits and heate doth flow out together, with the unprofitable matter, and ſo conſequently a diſſolution of all the powers.

Chap. XVIII.

Of the Perturbations, or Paſſions of the minde.

Why the Paſſions of the minde, are called Accidents.

Their force.

THe Perturbations, are commonly called the accidents of the minde, becauſe, as bodily accidents from the body, ſo may theſe be preſent and abſent from the minde, without the corruption of the ſubject. The knowledge of theſe muſt not be lightly paſſed over by the Chirurgion; for they ſtir up great troubles in the bodies, and yeeld occaſion of many & great diſeaſes; of which things, Ioy, Hope and Love, may give a apparent teſtimony. For by theſe motions the heate and ſpirits are ſometimes gently, ſometimes violently diffuſed over all the body, for the enjoying of the preſent, or hoped for good. For then the heart is dilated, as to embrace the thing beloved, and the face is died with a roſy and lively colour. For it is likely, that the facultie it ſelfe is ſtirred by the object, by whoſe power the heart it ſelfe is moved.

From whence they have their force.

The reaſon of Ioy.

For it is firſt neceſſary, before wee be moved by any Paſſions, that the ſenſes in their proper ſeates, in which they are ſeldome deceived, apprehend the objects, and ſtrait as meſſengers carrie them to the common ſenſe, which ſends their conceived formes to all the faculties. And then, that each facultie, as a Iudge may a freſh examine the whole matter, how it is, and conceive in the preſented objects ſome ſhew of good, or ill, to bee deſired, or ſhunned. For what man that was well in his wits, did ever fall into a laughter, unleſſe he formerly knew, or ſaw ſomewhat ſaid or done, which might yeeld occaſion of laughter? Therefore Ioy proceeds from the heart, for the thing cauſing mirth or joy, being conceived, the facultie moves the heart, which ſhaken and moved by the faculty which hath dominion over it, is dilated and opened, as ready to embrace the exhilarating object. But in the meane time by the force of that dilatation, it ſends forth much heate, and ſpirits together with the bloud into all the body. A great part of which comming to the face, dilates it, the forehead is ſmooth and plaine, the eyes looke bright, the cheekes become red, as died with Vermilion, the lips and mouth are drawen together, and made plaine and ſmoth; ſome have their cheekes dented with two little pits (which from the effects are called laughing cheekes)*because of the contraction or curling, which the muſcles ſuffer by reaſon of their fulneſſe of bloud and ſpirits, all which to be briefe is nothing but to laugh.

The effects of Ioy.

Ioy recreates and quickens all the faculties, ſtirres up the ſpirits, helpes concoction, makes the body to bee better likeing, and fattens it, the heate, bloud, and ſpirits flowing thither, and the nouriſhing dew or moiſture, watering and refreſhing all the members; from whence it is, that of all the Paſſions of the minde, this onely is profitable, ſo that it exceed not meaſure; for immoderate and unaccuſtomed joy, carries ſo violently the bloud and ſpirits from the heart, into the habit of the body, that ſodaine and unlookt for death enſues, by a ſpeedy decay of the ſtrength, the laſting fountaine of the vitall humour being exhauſted. Which thing principally happens to thoſe who are leſſe heartie, as women and oldmen.

Angers

Anger cauſeth the ſame effuſion of heate in us, but farre ſpeedier than joy; therefore the ſpirits and humors are ſo inflamed by it, that it often cauſes putrid feavers, eſpecially if the body abound with any ill humor.

Sorrow.

Sorrow, or griefe dries the body by a way quite contrary to that of anger, becauſe by this the heart is ſo ſtraitened, the heate being almoſt extinct, that the accuſtomed generation of ſpirits cannot be performed; and if any be generated, they cannot freely paſſe into the members with the bloud; wherefore the vitall facultie is weakened, the lively colour of the face withers and decaies, and the body waſtes away with a lingering conſumption.

Feare.

Feare in like ſort drawes in and calls backe the ſpirits, and not by little and little as in ſorrow, but ſodainely and violently; hereupon the face growes ſodainely pale, *Hippocrat.lib. 4.de morb.*

the extreame parts cold, all the body trembles or ſhakes, the belly in ſome is looſed, the voice as it were ſtaies in the jawes, the heart beate with a violent pulſation, becauſe it is almoſt oppreſt by the heate, ſtrangled by the plentie of bloud, and ſpirits abondantly ruſhing thither; The haire alſo ſtands upright, becauſe the heate and bloud are retired to the inner parts, and the utmoſt parts are more cold and drie than ſtone; by reaſon whereof the utmoſt ſkinne and the pores, in which the rootes of the haires are faſtened, are drawne together.

Shame.

Shame is a certaine affection mixed, as it were, of Anger and Feare; therefore if, in that conflict of, as it were, contending paſſions, Feare prevaile over Anger, the face waxeth pale, (the bloud flying backe to the heart;) and theſe or theſe Symptomes riſe, according to the vehemency of the contracted and abated heat. But if on the contrary, Anger get the dominion over Feare, the bloud runnes violently to the face, the eyes looke red, and ſometimes they even fome at the mouth.

Shameſaſtneſſe.

There is another kinde of ſhame, which the Latines call *Verecundia* (wee Shameſaſtneſſe) in which there is a certaine fluxe, and refluxe of the heate, and bloud firſt recoiling to the heart, then preſently rebounding from thence againe. But that motion is ſo gentle, that the heart thereby ſuffers no oppreſſion, nor defect of ſpirits; wherefore no accidents worthy to be ſpoken of, ariſe from hence: this affect is familiar to young maides and boyes; who if they bluſh for a fault committed unawares, or through careleſneſſe, it is thought an argument of a vertuous and good diſpoſition.

An agonie.

But an agony, which is a mixt paſſion of a ſtrong feare, and vehement anger, involves the heart in the danger of both motions; wherefore by this paſſion, the vitall facultie is brought into very great danger. To theſe ſixe Paſſions of the minde, all other may be revoked, as Hatred and Diſcord to Anger: Mirth and Boaſting, to Ioy; Terrors, Frights and Swoundings, to Feare; Envy, Deſpaire and Mourning, to Sorrow.

By theſe it is evident, how much the paſſions of the minde can prevaile, to alter and overthow the ſtate of the body; and that by no other meanes, than that by the compreſſion and dilatation of the heart, they diffuſe and contract the ſpirits bloud, and heate; from whence happens the diſſipation, or oppreſſions of theſe ſpirits.

Why the firſt ſignes of paſſions of the minde appeare in the face.

The ſignes of theſe Symptomes quickly ſhew themſelves in the face; the heart, by reaſon of the thinneſſe of the ſkinne in that part, as it were painting forth the notes of its affections. And certainely the face is a part ſo fit to diſcloſe all the affections of the inward parts, that by it you may manifeſtly know an old man from a young, a woman from a man, a temperate perſon from an untemperate, an Ethiopian from an Indian, a Frenchman from a Spaniard, a ſad man from a merry, a ſound from a ſicke, a living from a dead. Wherefore many affirme that the manners, and thoſe things which we keepe ſecret and hid in our hearts, may be underſtood by the face and countenance.

The uſe of paſſions of the minde.

Now wee have declared what commoditie and diſcommoditie may redound to man from theſe forementioned paſſions, and have ſhewed that anger is profitable to none, unleſſe by chance to ſome dull by reaſon of idleneſſe, or oppreſt with ſome cold, clammy and phlegmaticke humor; and feare convenient for none, unleſſe peradventure for ſuch as are brought into manifeſt and extreme danger of their life by ſome extraordinary ſweat, immoderate bleeding, or the like unbridled evacuation, Wherefore it behoves a wiſe Chirurgion to have a care, leſt he inconſiderately put any Patient committed to his charge into any of theſe paſſions, unleſſe there bee ſome neceſſitie thereof, by reaſon of any of the forementioned occaſions.

Chap. XIX.

Of things againſt Nature, and firſt of the Cauſe of a Diſeaſe.

What things againſt nature are.

HAving intreated of things naturall, and not naturall, now it remaines wee ſpeake of things (which are called) againſt nature, becauſe that they are ſuch as are apt to weaken and corrupt the ſtate of our body. And they bee three in number; The cauſe of a diſeaſe, a Diſeaſe, and a Symptome. The cauſe of a diſeaſe is an affect againſt nature, which cauſes the diſeaſe. Which is divided into Internall and Externall. The Externall, originall or primitive comes from ſome other place, and outwardly into the body, ſuch be meates of ill nouriſhment, and ſuch weapons and hoſtilely wound the body.

What, and how many the cauſes of diſeaſes be. The primitive cauſe.

Internall antecedent.

The Internall have their eſſence and ſeate in the body, and are ſubdivided into antecedent and conjunct. That is called an antecedent cauſe, which as yet doth not actually make a diſeaſe, but goes neare to cauſe one; ſo humors copiouſly flowing, or ready to flow into any part, are the antecedent cauſes of diſeaſes; The conjunct cauſe is that which actually cauſes the diſeaſe, and is ſo immediately joined in affinitie to the diſeaſe, that the diſeaſe being preſent, it is preſent, and being abſent, it is abſent.

Internall conjunct.

Againe, of all ſuch cauſes, ſome are borne together with us, as the over-great quantitie, and maligne qualitie of both the ſeedes, and the menſtruous bloud, from diſeaſed Parents are cauſes of many diſeaſes, and ſpecially of thoſe which are called Hereditary.

Other happen to us after wee bee borne, by our diet and manner of life, a ſtroke, fall, or ſuch other like. Thoſe which bee bred with us, cannot be wholy avoided or amended, but ſome of the other may be avoided, as a ſtroke and fall; ſome not, as thoſe which neceſſarily enter into our body, as Aire, Meate, Drinke, and the like.

The congenit, or inevitable cauſe of death.

But if any will reckon up amongſt the internall, inherent, and inevitable cauſes, the daily, nay hourely diſſipation of the radicall moiſture, which the naturall heate continually preyes upon; I doe not gainesay it, no more than that diviſion of cauſes celebrated and received of Philoſophers, divided into Materiall, Formall, Efficient, and Finall; for ſuch a curious contemplation belongs not to a Chirurgion, whom I onely intend plainely to inſtruct. Wherefore that wee have written may ſuffice him.

Chap. XX.

Of a Diſeaſe.

What a diſeaſe is, and how various.

A Diſeaſe is an affect againſt nature, principally and by it ſelfe, hurting and depraving the action of the part in which it reſides. The diviſion of a Diſeaſe is threefold; Diſtemperature, ill Conformation, and the Solution of Continuity.

A Diſtemperature.

Diſtemperature is a diſeaſe of the ſimular parts diſſenting, and changed from their proper and native temper. That digreſſion from the native temper, happens two wayes; either by a ſimple diſtemperature from the exceſſe of one qualitie; and this is fourefold; Hot, Cold, Moiſt, and Drie; or by a compound diſtemperature, by the exceſſe of two qualities, which alſo is fourefold, Hot and Moiſt; Hot and Drie, Cold and Moiſt; Cold and Drie. Againe, every diſtemper is the fault of one ſimple and ſingle qualitie, as an inflammation; or hath ſome vicious humors joyned with it, as a Phlegmon; Againe, a Diſtemperature is either equall, as in a *Sphacele*; or unequall, as in a *Phlegmon*, beginning, or increaſing.

Ill conformation.

Ill Conformity is a fault of the organicall parts, whoſe compoſure is thereby depraved. This hath foure kindes; the firſt is when the figure of the part is faultie, either by nature or accident, or ſome cavitie aboliſhed, as if a part, which nature would have hollow for ſome certaine uſe, doe grow or cloſe up; or laſtly, if they be rough, or ſmooth otherwiſe than they ſhould, as if that part which ſhould be rough, be ſmooth, or the contrary. Another is in the magnitude of the part increaſed, or diminiſhed contrarie to nature. The third is in the number of the parts, increaſed, or diminiſhed; as if a hand have but foure or elſe ſixe fingers. The fourth is in the ſite and mutuall connexion of the parts, as if the parts which ſhould be naturally united and continued bee pluckt aſunder, as happens in luxations; or the contrary.

Solution of Continuitie.

The third generall kinde of diſeaſe, is the ſolution of continuitie, a diſeaſe common, both to the ſimular and organicall parts, acquiring diverſitie of names, acccording to the varietie of the parts in which it reſides.

CHAP. XXI.

Of a Symptome.

What a Symptome is.

WE doe not in this place take the word Symptome in the moſt generall acceptation, for every change or accident which happens to man beſides his owne nature; but more reſervedly and ſpecially, onely for that change which the diſeaſe brings, and which followes the diſeaſe, as a ſhadow doth the body.

Three kindes thereof.

There be three kindes of a Symptome properly taken. The firſt is, when the action is hurt; I ſay hurt, becauſe it is either aboliſhed, weakened, or depraved; ſo blindneſſe is a deprivation, or aboliſhing of the action of ſeeing; dulneſſe of ſight, is a diminution, or weakening thereof; and a ſuffuſion, ſuch as happens at the beginning of a Cataract, when they thinke flies, haires, and ſuch like bodies flie too and fro before their eyes, is a depravation of the ſight.

The ſecond is a ſimple affect of the body, and a full fault of the habite thereof being changed, happening by the mutation of ſome qualities, ſuch is the changing of the native colour into a red by a Phlegmon, and into a livide and blacke by a Gangrene; ſuch is the filthy ſtench the noſe affected with a *Polypus* ſends forth; the bitter taſte, in ſuch as have the Iaundiſe; and the rough and rugged ſkinne in them which are Leprous.

The third is the fault of the overmuch retention of excrements which ſhould be expelled, and expulſion of ſuch as ſhould be retained; for the evacuation of an humor profitable both in quantitie and qualitie, is againſt nature, as bleeding in a body not full of ill humors, nor Plethoricke; and alſo the retention of things hurtfull in ſubſtance, quantitie and qualitie, as the Courſes in women, the urine, and the ſtone in the bladder.

CHAP. XXII.

Of Indications.

What an Indication is.

THe knowledge and exerciſe of Indications befits that Chirurgion, whom no blinde raſhneſſe of fortune, but reaſon; no chance, but counſell directs in the undertaking and performing the workes of his Art. For an Indication is a certaine ſafe and ſhort way, which leades the Phyſition, as by the hand, to the attainement of his purpoſed end, of preſerving the ſound, or curing the ſicke.

Sec. method. Cap.7. lib. de opt. ſecta, Cap.11.

For *Galen* doth define an Indication to be a certaine inſinuation of what is to be done, or a quick & judicious apprehenſion of that which may profit or hurt. And as Faulconers,

ners, Mariners, Plowmen, Soldiers, & all manner of Artizans, have their peculiar termes and words, which are neither knowne, nor uſed by the vulgar; ſo this word Indication is proper and peculiar to Phiſitions and Chirurgeons, as a Terme of Arte not vulgar; by conſideration of which, as by ſome ſigne, or ſecret token, they are admoniſhed what is to be done to reſtore health, or repell an imminent danger.

The kinds of Indications.

There are three prime and principall kinds of Indications, every of which is ſubdivided into many other. The firſt is from things naturall. The ſecond from theſe things which are termed not naturall. The third from thoſe things which are contrary to nature. Things naturall ſhew they muſt be preſerved by their like, and in the compaſſe of theſe are contained all the Indications which are drawne from the nature of the Patient, that is, from his ſtrength, temper, age, ſexe, habit, cuſtome, diet.

Lib. 9. Method. cap. 9.

Things not naturall may be doubted as uncertaine, for one while they indicate the ſame things with things naturall, that is, they coindicate with the ſtrength, temper and the reſt; otherwhiles they conſent with things againſt nature, that is, they coindicate with the diſeaſe. Wherfore *Galen* when he ſaith, that Indications are drawn from three things; The diſeaſe; The nature of the Patient, and the encompaſſing aire, by propoſing the familiar example of the aire, hee would have us to underſtand the other things not naturall; becauſe wee may ſhun, or embrace them more or leſſe as we will our ſelves, but we muſt, whether we will or no, endure the preſent ſtate of the aire. Therefore the aire indicates ſomething to us, or rather coindicates; for if it nouriſh the diſeaſe, as conſpiring with it, it will indicate the ſame that the diſeaſe, that is, that it muſt be preſerved in the ſame ſtate.

Indications drawne from things naturall.

Things contrary to nature indicate they muſt be taken away by their contraries; therefore that we may more accurately and fully handle all the Indications drawne from things naturall, we muſt note, that ſome of theſe are concerning the ſtrength of the Patient, by care to preſerve which, we are often compelled for a time to forſake the cure of the proper diſeaſe: for ſo a great ſhaking happening at the beginning of an ague or feaver, we are often forced to give ſuſtenance to the Patient, to ſtrengthen the powers ſhaken by the vehemency of the ſhaking, which thing notwithſtanding lengthens both the generall and particular fitts of the ague. Other pertaine to the temper, other reſpect the habite, if the Patient be ſlender, if fat, if well fleſht, if of a rare, or denſe conſtitution of body. Other reſpect the condition of the part affected in ſubſtance, conſiſtence, ſoftneſſe, hardneſſe, quicke or dull ſenſe, forme, figure, magnitude, ſite, connexion, principallity, ſervice, function and uſe. From all theſe, as from notes the skilfull Chirurgion will draw Indications according to the time and part affected: for the ſame things are not fit for ſore eyes, which were convenient for the eares, neither doth a Phlegmon in the jawes and throat admit the ſame forme of cure, as it doth in other parts of the body. For none can there outwardly apply repercuſſives, without preſent danger of ſuffocation. So there is no uſe of repercuſſives in defluxions of thoſe parts which in ſite are neere the principall. Neither muſt thou cure a wounded Nerve and Muſcle, after one manner. The temperature of a part, as Moiſture, alwayes indicates its preſervation, although the diſeaſe be moiſt and give Indication of drying, as an ulcer. The principallity of a part alwayes inſinuates an Indication of aſtringent things, although the diſeaſe require diſſolving, as an Obſtruction of the Liver; for otherwiſe unleſſe you mixe aſtringent things with diſſolving, you will ſo diſſolve the ſtrength of the part, that hereafter it cannot ſuffice for ſanguification. If the texture of a part be rare, it ſhewes it is leſſe apt, or prone to obſtruction; if denſe, it is more abnoxious to that diſeaſe; hence it is that the Liver is oftener obſtructed than the Spleene. If the part be ſcituate more deepe, or remote, it indicates the medicines muſt be more vigorous and liquid, that they may ſend their force ſo farre. The ſenſibleneſſe, or quicke-ſenſe of the part, gives Iudication of milder medicines, than paradventur the ſignes, or notes of a great diſeaſe require. For the Phiſition which applies things equally ſharpe to the Horny tunicle of the eye being ulcerated, and to the Legge, muſt needs be accounted either cruell, or ignorant. Each ſexe and Age hath its Indications, for ſome diſeaſes are curable in youth, which we muſt not hope to cure in old age; for hoarſeneſſe and great diſtillations in very old men, admit no digeſtion, as *Hippocrates* ſaith;

What the conditions of the parts affected do indicate.

Indications from the ages.

Aphor. 40. li. 2.

Nunquam decrepitus Branchum coquit, atque Coryzam.
The feeble Sire, for age that hardly goes,
Ne're well digeſts, the hurtfull Rheume or poſe.

Moreover according to his decree the diſeaſes of the Reines, and whatſoever paines moleſt the bladder, are difficultly healed in old men; and alſo reaſon perſwades that a Quartaine admits no cure in Winter, and ſcarſe a Quotidian, and ulcers in like manner are more hard to heale in Winter; that hence we may underſtand certaine Indications to be drawne from time; and to increaſe the credit of the variety and certainty of Indications, ſome certaine time, and ſeaſons in thoſe times command us to make choiſe of Medicines; for as *Hipocrates* teſtifies;

Aphor.6. ſect.6.

Aphor.5. ſect.4.

Ad Canis ardorem facilis purgatio non eſt.
In Dogdayes heat it is not good,
By purging for to clenſe the blood.

Neither ſhalt thou ſo well preſcribe a ſlender diet in Winter, as in the Spring, for the aire hath its Indications. For experience teaches us, that wounds of the head are farre more difficultly and hardly cured, at Rome, Naples, and Rochell in Xantoigne. But the times of diſeaſes yeeld the principall Indications, for ſome Medicines are onely to be uſed at the beginning and end of diſeaſes, others at the encreaſe and vigour of the diſeaſe. We muſt not contemne thoſe Indications which are drawn from the vocation of life, and manner of Diet; for you muſt otherwiſe deale with the painfull Husbandman (when he is your Patient) which leades his life ſparingly and hardly, than with the Citizen who lives daintily and idlely. To this manner of life and Diet may be referred a certaine ſecret and occult property, by which many are not onely ready to vomite at eating of ſome meats, but tremble over all their bodyes when they heare them but ſpoken of. I knew a prime Nobleman of the French Nobility, who was ſo perplext at the ſerving in of an Eele to the Table, at the middſt of dinner & amongſt his friends, that he fell into a ſwound, all his powers failing him. *Galen* in his booke *de Conſuetudine* tells that *Arius* the *Peripateticke* died ſodainly, becauſe compelled by the adviſe of thoſe Phyſitions he uſed, he dranke a great draught of cold water in the intollerable heat of a Feaver. For no other reaſon ſaith *Galen*, than that, becauſe he knowing he had naturally a cold ſtomacke from his childhood, perpetually abſtained from cold water.

From our Diet.

Hatred ariſing from ſecret properties.

Indications taken from things againſt nature.

For as much as belongs to Indications taken from things againſt nature; the Length and depth of a wound or ulcer indicates one way; the figure cornered, round, equall and ſmooth, unequall and rough, with a hollowneſſe ſtraight or winding, indicate otherwiſe; the ſite right, left, upper, lower in an other manner, and otherwiſe the force and violence of antecedent and conjunct cauſes. For oftentimes the condition of the cauſe indicates contrary to the diſeaſe, as when abundance of cold and groſſe humors cauſe and nouriſh a Feaver. So alſo a Symptome often indicates contrary to the diſeaſe, in which contradiction, that Indication muſt be moſt eſteemed, which doth moſt urge; as for example ſake, if ſwounding happen in a Feaver, the feaveriſh burning ſhall not hinder us from giving wine to the Patient.

Wherefore theſe Indications are the Principalleſt and moſt noble which leade us, as by the hand, to doe theſe things which pertaine to the cure, prevention and mitigating of diſeaſes. But if any object, that ſo curious a ſearch of ſo many Indications is to no purpoſe, becauſe there are many Chirurgions, which ſetting onely one before their eyes, which is drawne from the Eſſence of the diſeaſe, have the report and fame of skillfull Chirurgions, in the opinion of the vulgar; but let him know that it doth not therefore follow, that, this indication is ſufficient for the cure of all diſeaſes; for we doe not alwayes follow that which the Eſſence of the diſeaſe doth indicate to be done. But chiefly then, where none of the fore-recited Indications doth reſiſt or gaineſay; you may underſtand this by the example of a *Plethora*, which by the Indication drawne from the Eſſence of the thing requires Phlebotomy; yet who

We do not alwayes follow the Indication which is from the diſeaſe.

is it, that will draw blood from a child of three monethes old? Beſides, ſuch an Indication is not artificiall but common to the Chirurgion with the common people. For who is it that is ignorant, that contraries are the remedies of contraries? and that broken bones muſt be united by joyning them together? but how it muſt be performed and done, this is of Arte and peculiar to a Chirurgion, and not knowne to the vulgar. Which the Indications drawn from thoſe fountaines we pointed at before, aboundantly teaches, which, as by certaine limits of circumſtances, encompaſſe the Indication which is taken from the Eſſence of the diſeaſe, leſt any ſhould thinke, we muſt truſt to that onely. For there is ſome great and principall matter in it, but not all. For ſo the meaneſt of the common people is not ignorant, that the ſolution of continuity is to be cured by repairing that which is loſt. But in what parts we may hope for reſtitution of the loſt ſubſtance, and in which not, is the part of a skilfull Chirurgion to know and pronounce. Wherefore hee will not vainly beſtow his labour to cure the Nervous part of the *Diaphragma*, or Midriffe being wounded, or the Heart, ſmall Gutts, Lungs, Liver, Stomacke, braine or bladder; and that, I may ſpeake in a word, Emperickes are not much more skilfull than the common people, although they do ſo much extoll themſelves above others by the name of experience. For although experience be another inſtrument to find out things with reaſon, yet without reaſon, it will never teach, what the ſubſtance of the part in which the diſeaſe lyes, may be; or what the action, uſe, ſite, connexion, from whence ſpeciall and proper Indications are drawne; With which the Chirurgion being provided and inſtructed ſhall not onely know by what meanes to finde out a remedye, but alſo, leſt he may ſeeme to mocke any with vaine promiſes, he ſhall diſcerne what diſeaſes are uncureable, and therefore not to be medled withall.

In what parts we cannot hope for reſtoring of ſolution of continuity.

Exherience without reaſon, is like a blind man without a guide.

But implicite, or intricate diſeaſes require each to be cured in their ſeverall order, except ſome one of them be deſperate, or ſo urge and preſſe that the Phyſition think it neceſſary after a prepoſterous order, to begin with it, although often he be forced to make ſome one of theſe diſeaſes incureable, or give occaſion of cauſing ſome new one, into which ſtraits we are neceſſarily compelled to fall, when, (for example) we determine to pull, or take away ſome extraneous body; for the performance whereof we are compelled to enlarge the wound. So we are forced by neceſſitie to open the necke of the bladder, (that ſo we may draw forth the ſtone therein contained) with a wound which often degenerates into an uncurable Fiſtula. For that diſeaſe which threatens danger of preſent death is of ſuch moment, that to ſhun that, it may be counted a ſmal matter, and commodious for the ſicke to bring in other diſeaſes, though uncureable. For if a convulſion happen by pricking a Nerve which we cannot heale by any remedies, then by cutting the Nerve aſunder wee end the convulſion, but deprive the part into which that Nerve did goe, of the uſe of ſome voluntary motion. So if in any great joynt there happen a Luxation with a wound, becauſe there is danger of convulſion by trying to reſtore and ſet right the Luxated part, wee are forcte for ſhunning thereof, to attend the wound onely, and in the meane time to let alone the Luxation. Otherwiſe in implicite diſeaſes if there be nothing which may urge, or call us from the ordinary cure, we muſt obſerve this order, that beginning with that affect, which hinders the cure of the principall diſeaſe, we proſecute the reſt in the ſame and their proper order, untill all the diſeaſes being overcome we ſhall reſtore the part affected to its integrity. Therefore let us take for an example, an ulcer in the Leg, a *Varix* (or big ſwollen veine) and a Phlegmonous tumor round about it; and laſtly, a body wholy plethoricke and filled with ill humors; order and reaſon require this, that uſing the adviſe of ſome learned Phyſition we preſcribe a convenient diet, and by what meanes we may, bring him to an equality by purging and blood-letting, and then we will ſcarifie in divers places the part where it is moſt ſwollen, then preſently apply Leaches that ſo we may free it from the burden of the conjunct matter; then uſe Cauteryes to helpe the corruption of the bone, and in the meane time change the circular figure of the ulcer into an ovall, or triangular; then at the length we will undertake the cutting of the *Varix*, and cure the ulcer which remaines according to Arte, and ſo at the length cicatrize it. In all this whole time the Patient ſhall neither walke, nor ſtand, nor ſit, but lye quietly, having his Leg orderly and decently rowled up. But if

Indications in implicite diſeaſes.

An example of Indications in implicite diſeaſes.

What we muſt do when the temper of the part is different from the temper of the whole body.

An artificiall conjecture is of much force in Indications.

if (as it often happens) the temper of the hurt part, be different from the temper of the whole body, the manner of curing muſt be ſo tempered, that we increaſe the Doſis of hot or Cold medicines, according to the ratable proportion of the Indications requiring this, or that. Therefore imagine the part ulcerated to be ſuch, as that it is two degrees dryer than the juſt temper; but the whole body to exceed the ſame temper in one degree of humidity: reaſon and Arte will require, that the medicine applyed to the ulcer be dryer by one degree than that which the part would otherwiſe require if it were temperate; but on the contrary let us ſuppoſe thus. The whole body to be one degree more moiſt than the temper requires, & the ulcerated part to be one degree dryer, truly in this caſe the medicine that is applyed to the ulcer by reaſon of the part it ſelfe, ſhall not be encreaſed in dryneſſe, but wholy compoſed and tempered to the Indication of the ulcer; becauſe the force of the moiſture exceeding in the like degree, doth counterpoiſe the ſuperfluous degree of dryneſſe. But it is more eaſie by an artificiall conjecture to determine of all ſuch things, than by any rules or precepts.

Indication from ſimilitude.

Indication of a ſubtle device.

Examples.

To theſe ſo many and various Indications, I thinke good to add two other; the One from ſimilitude; the Other of a certaine crafty device, and as the latter Phyſitions terme it, of a certaine ſubtile ſtratageme. We draw Indication from ſimilitude, in diſeaſes which newly ſpring up and ariſe, as which cannot be cured by Indications drawne from their contraries, as long as their Eſſence is unknowne and hid; wherfore they thinke it neceſſary to cure them by a way and Arte like thoſe diſeaſes, with which they ſeeme to have an agreeing ſimilitude of Symptomes and Accidents; Our Anceſtors did the ſame in curing the French Pockes, at the firſt beginning thereof, as long as they aſſimulated the cure to that of the Leproſie, by reaſon of that affinity, which both the diſeaſes ſeeme to have. But we follow crafty devices and ſubtile counſells, when the Eſſence of the diſeaſe wee meet with is wholy ſecret and hid, either becauſe it is altogether of a hidden and ſecret nature, and which cannot be unfolded by manifeſt qualities, or elſe reſides in a ſubject which is not ſufficiently knowne to us, nor of a Phyſicall contemplation, as the Minde. For then we being deſtitute of Indications taken from the nature of the thing, are compelled to turne our cogitations to impoſtures and crafty counſells; and they ſay this Arte and Craft is of cheiſe uſe in Melancholy affects and fictions, which are often more monſtrous and deformed than the Chimera ſo much mentioned in the fables of the Ancients; to which purpoſe, I will not thinke much to recite two Examples. A certaine man troubled with a Melancholike diſeaſe, I know not by what errour of opinion, had ſtrongly perſwaded himſelf that he was without a head; the Phyſitions omitted nothing, by which they might hope to take this madd opinion out of his minde. But when they had in vaine tryed all medicines, at length they deviſed this crafty, but profitable device, they faſtened and put upon his head a moſt heavy helmet, that ſo by the paine and trouble of his head nodding and drawne downe by that weight, he might be admoniſhed of his error.

A Phyſition ſhould be of a quicke apprehenſion.

It is reported, another moleſted by the obſcurity and darkneſſe of the ſame diſeaſe, did verily beleeve, that he had hornes upon his head; neither could he be drawne or diverted from that abſurd and monſtrous opinion, untill that binding up his eyes, they miſerablely bruiſed and ſcratched his forehead with the bony roughneſſe of the lower parts of an oxes hornes, that ſo he begun to beleeve by the painefull drawing of the blood that ran downe his face, that thoſe bloody hornes, were forciblely plucked from him. Ingenious Chirurgions in imitation of theſe examples may in like caſes doe the like. For that caſe requires a man of a quicke apprehenſion and advice, who may give manifeſt proofe of his diligence and skill by medicinall ſtratagems, as who forthwith can politikly device ſtratagems of divers ſorts.

Indications indicative.

Coindicative.

Repugnant.

But, now comming to the end of this our tract of Indications, we muſt cheifly and principally obſerve; That of Indications ſome are Indicative; which abſolutely and of themſelves command this to be done; other coindicative, which indicate the ſame with the Indicative, and joyntly ſhew it to be done, but in ſome ſort ſecundarily and not primitively; ſome are repugnant, which of themſelves and their owne nature perſwade quite contrary to that the indicative primitively did; or which diſſwade us from doing that, to performe which the indicative did perſwade us; other correpugnant, which give their voyce after the ſame forme and manner with the repugnant againſt the indicative, as the coindicative conſent to and maintaine them, Let this ſerve for an example of them all. **Correpugnant**

A *Plethora*, or plenitude of humors of its owne nature, requires and indicates bloodletting, the Spring-time perſwades and coindicates the ſame, but to this counſell is quite oppoſite and repugnant, a weake faculty, and childhood is correpugnant.

Wherefore theſe foure muſt be diligently waighed and conſidered when we deliberate what is to be done, and we muſt rather follow that which the indicative, or repugnant ſhew and declare, as what the diſeaſe and ſtrength of the Patient require, than that which the coindicative, or correpugnant ſhall perſwade, becauſe they have a weaker and but ſecundary power of indicating, and not eſſentiall and primitive. But becauſe the kinds of Indications are ſo many and divers, therfore that the knowledge of them may be more perſpicuous and leſſe confuſed, I have thought good to deſcribe and diſtinguiſh them by this following ſcheme.

A Table of Indications.

- An Indication is a certaine plaine and compendious way which leades the Chirurgion to a certaine, determinate and propoſed end for the cure of the preſent diſeaſe; of which there are 3. kinds,
  - The firſt is drawne from things natural which indicate their preſervation by their like; of this kind are many other which are drawne, either
    - From the ſtrength and faculties of the patient.
      - For whoſe preſervation, oftentimes the proper cure of the diſeaſe muſt be neglected; for where theſe faile, it is impoſſible the Chirurgion ſhould performe what he deſires and expects.
    - From the tēperament, as if the Patient ſhall be--
      - Sanguine,
      - Cholericke,
      - Flegmaticke
      - Melancholicke
        - Of preſervatiō of which the Chirurgion muſt have care, and if they ſwarve from equallitie, to reduce them to that which formerly they naturally were.
    - From the habite of the body, as the patient ſhall be
      - Dainty and delicate,
      - Slender and weake.
      - Low of ſtature.
      - Rare, or elſe denſe and compacte.
    - From the native condition of the hurt or affected part, in which we cōſider, either
      - The ſubſtance therof, as for as much as it is ſimular, we conſider whether it be hot, cold, moiſt, dry, or as it is organicall, and then whether it be a principall and noble part, or a ſubordinate and ignoble part.
      - Or, the ſenſe whether quicke, or dull, by reaſon whereof the eye cannot endure ſuch ſharpe & acride medicines, as ſimple fleſh can.
      - Or the forme, figure, magnitude, number, ſite, connexion, action, uſe.
    - From the Age, for each age yeelds his peculiar Indications, hence you may obſerve moſt diſeaſes to be incureable in old men, which are eaſily cured in yong, others which in youth admit of no cure, unleſſe by the change of age and th'enſuing temperament.
    - From Sexe, for medicines work upon weomen farre more eaſily than upon men.
    - From the time of the yeare, for ſome meats and medicines are fit in Winter, ſome in Summer.
    - From the Region, for as there are diverſities of ſituations and habits of places, ſo alſo there are motions of humors, and manners of diſeaſes: hence it is that wounds on the head at Paris, & ſore ſhinns at Avignion are more difficult to be cured.
    - From the times of diſeaſes, for ſome things in the beginings, others in the encreaſe, ſtate and declining of the diſeaſe, are more convenient.
    - From the manner of diet, for this, as the proper temper, muſt be preſerved. Wherefore ſuch muſt be fed otherwiſe who live daintily, than thoſe who leade their lives ſparingly and hardly. Hereunto adde certaine peculiar natures, which by a certaine hidden property are offended at this, or that kinde of meate. For there are ſome which not onely, cannot concoct Ptiſane, Apples, Soles, Pertrige, Water and ſuch like, but can ſcarſe behold them without Nauſeouſnes.
  - The ſecond is drawne from things not naturall, which one while indicate their preſervation by their like, another while their change by their contraries; for ſo
    - If the Aire, have as it were conſpired with the diſeaſe by a certaine ſimilitude of qualities to the deſtruction of the Patient, it muſt be corrected by its contraries according to Arte.
    - But if by the diſagreement of qualities it reſiſt the diſeaſe, it muſt be kept in the ſame temper.
  - The third from things contrary to nature which ſhew they muſt be taken away by the uſe of their contraries, as
    - The diſeaſe, the Indication being drawne from theſe
      - The greatneſſe
      - The complication or commixtion with others ſo
        - In implicite, or mixed diſeaſes we may draw Indications from theſe 3. heades,
          - From that which is moſt urgent
          - From the cauſe
          - and
          - From that, without which the diſeaſe can not be taken away
            - ſuch are
              - Bitterneſſe of paine, a defluxion into a part, a Varix, or bigge ſwollen veine, a diſtemperature if they be joyned with a diſeaſe.
    - Cauſe of the diſeaſe
    - Symptomes
      - which two oftē indicate & require medicines contrary to the diſeaſe.

Chap. XXIII.

Of certaine wonderfull and extravagant wayes of Curing diſeaſes.

AS Monſters ſometimes happen in nature, ſo alſo in diſeaſes, and in the events and cures of diſeaſes. I underſtand by monſters certaine marvellous ſucceſſes in diſeaſes, or certaine wayes of curing them, which ſwarve from Arte, and happen beſides reaſon, nature, and common uſe.

Monſtrous diſeaſes.

Alexander ab Alexandro, and *Peter Gilius* tell, that in Apulia a part of Italy, they have a certaine kind of Spider very frequent, the natives call it *Tarentula*, *Petrus Rhodius* calls it *Phalangium*; The Inhabitants finde theſe Spiders in the firſt heate of Summer ſo venenate and deadly, that whomſoever they touch with their virulent biting, he preſently, without he have ſpeedy remedy, deprived of all ſenſe and motion falls downe, or certainely if he eſcape the danger of death, he leades the remnant of his life in madneſſe. Experience hath found a remedy by Muſicke for this ſo ſpeedy and deadly a diſeaſe; Wherefore as ſoone as they can they fetch Fidlers and Pipers of divers kinds, who by playing and piping may make Muſicke, at the hearing whereof, he which was fallen downe by reaſon of the venemous bite, riſes cheerfully and dances ſo long to their meaſures and tunes, untill by the painfull & continued ſhaking and agitation of the whole body, all the malignity is diſſipated by tranſpiration and ſweates.

The wonderfull force of the bite of a certaine Spider.

Muſicke the remidy thereof.

Alexander adds that it happened once in his ſight, that the Muſitions their winde & hands failing them ceaſed playing, and then the Danſer preſently fell downe as if hee had beene dead; But by and by the Muſicke beginning anew, he riſe up againe and continued his danſing till the perfect diſſipation of the venome. And that it hath happened beſides, that one not ſo perfectly healed, certaine reliques of the diſeaſe yet remaining, when a long time after he heard by chance a noiſe of Muſitions, he preſently fell a leaping and danſing, neither could he be made to leave before he was perfectly cured.

Some affirme according to the opinion of *Aſclepiades*, that ſuch as are Franticke are much helped with a ſweet and Muſicall harmony. *Theophraſtus* and *Aulus Gellius* ſay that the paine of the Goute and Sciatica are taken away by Muſicke. And the Sacred Scripture teſtifies, that *David* was wont by the ſweet ſound of the Harpe to refreſh and eaſe King *Saul* when he was miſerablely tormented by his evill ſpirit. *Herodotus* in *Clio* tells, that *Cræſus* the King of Lydia had a Sonne, which of a long time could not ſpeake, and when hee came to mans eſtate was accounted dumbe: but when an Enemie with his drawne ſword invaded his father (overcome in a great fight, and the City being take in which hee was) not knowing that hee was the King, the young man opened his mouth endeavoring to cry out, and with that ſtriving and forcing of the Spirit hee broke the bonds and hinderances of his tongue, and ſpoke plainely and Articulately, crying out to the Enemie that hee ſhould not kill King *Cræſus*. So both the Enemie withheld his ſword, and the King had his life, and his Sonne had his ſpeech alwayes after. *Plutarch* in his booke, Of the benefit to be received from our Enemies, tells that a Theſſalian called *Proteus*, had a certaine inveterate and incurable ulcer in a certaine part of his body, which could not be healed, before hee received a wound in a conflict in the ſame place, and by that meanes the cure being begun afreſh, the wound and ulcer were both healed.

Muſicke gives eaſe to paine.

A ſtrong perturbation of the minde helps by moving the ſpirits.

Quintus Fabius Maximus, as *Livye* writes, was long and very ſicke of a quartaine Ague, neither could have wiſhed ſucceſſe from medicines adminiſtred according to Arte, untill skirmiſhing with the *Allobroges* hee ſhaked off his old feaveriſh heate, by a new heate and ardent deſire of fighting. It was crediblely reported to me of late by a Gentleman of the Lord of *Lanſackes* Chamber, that there was a French Gentleman in Polonia who was greivouſly tormented with a quartaine

Chance ſometimes exceeds Arte.

Feaver, who on a time walking upon the banke of the River Wixell to take away the irkeſomeneſſe of his fit, was thruſt in jeaſt into the River by a friend of his that met him by chance, by which (although hee could ſwim, as hee alſo knew that thruſt him in) hee conceived ſo great feare, that the Quartaine never troubled him after. King *Henry* the ſecond commanded me to goe from the Campe at Amiens to the City Dorlan, that I might cure thoſe that were hurt in the conflict with the Spaniards, the Captaine *S. Arbin* although at that time he had a fit of a quartaine ague, yet would hee be preſent at the fight, in which being ſhott through the ſide of his necke with a Bullet, hee was ſtrucken with ſuch a terror of death, that the heate of the Feaver was aſſwaged by the cold feare, and he afterwards lived freed from his Ague.

Obſervat. 4. lib. 2.

Franciſcus Valleriola the famous Phyſition of Arles, tells that *John Berlam* his fellow Citizen troubled with a Palſey of one ſide of his body for many yeares, his houſe taking fire, and the flame comming neere the bed in which he lay, he ſtrucken with a great feare, ſuddenly raiſed himſelfe with all the force hee had, and preſently recovering the ſtrength of his body, leapes out at the window from the top of the houſe, and was preſently cured of his diſeaſe, ſenſe and motion being reſtored to the part, ſo that afterward hee went upright without any ſenſe of paine, who lay unmoveable for many yeares before. Hee tells the like in the ſame place of his coſen *John Sobiratius*; hee was a long time lame at Auignion, by reaſon that the nerves of his hams were ſhrunke and drawne up ſo that hee could not goe; being moved with a vehement and ſuddaine paſſion of anger againſt one of his ſervants whom hee endevored to beate, hee ſo ſtirred his body that forthwith the Nerves of his hams being diſtended, and his knees made plyant hee began to goe and ſtand upright without any ſenſe of paine, when hee had beene crooked about the ſpace of ſix yeares before, and all his life after he remained ſound.

Cap. ult. lib. de cur. rat. per ſanguinis miſſ.

Galen tells hee was once fetched to ſtanch the bleeding; for one who had an Artery cut nere his ancle, and that by his meanes hee was cured without any danger of an *Aneuriſma* (*i*) a relaxation of a veinous veſſell; and beſides by that accidentall wound hee was freed from moſt greivous paine of his hippe, with which he was tormented for foure yeares before: but although this eaſing of the paine of the Sciatica happened according to reaſon by the evacuation of the conjunct matter, by the artery of the anckle of the ſame ſide being opened; yet becauſe it was not cut for this purpoſe, but happened onely by chance, I judged it was not much diſſenting from this argument.

Galen by a dreame cures the Sciatica.

Pliny writes that there was one named *Phalereus*, which caſting up blood at his mouth, and at the length medicines nothing availing, being weary of his life, went unarmed in the front of the battell againſt the enemy, and there receiving a wound in his breaſt, ſhed a great quantity of blood, which gave an end to his ſpitting of blood, the wound being healed, and the veine which could not containe the blood being condenſate.

At Paris *Anno* 1572. in *Iuly* a certaine Gentleman being of a modeſt and courteous cariage fell into a continuall Feaver, and by that meanes became Franticke, moved with the violence of which hee caſt himſelfe headlong out of a window two ſtoryes high, and fell firſt upon the ſhoulder of *Vaterra* the Duke of Alenzons Phyſition, and then upon the pavement; with which fall hee cruelly bruized his ribbs and hippe, but was reſtored to his former judgment and reaſon. There were preſent with the Patient beſides *Valterra*, witneſſes of this accident theſe Phyſitions, *Alexis*, *Magnus*, *Duretus*, and *Martinus*. The ſame hapened in the like diſeaſe, and by the like chance to a certaine Gaſcoyne lying at the houſe of *Agrippa* in the Paved ſtreete.

Othomannus Doctor of Phyſicke of Mompelier and the Kings profeſſor, told me that a certaine Carpenter at Broquer a village in Switzerland, being franticke caſt himſelfe headlong out of an high window into a river, and being taken out of the water was preſently reſtored to his underſtanding.

But if we may convert caſualties into counſell and Arte, I would not caſt the

Patient headlong out of a window. But would rather caſt them ſodainely and thinking of no ſuch thing into a great ceſterne filled with cold water, with their heads foremoſt, neither would I take them out untill they had drunke a good quantitie of water, that by that ſodaine fall and ſtrong feare, the matter cauſing the Frenzy might be carryed from above downewards, from the noble parts to the ignoble; the poſſibility of which is manifeſt by the forerecited examples, as alſo by the example of ſuch as bit by a mad Dogge, fearing the water are often ducked into it to cure them.

The cauſe of the laſt recited cures,

Chap. XXIIII.

Of Certaine jugling and deceiptfull wayes of Curing.

HEre I determine to treat of thoſe Impoſtors, who taking upon them the perſon of a Chirurgion, doe by any meanes either right or wrong put themſelves upon the workes of the Arte; but they principally boaſt themſelves amongſt the ignorant common ſort, of ſetting bones which are out of joynt and broken, affirming as falſly as impudently that they have the knowledge of thoſe things from their Anceſtors; as by a certaine hereditary right; which is a moſt ridiculous fiction; for our mindes when we are borne, is as a ſmoth table, upon which nothing is painted. Otherwiſe what need wee take ſuch labour and paines to acquire and exerciſe ſciences? God hath endued all brute beaſts with an inbred knowledge of certaine things neceſſary for to preſerve their life, more than man.

Sciences are not hereditary

But on the contrary hee hath enriched him with a wit furniſhed with incredible celerity and judgment, by whoſe diligent and laborious agitation he ſubjects all things to his knowledge. For it is no more likely, that any man ſhould have skill in Chirurgery becauſe his father was a Chirurgeon, than that one who never endured ſweat, duſt nor Sunne in the field, ſhould know how to ride and governe a great horſe, and know how to carry away the credite in tilting, onely becauſe hee was begot by a Gentleman and one famous in the Arte of Warre.

There is another ſort of Impoſtors farre more pernitious and leſſe ſufferable, boldly and inſolently promiſing to reſtore to their proper unity and ſeate, bones which are broken and out of joynt, by the onely murmuring of ſome conceited charmes, ſo that they may but have the Patients name and his girdle. In which thing I cannot ſufficiently admire the idleneſſe of our Country-men ſo eaſily crediting ſo great and pernitious an error; not obſerving the inviolable law of the ancient Phyſitions, and principally of Divine *Hippocrates*, by which it is determined, that three things are neceſſary to the ſetting of bones diſlocated and out of joynt; to draw the bones aſunder; to hold the bone receiving, firmely immoveable with a ſtrong and ſteddy hand; to put the bone to be received into the cavity of the receiving. For which purpoſe the diligence of the Ancients hath invented ſo many engines, Gloſſocomies and bands, leſt that the hand ſhould not be ſufficient for that laborious worke; What therefore is the madneſſe of ſuch Impoſtures to undertake to doe that by words, which can ſcarſe be done by the ſtrong hands of ſo many Servants, and by many artificiall engines?

A moſt impudent ſort of Impoſtors,

Three things neceſſary for the cure of a Luxation,

Of late yeares another kind of Impoſture hath ſprung up in Germany, they beate into fine powder a ſtone within there mother tongue they call *Bembruch*, and give it in drinke, to any who have a bone broken, or diſlocated, and affirme that it is ſufficient to cure them. Through the ſame Germanie there wander other Impoſtors who bid to bring to them the Weapons with which any is hurt; they lay it up in a ſecret place and free from noiſe, and put and apply medicines to it, as if they had the patient to dreſſe, and in the meane time they ſuffer him to go about his buſines, & impudently affirme that the wound heales by litle and litle by reaſon of the medicine applyed to the weapon,

But it is not likely that a thing inanimate which is deſtitute of all manner of ſence, ſhould feele the effect of any medicine; and leſſe probable by much, that the wounded party ſhould receive any benefit from thence. Neither if any ſhould let mee ſee the truth of ſuch jugling by the events themſelves and my owne eyes, would I therefore beleeve that it were done naturally and by reaſon, but rather by charmes and Magicke.

In the laſt aſſault of the Caſtle of *Hiſdin* the Lord of *Martigues* the elder was ſhot through the breaſt with a Musket bullet. I had him in cure together with the Phyſitions, and Chirurgions of the Emperoure *Charles* the fift and *Emanuel Philibert* the Duke of Savoy, who becauſe hee entirely loved the wounded priſoner, cauſed an aſſembly of Phyſitions and Chirurgions to conſult of the beſt meanes for his cure. They all were of one opinion, that the wound was deadly and incureable, becauſe it paſſed through the midſt of his lungs, and beſides had caſt forth a great quantity of knotted blood into the hollowneſſe of his breſt.

There was found at that time a certaine Spaniard, a notable Knave, and one of thoſe Impoſtors who would pawne his life, that hee would make him ſound; wherefore this Honorable Perſonage being in this deſperate caſe was committed to his care. Firſt of all hee bid they ſhould give him the Patients ſhirte, which hee tore into ſhreds and peeces, which preſently framing into a Croſſe, hee laid upon the wounds whiſpering ſome conceived or coined words, with a low murmure. For all other things hee wiſhed the Patient to reſt content, and to uſe what diet hee pleaſed, for hee would doe that for him, which truely, he did. For hee eate nothing but a few Prunes, and drunke nothing but ſmall beere, yet for all this the wounded Prince died within two dayes; the Spaniard ſlipt away, and ſo ſcaped hanging. And whileſt I opened the body in the ſight of the Phyſitions and Chirurgions to embalme him, the ſignes and accidents of the wound did evidently and plainly appeare to be as we had pronounced before.

What wounds may be cured onely by lint, or by tents and water.

And there be alſo other Iugling companions of this tribe, who promiſe to cure all wounds with linte, or Tents either dry, or macerated in oyle, or water, and bound to the wound, having murmured over ſome charme or other, who have had ſometimes, good ſucceſſe, as I can witneſſe. But the wounds upon which triall was made were ſimple ones, which onely required union, or cloſing for to perfect the cure. So verily the bones of beaſts when they be broke, grow together by the onely benefit of Nature. But when the affect ſhall be compound by diverſity of Symptomes, as a wound with an ulcer, inflammation, contuſion and fracture of a bone, you muſt hope for no other from Tents or Lints, nor charmes than death. Therefore the common ſort who commit themſelves to theſe Impoſtors to be cured, doe not onely injure themſelves, but alſo hurt the Common-wealth, and the common profit of the Citizens; for whoſe good and juſtice ſake a prudent Magiſtrate ought to deprive impoſtors of all freedome in a free and Chriſtian common-weale.

Witches, Conjurers, Diviners, Soothſayers, Magitians and ſuch like, boaſt of curing many diſeaſes; but if they doe or performe any thing in this kind, they doe it all by ſlights, ſubtilties and forbidden Arts, as Charmes, conjurations, Witcheries, Characters, Knots, Magicall Ligatures, Rings, Images, Poyſons, laces tyed acroſſe, and other damnable trickes, with which they pollute, pervert and defame the prime and ſacred Arte of Phyſick & that with the danger of mens lives. Who certainly are to be baniſhed by the lawes of our country, eſpecially ſeeing it is decreed in *Moſes* Law. *Let none be found among you that uſeth witchcraft*, or a regarder of times, or a marker of the flying of Fowles, or a Sorcerer or a Charmer, or that counſelleth with Spirits, or a Soothſayer, or that asketh counſell at the dead; for all that doe ſuch things, are abomination to the Lord, and becauſe of theſe abominations the Lord thy God doth caſt them out before thee. But the Miracles of our

Deuteron. 18.

our Lord Ieſus Chriſt the Sonne of God, and of his Saints and Apoſtles in curing diſeaſes beyond nature and all Arte, are of another kind, which we ought to beleeve ſo firmely and conſtantly, that it ſhould be counted an impiety for a Chriſtian to doubt of them. All holy writings are full of theſe, as to give ſight to the blinde, hearing to the deafe, power to goe to thoſe ſicke of the Palſey, to drive forth Devills, to cure the Leproſy, to give fruitfullneſſe to weomen, to raiſe the Dead, and performe by the holy Ghoſt other Miracles which exceed the condition and law of Nature; whom here we earneſtly intreat to free and protect us from uncleane Divels and the ſpirits of diabolicall deceit, and to give us the minde that we may will and be able alwayes to aſpire to Heaven and faſten the hope, ſafety and anchor of all our fortunes in God alone. Amen.

The End of the firſt Booke.

⁂

THE SECOND BOOKE OF LIVING CREATVRES, AND OF THE EXCELLENCY Of Man.

The difference of brute beaſts.

BEfore I come to ſpeake of the Anatomie of mans body; I have thought fit to ſay a little of the nature of brute Beaſts. There is betweene beaſts a great deale of difference by nature; for of theſe, ſome are hardy and bold, others fearefull; ſome wilde and ſavage, others tame; ſome walking in heards, others wandring alone; ſome covered and defended with ſhels and ſcales, as the Crocodile, the Tortois and many kinds of fiſh, others have ſtings and prickles.

The Horſe hath his hard and ſtrong hoofes, his creſt (as being a generous beaſt) beſet with a thicke and harſh mane, The defence of the magnanimous Lion, are his teeth, his crooked pawes and taile; Bulls are formidable by their hornes; the Boare by his tuskes ſtanding out, as it were naturall hunting ſpeares. The Hare being a timerous creature, is naked and unarmed, but in recompence thereof nature hath made her nimble and ſwift of foot. For what the more noble and couragious beaſts have in armes, is ſupplied in the fearefull by nimbleneſſe and celerity. Infinite are the other endowments of brute beaſts, and ſuch as can hardly be imagined, or deſcribed. For if wee diligently ſearch into their nature, wee ſhall obſerve the impreſſions and ſhadowes of many vertues, as of magnanimitie, prudence, fortitude, clemency, and docillitie: for they entirely love one another, follow thoſe things that are good, ſhunne thoſe that are hurtfull, and gather and lay up in ſtore thoſe things that are neceſſary for life and food. Laſtly, they give undoubted preſages of the weather, and Aire. They have taught men many things, and are of a moſt exquiſite and quicke ſence; of rare Art in vocall muſicke, prdent and carefull for their young, and faithfull lovers of their native ſoile. They are religiouſly obſervant of the rights of friendſhip and chaſtitie. They have their weapons whereby they are prepared, both to invade, and to defend themſelves being invaded; they ſubmit themſelves to the diſcipline of man, practiſe and imitate his ſpeech, and mutually prattle and chant one to another. They have a kind of weale-puklicke amongſt themſelves, and know

Some ſhadow of vertue in beaſts.

know how to preſerve their preſent welfare, and to depell the contrary, being in this their owne Counſellors, and not tutored by man. Yea man is beholden to them for the knowledge of many wholeſome things. The conſideration of which bred ſo great a doubt amongſt the ancient Philoſophers, that it was a queſtion amongſt them, whether beaſts had uſe of reaſon, or no? Therefore alſo the wiſe *Salomon* ſends us for examples of parſimonie and diligence unto the Ant or Piſmire; and *Eſaias* in exprobration of the people of Iſrael for their ingratitude and rebellion againſt God, ſends them to the Oxe and Aſſe; for they doe not onely know, but reverence their Maiſters.

But from whence is the knowledge of theſe medicines, wherewith the Art of Phyſicke is ſo richly adorned, but from brute beaſts, as *Pliny* affirmeth. The infallible vertue of the herbe *Dictamnus*, in drawing darts out of the fleſh, was taught us by the Hart, who wounded with the Huntſmans darts or arrowes, by meanes hereof drawes out the weapons which remaines ſticking in her. Which is likewiſe practiſed by the Goates of Candie, as *Ariſtotle* writeth. The wonderfull effect which *Celandine* hath upon the ſight, was learnt by the practiſe of Swallowes, who have bin obſerved with it to have beſmeared, and ſo ſtrengthened the eyes of their young. Serpents rubbe their eyelids with fennell, and are thought by that meanes to quicken and reſtore the decaying ſight of their eyes. The Tortois doth defend & ſtrengthen her ſelfe againſt the biting of Vipers, by eating of ſavorie. Beares by eating of Piſmires, expell that poiſon that they have contracted by their uſe of Mandrakes. And for correction of that drowzineſſe and ſloth which growes upon them by their long ſleepe in their dens, they eate the herbe *Aron* (i) Cuckopint. But the Art they uſe in the entiſing and catching of Piſmires is very pretty; They goe ſoftly to the holes or hilles of the Piſmires, and there lay themſelves all their length upon the ground, as if they were dead, hanging out their tongue wet with their foame, which they draw not againe into their mouth, before they feele them full of Piſmires, which are intiſed by the ſweetneſſe of the foame: And having taken this as a purging medicine, they expell by the guts, thoſe ill humors wherewith they were offended. Wee ſee that Dogges give themſelves a vomit, by eating of a kinde of graſſe, which is from thence called Dogge-graſſe. Swine, when they finde themſelves ſicke, will hunt after ſmale or river lobſters. Stockdoves, Blackbirds, and Partridges, purge themſelves by bay leaves. Pigeons, Turtels, and all ſort of Pullen, diſburden themſelves of groſſe humors, by taking of Pellitory of the wall. The bird Ibis (being not much unlike the Storke) taught us the uſe of Cliſters. For when he finds himſelfe oppreſſed with a burden of hurtfull humors, he fills his bill with ſaltwater, and ſo purgeth himſelfe by that part, by which the belly is beſt diſcharged. The invention of the way of removing the Cataract of the eye, wee muſt yeeld unto the Goate, who by ſtriking by chance againſt the thorny buſhes, pulls off the Cataract which hinders the ſight, and covers the ball of the eye, and ſo recovers his ſight. The benefit of Phlebotomie, we owe unto the Hippotamus or River-horſe, being a kinde of Horſe, and the inhabitant of the river Nilus; who being a great devourer, when hee finds himſelfe ſurcharged with a great deale of bloud, doth by rubbing his thigh againſt the ſharpe ſands on the bankeſide, open a veine, whereby the ſuperfluous bloud is diſcharged, which he ſtoppeth likewiſe when it is fit, by rowling himſelfe in the thicke mudde. The Tortois having chanced to eate any of the fleſh of a Serpent, doth make *origanum* and marjerom her Antidote. The ancients found helpe from brute beaſts, even againſt the dreadfull and none-ſparing force of lightning; for they were of opinion that the wings of an Eagle were never ſtrucke with lightning, and therefore they put about their heads little wreathes of theſe feathers. They were perſwaded the ſame thing of the Seale, or Sea-calfe, and therefore were wont to encompaſſe their bodies with his ſkinne, as a moſt certaine ſafegard againſt lightning. It were a thing too long, and laborious, to ſpeake of all thoſe other muniments of life and health (obſerved here and there by *Ariſtotle* and *Plinie*) which we have learnt of brute beaſts. I will therefore end this Chapter, after that I have firſt added this; That we are beholding to beaſts not onely for the skill of curing diſeaſes, and of preſervation of health, but for our foode, our raiment, and the ornament and beautifying the bodies.

Lib.8.cap.27.

The craftineſſe of Beares.

The bird Ibis the firſt inventer, or ſhewer of Clyſters.

The invention of removing a Cataract.

The invention of Phlebotomie.

A preſervative againſt thunder.

Of

Of the Faculty of brute Beaſts in Preſaging.

The firſt knowledge and skill of Prognoſtication, and obſervation of weather by the Aire, was firſt delivered unto us from beaſts of the land and water, and from fowle. For we ſee in daily obſervation, that it is a ſigne of change of weather, when Lambes and Rammes doe butt at one another with their hornes, and playing wantonly doe kicke, and keepe up their heeles. The ſame is thought to bee preſaged when the Oxe lickes himſelfe againſt the haire, and on the ſodaine fills the Aire with his lowing, and ſmells to the ground, and when he feedes more greedily than he uſed to doe. But if the Piſmires in great multitudes fetch their prey ſo haſtily, that they runne and tumble one upon another in their narrow pathes, it is thought a ſigne of raine; As is alſo the buſie working of Moales, and the Cats rubbing and ſtroaking of her head and necke, and above her eares, with the bottome of her feete. Alſo when Fiſhes play and leape a little above the water, it is taken for a ſigne of raine. But if the Dolphins doe the ſame in the ſea, and in great companies, it is thought to preſage a ſodaine ſtorme and tempeſt. Whereby the Marriners forewarned, uſe all care poſſible for the ſafetie of themſelves and their ſhippes, and if they can, caſt Anchor. And it is ſufficiently knowne what the louder croaking of Frogges than ordinary portends.

What the butting of Rams ſignifies.

Preſages of raine.

The ſigne at ſea of a ſtorme at hand.

But the facultie of birds in this kinde of preſaging is wonderfull. If Cranes flie through the aire without noiſe, it is a ſigne of faire weather, and of the contrary, if they make a great noiſe and flie ſtragglingly. As alſo if Sea-fowle flie farre from the ſea, and light on the land. The crie or ſcritching of Owles portends a change of the preſent weather, whether foule or faire. *Plutarch* ſaith, that the loude cawing of the Crow betokens windes and ſhowres, as alſo when he flappes his ſide with his wings. Geeſe, and Duckes, when they dive much, and order, and prune, and picke their feathers with their beakes, and crie to one another, foretell raine; and in like manner Swallowes when they flie ſo low about the water, that they wet themſelves, and their winges. And the Wren, when he is obſerved to ſing more ſweetly than uſuall, and to hop up and downe. And the Cocke when he chants, or rather crowes preſently after the ſetting of the Sunne. And Gnats, and Fleas, when they bite more than ordinary. If the Herne ſoare aloft into the aire, it betokeneth faire weather, if on the contrary he flie cloſe by the water, raine. If Pidgeons come late home to the Dove-houſe, it is a ſigne of raine. If Bats flie in the evening, they foreſhew wet weather. And laſtly, the Crocodile layes his egges in that place, which muſt be the bounds of the overflowing of the river Nilus; And therefore he that firſt meetes with theſe egges, tels the reſt of the countrie people, and ſhewes them how high the floud will riſe, and what inundation it will make upon their grounds. A thing moſt worthy of admiration, that in this monſter, there ſhould be that ſtrong facultie of preſaging.

The Crocodile by laying her egges, ſhewes the bounds of the increaſe of the river Nilus.

Of the Induſtry of Fiſhes.

Many ſea-Fiſhes, when they feele a tempeſt comming, doe gravell or balaſt themſelves, to the end they may not be toſſed up and downe at the pleaſure of the waves. Others when the fury of the ſea is at the hight, hide themſelves in the holes of rockes. But in that they ſwim againſt the ſtreame, they doe it, for this cauſe and reaſon, that the force of the ſtreame, and the floud may not take from them, and ſtrike off their ſcales, and that their gills may not fill with water which would hinder their ſwimming, and intercept their reſpiration. As by the ſame adviſe Cranes flie againſt the winde, whereas if they ſhould flie downe the winde, their feathers would be diſplaced and broken, and they would not be able to flie.

How Fiſhes provide for their ſafetie againſt a ſtorme.

How they ſwimme againſt the ſtreame.

Of the induſtry of Birds in the building of their neaſts.

Of what things birds build their neaſts.

In what ſhape.

With what care Sparrowes breed their young.

THe induſtrie of Birds in the building of their neaſts, is ſuch, that it doth farre exceede the art and skill of all Maſons, and Architects. From whence it is become a Proverbe, *That men know, and can doe all things but make Birds neaſts.* They are built within with wooll, and feathers, and ſuch kinde of ſoft things, which are as a kinde of a pallet for the young ones. Swallowes build their neaſts in a round forme, that they may be the more firme, and leſſe ſubject to be hurt by any thing that ſhall ſtrike againſt them; and likewiſe more capacious. They chuſe their matter out of dirt and chaffe (interlacing it with many ſtrawes) as it were their plaſter, or lime. Thoſe that build in trees, doe make choiſe of the ſoundeſt boughes, as if they meant to have them as a ſure foundation for the building which they ſhould erect thereon. The Cocke and the Henne doe by turnes ſit over their egges, and likewiſe fetch their meate, interchanging each others labour, neither doe they ever forſake their young, before they are able to get their owne living. I had at my houſe a great number of Sparrowes neaſts in earthen pots, And when the young ones begun to waxe pretty bigge, and to be covered with feathers, I made the whole neaſt be taken down, and ſet upon the ground, that I and my friends might delight our ſelves in beholding the care of the old ones in the feeding of their young; for they feede them every one in order, skipping none, neither will they (to the wrong of the reſt) give one two parts, although he gape, and be importunate for it.; dividing moſt juſtly to every one his owne ſhare, according to the exact rule of diſtribution. And often times for experiment, I would make triall with a ſtrange Sparrow of the ſame age, laid neere, or put among the reſt of the young ones, whether the old ones would feede the ſtranger, as if it were legitimate. But this as a ſtranger and a baſtard they would ſuffer to ſtarve, skipping it when it gaped after the meate. And in like manner Lambes and young Kiddes doe in the fields, in the midſt of a great flocke, runne every one to his owne damme, who being moſt certainely able to diſtinguiſh betweene the legitimate and a baſtard, will not ſuffer her ſelfe to be ſuckt but by her owne young.

Of the induſtry of Spiders.

How the Spiders weave

How they catch their prey.

THe Spider ſpinnes her web with wonderfull artifice, hanging and faſtening it to every tacke or ſtay that is nigh, drawing of his thread, and running upwards, and downewards, and every way. And although the diligence of the chamber maid beates downe, and marres this pendulous and new begunne worke, yet her ſeate and her hold, the Spider keepes ſtill, neither is ſhe, or will ſhe deſiſt from the worke ſhee hath begunne, but in a very ſhort time, weaves a great deale more unto the ruines of her former worke, than can bee unweaved againe with much labour. So that from hence all cloth and linnen Weavers, all imbroiderers, and workers with the needle, (you will eaſily thinke) have learnt their Arts, if either you obſerve the exactneſſe of the weaving, the fineneſſe of the thred, or the continuation and indiſſoluble knitting together of the whole web; for being abrupt and troubled with no ends of threds at all, it reſembles a thinne membrane, annointed with a kinde of glew, wherewith when the prey is entangled, the Spider runnes preſently in, and as it were drawes her nets, and infolds, and takes the captive after the manner of huntſmen. If this were not daily ſeene with our eyes, it would be thought fabulous.

Of Bees.

Bees chuſe themſelves a King.

I cannot paſſe in ſilence the great induſtry of Bees. For having eſtabliſhed a kinde of Weale-publique, they make election of a King, who is ſuch a one, as in proceritie of body, and excellencie of feature, exceedeth all the reſt. He is remakeable by his ſhort wings, his ſtraight legges, his grave gate, and in ſtead of a Diadem or regall Crowne, either he hath no ſting, or elſe doth not uſe it, which is the Artillery of the reſt. He never goeth unattended out of the hive, but alwaies invironed with a princely retinue, the reſt of his traine following after, neither goes he at any time abroad, but upon urgent affaires which concernes the whole ſtate. His progreſſe is forewarned by the voice and ſound of trumpets, and as it were with ſinging, and they all draw nigh. Every one gets as neere to his perſon as he can, and when he is weary with flying, they all beare him up with thir owne bodies.

Their pitching their tents.

Their obſequies for their dead King.

On what place ſoever he alighteth, there they forthwith pitch their tents. If hee chance to die, they goe not abroad to ſeede, but ſtand all mourning round about the corps; then carrie him out of the hive, and (as it were) follow his hearſe and bury him; and laſtly, having with ſolemnity performed all the funerall rites and obſequies, they chuſe themſelves another King, for without a King they cannot live. He then taketh care of all things, having his eye every where, whileſt that the reſt intend the performance of the worke. And ſuperviſing all, giveth them incouragement, and chaſtiſeth negligence. For their time of going forth for foode, they chuſe a cleare and faire day; for they have a naturall facultie of preſaging of the weather. They are ſuch obſervers of iuſtice and equitie, that never, either with their ſting, or by any other way, doe they moleſt any creature, neither doe they exerciſe and prepare their ſpeares againſt any, but for the ſafegard of themſelves and their hives.

Their iuſtice.

Of the care of Bees.

Their watch.

Their divers imployments.

THey manage and order their affaires in this manner, in the day time they appoint before their gates a ſtation of watchmen, and guarders. In the night, they reſt from their labours, ſo long, till that one (who is appointed to this charge) by one or two hummes, as by a ſound of a Trumpet, rowſeth all the reſt. Then come they together to obſerve what is the ſtate of the weather, which if they foreſee will bee faire, then abroad goe they into the fields, and paſtures. Some therefore bring into the hive little faſcicles of flowers on their thighes, others water in their mouth, and others a dewey moiſture gathered on their bodies. Theſe are met by others, who receive their burdens, which they diſpoſe in their due and proper places. Thoſe that are ſent out into the fields for foode, are the youngeſt and the ſmalleſt. And therefore if the winde chance to riſe any thing high, they expect untill it ceaſe, and that the force and violence thereof bee over. But if it continue violent, then doe they ballaſt themſelves with a little ſtone flying cloſe by the ground, to prevent their being driven too and fro by the force of the winde. They are exceeding diligent in all their buſineſſe, and doe puniſh the ſloth of the lazie oftentimes with death. Some of them are the builders, others poliſh the building, and the reſt bring in their materials.

They puniſh ſloth with baniſhment.

The building in their arched hives is with wonderfull artifice, being made with two doores, one to come in, and the other to goe out at. They have all things alike, leaſt that the inequalitie, either of their food or labour, ſhould give occaſion of diſſention. Their care is, that their houſes may ſhew both ſtate and handſomeneſſe. Idle droanes, borne for nothing but to eate, and conſume the fruits of their labours, they chaſe from their hives. Thoſe that chance to loſe their ſtings, are utterly diſabled, and in a ſhort time their guts come out that way, and they die. They bring to their owners wonderfull increaſe of wax and honey.

Ariſtomachus a diligent obſerver of Bees.

Ariſtomachus the Philoſopher doth boaſt, that for fiftie eight yeares together, hee had with great care beene a nouriſher of Bees, onely that he might the better attaine to the knowledge of their ſtate and condition.

Of Piſmires, and Ants.

NEither truly is the induſtry, diligence, and experience of the Piſmire leſſe worthy of admiration, than that of the Bees. Inſomuch as that *Salomon* bids the ſluggard to take an example of diligence from the Piſmire. Truly if experience did not witneſſe it, it would ſeeme incredible, that ſo ſmall a creature ſhould be able to ſtore up ſuch aboundance of corne, to diſpoſe and manage her affaires in that good

Lib.11.&.30

Wonderfull care.

order that we ſee ſhe doth. *Plinie* ſaith, that they have among them the forme of a well governed and well ordered common weale. For how pretty a ſight it is to ſee them, when they ſeize upon a graine which they have a minde to carrie away, how they ſet to it, and lift it with head and ſhoulders. And how leaſt the corne which they carrie to their ſtore-houſe, ſhould put forth and grow, they bite it at one end. If it be ſo bigge that they cannot carry it into their little hole, they divide it in the middle. If it be dampiſh, they lay it out to drie in the Sunne and open aire. When the Moone is at the full, they follow their worke in the night, when ſhee doth not ſhine, they take their reſt, whereby they ſhew themſelves to have ſome knowledge of heavenly things *Plinie* affirmeth that they have their ſet Faires and Markets, whither they come in great companies, and where they uſe to eſtabliſh leagues of amitie and friendſhip one with another. And when one markes them well, would hee not thinke that they were in conference one with another, and that they did diſcourſe among themſelves of their buſineſſe? Doe wee not ſee that the often trampling of their little feete doth weare a path even upon hard flint ſtones?

There is nothing but may be attained by diligence.

From whence wee may note, what in all kinde of things is the effect of aſſiduitie. They ſay alſo that they performe the rites of buriall one unto another, after the manner of men. What words ſhall I uſe (ſaith *Plutarch*) to expreſſe ſufficiently the diligence and induſtry of the Piſmires. There is not among all the great things in nature, a ſight of greater wonder than theſe. For in the Piſmires are ſeene the markes of all vertue. Their great meetings argue that they maintaine a kinde of friendſhip.

The formes of all vertues expreſt in Piſmires.

Their alacritie in the undergoing of their laboures, ſeemes to ſhew their fortitude and magnanimity; and laſtly, they are eminent examples of temperance, providence, and juſtice. Their mutuall charitie appeareth in this, that if one of them that is not loaden meets another (in one of their narrow paths) that is, hee will give him the way, that hee may the better goe on in his intended journey. They ſay that the firſt entrance into their hole, is not ſtraight, but full of many diverticles and crooked paths, which all end, which will bring you to three little cells; in one of which they have their conventicles, in the other they lay up their proviſions, and in the third they bury the carkaſſes of their dead. This doth *Plutarch* ſpeake concerning Piſmires.

Of Silke-Wormes.

WIth the induſtry of theſe creatures, I ſhall not unfitly joyne that of the Silkewormes, of whoſe paines and care, both in the making of their neaſts, and the ſpinning of their threed and bottomes (wherewith Kings are ſo magnificently adorned) Philoſophers have written very ſtrange things.

Diligence the mother of wealth.

And who can chuſe but wonder at thoſe great endowments of skill and knowledge, and that exceeding induſtry, (the mother of ſo much wealth) in the little body of ſo ſmall a creature? The providence therefore of God, doth not onely appeare in this, that hee hath adorned each creature with a peculiar and proper endowment, but in this eſpecially, that on the leaſt creatures of all, hee hath beſtowed the greater portion of skill, induſtry, and ingenuity to ſupply their defect of bodily ſtrength.

Of the love of Beaſts one towards another and to their young.

The induſtry of Partridge in preſerving their young.

PLutarch writeth; That all kinde of creatures beare a ſingular love, and have a kinde of care of thoſe thatt are generated of them, and the induſtry of the Partridges, this way is much commended; for during the time that their young ones are weake and unable to flie, they teach them to lie upon their backes, and to hide themſelves among the cloddes on the ground, that ſo being almoſt of the ſame colour, they may not be diſcerned by the Faulkoner. But if notwithſtanding, they ſee any body comming, and that hee is neere them, they doe with a hundred dodges and ſtoopings of themſelves, as if they were wearie with flying, entiſe him away from their young to follow after them, and when they have their purpoſe, they then, as if they had recovered ſome freſh ſtrength, fly quite away; who can but wonder at this both affection and ſubtilty?

Neither are thoſe things leſſe wonderfull that are reported of Hares, for when they would goe to their ſeate, they ſever their young, and commit them to the truſt of divers places, it may be two acres aſunder one from another, leaſt peradventure, a Huntſman, a dogge, or any man ſhould chance to come that way, and they might be in danger to be loſt at once. And then after they have traced up and downe, hither and thither, and every way that the dogges may not trace them, nor the Huntſman pricke them, they take a leape or two, and leape into their formes.

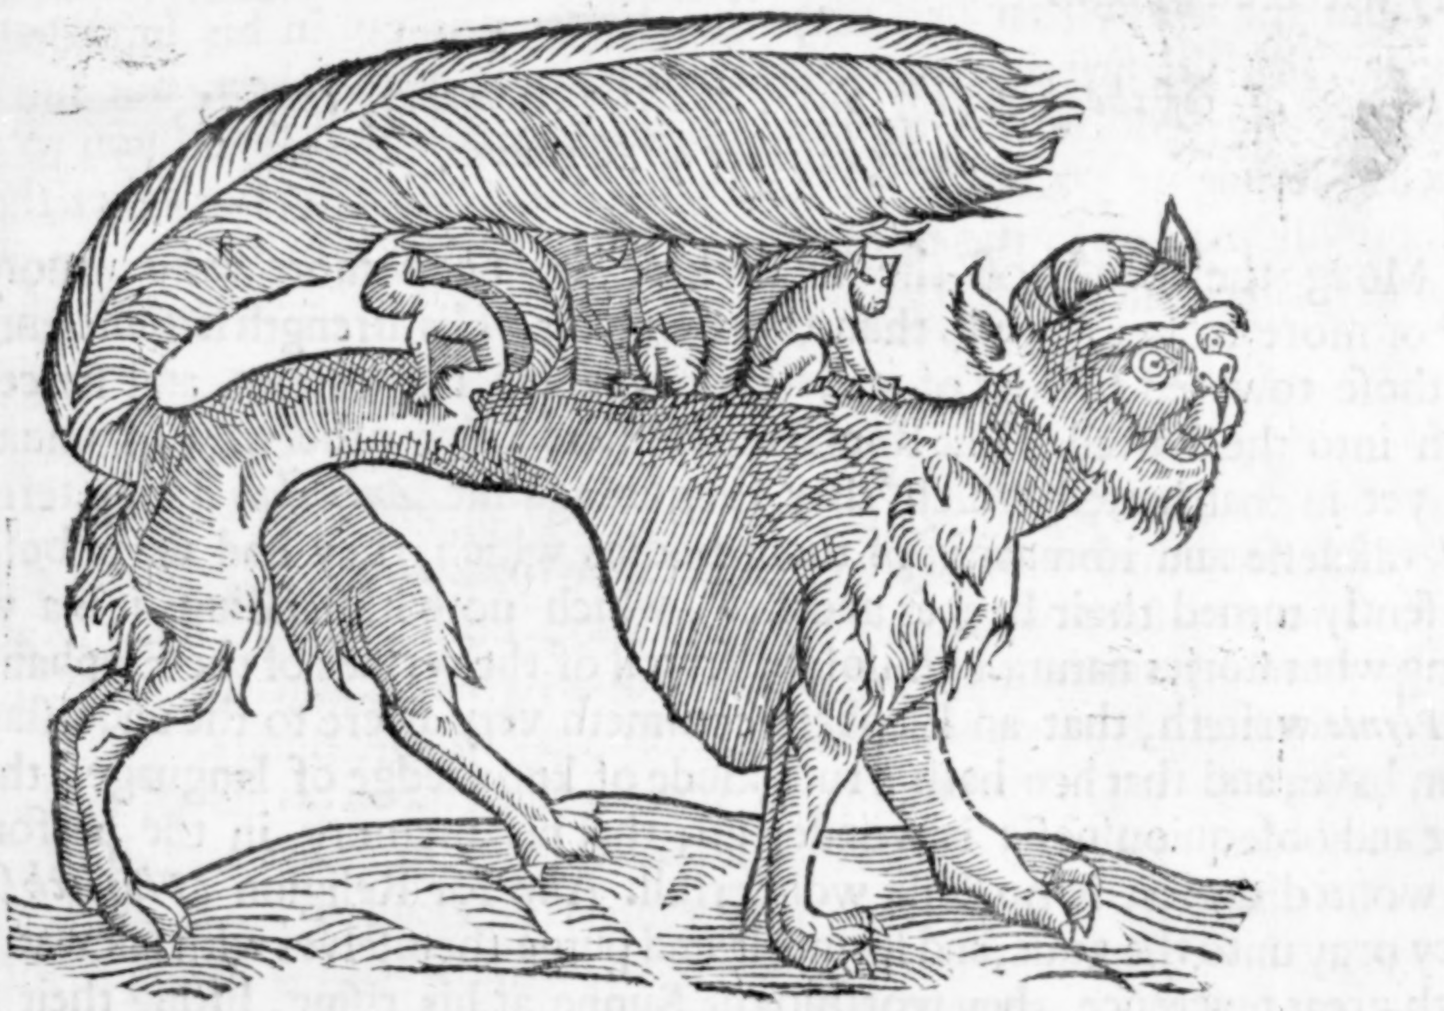
How Hares provide for themſelues and their young, for feare of hunters.

Nor inferior to this is the craft of the Hedghogge, for when the Foxe purſueth him, and is now at his heeles, hee rowles himſelfe up in his prickles like a cheſnut in the outward ſhell, ſo that every part being rounded and encompaſſed with theſe ſharpe and dangerous prickes, hee cannot be hurt. And ſo ſaves himſelfe by this tricke; for his young he provides in this manner.

In the time of Vintage he goes to the vines, and there with his feete hee ſtrikes off the boughs and the grapes, and then rowling his body makes them ſticke upon his prickles, and ſo doth as it were take his burthen upon his backe, and then returnes to his hole; you would thinke that the grapes did move of themſelves; the prey hee devides betweene himſelfe and his young.

The care of the Hedghogge to provide for her young.

In Florida part of the Weſt Indies they have a beaſt, which for the variety and deformitie of it I cannot paſſe over in ſilence; The natives call it Succarath, the Canibals, Su. It keepes for the moſt part about the rivers, and the ſea-ſhore, and lives by



prey. When hee perceiveth that hee is purſued by the Huntſman, hee gets his young ones upon his backe, and with his taile, which is very long and broad, he covereth them, and ſo flying, provideth both for his owne, and their ſafetie; neither can he be taken by any other way but by pits, which thoſe Savage men uſe to digge in the places neere which he is to runne, into which at unawares hee tumbles headlong. This Picture of him here, I drew out of *Thevets* Coſmographie.

Tom.2.lib.23 cap.1.

Of the affection of Birds, and of Dogges, towards their Maſters.

THe young Storke provides for the old which is diſabled by age, and if any one of their equalls come to any miſchance, that hee is not able to flie, they will give him their aſſiſtance, and beare him on their backes and wings. And therefore

The pietie of Storkes.

fore this affection and piety towards the old ones, and as it were brotherly love towards their equalls, is commended in the Storke.

The Henne in any kinde of danger gathers her chickins under her wings, and as it were with that guard, defends them as well as ſhee can. For their ſake ſhee expoſeth her ſelfe to the crueltie of the fierceſt beaſts, and will flie in the eyes of a dogge, a Wolfe or a Beare, that by chance offers to meddle with her chickins.

The fidelity of Dogges.

But who is there that doth not admire the fidelitie and love of dogges towards their Maſters, whereby they recompence them for their keeping? A dogge will never forſake his Maſter, no, if he be never ſo hardly uſed. For there is no man can finde a ſticke hard enough to drive that dogge cleane away from him which hath once taken a love to him. There is no kinde of creature that doth more certainely and readily remember his maſter, hee will know the voice of all the houſehold, and of thoſe which frequent the houſe. There cannot bee a truſtier keeper (as *Cicero* himſelfe ſaith) than a Dogge is; I ſpeake not of their faculty of ſmelling, whereby they follow their Maſters by the foote, and finde them, neither doe I ſpeake of thoſe infinite examples of the fidelity of Dogges, which were too long to rehearſe.

Doves free from adultery

Pidgeons, as well the Cocke as the Henne, although they are all very venereous, yet they know no adultery, yea and the Henne will beare with the frowardneſſe of the Cocke, neither will ſhe ever leave him, but reconciling him unto her by her officious diligence, bring him to his wonted dalliance and kiſſes, neither is the love of either of them leſſe towards their young.

Turtles never couple twiſe.

There is the like mutuall bond of love betweene Turtles, for if one of them die, the ſurviver never ſolicites Hymen more, neither will he ever chuſe other ſeate than a dry withered bough.

Of the ſtrength, piety, docilitie, clemency, chaſtity, and gratitude of Elephants.

AMong the beaſts of the field there is none more vaſte, more ſtrong, or more to bee feared, than the Elephant. His ſtrength is ſufficiently ſhowne by thoſe towered Caſtles of armed men, which hee carries, and fiercely ruſheth with into the battell. The Romane ſouldiers being otherwiſe of undaunted ſpirit, yet in that battell which they fought againſt *Antiochus* being terrified with the vaſtneſſe and immanity of theſe bodies which they had never before ſeene, preſently turned their backes and fled, which notwithſtanding, it is a wonderfull thing what ſtories naturall Philoſophers tell of the vertues of the Elephant.

Lib.8. cap.1.

Plinie writeth, that an Elephant commeth very neere to the underſtanding that men have, and that hee hath a rude kinde of knowledge of language; that his facilitie and obſequiouſneſſe is wonderfull, that his memory in the performance of his wonted duties, is no leſſe wonderfull. And for Religion (*Plutarch* ſaith) that they pray unto the gods, and ſprinckle and purge themſelves with ſalt water, and that with great reverence, they worſhip the Sunne at his riſing, lifting their trunkes up towards heaven, for want of hands. *Plinie* addeth, that they doe with the like reverence worſhip the Moone and the Starres. For it is related in the Hiſtories of the Arabians, that at a new Moone the Elephants goe by troupes downe unto the rivers, and there waſh themſelves with water, and being thus purged, kneele downe and worſhip the Moone, and then returne to the woodes, the eldeſt going firſt, and the other following after according to their age.

The religion of the Elephant.

Plutarch reporteth, that it happened once, that among the Elephants which were taught at Rome againſt the Panegyricke ſhewes, there was one that was ſomething dull, and not ſo docile as the reſt, which made him be deſpiſed by his fellowes, and often beaten by his maſter. But that this Elephant, that he might ſupply by diligence what he wanted in wit, was oftentimes obſerved in the night, by the light of the Moone, to be practiſing and conning what he had learnt of his Maiſter in the day time. For they were wont to bee taught to make letters, and alſo to preſent

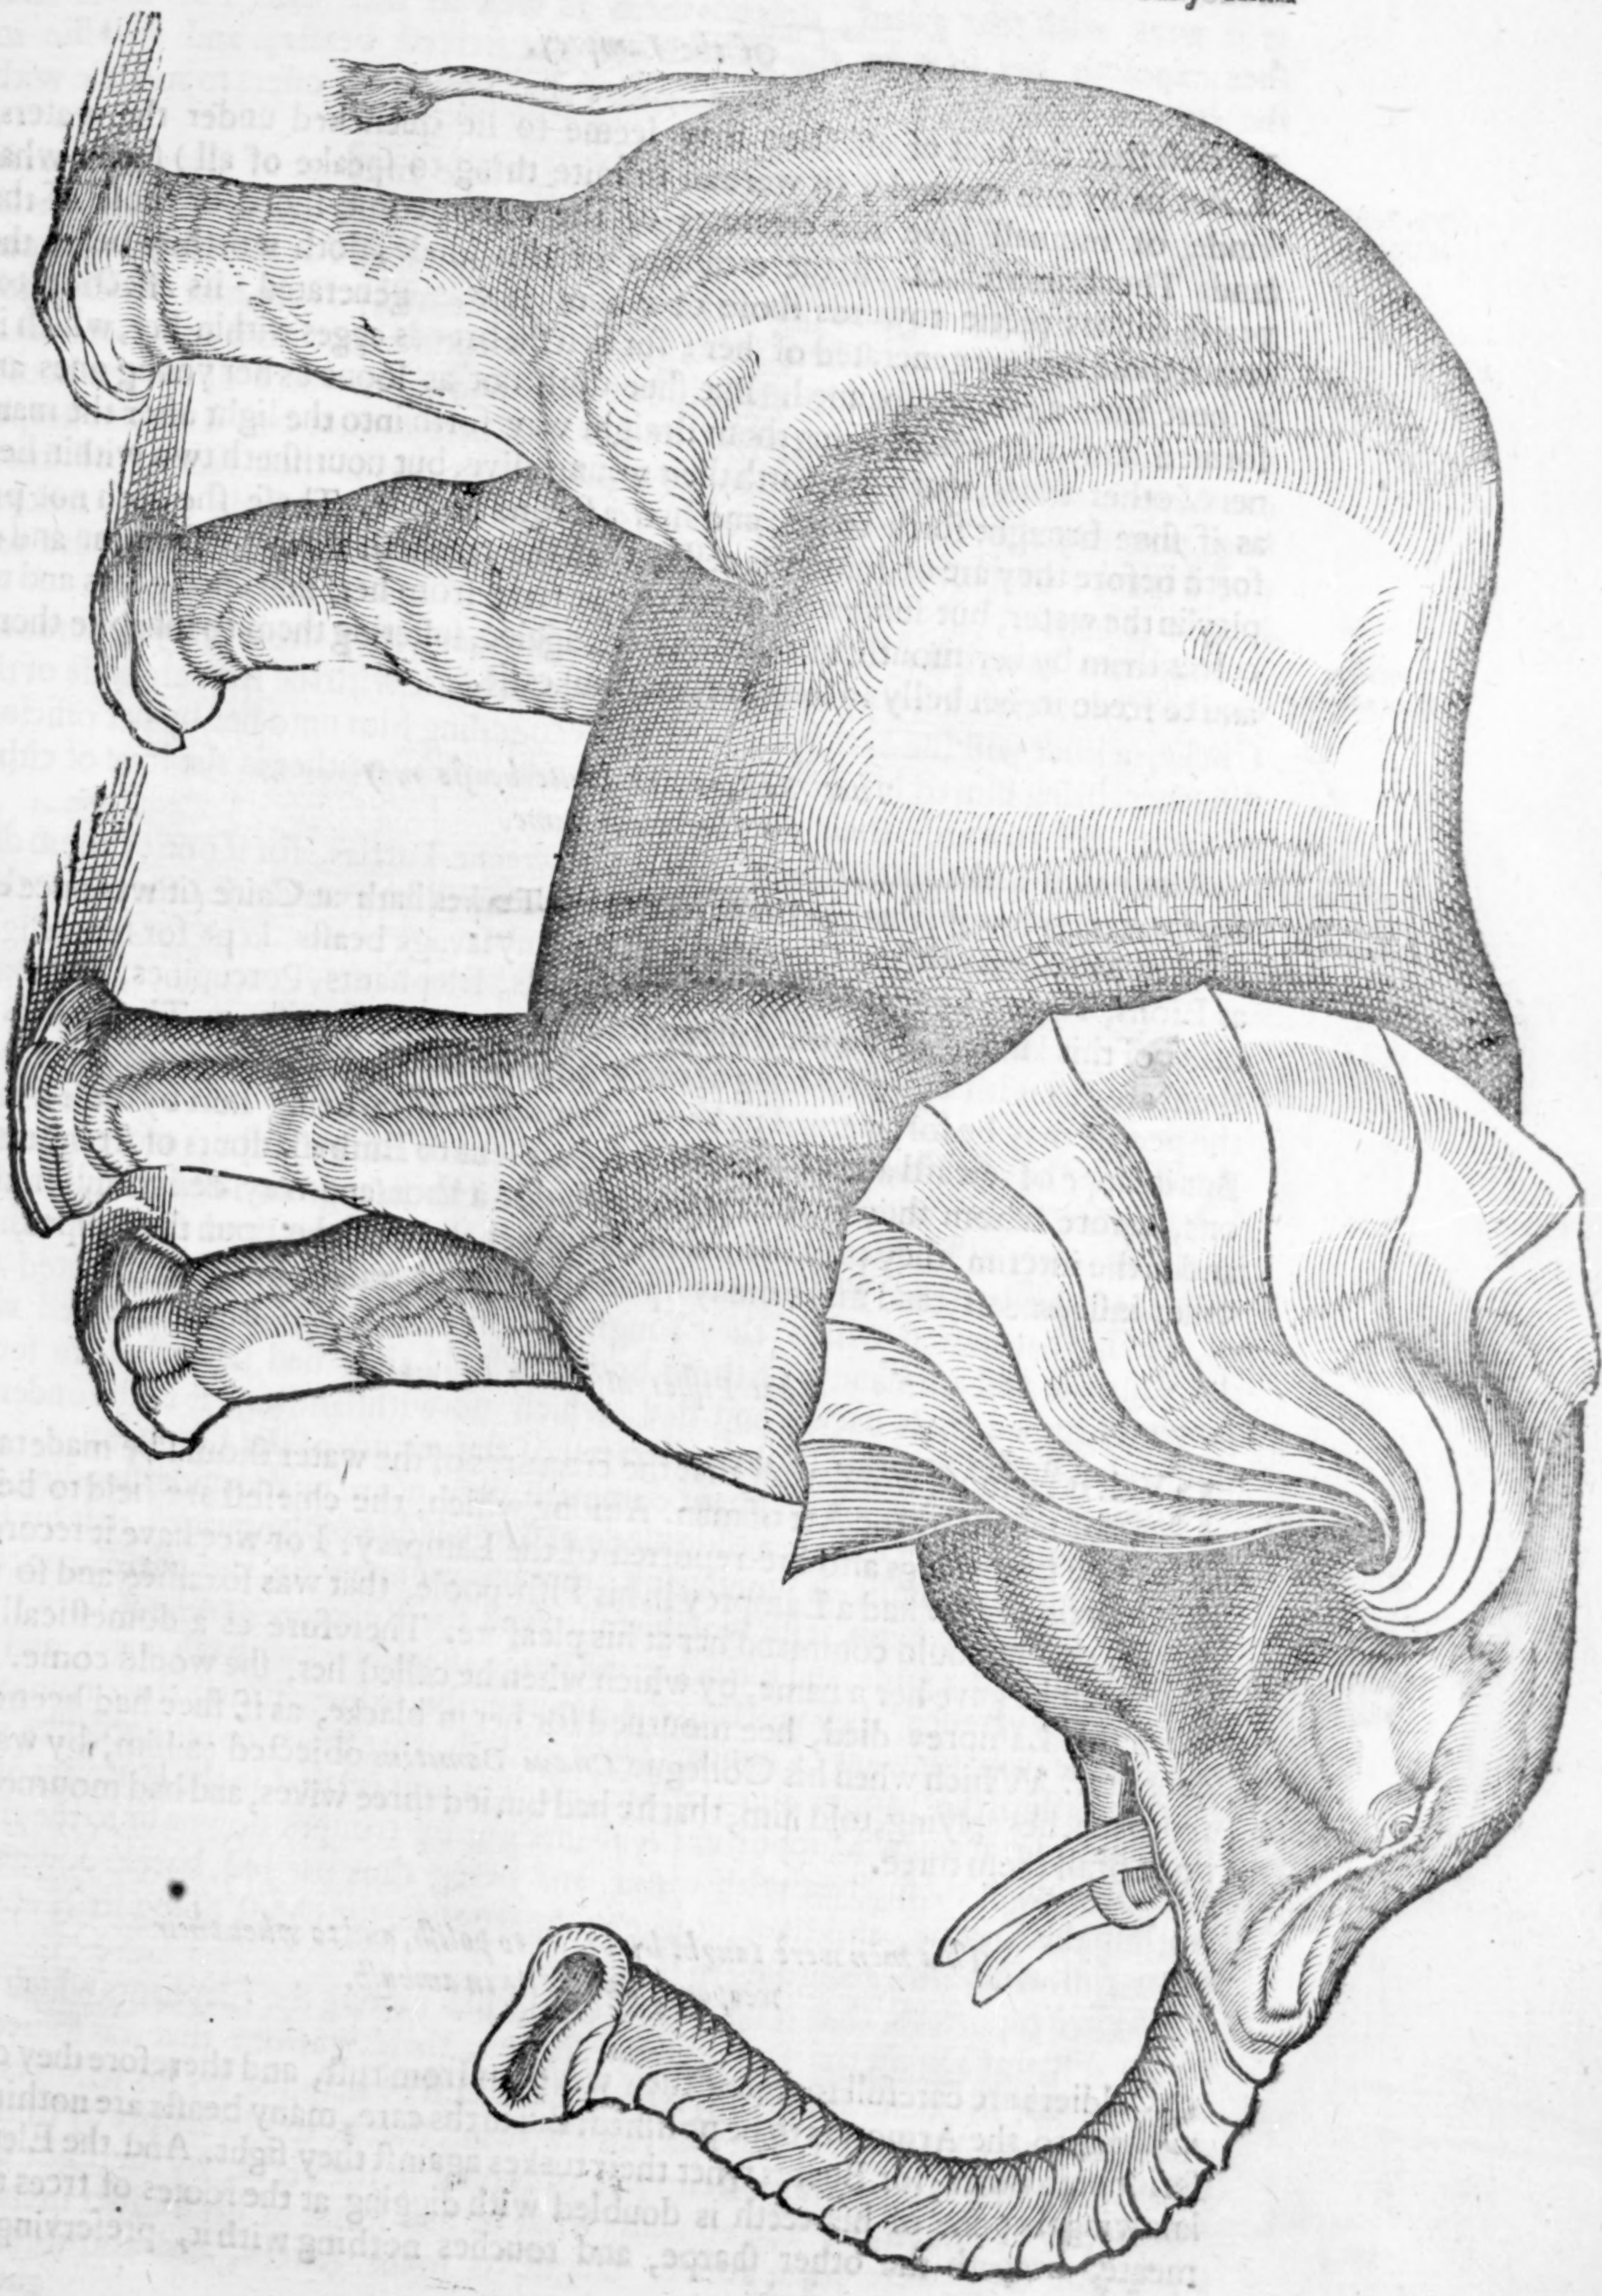
garlands to the ſpectators; and other ſuch like trickes. But they can never bee brought to goe aboord a ſhippe, to bee carried over the ſea into any ſtrange land, unleſſe their Maſter give them his word to aſſure them that they ſhall



returne againe to their owne native ſoile. They never hurt any one that doth not firſt provoke them. They never gender but in private out of ſight, an argument of their modeſtie.

Of the Lamprey.

LEaſt that the heat of affection may ſeeme to lie quenched under the waters, let us by one example, (it were an infinite thing to ſpeake of all) ſee in what kinde of mutuall love the creatures of the water come ſhort of thoſe of the land. The Lamprey of all the creatures of this kinde doth worthily beare the praiſe for its pietie towards thoſe of whom it was generated, its affection towards thoſe that are generated of her; for firſt ſhe breeds egges within her, which in a ſhort time after are ſpauned. But ſhee doth not as ſoone as her young ones are formed and procreated, bring them ſtraight way forth into the light after the manner of other fiſhes, that bring forth their young alive, but nouriſheth two within her, as if ſhee brought forth twice, and had a ſecond broode. Theſe ſhe doth not put forth before they are of ſome bigneſſe, then ſhe teacheth them to ſwimme and to play in the water, but ſuffers them not to goe farre from her, and anon gapes and receives them by her mouth into her bowells againe, ſuffering them to inhabite there, and to feede in her belly ſo long as ſhee thinkes fit.

That Savage, or brute beaſts may bee made tame.

Coſmograph. Tom.2.lib.19. cap 7. THevet reporteth, that the Emperour of the Turkes hath at Caire (it was once called Memphis) and at Conſtantinople, many ſavage beaſts kept for his delight, as Lions, Tigers, Leopards, Antilopes, Camels, Elephants, Porcupines, and many other of this kinde. Theſe they uſe to leade about the citie to ſhew. The maſters of them are girt with a girdle, hung about with little bells, that by noiſe of theſe bells the people may be forewarned to keepe themſelves from being hurt by theſe beaſts. But in hope of reward and of gifts, they ſhew them to Embaſſadours of ſtrange nations, before whom they make theſe beaſts doe a thouſand very delightfull trickes, and in the interim, they play their countrey tunes and muſicke upon their pipes, and other inſtruments, and make many ſports in hope of gaine.

That Fiſhes alſo may be tamed.

BVt it is far more wonderfull, that the creatures of the water ſhould be made tame, and be taught by the Art of man. Among which, the chiefeſt are held to be the Eele. The ſame things alſo are reported of the Lamprey. For wee have it recorded, that *Marcus Craſſus* had a Lamprey in his Fiſh-poole, that was ſo tame, and ſo well taught, that he could command her at his pleaſure. Therefore as a domeſticall and tame beaſt he gave her a name, by which when he called her, ſhe would come. And when this Lamprey died, hee mourned for her in blacke, as if ſhee had beene his daughter. Which when his Collegue, *Cnæus Domitius* objected to him, by way of reproach, he replying, told him, that he had buried three wives, and had mourned for none of all them three.

That men were taught by beaſts to poliſh, and to whet their weapons, and to lie in ambuſh.

SOuldiers are carefull to keepe their weapons from ruſt, and therefore they carrie them to the Armorers to be poliſhed. But in ths care, many beaſts are nothing inferior unto them; for Boares whet their tuskes againſt they fight. And the Elephant knowing that one of his teeth is doubled with digging at the rootes of trees to get meate, keepeth the other ſharpe, and touches nothing with it, preſerving it for his

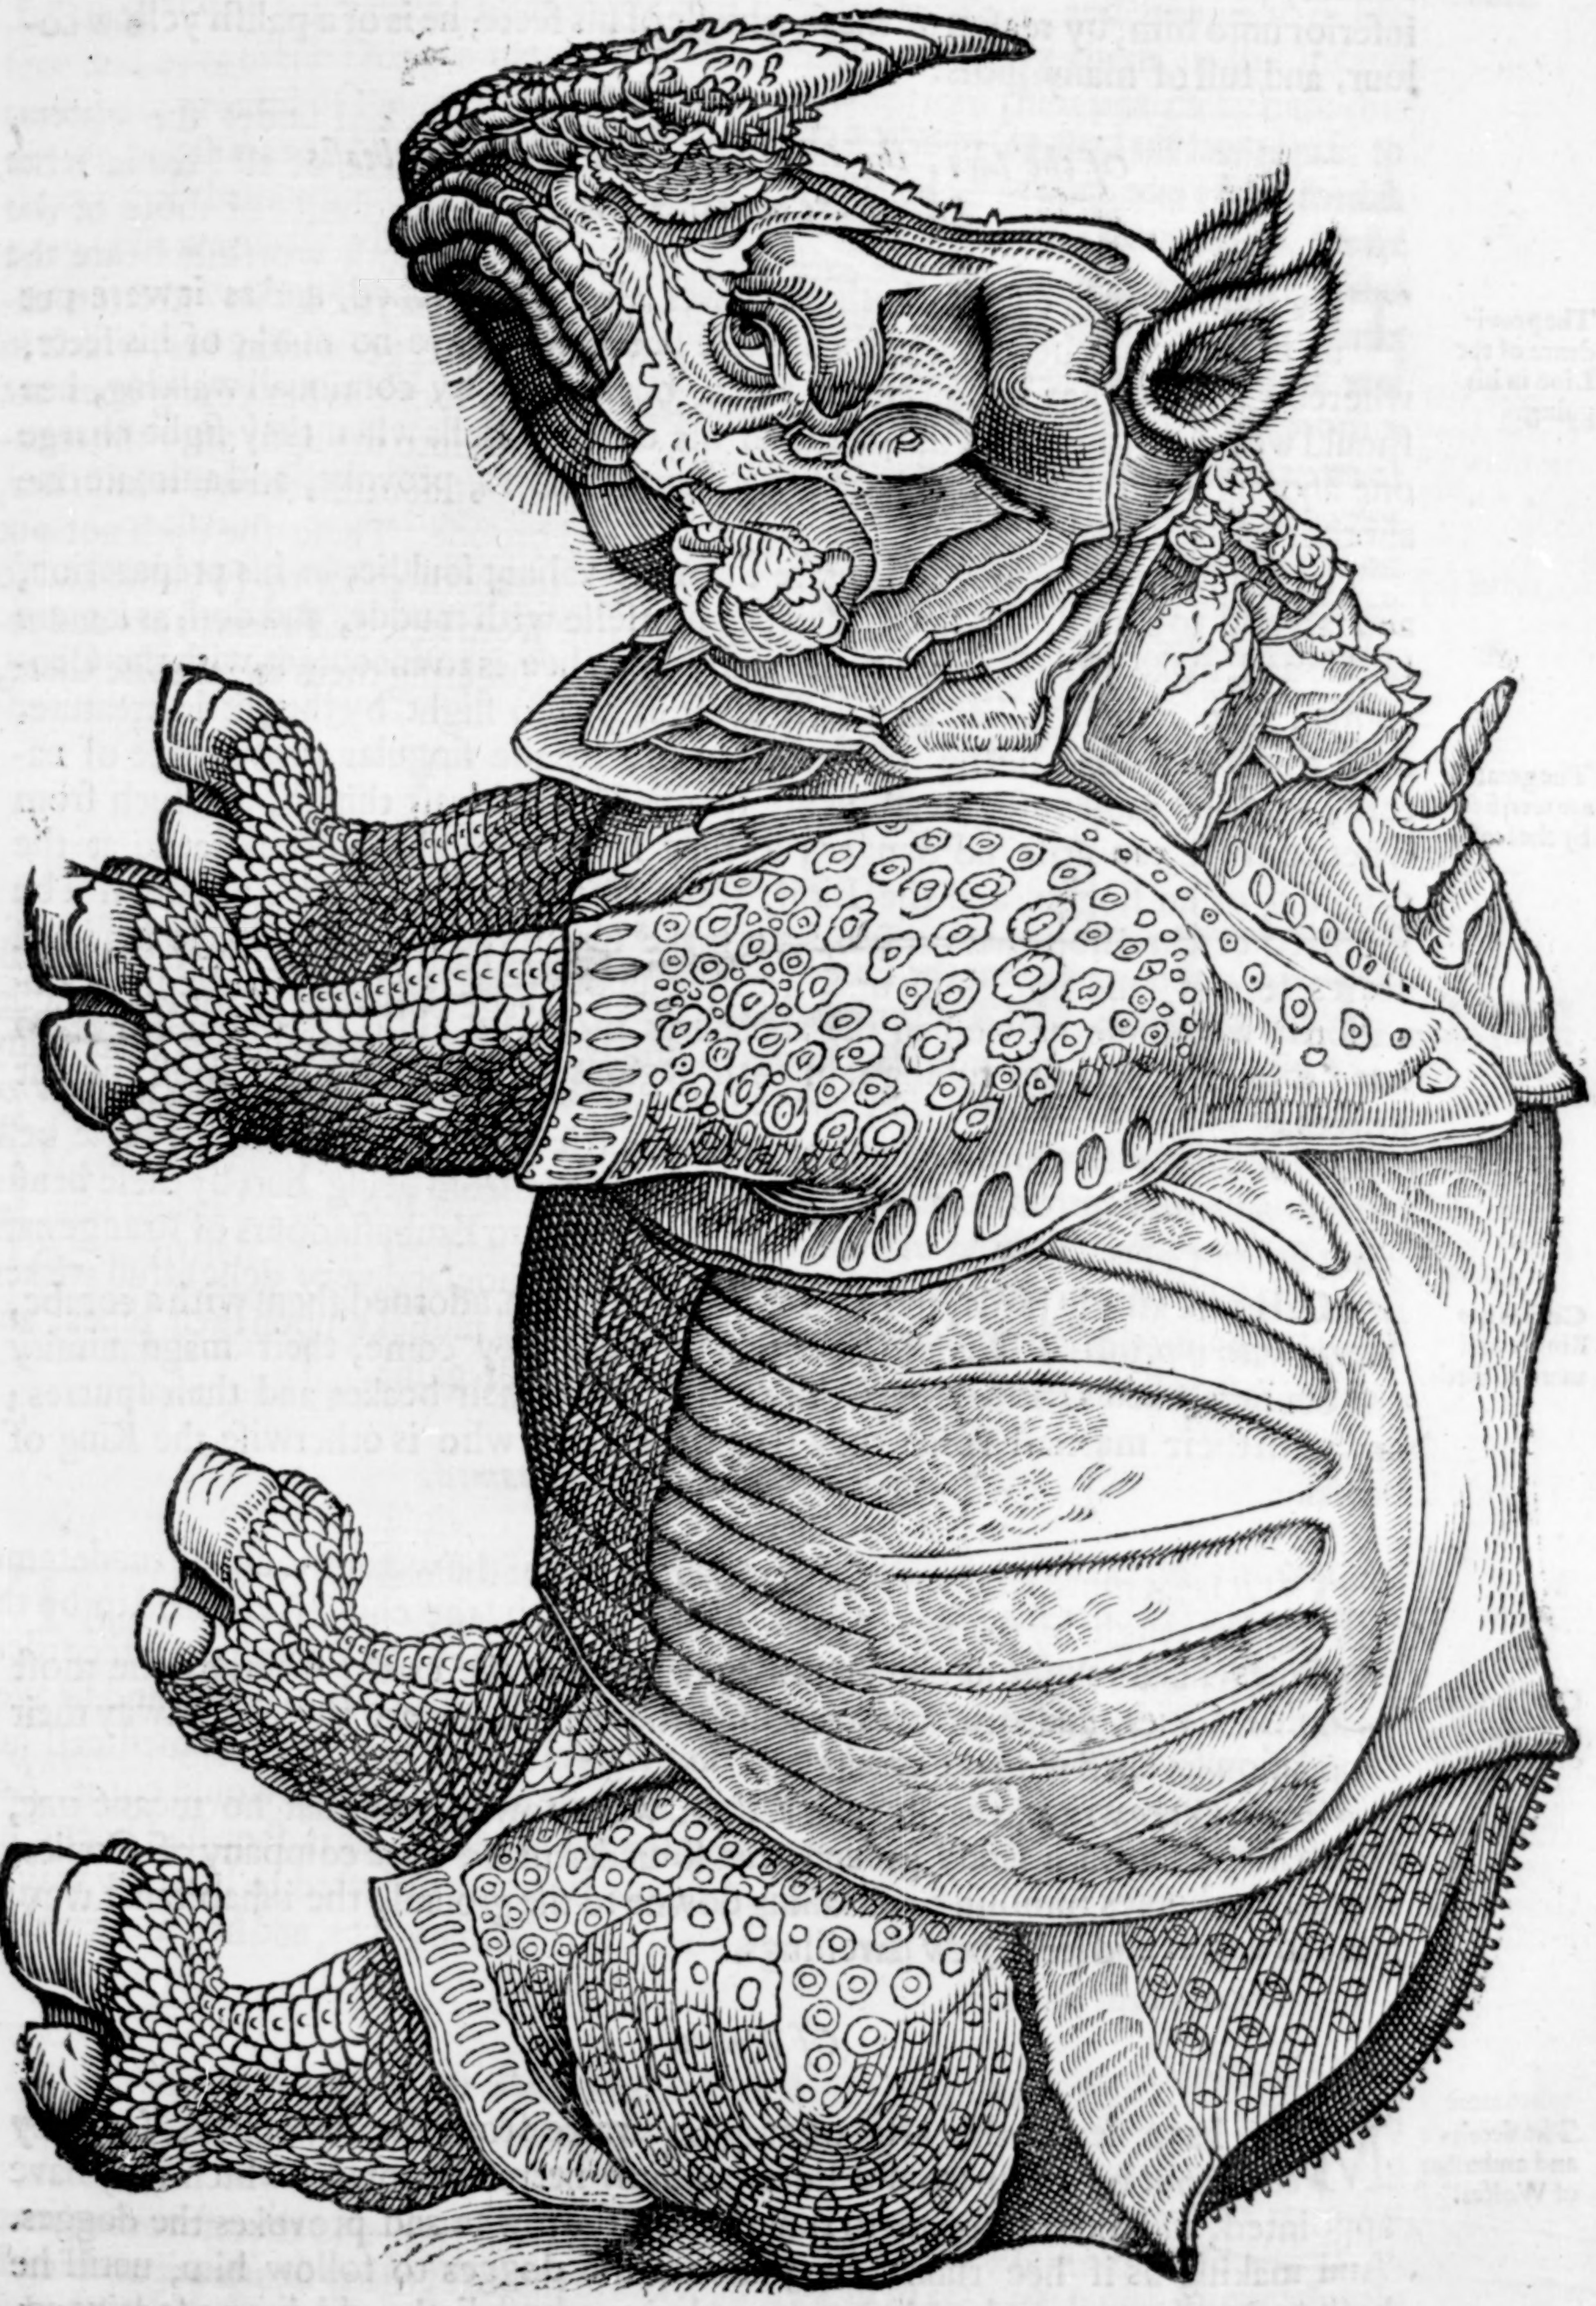
his combate with the Rihnocerot his enemy; but the craft of the Rhinocerot is very remarkeable, that being in continuall enmity with the Elephant, at the time

The craft of the Rhinocerot about to fight with the Elephant.



when

The craft of the Rhinocerot about to fight with the Elephant.

when hee prepares for the battell, he whets his horne againſt a rocke, as if it were with a whetſtone; nor (if he can chuſe) will he ſtrike any other part of the Elephant but the belly, becauſe he knowes that part of the Elephant is ſo tender, that it may be eaſily pierced. This beaſt is in length equall to the Elephant, but in height hee is inferior unto him, by reaſon of the ſhortneſſe of his feete; he is of a paliſh yellow colour, and full of many ſpots.

Of the Lion, the Ichneumon, and thoſe other beaſts which are not eaſily terrified.

The providence of the Lion in his going.

THe Lion when hee goes, hath his clawes alwayes clutched, and as it were put up in their ſheathes, not onely becauſe hee would leave no marke of his feete, whereby hee may bee traced and ſo taken, but becauſe by continuall walking, hee ſhould weare off, and blunt the points of his clawes. Bulls when they fight charge one another with their hornes, and like valiant ſouldiers, provoke, and animate one another to the battell.

The greateſt are terrified by the leaſt.

The Ichneumon ſeemes to imitate the moſt valiant ſouldier in his preparation, and acceſſe to battell, for hee bedawbes himſelſe with mudde, and doth as it were buckle and make tite his armour; eſpecially when hee is to encounter with the Crocodile; who although hee be a vaſte beaſt, is put to flight by this little creature. And this truly hath beene obſerved to bee by the ſingular providence of nature, that the moſt vaſte creatures are terrified by the leaſt things, and ſuch from whence there can ariſe no danger; ſo they ſay the Elephant doth ſtartle at the grunting of an hogge, and the Lion, at the crowing of a Cocke; although it be reported of the Lion that no feare can make him turne his face. Theſe kinde of feares, terrors, and affrightments, ariſing upon light, and moſt ridiculous occaſions, wee finde as well in the ancient as moderne Hiſtories of our times, to have diſperſed and put to flight mightie legions of ſouldiers, and moſt potent armies.

Of Cockes.

Cockes are Kingly and martiall birds.

COckes are kingly birds, and therefore nature hath adorned them with a combe, as with a princely Diadem, and whereſoever they come, their magnanimity and courage makes them Kings. They fight with their beakes and their ſpurres; and with their martiall voice they fright the Lion who is otherwiſe the King of beaſts.

Of Conies.

Conies have taught us undermining.

COnies have taught us the Art of undermining the earth, whereby the moſt loftie Cities, and ſtructures reaching the very skies, are by taking away their foundation levelled with the ground.

Marcus Varro writes, that in Spaine there was a towne, and that no meane one, which ſtanding on a ſandy ground was ſo undermined by a company of Conies, that all the houſes tumbling and falling downe to the ground, the inhabitants were faine to depart and ſeeke new dwellings.

Of Wolfes.

The deceits and ambuſhes of Wolfes.

MEn have learnt the arts of waging warre from the Woulfes, for they come out by troupes, and lie in ambuſh neere the townes which they have appointed, and then one of them runnes unto the towne and provokes the dogges. And making as if hee runne away incites the dogges to follow him, untill he hath gotten them unto the place where their ambuſh lieth, which on a ſodaine appeareth, and ruſheth out upon them. And ſo they kill and eate all, or as many of the dogges as they are able to catch.

Of the Fox.

IN ſubtilty and craft the Fox exceedeth all other beaſts; when in the chaſe the Doggs are at his heeles, he berayes and bepiſſes his taile, and ſwings it in the face and eyes of the Dogges that follow him, and ſo blinding them, in the meane time getts ground of them. To fetch the Hens downe from their pearch he hath this deviſe, hee ſhakes and ſwings his taile upwards and downewards, as if hee meant to throw it at them; which they fearing tumble down, & he takes up one of them for his prey. His warineſſe when he paſſeth over a River that is frozen is wonderfull, for he goes ſoftly to the banck, and layes his eare to liſten, if he can heare the noyſe of the water running under the ice. For if he can, back he goes, and will not venter to paſſe over. The knowledge of which thing he could never meerely by his ſubtilty and craft attaine unto, but that of neceſſity hee muſt have ſome faculty of reaſoning. ioyned with it, which by diſcourſe and by proving one thing by another arrives at this Concluſion: Whatſoever is liquid and maketh a noyſe is in motion, whatſoever liquid is in motion is not concrete and frozen, that which is not concrete and frozen is liquid, whatſoever is liquid will not beare a heavier body, whatſoever will not beare a heavier body, cannot with ſafety be adventured on; And therefore backe againe muſt I goe, and not paſſe over this River.

The craft of the Foxe.

The Foxe ſeemes to reaſon with himſelfe.

His *Sorites*.

Of Swine.

SWine, if in the woods, they heare any one of the ſame Heard with them crying out, they ſtraight make a ſtand, and marſhalling their forces haſte all, as if they had beene warned by the ſound of a martiall trumpet, to the aſſiſtance of their fellowes.

Of the *fiſhes* Scarus *and* Anthia.

P*Lutarch* reports of the *Scari*, that when one of them chances to ſwallow a hooke and be taken, the reſt of the ſame kind come in to his reskue, and ſhearing the Line with their teeth ſet him at liberty. But the readines of the *Anthiæ* to the mutuall aſſiſtance of one another, is yet more manifeſt, for by caſting the Line upon which the hooke hangeth, on their backe, with the ſharpneſſe of their fins they cut it aſunder, and ſo ſet free themſelves and their captived fellowes.

The love of Fiſhes one to another.

Of the Pilot *Fiſh*.

THere is great kindneſſe betweene the *Pilot* Fiſh and the Whale. For although in bulke of body the Whale ſo farr exceed him, yet he leades the Whale and goes alwayes before him as his Pilot, to keepe him from running himſelfe into any ſtraight or muddy place, whence he might not eaſily get out. And therefore the Whale alwayes followes him, and very willingly ſuffers himſelfe to be led by him, it being for his owne good. And in like manner he getts into the Whales mouth, and there lodging himſelfe ſleepes when he ſleepes, and leaves him not either by day, or night.

The Whales pilot or guid.

Of Cranes.

CRanes when they are to take a long journey into ſome Countrey croſſe the ſeas, put their company in ſo good order, that no Captaine can put his ſoldiers in better. For before they ſtir out of any place, they have as it were their trumpets to call them together, and encourage them to fly. They come together and then fly up on high, that they may ſee a far off, chooſing a Captaine whom they are to follow. They have their Serjants to take care of their rankes, and keepe their nightly watches by turnes. *Plutarch* tells us that the Crane, which is appointed to ſtand Sentinell for all the reſt, holds a ſtone in her foote, to the end that if ſhe chance to

Cranes order themſelves in rankes.

The ſentinell Crane.

give way to nature and ſleepe, ſhe may be waked by the noiſe of the falling ſtone. The leader lifting up his head, and ſtretching out his long necke, lookes about him farre and wide, and gives warning to the reſt, of any danger, that may befall them. The ſtrongeſt leade the way, that they may the better with the flapping of their wings breake the force of the aire, and this they doe by turnes. And that they may the eaſilier prevaile againſt the force and oppoſition of the winds, they diſpoſe their company into a wedge in the forme of the Greeke letter Δ or a triangle; and being ſkilfull in the ſtarres they foreſee when tempeſts are comming, and fly downe to the ground to keepe themſelves from the injury of the approaching ſtorme.

Of Geeſe.

The care of the Geeſe, that their gagling, doe them no harme.

THe Geeſe of Sicilie doe with great warineſſe take care that by their ceeking and their noyſe, they doe not expoſe themſelves to the rapacity of Birds of prey: (for *Plutarch* ſayth) that when they are to fly over the hill Taurus, for feare of the Eagles that are there, they hold ſtones in their mouthes to keepe themſelves from gaggling, untill that they come unto a place where they may be ſecure.

Of Dragons.

The craft of Dragons fighting againſt the Elephant.

NEither are the Dragons leſſe crafty; for thus doe they overcome thoſe vaſte and otherwiſe invincible beaſts the *Elephants*. They lye in ambuſh and ſuddainly ſet upon the *Elephants* where they feare no ſuch matter, and involve their leggs with the twines of their taile, in ſuch ſort, that they are not able to goe forward; and ſtop their noſthrils with their heads ſo that they cannot fetch their breath, they pull out their eyes, and whereſoever they find the ſkin moſt tender, there they bite and ſucke the blood untill they make them fall downe dead. *Pliny* ſayth, that there are Dragons found in Æthiopia of ten Cubits long, but that in India there are Dragons of an 100. foot long, that fly ſo high, that they fetch Birds and take their prey even from the midſt of the cloudes.

Lib. 8. cap. 11. and 12.

Of the Fiſh called, the Fiſherman.

The craft of the Fiſherman-fiſh in taking her prey.

THis Fiſh is called the Fiſherman, becauſe he hunts and takes other Fiſhes, which he doth almoſt by the ſame cunning which the *Cuttell* uſes; for he hath hanging at his throat a certaine bagge like the Wattells of a Turckycocke. This when hee liſteth he caſteth out, and layeth before the little fiſhes for a baite, and then by litle and litle drawes it up againe untill he catch for food the litle fiſhes ſeazing upon it as a prey.

Of the Cuttell Fiſh.

The craft of the Cuttell to ſave her ſelfe.

VVOnderfull is the craft of the Cuttell Fiſhes, for they carry a bladder at their necke full of a blacke juice or Inke, which they poure forth as ſoone as they feele themſelves taken; that ſo they may blinde the eyes of the Fiſhermen, as *Plutarch* ſaith; and as *Ariſtotle* witneſſeth, they with their long fangs doe not onely hunt and take little Fiſhes, but oftentimes alſo Mullets.

Lib. 9. de Hiſt. animal. Cap. 37.

Of the Armes or weapons of brute beaſts.

BRute beaſts are naturally ſo furniſhed with armes, that they have no neede to get, make or borrow in any other place.

And ſome of them nevertheleſſe are ſo furniſhed with ſuch armes that they captivate thoſe which hold them priſoners; an example of this is the *Torpedo*, which doth not onely hurt by touch, but alſo by the net being betweene, he breathes ſuch a quality from him, as ſtupifies the hands of the Fiſhermen, ſo that they are forced to let goe their nets, and ſo let him goe; moreover if it touch a ſhip it makes it ſtay. *Thevet* writes, that the *Perſian* bay towards *Arabia* nouriſhes a Fiſh equall in length and

Coſmog. Tom. 1. lib. 10. cap. 10.

thickneſſe to a Carpe, on every ſide encompaſſed with ſharpe and ſtrong pricks, like our Porcupine, with which hee fights againſt all kinds of fiſh. If a man chance but to be lightly hurt either with theſe or his teeth, he will dye within 24.houres.

Of the fiſh Vtelif.

HEe ſaith moreover, that as he was carryed by force of tempeſt through the Atlanticke Ocean, he ſaw this fiſh having as it were a Saw in his forehead of three foot long, and foure fingers bread, armed on each ſide with ſharpe ſpikes; They call it *Vtelif* in their Country ſpeech.

Of the fiſh Caſpilly.

THere is another fiſh to be ſeene in the Arabian Gulfe, which the Arabians call Caſpilly, its two foot long and as many broad, it hath a skin not much unlike a Dogfiſh, but armed with ſpikes, one whereof he carryes in his forehead a foot and halfe broad, in ſharpeneſſe and force of cutting not much ſhort of a graver or chiſſell: with this weapon when ſhe is oppreſt with hunger ſhe aſſailes the firſt fiſh ſhee meets, neither doth ſhe give over before ſhe carry her as a prey, whither ſhe pleaſe, as *Thevet* ſaith he hath ſeene.

Tom.1 lib.5. cap 2.

Of Crabs.

CRabs and Lobſters though in the quantity of their body they be but ſmall, yet they uſe their forked clawes before, not onely in feeding but alſo in defending themſelves and aſſailing others.

Of the Docility of Beaſts, and firſt of the Dog.

BEaſts are apt to learne thoſe things which men deſire, whereby they ſhew themſelves not wholy void of reaſon. For Dogges, Apes and Horſes learne to creepe thorough the Iuglers hoopes, and riſe on their hinder feet as though they would dance. *Plutarch* tells, that a Iugler had a Dog which would repreſent many things upon the ſtage befitting the occaſion and argument of the play; amongſt the reſt, hee exceeded all admiration in that, that taking a ſoporificke medicine, hee excellently feigned himſelfe dead; for firſt as taken with a giddineſſe in his head he begun to tremble, then preſently fell down, and lying on the ground, as it were contracted his dying members, and laſtly as if truely dead he waxt ſtiffe; and moreover ſuffered himſelfe diverſly to be fitted according to divers parts of the Theater, the fable ſo requiring. But when he, by thoſe things that were ſaid and done, knew it was time to riſe, he firſt begun to move his legs by litle and litle, as if hee had been wakened from a ſound ſleepe; then preſently with his head a litle lifted up, hee looked this way and that way to the great admiration of all the beholders, and finally riſe up and went familiarly and cheerfully to him he ſhould; the which ſight the Emperour *Veſpatian* (who was then preſent in *Marcellus* his Theater) never ſaw any which more delighted him.

The wonderfull docillity of Dogs.

A ſpectacle full of admiration and mirth

Of the Ape.

AN Ape is a ridiculous Creature, and which makes men much ſport, in imitating their actions. There hath beene ſeen an Ape which would pipe and ſing, and beſides dance and write, and endeavour to performe many other things proper to men. I remember I ſaw in the Duke of *Somes* houſe a great and curſt Ape, who becauſe he much troubled many, had his hands cut off, who ſuffering himſelf to be cured, when the wound was cicatrized, he grew more mild and docile. Wherefore cloathed in a greene coate, and girt over his loines with a girdle, he carried hanging therat a caſe of ſpectacles, a paire of knives & a childs handkercheife. He was commited to the charge of the Maſter Cooke to teach, becauſe he had taken up his lodging in the Chimney corner,

Gal.lib.1.de uſu partium.

he

hee was taught many pretty tricks and feates. If at any time hee ſwarved from his doctrine and precepts,in a trice the whip was upon his back & loines, and much was abated of his daily allowance, for as *Perſius* ſaith, The belly is the maſter of Arts and ſharpener of wit. By theſe means be profited ſo,in a ſhort time,that he much exceeded all the Apes of his time in the glory of his wit;& there was none counted more ſkilfull in leaping and dancing to the pipe, running up a pole and nimbly leaping through his Maſters legs. To conclude,he performed all the actions of a ſtrong Ape,and very reverently carried up diſhes with the waiters & ſervingmen, and made cleane the diſhes and platters by licking,and did much other drudgery,ſo that he was commonly called Maſter *Iohn Do-all*. At dinner and ſupper ſitting in a chaire he ſaid grace, and caſt his eyes up towards heaven,and rouled them this way and that way, and ſmote his breaſt with the ſtumpes of his hands with much lamentation, and imitated prayer by the gnaſhing,or beating together of his teeth. He would turne up his taile to any that offended him(for his coate ſcarſe covered halfe his buttocks leſt he ſhould have filed it)he made much other paſtime, alwayes going upright by reaſon of the cutting away of his hands,unleſſe at any time through wearineſſe he were forced to ſit on his buttocks.

Of Ravenous birds.

The diligence of Faulconers in training up their Hawkes.

BVt let us take a veiw of Faulconers teaching ravenous birds,how with ſwift wings carried aloft into the Aire,they may ſeaze upon other Birds and caſt them downe dead to the ground; in performance whereof, they often too freely ſoare up to the clouds ſo that they carry themſelves out of the Faulconers ſight, with a deſire to ſun themſelves, neglecting in the meane time their deſigned prey.

The fight of the Herne and Faulcon,

The *Herne* when ſhe ſees her ſelfe kept under and below the *Falcon* carried up by his ſtrong wings with a merveilous ſwiftneſſe, with her beake,which is long & ſharpe, hid under her wings and turned upwards,ſhe receives the *Falcon* blinded with the heat of fight and deſire of prey,careleſly flying downe and ruſhing upon him ;ſo that he often ſtrikes him through the gorge,ſo that oft times they both fall downe dead to the ground. But if the *Falcon* without harme eſcape the deceits by Arte & the happy turning of his body,and the *Herne* be not caſt downe,the Faulconer calling her backe with never ſo loud a voyce, yet by ſetting up her Feathers ſhe dares her to the pretended fight.

Of the Camels.

Camel both tame and wilde,

THe *Camell* is a very domeſticall and gentle beaſt, and which is eaſily tamed and taught all kind of obedience and ſervice ; although ſome of them are cruell wilde and troubleſome by biting and ſtriking ſuch as they meet, no leſſe than untamed horſes. There is no neede to houſe them in the night, for they may be left in the plaine fields in the open and free aire,feeding upon the graſſe and trees and cropping the tops of the thiſtles, neither in the morning doe they any whit the worſe undergoe or carry their burdens. They are not put to carry burdens before they be foure yeare old. The Arabians geld them young, that they may enjoy their labour the longer, neither being gelt doe they rage for love or deſire of venery. At the putting in of the Spring they endure hunger and thirſt for eight dayes; they are ſo dutifull,that at the becke of the Turkiſh ſlaves, or but touched on the necke with a twigge, they preſently kneele on the ground to take up their burden, neither doe they lift themſelves up before that they finde they have a ſufficient load layd upon them. Thoſe which have but one bunch on their backe are of Africke ; but ſuch as have two bunches are of Aſia, or Scythia. Thoſe kinde of *Camels* that are the bigger are uſed to carry packes, but the leſſer are uſed to ride upon, as our horſes are. They love nothing ſo well as beanes, and yet they live content with foure handfulls of beanes for a day. The greateſt wealth of the Arabians conſiſts in *Camels*, and ſo they eſtimate their riches, not by the quantity of ſilver, or gold, but by the number of *Camels*. The Turkiſh Emperour (*Thevet* being the reporter) made a Captaine over the heards of his *Camels*, giving him a great troope, of African and Chriſtian ſlaves, that they might be the better looked unto. I have heard it reported (ſaith *Thevet*) by certaine Arabian, African and Iewiſh Merchants who were preſent, at that time when *Sultan Selim* the firſt of that name, beſeiged

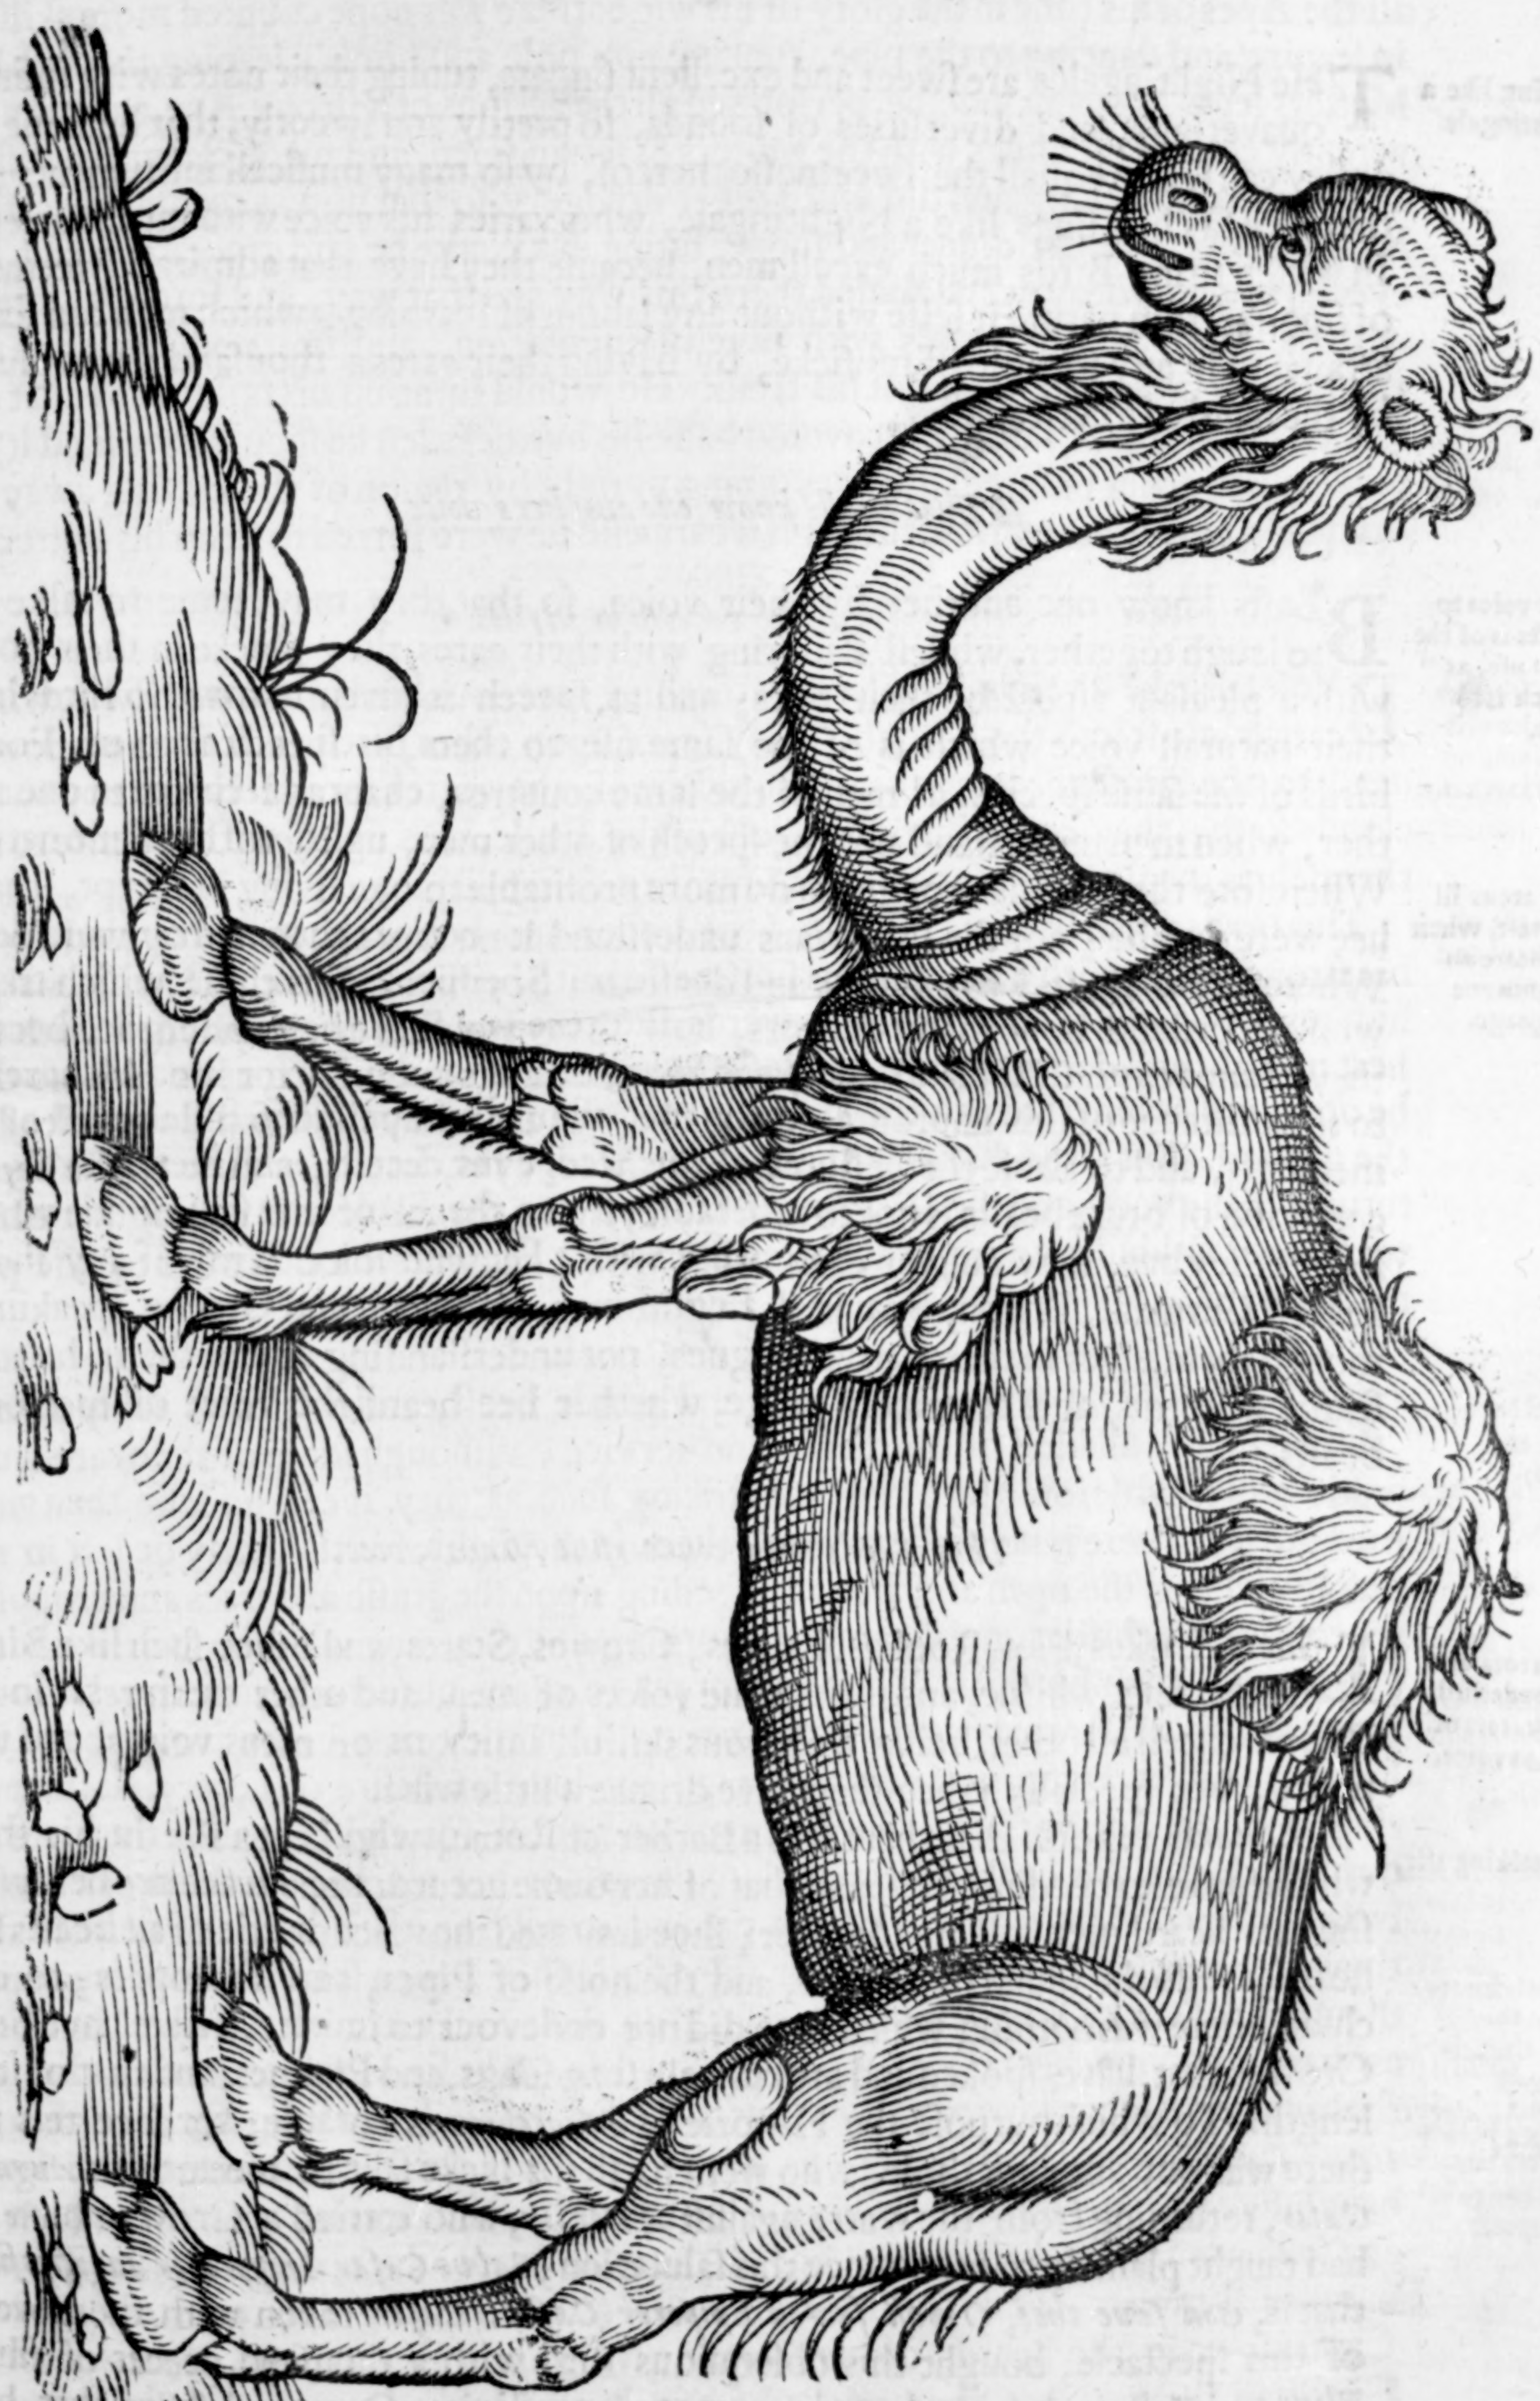
The eaſie and not chargeable keeping of Camels.

Camels know when they have a ſufficient loade.

Camels both to carry burdens and to ride upon.

beſeiged Caire in Ægypt (which in former times was called *Memphis*) that there

Mighty troop of Camels.



was then in that Emperours army ſixtie thouſand Cammels, beſides a mighty company of Mules.

That Birds have taught us muſicall tunes.

To ſing like a Nightingale

THe Nightingales are ſweet and excellent ſingers, tuning rheir notes with infinite quaverings, and diverſities of ſounds, ſo pretily and ſweetly, that humane induſtry can ſcarſe equall the ſweetneſſe thereof, by ſo many muſicall inſtruments; ſo that wee ſay hee ſings like a Nightingale, who varies his voice with much varietie. In which thing Birds much excell men, becauſe they have that admirall ſweetneſſe of ſinging from nature it ſelfe without any labour of learning; which men can ſcarſe attaine to in any ſchoole of muſicke, by having their eares a thouſand times pluckt by the hand of a curſt maſter.

That Beaſts know one anothers voice.

The voice to beaſts is of the ſame uſe, as ſpeech is to men.

BEaſts know one another by their voice, ſo that they may ſeeme to talke and to laugh together, whileſt flattering with their eares, they plucke in their noſes, with a pleaſant aſpect of their eyes; and as ſpeech is given to men, ſo Birds have their naturall voice which is of the ſame uſe to them, as ſpeech is to us. For all birds of the ſame ſpecies, as men of the ſame countrey, chant and chirpe to one another, when men underſtand not the ſpeech of other men, unleſſe of the ſame nation. Wherefore the Scythian tongue is no more profitable to one living in Egypt, than if hee were dumbe; nor the Egyptians underſtand it no more than if they were deafe. Wherefore an Egyptian is dumbe and deafe to a Scythian. This thoſe which travell well underſtand how many dangers, how many troubles they undergoe, becauſe they cannot expreſſe their mindes, and require things neceſſary for life. Wherefore to the aſſiſtance of this unprofitable tongue, we are compelled to call the reſt of the members, and to abuſe the geſtures of the head, eyes, hands, and feete. Truly the condition of brute beaſts is not ſo miſerable, ſeeing that all of the ſame kinde whereſoever they bee, may anſwer each other with a knowne voice. Truly if any ſhould heare a Germane, Briton, Spaniard, Engliſhman, Polonian, and Greeke, ſpeaking amongſt themſelves in their native tongues, not underſtanding any of them, he could ſcarce diſcerne, and certainely judge, whether hee heard the voice of men or of beaſts.

We are as ill as deafe, when we heare an unknowne language.

That Birds may counterfeit Mans voice.

Parrots are wonderfull imitaters of mans voice.

LInets, Larkes, Pies, Rookes, Dawes, Crowes, Stares, and other ſuch like Birds, ſpeake, ſing, whiſtle, and imitate the voices of men, and other creatures. In this Parrots excell all other, being wondrous ſkilfull imitaters of mens voices, and very merry, but ſpecially when they have drunke a little wine.

A talking Pie.

Plutarke reports that there was a Barber at Rome, who kept a Pie in his ſhop, which ſpoke exceeding well, and that of her owne accord, none teaching her, when ſhe firſt heard men talking together; ſhee imitated the voice or crie of all beaſts ſhee heard, as alſo the ſound of Drums, and the noiſe of Pipes, and Trumpets; to conclude, there was nothing which ſhee did not endevour to imitate. There have beene Crowes that have ſpoken and articulately ſung ſongs, and Pſalmes, and that of ſome length. To which purpoſe the Hiſtorie of *Macrobius* is notable; for hee tels that there was one amongſt thoſe, who went forth for lucke ſake to meete with *Auguſtus Cæſar*, returning from the warre againſt *Antonius*, who carried a Crow, which hee had taught plainely to pronounce this ſalutation; *Salve Cæſar Imperator auguſtiſſime*, that is, *God ſave thee, O moſt ſacred Emperor Cæſar*. *Cæſar* taken with the noveltie of this ſpectacle, bought this obſequious Bird with a thouſand peeces of ſilver. *Pliny* and *Valerius* have reckoned up amongſt prodigies, Oxen and Aſſes that have ſpoken. I omit infinite other things recorded by the ancients, *Plato, Ariſtotle Pliny, Plutarch*, and other Philoſophers of great credite, of the docilitie of beaſts, and their

Lib.2.Saturn. cap.4.

admirable felicity of underſtanding. Which things, if untrue, theſe learned men would never have recorded in writing, leſt ſo they might brand with vanity, (then which nothing is more baſe,) the reſt of their writings to poſterity in all enſuing ages.

Of the Sympathy and Antipathy of Living creatures amongſt themſelves.

HAving briefly deſcribed the underſtanding of brute beaſts, it ſeemes not impertinent to ſet downe ſome things more worthy of knowledge, happening unto them by reaſon of Sympathy and antipathy; that is, mutuall agreement and diſagreement, which happens not onely to them living, but alſo dead, by a certaine ſecret and hidden propertie, through occaſion whereof ſome deſire, other ſhun, and others proſequute one another even to death. In teſtimony whereof; The Lyon the king of beaſts excelling all other in courage and magnanimitie, feares the Cocke, for he is not onely terrified by his preſence, but alſo by his crowing being abſent. So an Elephant feares a Hogge; but hee is ſo affraid of Mice and Ratts, that he will not touch the meat that is given him, if hee ſmell that it hath beene defiled with ſuch creatures. There is deadly hatred betweene the Elephant and Rhinocerot; yet when the Elephant is furious and angry, hee becoms quiet and calme at the ſight of a Ram. A horſe is ſo afraid of a Camel, that he cannot endure his ſight. The Dog hates the Wolfe, the Hart flyes the Dogge. The Snake flyes from and feares a naked man, and followes him being clothed. There is deadly hatred between the Aſpis and Ichneumon, for he when he hath rowled himſelfe in the clay, dryes himſelfe in the Sunne, and ſo being covered over (by doing thus diverſe times) as it were with ſhells, or armour, he enters into Combat, ſtretching out his taile and preſenting his backe, untill he get opportunity to choake his adverſary, by leaping and faſtening on her jawes, by which ſtratageme he alſo kills the Crocodile. The green Lizard is a capitall enemy to the Serpent, but moſt friendly to man, as *Eraſmus* witneſſeth by many hiſtoryes concerning that matter, in his dialogue of Sympathy and Antipathy. There is a great deale of hatred betweene a man and a Wolfe, which is moſt manifeſt by this, that if the Wolues firſt ſee a man, his voyce is taken away, and his intended cry hindred. If the Weaſell intend to ſet upon the Aſpis that moſt venemous Serpent, ſhee armes her ſelfe by eating Rue, as a moſt certaine Antidote. The Ape feares the Torpedo, as *Eraſmus* manifeſts by a pleaſant hiſtory in the fore mentioned Dialogue; where alſo he pretily ſhewes the deadly hatred betweene the Serpent called Areus and the Toad. The like hate is between the Owle and Crowes, ſo that the Owle dares not go out, fly abroad, or ſeeke her food unleſſe by night. The water or River fowle are afraid of the *Falcon*; that if they but heare her bells, they had rather be killd with ſtaves and ſtones, than take wing to fly into the aire. So the Larke yeelds her ſelfe to be taken by a man, leaſt ſhe fall into the tallents of the Hobby. The Caſtrill, or Merlin is naturally a terrour to Haukes, ſo that they both ſhun his voyce and preſence.

The Lion feares a cocke.

A horſe feares a Camell

Water fowle feare the Falcon.

The Kites are all at perpetuall enmity with the Crowes, wherefore the Crow alwayes gets away the Kites proviſion. All kind of Pullen feare the Foxe. The Chicken feares neither a Horſe, nor an Elephant, but ſcarſe hatched, it preſently runs away at the voyce or ſight of a Kite, and hides it ſelfe under the hens wings. The Lambe and Kid flye from the Wolfe when they firſt ſee him, nether doth death give an end to that hatred, but it ſuperviues their funerall. An Experiment whereof (they ſay) is, that if one drum be headed with Wolves ſkinnes and another with Sheepes, and beaten up together, you ſhall ſcarſe heare the ſound of the Drum covered with ſheepes skins. And beſides, if you ſtring one Harpe with ſtrings made of ſheepes gutts, and another with ſtrings of Wolues gutts, you cannot bring it to paſſe, by any Arte, to make them agree and goe in one tune. It is reported from the experiments of many men, that if a Wolues head be hanged up on high in the place where Sheepe are, that they will not touch the graſſe how good and freſh ſoever it be, nor reſt quiet in any place, but tumultuouſly runne up and downe, untill all ſuch kinde of terrour be taken away; The hate

The enmity betweene the Kites and Crowes.

The diſcord between the Lambe and Wolfe is not ended by deal.

How to make cheeſe that Mice will not gnaw.

betwixt Mice and Weaſells appeares by this, that if you mixe never ſo little of the braines of a Weaſell in the rennet, with which you crudle you Cheeſe, the Mice will never gnaw or touch that cheeſe. The Linnet doth ſo hate the bird *Florus*, that both their bloods put into one veſſell cannot be mixed together. A Wolues head hung up in a dovehouſe, drives away Poll-Cats and Weaſells. The Panther and Hyæna burne with ſo great hatred, that if both their skins be laid one againſt the other, the Panthers will ſhed the haire, the haires of the Hyæna remaining entire and not moved; which thing, they ſay, happens to the feathers of other birds if any one chance to tye them up in a bundle with the Eagles. Let theſe ſuffiſe for ſome few examples of many, of the Antipathy amongſt beaſts. But of the Sympathy, and conſent of beaſts amongſt themſelves, I thinke needleſſe to write any thing, being it is ſufficiently knowne to all, that one Iay aſſociates another, and the cruell Beares agree amongſt themſelves; and beaſts of the ſame ſpecies doe wonderfully conſent one with another.

That Man excells all beaſts.

Man beares Gods image.

Man hath given names to things.

I Now thinke it fit to aſſay to write of that excellency of man over beaſts, which I have ſo long intended. Neither would I that Epicures and other too much naturall and materiate Philoſophers, ſo take thoſe things I haue written of the endowments of beaſts, as though we ſhould thinke, there were no difference betweene man and beaſt. I had no ſuch meaning, no ſuch intention; but onely that man ſhould not become too ſtately, or too ingrate in leſſe acknowledging God to be the Author of ſo many benefits with which he abounds. For whatſoever we have largely ſpoken of beaſts, yet there is no compariſon betweene beaſts and man, for there is too great a difference betweene them. For mans minde is adorned with religion, juſtice, prudence, magnanimitie, faith, piety, modeſty, clemency, fortitude and other vertues as lights, which ſhine much more bright in man than in beaſts. For they are ſometimes all in ſome one man, each whereof are thought great in beaſts. For ſeeing that man is made to the Image of God, it cannot be, how much ſoever he defile himſelfe with the pollution of vices, that he can ſo obſcure that inbred light, but that alwayes ſome beame of the divine wiſedome will be inherent and ſhine in him. But although by collation to ſome beaſts, hee may ſeeme a defective and weake Creature; yet no fortitude nor ſtrength of beaſts can be ſo great as to equall the fortitude of man. For God hath engraven in man the character of his divine virtue, by the aſſiſtance whereof, he might have all beaſts under and obedient to him. And though by that we have formerly ſaid, beaſts may ſeeme to have a certaine ſhadow of reaſon, yet that ſmall light is not fit for many and diverſe uſes, but there is onely given them ſo much providence, as ſhould be ſufficient for them and the preſervation of their bodyes. But men have reaſon given them to crop or gather the fruits of eternall life, (as *Lactantius* ſaith) whereby it comes to paſſe, that man onely, amongſt ſo many creatures, hath ſenſe and underſtanding of divine things. Which *Cicero* thought to be knowne by that, becauſe man onely had a certaine knowledge of God in his mind. Wherfore he was enriched by God with reaſon, ſpeech and hands as helps for the performance of all his actions; moreover by his ſingular and almoſt divine wit he eaſily excells all brute beaſts. For firſt, reaſon being his guide, he invented things neceſſary for life, fitly impoſed names on the things invented befitting their natures, framed letters and Characters, invented all liberall Arts and handy-crafts, and found meanes to meaſure the Land and Sea. Hee hath obſerved and drawne into an Arte the ſpaces of the Celeſtiall Globe, the diſtinctions of the Starres, the changes and orders of dayes and nights, of times and ſeaſons, the riſings and ſettings of Starres, and their power and effects over theſe lower bodyes. Laſtly, he records in writing to perpetuall memory that which concernes his owne nature, or the nature of other things, the precepts and ordinances of life and manners, by which ſingular gift, we can now conferre with *Socrates*, *Plato*, *Ariſtotle*, and other Philoſophers of ancient times, as if they were living.

What

What benefit man hath by reaſon of his native nakedneſſe and ignorance.

BVt as Mans body is by nature naked and unarmed, ſo is his minde like a ſmoth table in which nothing is painted, nothing graven; but for helpe of his nakedneſſe he hath hands, and for ſupply of his ignorance, reaſon and ſpeech. And by theſe three being as it were the miniſters of infinite varietie of things, he clothes and defends his body with all things needful: & inriches his minde with the knowledge of Arts & ſciences. Now if he had certaine weapons borne with him, he ſhould uſe them only; if he ſhould be borne skilfull in any Arte, he would meddle with none elſe. Therefore becauſe it was more expedient to uſe all ſorts of weapons with the hand, and be skilfull in all Arts; therefore he muſt be borne wanting and ignorant of all. *Ariſtotle* very wittily called the hand the inſtrument of inſtruments: in imitation of which ſpeech, one may rightly affirme, That Reaſon is the Arte of Arts: for as the hand in worth exceeds the other inſtruments, becauſe it can make, handle and fit them for uſe; ſo reaſon and ſpeech, though names of no Arte, yet comprehend and encreaſe all Arts. Therefore man ſeeing he hath his minde inſtructed by Arte, that is, by reaſon; it is fit he ſhould have his body defended with a weapon, or inſtrument, that is, the hand, which in agility and excellency ſhould excell all other inſtruments. For ſo Man hath his hands in ſtead of all weapons, which he may uſe in warre and peace as the inſtruments of all Arts; he wants not the Bulls hornes, the Boares tuskes, the horſes hoves, nor to conclude, any armes of any other beaſt. For by the benefit of his hands he can handle other armes farre more profitable and ſafe, as a Lance, Sword, Speare, halberd; but man alſo can uſe at ſome diſtance the bow, ſling and handgun, when the horne and the hooſe cannot be uſed but neer at hand. But ſome may ſay; A Lion exceeds a man in ſwiftnes of foot; what then? is man therefore inferiour to him? no for by the meanes of his hands and the guidance of his reaſon he bridling and riding upon a horſe, out runs the Lyon, and being victor followes him to and againe as he himſelfe pleaſes, or vanquiſhed flyes away, and from the horſes backe as from a tower wounds the Lyon with what weapons he pleaſes. To conclude, man is aboundantly provided with meanes, to defend himſelfe from the violence of all other beaſts. For this purpoſe he doth not onely harneſſe himſelfe as with braſen walles, but alſo makes ditches and Bulwarkes; he makes by the miniſtery of his hands all kind of weapons, weaves himſelf graments, caſts into the water and drawes forth nets to catch fiſh; and to conclude, he performes all things to his owne contentment, and having that priuiledge granted him by God, he rules over all the earth; all things which lye hid in the bowells of the earth, which goe, or creepe upon the earth, which ſwim in the ſea, and fly through the aire, or are any where ſhut up in the compaſſe of the skie, are in mans dominion.

Gal. cap. 4. lib. 1. de uſu partium.

As the hand is the inſtrument of inſtruments ſo Reaſon is the Arte of Arts.

Man under God is the king and Emperour of the world.

How wonderfull God hath ſhewed himſelſe in making man.

GOds Deity and providence hath principally ſhewed it ſelf in the creation of man; neither his ſo admired light hath ſo ſhone in the production of other creatures, ſeeing that God would have them to live and have their being, onely for mans ſake, that they might ſerve him. Therefore man is, if we diligently conſider all his endowments, a certaine patterne and rule of the divine majeſty & (if If I may ſo ſay) Artifice. For being made to Gods image, he is as it were his coine, exceeding the capacity of all humane underſtanding. Which ſeemed a juſt reaſon to the ancient Philoſophers, that he ſhould be called *Micrecoſmos*, or a litle world, becauſe the particles of all things conteined in the compaſſe of heaven and earth, are contained in his minde and body, that in the meane time I may in ſilence paſſe over his ſoule more great and noble than the whole world.

Men is the end of all mundane things.

Man a litle world, yea almoſt a great world.

Why Nature hath not given Man the facultie of perſaging.

Man is not obnoxious to the Aire and ſtars.

One man will counterfeit the voyces of infinite varieties of beaſts.

THis ſeemes the reaſon, that men by the inſtinct of nature doe not foreſee the future ſeaſons and diſpoſitions of the heaven and aire; becauſe, ſeeing they have received certaine ſparks of prudence from God, by whoſe care and guidance they are led to the knowledge of things by no deceiptfull but certaine judgment, being not obnoxious to the conditions and changes of times and ſeaſons, as beaſts are. Wherefore knowing all theſe airy changes to be placed under them, that is to ſay their minds, according as occaſion ſerves, and their minds deſire, they give themſelves to mirth when the Aire is wet, ſtormy and darke, and on the contrary in a cleare and faire ſeaſon to a ſincere and grave meditation of things ſublime & full of doubt. But beaſts accommodating themſelves to that diſpoſition of the aire which is preſent & at hand, are lively, or ſad, not from any judgment as men, but according to the temper and cōplexion of their bodies following the inclinations of the aire, and of the humors one while diffuſed, another while contracted. Neither ought we to blame man, becauſe he can imitate the voyce of beaſts, but rather much commend him, that he can infinitely wreſt and vary one thing, that is his voyce; for men can barke like Foxes and doggs, grunt like hogs; whet and grinde their teeth like boares; roare like Lyons; bellow like Bulls; neigh like horſes; knacke their teeth like Apes; houle like Wolues; bray like Aſſes; bleate like Goats and Sheepe; mourne like Beares, Pigeons and Turtles; Keeke and gaggle like geeſe; hiſſe like Serpents; cry like Storkes, caw like a Crow, and crow like a Cocke, clocke like Hennes; chatter as Swallowes and Pyes; ſing like Nightingales; croake like Frogs; imitate the ſinging of Waſpes and Humming of Bees; Mew like Catts. The ſinging of Birds ſcarſe ſeemes to merit the name of Muſicall, compared to the harmony of men fitted and tuned with infinite variety of voyces. For with this they poſſeſſe the eares of Kings and Princes; provoke and temper their wrath, and carry mens minds beyond themſelves, and tranſforme them into what habits they pleaſe. But if thoſe cruell beaſts have any humanitie, they owe it all to man. For he tames Lyons, Elephants, Beares, Tigers, Leapards, Panthers and ſuch other like.

The power of Muſicke.

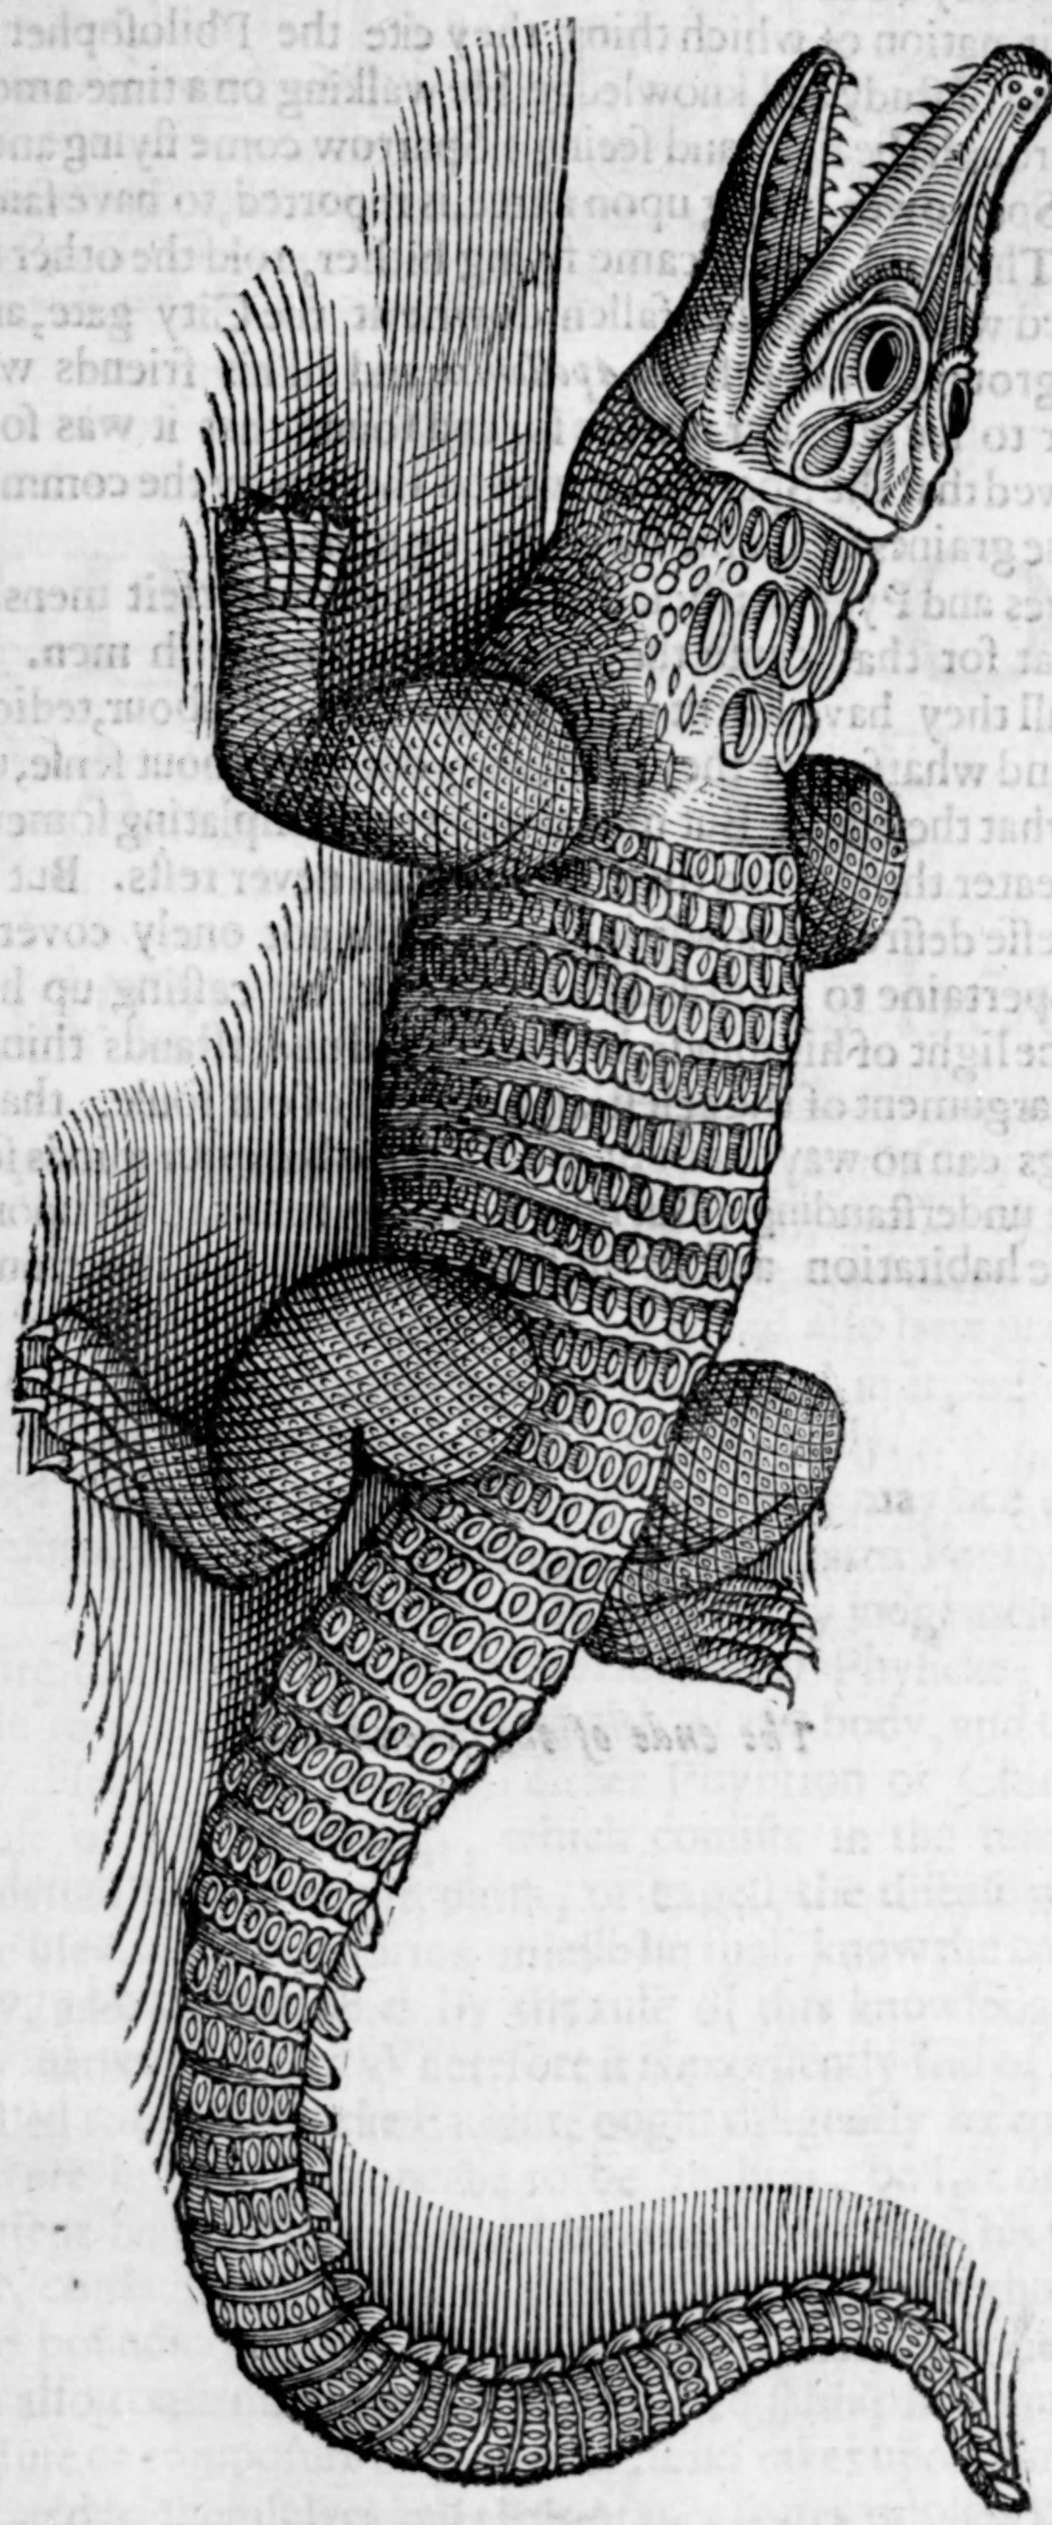
Of the Crocodile.

A tame Crocodile.

PLutarch reports of the *Crocodile* (whoſe figure is here deliniated) that being tamed, and taught by man, hee doth not onely heare mans voyce, and anſweres to his call, but ſuffers himſelfe to be handled, and opening his throate, lets his teeth be ſcratched and wiped with a towell. How ſmall a part of Phyſicke is that, which beaſts are taught by nature? Certainely nothing in compariſon of man, who by the ſtudy and practiſe of a few yeares can learne at his fingers endes all the parts of Phyſicke: and practiſe them not onely for his owne, but alſo for the common good of all men. But why cannot beaſts attaine unto the knowledge of Phyſicke ſo well as men? I thinke, becauſe ſo great an Arte as Phyſicke is, cannot be attained unto by the dull capacities of Beaſts.

In what ſenſe we ſaid Elephants had religion.

But for that I have written of the Religion of Elephants, if I muſt ſpeake according to the truth of the matter, wee cannot ſay they worſhip God, or have any ſenſe of the divine Majeſty. For how can they have any knowledge of ſublime things or of God, ſeeing they wholy following their foode, know not how to meditate on celeſtiall things? Now for that they behold and turne themſelves to the Moone by night, and to the Sunne in the morning, they doe not that as worſhipping, or for that they conceive any excellency or divinitie in the Sunne; but becauſe nature ſo requiring and leading them, they feele their bodyes to rejoyce in that light, and their entralls and humors to move and ſtirre them to it. Therefore when we attributed religion to Elephants, we ſaid it rather popularly, than truely, and more that we might exhort men to the worſhip of God,



than that we thought Elephants had any knowledge of divine worſhip implanted in their mindes.

That man may attaine unto the knowledge of all voyces and tongues.

THe docility of mans wit is ſo great, and the facillity of the body obeying that divine gift of wit ſuch, that he is not onely able to learne to underſtand and ſpeak

Man not onely the imitater, but the interpreter of the voices of beaſts and birds.

the tongues of diverſe nations differing in ſo many peculiar languages; and not only to imitate and counterfeit the voyces of all beaſts though ſo much different from man, which many flattering and jugling companions, followers of other mens tables, will doe; but alſo may be able to know and underſtand both what they pretend and ſignifie. In confirmation of which thing they cite the Philoſopher *Apollonius* moſt famous in this kind of ſtudy and knowledge. He walking on a time amongſt a company of his friends thorough the field, and ſeeing a Sparrow come flying and chirping much to diverſe other Sparrowes ſitting upon a tree, is reported, to have ſaid to thoſe which were with him: That bird, which came flying hither, told the other in her language; that an Aſſe laided with corne was fallen downe at the City gate, and had ſhed the wheat upon the ground. Wherefore *Apollonius* and all his friends which were with him went thither to ſee whether it were ſo, and found that it was ſo, as he had told them, and obſerved that the Sparrowes moved thereto by the comming of the other, were eating up the graines of Corne ſhed on the ground.

The unquenchable deſire of learning in man.

But for Crowes and Pyes artificially taught to counterfeit mens voyces, it is too ſmall a thing, that for that cauſe they ſhould contend with men. For they have quickly babled all they have learnt with longer coſt and labour, tediouſly ſinging ſtill the ſame ſong, and whatſoever they prate they doe it without ſenſe, underſtanding or any reaſon for what they ſay. But man alwaies contemplating ſomewhat more high, ſtill thinkes of greater things than theſe preſent, and never reſts. But burning with an infinite and endleſſe deſire of knowledge, hee doth not onely covet to know theſe things which appertaine to food and clothing, but by caſting up his eyes towards heaven, and by the light of his minde, he learnes and underſtands things divine. Which is ſo certaine an argument of the celeſtiall originall of our ſoule, that hee which conſiders thoſe things can no wayes doubt, but that we have our minds ſeaſoned, by the univerſall divine underſtanding. But now it is time for us to ſet upon the deſcription of the body, the habitation and fit inſtrument of all the functions of that divine minde.

The ende of the ſecond Booke.

THE THIRD BOOKE TREATING OF THE Anatomy of Mans body.

I Following cuſtome and the manner of ſuch as before me have written of Anatomy, will firſt, (that I may make the mindes of the Readers more attentive and deſirous of theſe ſtudies) declare how neceſſary it is, and alſo how profitable, and then ſhew the order to bee obſerved in it, before I come to the particular deſcription of mans body.

The neceſſitie of the knowledge of Anatomy.

Initio lib. de Offic. medici.

Lib. de oſſibus.

1. de loc. affect. & lib. 3. Meth.

Furthermore, how Anatomy may bee defined, and the manner of the definition of the parts. For the firſt, the knowledge of Anatomy ſeemes in my judgement very neceſſary to thoſe that deſire to excell, or attaine to perfection of Phyſicke; that is, whereby they may be able to preſerve the preſent health of the body, and the parts thereof, and drive away diſeaſes. For how can either Phyſition or Chirurgion preſerve health by the uſe of the like things, which conſiſts in the temperament, conformation, and naturall union of the parts; or expell the diſeaſe which hurts thoſe three, by the like uſe of their contraries, unleſſe he ſhall know the nature and compoſure of the body, and underſtand as by the rule of this knowledge, how much it ſwerves from the nature thereof? Wherefore it is excellently ſaid of *Hippocrates*; that the Phyſition called to cure the ſicke Patient, ought diligently to conſider, whether thoſe things that are in him, or appeare to be in him, be like or unlike, that is, whether the Patient be like himſelfe and his owne nature in all his parts and functions, temperature, compoſure and union; that hee may preſerve thoſe which are yet contained in the bounds of nature, and reſtore thoſe that are gone aſtray. Which thing *Galen* hath alſo confirmed, ſpecially where hee ſaith; hee muſt well know the nature and ſtructure or compoſure of the bones, who takes upon him to reſtore them broken or diſlocated to themſelves and their proper ſeates or places. Moreover ſeeing that healing doth not onely conſiſt in the knowledge of the diſeaſe, but as well in preſcribing fit medicines and like application of them to the body and the parts thereof, all which by their naturall diſſimilitude, doe require unlike medicines, according to *Galens* opinion: I prethe tell mee, who can performe this, which is ignorant of the deſcription of the whole and the parts thereof, taught by Anatomie? We may ſay the like of the Apothecarie, who ignorant of the ſcituation of the parts in the body, cannot apply Emplaiſters, Ointments, Cataplaſmes, Fomentations, Epithemes, bagges to the fit places, as to the ſutures of the skull, to the Heart, Liver,

Stomacke,

Why when the liver is hot, the ſtomacke is commonly cold.

Stomacke, Spleene, Reines, Wombe or Bladder. For example, let us imagine the Liver to be troubled with a hot diſtemperature, but on the contrary the ſtomacke with a cold (which commonly happens, ſeeing the Liver hotter than it ought to be, ſends up many vapours to the head; from whence cold humors fall into the ſtomacke) if hot things to be applied to the ſtomacke by the Phyſitions preſcription, be by the Apothecarie making no difference, applied both to the ſtomacke and neighbouring Liver (which may chance if hee be ignorant that the ſtomacke bends ſomewhat to the left ſide under the breaſt-blade; but the liver ſo takes up the right ſide of the body that with a great parr thereof, it covers almoſt all the ſtomacke) will not he much offend by encreaſing the hot diſtemper of the liver, and not thereby giving eaſe, or helpe to the diſeaſe? Shall not by this his ignorance, the Patient be fruſtrated of his deſire, the Phyſition of his intent, and the medicine of its effect? By theſe examples I thinke it moſt manifeſt, that the Anatomicall knowledge of the parts of the body is exceeding neceſſary to all Phyſitions, Chirurgions, and Apothecaries, who will practiſe Phyſicke with any praiſe to the glory of God, and the benefit and good of man, for whoſe ſake wee have writ theſe things, and illuſtrated them by figures, ſubjecting the parts to the eye, and fitly put them in their proper places,

The knowledge of Anatomy, is commodious foure manner of wayes.

But Anatomy is commodious foure manner of wayes; the firſt is, becauſe thus we are led to the knowledge of God the Creator, as by the effect to the cauſe; for as we reade in Saint *Paul*, The inviſible things of God are made manifeſt by the viſible. The ſecond is, That by meanes hereof wee know the nature of mans body, and the parts thereof, whereby wee may more eaſily and certainely judge and determine of ſickneſſe and health. The third is, that by the knowledge of the body and its parts, and together therewith its affections and diſeaſes, wee may prognoſticate what is to come, and foretell the events of diſeaſes. Laſtly, the fourth is, that conſidering the nature of the diſeaſed part, we may fitly preſcribe medicines, and apply them in their due places.

There is a threefold method.

Now we muſt declare in what order Anatomie may be fitly delivered; but firſt we muſt obſerve there is a threefold Methode; The firſt is called of Compoſition, being very commodious for the teaching of Arts, which *Ariſtotle* hath uſed in his Workes of Logicke, and naturall Philoſophy, the order and beginning taken from the leaſt and moſt ſimple to the more compound. The ſecond of Diviſion, fit for the inventing or finding out of ſciences. *Galen* hath followed this order in his Bookes of Anatomicall Adminiſtrations, and of the uſe of the parts. The third of Definition, which ſheweth the nature and eſſence of things, as appeares by *Galen* in his Booke *De Arte parva*. And becauſe this order doth alſo proſecute the diviſions, therefore it is commonly accuſtomed to bee comprehended in the compaſſe of the ſecond.

The Authors intent.

Therefore I will follow this in my Anatomicall Treatiſe, deviding mans body into its parts, which I will not onely ſubject to the eye in the way of knowing them, but alſo to the minde in the faithfull underſtanding them. For I will adjoyne thoſe things that are delivered of them by *Galen* in his Booke of Anatom. Adminiſtrations, with thoſe which hee hath taught in his Bookes of the uſe of the parts. For there hee fitly laies the parts of mans body before our eyes, to the ſenſe. But here he teaches to know them, not to ſee them; for hee ſhewes why, and for what uſe they are made. Having briefely handled theſe things, wee muſt declare what Anatomy is; that as *Cicero* ſaith out of *Platoes Phædro*, it may be underſtood of what we diſpute. And becauſe we attaine that by definition (which is a ſhort and plaine ſpeech, conſiſting of the *Genus* and difference of the things defined, being the eſſentiall parts, by which the nature and eſſence of the thing, is briefly and plainely explained) firſt we define Anatomy, then preſently explaine the particular parts of the definition.

What Anatomie is.

Wherefore Anatomy, (if you have regard to the name) is a perfect and abſolute deviſion, or artificiall reſolution of mans body into its parts, as well generall as particular, as well compound as ſimple. Neither may this definition ſeeme illegitimate, ſpecially amongſt Phyſitions and Chirurgions. For ſeeing they are Artizans humiliated to the ſenſe, they may uſe the proper and common qualities of things for their eſſentiall differences and formes. As on the contrary, Philoſophers may refuſe all definitions as ſpurious, which conſiſt not of the next *Genus* and the moſt proper, and eſſentiall

How a definition differs from a deſcription.

ſentiall differences. But ſeeing that, through the imbecilitie of our underſtanding, ſuch differences are unknowne to us, in their places we are compelled in defining things, to draw into one many common and proper accidents, to finiſh that definition which we intend, which for that cauſe wee may more truly call a deſcription, becauſe for the matter and eſſentiall forme of the thing, it preſents us onely the matter adorned with certaine accidents. This appeares by the former definition, in which *Diviſion* and *Reſolution* ſtand for the *Genus*, becauſe they may be parted into divers others, as it were into *ſpecies*. That which is added over and beſides, ſtands in place of the difference, becauſe they ſeparate and make different the thing it ſelfe from all other raſh and unartificiall diſſections. We muſt know an artificiall diviſion, is no other than a ſeparation of one part from another, without the hurt of the other, obſerving the proper circumſcription of each of them; which if they periſh or be defaced by the diviſion, it cannot be ſaid to be artificiall; and thus much may ſuffice for the parts of the definition in generall.

For as much as belongs to the explication of each word; we ſaid *of Mans body*, becauſe, as much as lies in us, we take care of, preſerve the health, and depell the diſeaſes thereof, by which it may appeare that mans body is the ſubject of Phyſicke, not as it is mans, or conſiſts of matter and forme, but as it is partaker of health and ſickneſſe.

The Subject of Phyſicke.

Wee underſtand nothing elſe by a part, according to *Galen*, than ſome certaine body, which is not wholy disioyned, nor wholy united with other bodies of their kindes; but ſo that, according to his opinion, the whole being compoſed therewith, with which in ſome ſort it is united, and in ſome kinde ſeparated from the ſame, by their proper circumſcription. Furthermore by the *parts in generall*, I underſtand the head, breaſt, belly, and their adjuncts. By the particular parts of thoſe, I underſtand, the ſimple parts, as the ſimilar, which are nine in number, as a griſtle, bone, ligament, membrane, tendon, nerve, veine, arterie, muſculous fleſh; ſome adde fibers, fat, marrow, the nailes and haires; other omit them as excrements; but wee muſt note that ſuch parts are called ſimple, rather in the judgement of the ſenſe, than of reaſon. For if any will more diligently conſider the nature, they ſhall finde none abſolutely ſimple, becauſe they are nouriſhed, have life and ſenſe, either manifeſt or obſcure, which happens not without a nerve, veine, and artery.

Gal lib. 1. de vſu part. lib. 1. Meth.

The ſimular parts are 9.

But if any ſhall object, that no nerve is communicated to any bone, except the teeth; I will anſwer, that neverthele ſſe the bones have ſenſe by the nervous fibers, which are communicated to them by the *Perioſteum*, as by whoſe mediation the *Perioſteum* is connext to the bones, as we ſee it happens to theſe membranes, which involue the bowels. And the bones, by this benefit of the animall ſenſe expell the noxious and excrementitious humors from themſelves into the ſpaces betweene them and the *Perioſteum*, which as indued with a more quicke ſenſe, admoniſheth us, according to its office and dutie, of that danger which is ready to ſeaze upon the bones, unleſſe it be prevented. Wherefore wee will conclude according to the truth of the thing, that there is no part in our body ſimple, but only ſome are ſo named and thought, according to the ſenſe; although alſo otherwiſe ſome may be truly named ſimple, as according to the peculiar and proper fleſh of each of their kindes. Thoſe parts are called compound which are made or compoſed by the mediation, or immediately of theſe ſimple, which they terme otherwiſe organicall or inſtrumentall; as an arme, legge, hand, foote, and others of this kinde.

How the bones come to feele.

The compound, or organicall parts.

And here wee muſt obſerve, that the parts are called ſimple and ſimilar, becauſe they cannot be devided into any particles but of the ſame kinde; but the compound are called diſſimular from the quite contrary reaſon. They are called inſtrumentall and organicall, becauſe they can performe ſuch actions of themſelves, as ſerves for the preſervation of themſelves and the whole; as the eye of it ſelfe, without the aſſiſtance of any other part, ſeeth, and by this faculty defends the whole body, as alſo it ſelfe. Wherefore it is called an inſtrument or organe, but not any particle of it, as the coates, which cannot of it ſelfe performe that act. Whereby wee muſt underſtand, that in each inſtrumentall part we muſt diligently obſerve foure proper parts. One by which the action is properly performed, as the Cryſtalline humour in the eye,

Foure particles to be obſerved in each organicall part.

eye; another without which the action cannot be performed, as the nerve & the other humors of the eye. The third, whereby the action is better and more conveniently done, as the tunicles and muſcles. The fourth, by which the action is preſerved, as the eye-lids and circle of the eye. The ſame may be ſaid of the hand, which is the proper inſtrument of holding, for it performes this action; firſt by the muſcle, as the principall part; Secondly, by the ligament, as a part without which ſuch action cannot be performed. Thirdly by the bones and nailes, becauſe by the benefit of theſe parts, the action is more happily performed. Fourthly, by the veines, arteries and skin, for that by their benifite and uſe, the reſt, and ſo conſequently the action it ſelfe is preſerved.

Foure ſorts of inſtrumentall parts.

But we muſt conſider, that the inſtrumentall parts have a fourefold order. They as ſaid to be of the firſt order, which are firſt and immediately compoſed of the ſimple, are onely the authors of ſome one action, of which kinde are the muſcles and veſſels. They are of the ſecond which conſiſt of theſe firſt ſimple, and others beſides, as the fingers. They are counted of the third rancke, which are compoſed of parts of the ſecond order and ſome beſides, as the hand taken in generall. The fourth order is the moſt compoſed, as the whole body, the organ and inſtrument of the ſoule. But you muſt obſerve, that when we ſay the muſcles and veſſels are ſimple parts, we refer you to the ſenſe and ſight, and to the underſtanding, comparatively to the parts which are more compound; but if any conſider their eſſence and conſtitution, he ſhall underſtand they are truly compound, as we ſaid before. Now it remaines, that wee underſtand, that in each part, whether ſimple or compound, nine things are to bee conſidered, as ſubſtance, quantitie or magnitude, figure, compoſition, number, connexion, (by which name, we alſo underſtand the orginall and inſertion) temperature, action, and uſe; that by the conſideration of theſe things, every one may exerciſe the art of Phyſicke, in preſerving health, curing diſeaſes, or foreſeeing their events and ends.

Nine things to be conſidered in each part.

Why the three principall parts are ſo called.

But alſo wee muſt note, that of the organicall parts, there be three, by whoſe power the body is governed; which for that cauſe they call regent and principall; becauſe they governe all the reſt; they are the liver, heart, and braine. But they are called principall, not onely becauſe they are neceſſary for life (for the ſtomacke, winde-pipe, lungs, reines, bladder, and ſuch like parts perhaps are equally as neceſſary for life) but becauſe from each of theſe three, ſome force, power, and facultie, or alſo matter neceſſary for the whole body, flow over all the body, when no ſuch thing proceeds from the reſt of the parts. For from the liver a matter fit for nouriſhment, is diſtributed by the veines through all the body; from the heart the vitall force diffuſed by the arteries, imparts life to the whole body; from the braine by the nerves a power or facultie is carried through all the parts of the body, which gives them ſenſe and motion.

Lib. de Arte medica.

Galen would have the Teſticles to be of this kinde, not for the neceſſitie of the individuall, or peculiar body, but for the preſervation of the *Species* or kind. And moreover in his book *de Semine* comparing the Teſticles with the heart, he makes them the more noble by this reaſon, that by how much it is better to live well and happily, than ſimply and abſolutely to live, by ſo much the teſticles are more excellent than the heart, becauſe with them wee may live well and pleaſantly, but with this ſimply live, as we ſee by the example of Eunuches, and ſuch as are gelt, by which the Teſticles ſeeme rightly to be accounted amongſt the principall parts; for nature ſeeing it deſired, that this its worke ſhould be immortall, for the attaining of that immortality which it intends, frames thoſe parts, like as prudent founders of a Citie, who doe not onely procure to furniſh their citie with many inhabitants, ſo long as they are in building it, but alſo that it may remaine in the ſame ſtate and condition for ever, or at leaſt for many ages. And yet notwithſtanding of ſo many cities built in the firſt memory of man, there remaines none, whoſe fame and ſtate, together with the builders name is not decaied and periſhed. But this humane worke of nature, ſtands yet ſecure for this many thouſand of yeares, and ſhall endure hereafter, becauſe it hath found a way, by which every one may ſubſtitute another in his place before he depart. Hence it is that all creatures have members fit for generation, and pleaſures inſerted

The uſe and function of the parts ſerving for generation.

in thoſe members, by which they might be inticed to mutuall embraces and copulations. But the mind, which hath dominion over thoſe members, hath an incredible deſire of propagating the iſſue, by which alſo brute beaſts incited, deſire to propagate their kinds for ever. For ſeeing that nature underſtands all theſe her workes conſidered particularly by themſelves, are fraile and mortall, it hath done what it could to recompence that fatall neceſſitie of dying, by a perpetuall ſucceſſion of individuals.

Hitherto we may ſeeme to have aboundantly ſhewed what neceſſitie of knowledge in Anatomy belongs to all Artizans in Phyſicke, and alſo what order is to be obſerved in the ſame. And laſtly, how it is defined, and the reaſon of the parts of the definition. Wherefore it remaines that wee proſecute what wee have taken in hand; which is, that wee ſhew and declare how to know all and every the parts of mans body, how many, and what they be, and to underſtand wherefore they be. For although the true knowledge of Anatomy may be perfected by the ſight of the eye, and touching and handling each part with the hand, yet nevertheleſſe the labour of deſcribing Anatomy is not unprofitable. For by reading, ſuch as have often exerciſed themſelves in the diſſecting of mens bodies may refreſh and helpe their memories, and ſuch as have not, may make plaine and eaſie the way to the underſtanding of diſſections.

CHAP. I.

The Diviſion or partition of Mans body.

BY reaſon the partition of mans body can hardly be underſtood, if the diſtinction of the proper faculties of the ſoule be not underſtood, for whoſe cauſe the body enjoyes that forme (which wee ſee) and deviſion into divers inſtruments; Therefore I thought good in few words to touch that diſtinction of the faculties of the ſoule, for the better underſtanding of the partition of the body which wee intend. Wherefore the ſoule, the perfection of the body, and beginning of all its functions, is commonly diſtinguiſhed and that in the firſt and generall diviſion, into three faculties, which are the Animall, vitall, and naturall. But the Animall is devided into the principall, ſenſitive, and motive; Againe, the principall is diſtinguiſhed into the imaginative, reaſonable, and memorative. And the ſenſitive into Seeing, Hearing, Smelling, Taſting, and Touching. But the motive into progreſſive and apprehenſive. And the vitall is devided into the dilative, and contractive facultie of the heart and arteries, which we know or underſtand by the pulſificke facultie. But the naturall is parted into the nutritive, auctive, and generative faculties; which three performe their parts by the helpe and miniſterie of five other faculties, which are, the Attractive, Retentive, Concoctive, Aſſimulative, and Expulſive.

What the ſoule is, and with how many faculties it is endewed.

After the ſelfeſame manner, the organ or inſtrument of the ſoule, to wit, Mans body, at the firſt diviſion is diſtinguiſhed into three parts, which from their office they call Animall, vitall, and naturall. Theſe againe, according to the ſubdiviſion of the ſubalternall faculties, are devided particularly into other parts; ſo that any one may know the organe of each facultie, by the propertie of the function. For while other Anatomiſts devide mans body into foure univerſall and chiefe parts, they diſtinguiſh from the three firſt, thoſe which they call the Extremities; neither doe they teach to what rancke of the three prime parts each extremitie ſhould be reduced. From whence many difficulties happen in reading the writings of Anatomiſts; for ſhunning whereof, we will proſecute, as wee have ſaid, that diſtinction of mans body, which we have touched before.

All the parts of mans body are diſtinguiſhed into three.

Wherefore, as wee ſaid before, mans body is devided into three principall and generall parts, Animall, Vitall, and Naturall. By the Animall parts, wee underſtand not onely the parts pertaining to the head, which are bounded with the crowne of the head, the coller-bones, and the firſt *Vertebra* of the breaſt, but alſo the extremities,

What parts are here called Animall.

Lib,6,Epidem,

ties, becauſe they are organs and inſtruments of the motive facultie; *Hippocrates* ſeemes to have confirmed the ſame, where hee writes; Thoſe who have a thicke and great head, have alſo great bones, nerves, and limbs. And in another place hee ſaith, thoſe who have great heads, and when they ſtoope ſhew a long necke, ſuch have all their parts large, but chiefly the animal. Not for that *Hippocrates* would therefore have the head the beginning and cauſe of the magnitude and greatneſſe of the bones, and the reſt of the members; but that he might ſhew the equallity, and private care or government of nature, being moſt juſt and exact in the fabricke of mans body, as if ſhe hath well framed the head, it ſhould not be unlike, that ſhee idlely or careleſly neglected the other parts which are leſſe ſeene. I thought good to dilate this paſſage, leaſt any might abuſe that authoritie of *Hippocrates*, and gather from thence, that not onely the bones, membranes, ligaments, griſtles, and all the other animall parts, but alſo the veines and arteries depend on the head as the originall. But if any obſerve this our diſtinction of the parts of the body, he will underſtand wee have a farre other meaning.

What parts are called vitall,

The deviſion of the animall parts.

The deviſion of the vitall parts.

The deviſion of the naturall parts.

By the vitall parts, we underſtand onely the heart, arteries, lungs, winde-pipe, and other particles annexed to theſe. But by the naturall, wee would have all thoſe parts underſtood which are contained in the whole compaſſe of the *Peritonæum* or Rim of the body, and the proceſſes of the *Erythroides*, the ſecond coate of the Teſticles. For as much as belongs to all the other parts, which we call containing; they muſt be reckoned in the number of the animall, which notwithſtanding, we muſt thus devide into principall, ſenſitive, and motive; and againe, each of theſe in the manner following. For firſt the principall is devided into the imaginative, which is the firſt and upper part of the braine, with its two ventricles and other annexed particles; into the reaſoning, which is a part of the braine, lying under the former, and as it were the toppe thereof with its third ventricle. Into the memorative, which is the *cerebellum* or afterbraine, with a ventricle hollowed in its ſubſtance. Secondly, the ſenſitive is parted into the viſive, which is in the eyes; the auditive, in the eares; the ſmelling, in the noſe; the taſting, in the tongue and palate; the tactive, or touching which is in the body, but moſt exquiſite in the skinne which inveſts the palmes of the hands. Thirdly, the motive, is devided into the progreſſive, which intimates the legges, and the comprehenſive, which intimates the hands. Laſtly, into ſimply motive, which are three parts, called bellies, for the greateſt part terminating and containing; for the vitall, the inſtrument of the faculty of the heart, and dilatation of the arteries, are the direct or ſtreight fibers, but of the conſtrictive the tranſverſe; but the three kinds of fibers together, of the pulſificke; or if you pleaſe you may devide them into parts ſerving for reſpiration, as are the lungs, and weazon, and parts ſerving for vitall motion, as are the heart and arteries, furniſhed with theſe fibers, which we formerly mentioned. The deviſion of the naturall parts remaines, which is into the nouriſhing, auctive and generative, which againe are diſtributed into attractive, univerſall, and particular; retentive, concoctive, diſtributive, aſſimulative, & expulſive. The attractive, as the gullet and upper orifice of the ventricule; the retentive, as the *Pylorus* or lower paſſage of the ſtomacke; the concoctive, as the body of the ventricle, or its inner coate; the diſtributive, as the three ſmall guts; the expulſive, as the three great guts; we may ſay the ſame of the liver, for that drawes by the meſaraicke and gate veines, retaines by the narrow orifices of the veines diſperſed through the ſubſtance thereof; it concocts by its proper fleſh; diſtributes by the hollow veine, expels by the ſpleene, bladder of the gall and kidneies. We alſo ſee the parts in the teſticles devided into as many functions; for they draw by the preparing veſſels; retaine by the varicous crooked paſſages; in the ſame veſſels they concoct the ſeed by the power of their proper ſubſtance and facultie; they diſtribute by the ejaculatorie, at the glandules called *Proſtata*, and the hornes of the wombe, ſupplying the place of proſtates; Laſtly, they expell or caſt forth by the proſtates, hornes, and adjoyning parts. For as much as belongs to the particular attraction, retention, concoction, diſtribution, aſſimulation of each part, that depends of the particular temper, and as they terme it, occulte propertie of each ſimilar and ſimple part. Neither doe theſe particular actions differ from the univerſall, but that the generall are performed by the aſſiſtance of the three ſorts of fibers, but the ſpeciall by the ſeverall occult propertie of their fleſh, ariſing from their temperature, which we may call a ſpecificke propertie. Now in the compoſition of mans body, nature principally aimes at three things. The firſt is, to create parts neceſſary for life, as are the heart, braine, and liver. The ſecond, to bring forth other for the better and more commodious living, as the eyes, noſe, eares, armes and hands. The third is, for the propagation and renewing the *ſpecies* or kind, as the privie parts, teſticles, and wombe. And this is my opinion, of the true diſtinction of mans body, furniſhed with ſo many parts, for the performance of ſo many faculties; which you, if you pleaſe, may approve of and follow. If not, you may follow the common and vulgar, which is, into three bellies, or capacities, the upper, middle, lower (that is, the head, breaſt and lower belly) and the limbs or joints. In which by the head we doe not underſtand all the Animall parts, but onely thoſe which are from the crowne of the head to the firſt *vertebra* of the necke, or to the firſt of the backe, if according to the opinion of *Galen Lib. de oſsibus*, where he makes mention of *Enarthroſis* and *Arthrodia*, we reckon the necke amongſt the parts of the head. By the breſt, whatſoever is contained from the coller bones to the ends of the true and baſtard, or ſhort ribbs, and the midriffe. By the lower belly, the reſt of the trunke of the body, from the ends of the ribbs to the ſhare-bones; by the limbs, we underſtand the armes and legges. We will follow this diviſion in this our Anatomicall diſcourſe, becauſe wee cannot follow the former in diſſecting the parts of mans body, by reaſon the animall parts are mutually mixed with the vitall and naturall, and firſt of the lower belly.

The vulgar diviſion of mans body.

Nature would not have this lower belly bony, becauſe the ventricle might bee more eaſily dilated by meate and drinke, children might grow the better, and the body be more flexible. It is convenient we beginne our Anatomicall adminiſtration from this, becauſe it is more ſubject to putrifaction than the reſt, both by reaſon of its cold and moiſt temperature, as alſo by reaſon of the feculent excrements therein contained. Yet before we goe any further, if the Anatomicall adminiſtration muſt be performed in publike, the body bring firſt handſomely placed, and all the inſtruments neceſſary for diſſection made ready, the belly muſt be devided into its parts, of which ſome containe, and otherſome are contained.

Why the belly is not bony.

They are called containing, which make all that capacity which is terminated by the *Peritonæum* or Rim of the belly. The vpper part whereof is bounded by *Galen* within the compaſſe of the direct muſcles, and by a generall name is called *Epigaſtrium*, or the vpper part of the lower belly. That againe is devided into three parts, that is, into that which is above the navell, and which carries the name of the whole, into that which is about the navell, and is called the umbilicall or middle part; and laſtly, into that which is below the navell, called the *Hypogaſtrium*, or the lower part of the lower belly.

The deviſion of the lower belly.

In every of which three parts there be two laterall, or ſide parts to be conſidered, as in the *Epigaſtrium*, the right and left *Hypochondria*, which are bounded above and below, in the compaſſe of the midriffe, and the ſhort ribbs. In the vmbilicall the two Lumbares (ſome call them *Latera* ſides) which on both ſides from the loweſt parts of the breaſt, are drawne to the flankes, or hanch-bones; in the *Hypogaſtrium*, the two *Ilia*, or flankes, bounded with the hanch and ſhare-bones. Neither am I ignorant, the *Ilia* or flankes, which the Greekes call Λαγόες ſignifie all the emptie parts, from the ends of the ribs, even to the hanch-bones, whereupon they alſo call them Κενεῶνες as if you ſhould ſay, empty ſpaces, becauſe they are not encompaſſed with any bone. Yet I thought good that this doctrine of deviding the belly ſhould be more diſtinct, to call the parts which are on each ſide the navell *Lumbares*, and thoſe on the lower part of the lower belly *Ilia*, flankes. But we muſt obſerve that the Ancients have been ſo diligent in deciphering the containing parts, that as exactly as might be, they deſigned the bowells contained in the belly, which being diverſe lie in ſundrie places; for the greater portion of the liver lies under the right *Hypochondrium*; under the left almoſt all the ventricle and ſpleene. Vnder the *Epigaſtrium* the lower orifice of the ventricle, and the ſmaller portion of the liver; In the *Lumbares*, or ſides, in the right and upper part the right kidney, in the lower part towards the flancke, the

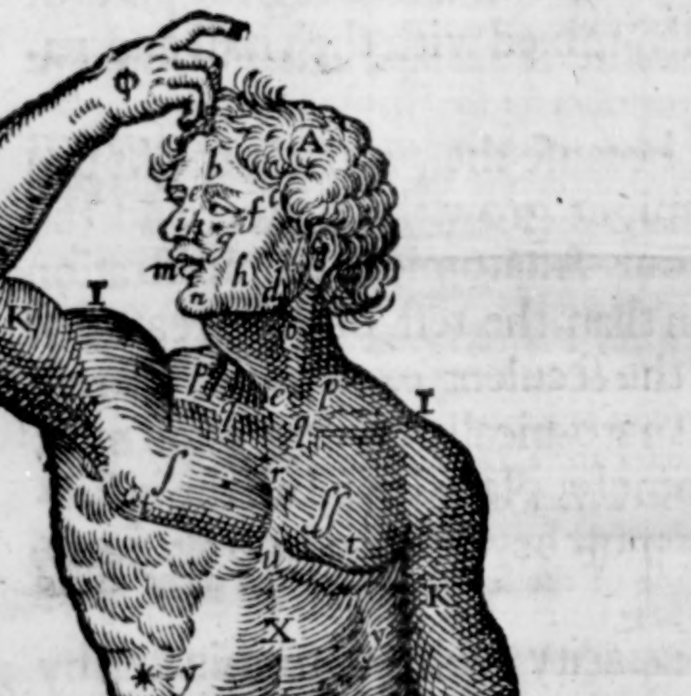
The *Hypochondria*.

blinde gut; in the middle part thereof the collicke and emptie guts. In the upper part of the left ſide lies the left kidney, in the middle part, the reſt of the emptie and collike guts. Vnder the region of the navell, lies the girdle or upper part of the kall, the collike gut thruſting it ſelfe alſo through that way. Vnder the *Ilia* or flankes, the right and left, lie the greater part of the gut Ileon, the hornes of the wombe in women bigge with child, and the ſpermaticke veſſels in men and women. Vnder the *Hypogaſtrium* in the lower part lies the right, or ſtraight gut, the bladder, wombe, and the reſt of the *kall*.

A moſt certaine note of the part affected, by the place where the paine is.

If we know, and well underſtand theſe things, wee ſhall more eaſily diſcerne the parts affect by the place of the paine, and cure it by fit application of remedies, without the hurting of any part. The diſtinction of ſuch places, and the parts in thoſe places, as ſeeming moſt profitable, *I* have thought good to illuſtrate by the placing theſe two following figures, in which thou haſt deciphered, not onely the foreſaid parts, containing, and contained, but alſo of the whole body, and many other things which may ſeeme to conduce to the knowledge of the mentioned parts. The Figures are theſe.

The Figure ſhewing the foreparts of the body.



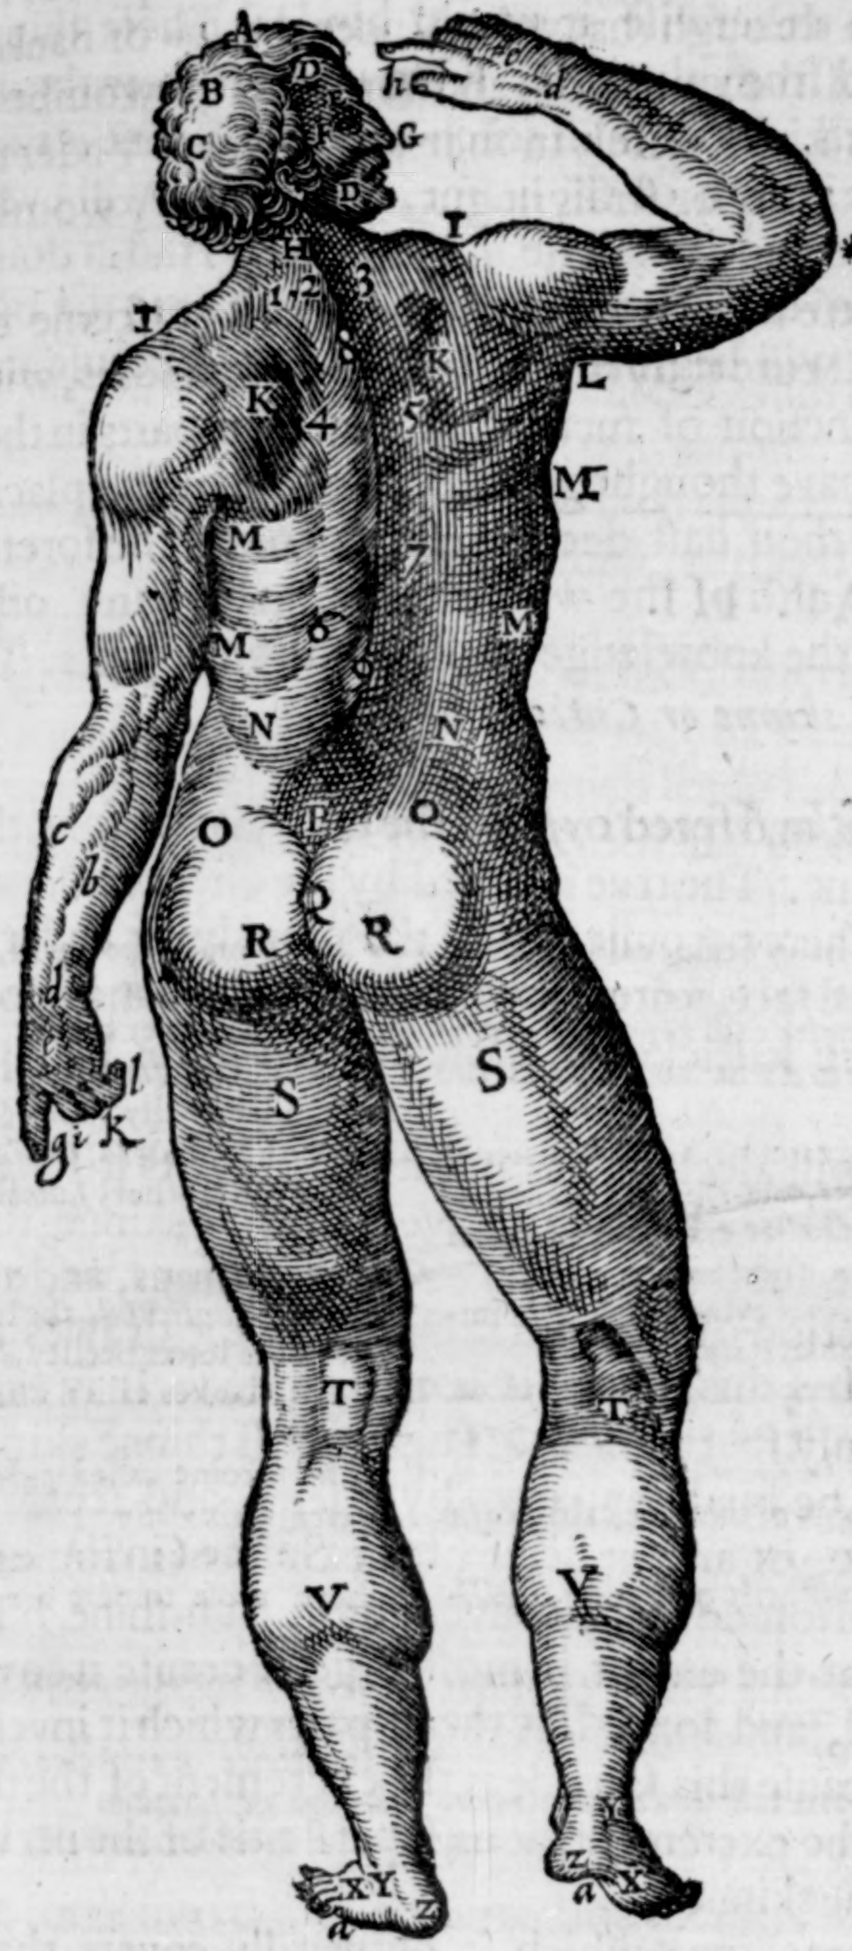
A The hairy Scalp, cald τριχωτὸς.
b the forehead cald *Frons*. μέτωπον.
c the temples cald *tēpora*, κρόταφοι.
From *b* to *d* The compaſſe of the face.
e The greater or inward corner of the eyes, cald *Canthus internus.*
f The leſſer or externall angle of the eye, cald *Canthus externus,*
* The lower eybrow which is immoveable, *Palpebra.*
g The cheek-ball cald *mala*, μῆλα.
h The chek-puf cald *bucca*, γνάθος.
i The ridge of the noſe cald *Naſus externus*, ῥὶν.
k The noſthrils cald *nares*, μυκτῆρες.
l The outward eare; *auris externa.*
m The mouth made of the two lips, *Os.*
n The chin called *mentum*, γένειον.
o The necke, *collum* αὐχὴν and τράχηλος.
From *o.* to *e.* the pillar of the necke, *truncus*, and ὅλμος.
pp The hollow of the necke, called *iuguli*, σφαγαὶ.
qq The patel bones, *claves* κλεῖδες.
r The cheſt *pectus*, στέρνον.
ſ The right breſt.
ſſ The left breſt: to this Region we apply cordiall *Epithemations* moiſt and drie.
tt The nipples of the breſts, *Papillæ* θηλαί.
u The trench of the heart which the Ancients called καρδία. The Latines *ſcrobiculus Cordis*, This part is annointed for the mouth of the ſtomacke.
From *u* to E, the lower belly, γαστήρ.
χ. The *Epigaſtirum* or upper part of the lower belly.
yy. The *Hypocondria* or *Præcordia.*
* The outward Liver-remedies are applied to this place.

Z. The region of the navill, callep *umbilicalis*, or the middle part of the lower belly.
A. The navill *umbilicus*. The roote of the belly ὀμφαλός.
BB. The ſide, *Latera*, πλευραί. and in our Author, *Lumbi ſeu Lumbaris regio.*
C. *Hypogaſtrium*, the water-courſe, *Aqualiculus*, the lower part of the lower beelley, ἦτρον.
DD. The flankes called *Ilia* and κενεῶνες.
E. The Groine called *pubes* or *pecten*, κτεὶς ἥβη.
FF. The Leske cald *inguen*, where thoſe tumors are cald *Bubones.*
G. the yard with the foreskinne, *penis cumpræputio.*
H. the ſtones or teſticles, with the cod or *ſcrotum.*
II. the ſhoulders *humeri*, ἐπωμίδες.
KK. the armes *Brachia*, βραχίονα.
L. the bowt of the arme, called *Gibber*, ἀγκών.
M. the outſide of the lower part of the arme cald *cubitus* πῆχυς.
N. the wreſt called *Brachiale* καρπός.
O. the after-wreſt *poſtbrachiale*, μετακάρπιον.
P. the Palme called *Palma* or *volo manus*, θέναρ.
φ the backe of the hand *Dorſum manus*, ὀπισθέναρ.
QQ. the fore ann middle part of the thigh, where wee apply cuppingglaſſes to bring downe womens courſes, μηρόν.
RR. the knee, *genus* γόνυ.
SS. the leg, *Tibia* κνήμη.
TT. the calfe of the leg *ſura*, γαστροκνήμιον.
VV. the inſtep, *tarſus*,
XX. the top of the foote *Dorſum pedis*, στῆθος ποδός.

YY. the inner Ankles, σφυρά. ZZ. the outward anckles. αα the toes of the feete, β the place under the inward anckle, where the veine called *Saphena* is opened.

The

The Figure of the backe parts of a man.



A The forepart of the head, *ſynciput*, βρεγμα.
B. the top or crowne of the head *vertex*, κορυφή.
C. the hinder-part of the head, *occiput*, κότις καὶ ἰνιὸν.
From D. to D. the face, *Facies*. πρόσωπον.
*E. the eyebrowes *ſupercilia*, ὀφρῦς.
F. the upper eye-lid, βλέφαρον.
* The tip of the noſe cald *globulus naſi*.
H. the backe part of the necke, cald *cervix*, αὐχήν. and the nuke or nape of the necke. There is a hollownesſe at the top of this *cervix*, where wee apply Seatons.
I. the backe part of the ſhoulder top, called *axilla*, ὦμος.
KK. the ſhoulder blades *ſcapulæ*, ὠμοπλάται.
1,2,3. On this place wee ſet cupping glaſſes.
4,5,6,7. the backe *dorſum*, νῶτον.
8,9. the ridge, *ſpina dorſi*, ῥάχις.
L the arme hole, *ala*, μασχάλη.
* the elbow, *Gibber brachij*.
M M M M. the ſides, *Latera*.
N N the loines *Lumbi*, or the region of the kidneyes, ὀσφύες.
O O. the place of the hips, *coxendices*, where we apply remedies for the Sciatica.
P. the place of the holy-bone, or *Os ſacrum* where we apply remedies in the diſeaſes of the right gut.
Q. the place of the Rumpe or *Coccyx*.
RR. the buttocks *Nates*, κλῶνες.
SS. the backe parts of the thigh, *Femen*.
TT. the ham, *Poples*, ἰγνύς.
VV. the calfe of the leg, *ſura*.
XX. the foote or *paruus pes*, πούς.
YY. the utter ancle, *Malleolus externus*.
ZZ. the heele, *calx* or *calcaneus*, πτέρνα.
aa the ſole of the foote *Planta pedis*, κοῖλον τοῦ ποδός.
b the inſide of the lower part of the arme called *Vlna*, ὠλένη.
c. the outſide of the ſame, *Cubitus* πῆχυς.
dd the wreſt, *Carpus*
ee the backe part of the hand, *dorſum manus*. *g*. the forefinger *index* λειχανός. *h*, the thumb, *pollex*, ἀντίχειρ.
i the middle finger, *medius*, μέσος.
k the rig-finger *Annularis*, *medicus*, ἰατρικός.
l. the little finger, *Auricularis*, *minimus*, ὠτίτης.

CHAP. II.

Of the containing parts of the Epigaſtrium, *and the preparation to Anatomicall adminiſtration.*

The containing parts of the lower belly.

THe containing parts of the *Epigaſtrium* are the *Epidermis* or thinne outward skinne, the true skinne, the fleſhie or fatty Panncle, the eight muſcles of the *Epigaſtrium* with their common coate, the Rim of the belly, the five vertebra's of the loines, all the holy-bone, the hanch-bone, ſhare-bone, the white line, and midriffe. Of theſe parts ſome are common to the whole body, as the three firſt; the other proper to the parts contained in the *Epigaſtrium* taken in generall. Which that you may ſee in their order, firſt you muſt cut round about the navell, to the upper ſuperficies of the muſcles, that ſo wee may keepe it, till ſuch time, as occaſion ſhall offer it ſelf, to ſhew the umbilicall veſſels lying in that place, which are one veine, two arteries, & the *vrachus* (if it be there.) Which being done, you muſt draw a ſtraight line from the cheſt, over the breaſt-blade, even to the ſhare-bone, which may divide the common containing parts, even to the white line.

Then preſently it will be convenient to draw two other lines acroſſe, or overtwhart, of the like depth on each hand, from the circumference of the navell, even to the ſides, that ſo on each part wee may draw the skinne more commodiouſly from the parts lying vnder it; the ſight of which otherwiſe it would hinder. Theſe things being done, the skinne muſt bee devided from the parts lying under it from the deſigned circumference left about the navell. Wee muſt teach how the skinne is twofold, the true and falſe, and render a reaſon of the name, which we will every where doe, as farre as the thing will ſuffer, and it ſhall lie in our power. And in doing or examining theſe things, it will be convenient diligently to inquire into the nine things mentioned in the preface. Wee will beginne with the skinne, becauſe that part is firſt obvious to our ſenſes.

CHAP. III.

Of the utmoſt skinne or Cuticle.

The skinne twofold. From what parts the skin cannot be ſeparated.

THe skinne being the firſt part, and ſpred over all the body, is twofold, that is, the true, and baſtard skinne. The true is called by the Greekes *Derma*, which may almoſt every where be pulled from the parts lying under it, which it inveſts; except in the face, eares, the palmes of the hands, ſoles of the feete, fingers, and privities, where it ſtickes ſo cloſe that it cannot be ſeparated.

The matter of the Cuticle.

Thequantitie.

The figure. The compoſure.

The baſtard (which firſt of all wee will declare, becauſe it firſt preſents it ſelfe to our ſight) is by the Greekes called *Epidermis*; becauſe it covers the true skinne, they terme it commonly the Cuticle. The ſubſtance of it is excrementitious, and as it were a certaine drie flouring, or production of the true skinne. That it drawes not its ſubſtance from the ſeede is apparent by this, that as it is eaſily loſt, ſo it is eaſily repaired, which happens not in parts truly ſpermaticall. This utmoſt thinne skinne, or cuticle, may two manner of wayes be made apparent by it ſelfe, and ſeparated from the other, as by burning with fire, or ardent heate of the Sunne (in ſome delicate bodies, and ſuch as are not accuſtomed to be converſant in Sun-ſhine.) The quantitie in thickneſſe is very ſmall; but the extent is moſt large, becauſe it covers all the skinne; the figure of it is round, and long, like thoſe parts which it inveſts. The compoſure of it is obſcure; yet becauſe this Cuticle is the excrement of the true skinne, wee ſay it hath its matter from the excrementitious ſuperfluitie of the nerves, veines, arteries, and ſubſtance of the true skinne.

The number.

The temperatuer.

The uſe

Why the cuticle cannot be reſtored in ſcars.

It is in number one, like as the true skinne which it outwardly covers, that it might be a *medium* betweene the object, and fixed facultie of touching, diffuſed over all the true skinne which every where lies under it. For the temperature, by the common conſent of Phyſitions, it is in the midſt of all exceſſe; for that ſeeing it is the *medium* betweene the object and facultie, if it ſhould be hotter, colder, moiſter, or drier, it would deceive the facultie by exhibiting all objects, not as they are of themſelves, but as it ſhould be; no otherwiſe than as to ſuch as looke through red or greene ſpectacles, all things appeare red, or greene. Wherefore for this reaſon it was convenient the cuticle ſhould be void of all ſenſe. It hath no action in the body; but it hath uſe, for it preſerves and beautifies the true skin; for it ſeemes to be given by the ſingular indulgence of nature, to be a muniment and ornament, to the true skinne. This providence of nature, the induſtrie of ſome Artizans (or rather *Curtizans*) doth imitate, who for to ſeeme more beautifull, doe ſmooth and poliſh it. By this you may underſtand; that not all the parts of the body have action, yet have they their uſe, becauſe, according to *Ariſtotles* opinion; Nature hath made nothing in vaine. Alſo you muſt note that this thinne skinne, or cuticle being loſt, may everie where be regenerated, unleſſe in the place which is covered with a ſcarre. For here the true skinne being deficient, both the matter and former facultie of the cuticle is wanting.

CHAP. IIII.

Of the true skinne.

The ſubſtance.
Magnitude.

THe true skinne called by the Greekes *Derma*, is of a ſpermaticke ſubſtance, wherefore being once loſt, it cannot be reſtored as formerly it was. For in place thereof comes a ſcarre, which is nothing elſe but fleſh dried beyond meaſure. It is of ſufficient thickneſſe, as appeares by the ſeparating from the fleſh.

Figure.

But for the extent thereof it encompaſſes the whole body, if you except the eyes, eares, noſe, privities, fundament, mouth, the ends of the fingers where the nailes grow, that is, all the parts by which any excrements are evacuated. The figure of it is like the cuticle round and long, with its productions, with which it covers the extremities of the parts.

Compoſure.

It is compoſed of nerves, veines, arteries, and of a proper fleſh and ſubſtance of its kinde, which wee have ſaid to bee ſpermaticall, which ariſeth from the proceſſe of the ſecundine, which leade the ſpermaticke veſſels even to the navell, in which place each of them into the parts appointed by nature, ſend forth ſuch veſſels, as are ſpread abroad and diffuſed from the generation of the skinne. Which alſo the ſimilitude of them both, that is, the skinne and membrane *Chorion* do argue. For as the *Chorion* is double, without ſenſe, encompaſſing the whole infant, lightly faſtened to the firſt coate which is called *Amnios*; ſo the skinne is double, and of it ſelfe inſenſible (for otherwiſe the nerves were added in vaine from the parts lying under it) ingirting the whole body, lightly cleaving to the fleſhie Pannicle. But if any object that the Cuticle is no part of the true skinne, ſeeing it is wholy different from it, and eaſily to be ſeparated from it, and wholly void of ſenſe: I will anſwer, theſe arguments doe not prevaile. For that the true skinne is more craſſe, thicke, ſenſible, vivide, and fleſhie, is not of it ſelfe, being rather by the aſſiſtance and admixture of the parts, which derived from the three principall it receives into its proper ſubſtance; which happens not in the cuticle. Neither if it ſhould happen would it be better for it, but verily exceeding ill for us, becauſe ſo our life ſhould lie fit and open to receive a thouſand externall injuries, which encompaſſe us on every ſide, as the violent and contrary acceſſe of the foure firſt qualities.

The skinne of it ſelfe is void of ſenſe.

The number.
Connexion.

There is only one skin, as that which ſhould cover but one body, the which it every where doth, except in thoſe places I formerly mentioned. It hath connexion with the parts lying under it by the nerves, veines, and arteries, with thoſe ſubjacent parts put forth into the skinne inveſting them, that there may be a certaine communion of all the parts of the body amongſt themſelves.

Temperature.

Vſe.

It is cold and drie in its proper temper in reſpect of its proper fleſh and ſubſtance, for it is a ſpermaticall part. Yet if any conſider the ſinewes, veines, arteries, and fleſhie threds which are mixed in its body, it will ſeeme temperate, and placed as it were in the midſt of contrarie qualities, as which hath growne up from the like portion of hote, cold, moiſt, and drie bodies. The vſe of the skinne is to keepe ſafe and ſound the continuitie of the whole body, and all the parts thereof, from the violent aſſault of all externall dangers, for which cauſe it is every where indewed with ſenſe, in ſome parts more exact, in others more dull, according to the dignitie and neceſſitie of the parts which it ingirts, that they might all be admoniſhed of their ſafetie and preſervation. Laſtly, it is penetrated with many pores, as breathing places, as we may ſee by the flowing out of ſweate, that ſo the arteries in their *diaſtole* might draw the encompaſſing aire into the body, for the tempering and nouriſhing of the fixed inbred heate, and in the *Syſtole* expell the fuliginous excrement, which in Winter ſuppreſt by the cold aire encompaſſing us, makes the skinne blacke and rough. Wee have an argument and example of breathing through theſe, by drawing the aire in by tranſpiration, in women troubled with the mother, who without reſpiration live onely for ſome pretty ſpace by tranſpiration.

The reaſon why the skin is blacker and rougher in Winter.

CHAP. V.

Of the fleſhie Pannicle.

AFter the true skinne, followes the membrane, which Anatomiſts call the fleſhy Pannicle, whoſe nature that we may more eaſily proſecute and declare, we muſt firſt ſhew what a membrane is, and how many wayes the word is taken. Then wherefore it hath the name of the fleſhie Pannicle. A membrane therefore is a ſimple part, broade and thin, yet ſtrong and denſe, white and nervous, and the which may eaſily, without any great danger be extended and contracted. Sometimes it is called a coate, which is, when it covers and defends ſome part. This is called the fleſhie Pannicle; becauſe in ſome parts it degenerates into fleſh, and becomes muſculous, as in a man from the coller bones, to the haire of the head, in which part it is therefore called the broad muſcle, where as in other places it is a ſimple membrane, here and there intangled with the fat lying under it, from whence it may ſeeme to take or borrow the name of the fatty Pannicle. But in beaſts (whence it tooke that name, becauſe in thoſe a fleſhie ſubſtance maketh a great part of this Pannicle) it appeares manifeſtly fleſhie and muſculous over all the body, as you may ſee in Horſes, and Oxen; that by that meanes being moveable, they may drive and ſhake off their flies, and other troubleſome things, by their ſhaking and contracting their backs. Theſe things conſidered, we ſay the fleſhie Pannicle in its proper body, is of a nervous or membranous ſubſtance, as that which hath its originall from the coate *Amnios*, (which is next to the infant) dilated neare to the navell and ſtretched forth for the generation of this Pannicle; in which thing I thinke good to note, that as the membranes *Chorion* and *Amnios* mutually interwoven with ſmall nervous fibers, encompaſſe and inveſt the child, as long as it is contained in the wombe; ſo the skinne and fleſhie Pannicle knit together by ſuch like bands, engirt the whole body.

What a membrane, is.

Why it is ſometimes called a coate, ſometimes the fleſhie and fattie Pannicle.

Why beaſts have this pannicle wholy, fleſhie or muſculous.

The ſubſtance

Therefore the fleſhie Pannicle is equall in magnitude and like in figure to the true skinne, but that it lies under it, and is contained in it, in ſome places mixt with the fat, in others encreaſed by the fleſh interwoven with it, and in other ſome is onely a ſimple membrane.

The magnitude and figure.

The compoſition of it is ſuch, as the ſight of it preſents to our eye, that is, of veines, arteries, nerves, and the proper fleſh, ſome whites mixed and interlaced with fat, and ſometimes with muſculous fleſh. It is but one, by reaſon of the uſe wee ſhall preſently ſhew; It is ſituated betweene the skinne and fat, or common coate of the muſcles, annexed to theſe and the other parts lying under it, by the veines, nerves, and arteries aſcending from theſe inward parts, and implanting themſelves into the ſubſtance thereof, and then into the true skinne.

Number.
Compoſure.

The temperature thereof is diverſe, according to the varietie of the parts interwoven with it. The uſe of it is, to leade, direct, and ſtrengthen in their paſſage, the veſſels which are diſſeminated into the true skinne, and the whole ſuperficies of the body. But in beaſts it hath another commoditie, that is, it gives a ſhaking or trembling motion to their skinne and backe, for that cauſe we formerly touched.

The temperature.
The uſe.

CHAP. VI.

Of the Fat.

THe fat comming neare the condition of an excrement, rather than of a part (as we ſaid, when we treated of the ſimular parts) is of an oily ſubſtance, bred of the aiery and vaporous portion of the bloud, which ſweating through the pores of the coates, or mouthes of the veſſels, becomes concreate about the membranes, and nerves, and cold bodies, and turnes into fat by the coldneſſe of the place. Whereby we may know that cold, or a more remiſſe heate, is the efficient cauſe of fat, which is manifeſt by contemplation not onely of creatures of diverſe kindes, but alſo by thoſe of the ſame ſpecies and ſexe, if ſo be that the one be colder than the other.

The fat is rather an excrement than a part.
The ſubſtance

The efficient cauſe of fat.

By which we may underſtand that the fat is the more or leſſe in quantity according to the different temper of the whole body, and of its particular parts; for its compoſition, it conſiſts of that portion of the blood which we formerly mentioned, intermixt with certaine membranes, nervous fibers, veines and arteryes. The greateſt part of it lyes betweene the fleſhy pannicle and the common coate of the Muſcles, * Otherwiſe it is diffuſed over all the body, in ſome places more, in ſome leſſe, yet it is alwaies about the nervous bodyes, to which it delights to cleave. Moſt Anatomiſts enquire whether the fat lye above or beneath the fleſhy pannicle. But methinkes this queſtion is both impertinent and idle; being we often ſee the fat to be on both ſides. It is of a middle temper betweene heat and cold, being it ariſeth of the more aery portion of the blood; although it may ſeeme cold in reſpect of the efficient cauſe, that is, of cold by which it concreats. For the reſt, moiſture is predominant in the fat. The uſe therof is, to moiſten the parts which may become dry by long faſting, vehement exerciſe or immoderate heat, and beſides to give heat, or keep the parts warme. Although it doe this laſt rather by accident, than of its owne nature, as heated by exerciſe, or by ſome ſuch other chance; it heats the adjacent parts, or may therefore be thought to heat them, becauſe it hinders the diſſipation of the native and internall heat; like as cold heats in winter, whereby the bellyes are at that time the hotter. I know ſome learned Phiſitions of our time ſtiffly maintained, that the fat was hot, neither did they acknowledge any other efficient cauſe thereof, than temperate heat and not cold. But I thinke it beſt to leave the more ſubtle agitation of theſe queſtions to naturall Philoſophers. But we muſt note, that at the joints which are more uſually moved, there is another ſort of fat, farre more ſolid and hard, than that which we formerly mentioned, often found mixed with a viſcid and tough humor like the whites of Eggs, that ſo it might be ſufficient for a longer time to moiſten theſe parts, ſubject to be hurt by dryneſſe, and make them ſlippery & ſo fitter for motion, in imitation whereof they uſually greaſe hard bodyes, which muſt be in frequent motion, as coach wheeles and axeltrees. And there is another kind of fat, which is called *Sevum*, ſeame, in one thing differing from the ordinary fat, that is much dryer; the moiſter and ſofter portion of the fat being diſſipated by the raging heat of the place. For it is found principally about the midriffe, where there are many windings of arteryes and veines, and it is alſo about the reines, Loines, and *baſis* of the heart. The fat is waſted by long faſting; is dryed and hardened by vehement exerciſe and immoderate heate. Hence it is that it is much more compact in the palmes of the hands, and ſoles of the feet, about the eyes and heart, ſo that it reſembles the fleſh in denſitie and hardneſſe; becauſe by the continuall motion and ſtrong heat of theſe parts, the thinner portion being diſſipated & diffuſed, the more Groſſe & terreſtriall remaine.

The quantity.

The compoſure.

The ſite.

I was preſent at the opening a body, Feb: 1630. in which the fat, in the lower part of the lower belly was in thickneſſe above 8, inches, upon the breſt betweene 4 and 5 inches: which I thought good to remember in this place both for the rarity of the thing, as alſo becauſe it was encreaſed by report, and the place miſtaken ſome ſaying the *Omentum* or Call was ſo thicke, which was falſe, for it did not much exceed the quantity of that part, in other fat men.

The Temper.

The uſe.

The ſolides fat, or ſeame.

In what parts and for what cauſe the fat is more denſe.

CHAP. VII.

Of the common coate of the Muſcles.

Next under the fat, appeares a certaine coate, ſpred over all the Muſcles, and called the common coate of the Muſcles, it is of a nervous ſubſtance; as all other membranes are. The quantity and breadth thereof is bounded by the quantity of the Muſcles which it involves, and fits it ſelfe to, as that which encompaſſes the Muſcles of the *Epigaſtrium*, is of equall largneſſe with the ſame Muſcles. The figure of it is round. It is compoſed of veines, nerves, arteryes and its peculiar fleſh conſiſting of three ſorts of fibers; the beginning of it is from the *Perioſtium*, in that part where the bones give ligaments to the Muſcles; or according to the opinion of others, of the nervous and ligamentous fibers of the Muſcles, which riſing up and diffuſed over the fleſhy ſuperficies thereof, are united for the generation of this coate. But this membrane ariſing from the *Perioſtium* (as every membrane which is below the head takes its originall from the *Perioſtium* either primarily, by the interpoſition of no *Medium*, or ſecondarily) is ſtretched over the Muſcles by their tendons. But if any object, that this membrance pluct from the belly of the Muſcle, may ſeeme

The ſubſtance

The quantity

The Compoſure.

The Original

to end in a ligament. I will anſwer, that it is the condition of every nervous part, ſo to binde or faſten it ſelfe to another part of his owne kinde as to a ſtay, ſo that it can ſcarſe be pluckt from thence. We ſee the proofe hereof, in the *Peritonæum* or *Rim* in the *Epigaſtrium* or lower part of the lower belly. **The number.** That which covers the Muſcles of the *Epigaſtrium* is but one, unleſſe you had rather part it in two, the right and the left diſtinguiſhed by the interpoſition of the *Linea Alba*, or white Line. **The ſite.** It is ſcituate betwixt the fat and Muſcles; for it is faſtened above and below to theſe parts with fibers, which in ſmallneſſe and fitneſſe exceed the Spiders web. But by its veſſells, it participates with the three principall parts, and is of a cold and dry temper. **The uſe.** The uſe of it is, to containe the Muſcles in their naturall vnion, and to keepe them as much as in it lyes, from putrifaction, which may happen to them from *pus* or matter, which is often caſt forth of the ſimular parts into the empty ſpaces and diſtances of the Muſcles. Wherefore going about to ſeparate the fat of the *Epigaſtrium* (where thou muſt begin the diſſection of mans body) you muſt have a care, that you hurt it not with your knife, but that, before you touch the Muſcles, ſee you artificially take it away, that you may the more eaſily ſeparate the Muſcles lying under it, **What the white lime is.** diſtinguiſhed by a manifeſt ſpace at the white Line, which is made by the meeting together of the proper coates of all thoſe muſcles.

CHAP. VIII.

What a Muſcle is, and how many differences there be thereof.

What a Muſcle is. A Muſcle is the inſtrument of voluntary motion; and ſimple voluntary motion is performed ſix manner of wayes, upwards, downewards, forwards, backwards, to the right hand and to the left; **How the circular motion is performed.** but the compound one way, which is circularly, the which is performed by the continuall ſucceſſion of the motion of the Muſcles ingirting the part. Such a Motion Falconers uſe when they ſtretch forth their hand and Lure their Hauke. We have ſome parts, which have motion without a Muſcle, but that motion is not voluntary, ſuch parts be the heart, ſtomacke, gutts, both the bladders (that is, that of the Gall and that of the urine) and diverſe other which have the motions of attraction, expulſion and retention, by the meanes of the three ſorts of fibers; for they draw by the right, expell by the tranſverſe, and retaine by the oblique. **From whence the differences of muſcles are drawne.** The differences of Muſcles which are many and diverſe, are taken from their ſubſtance, originall, inſertion into the part which they move, forme or figure, holes or openings, magnitude, colour, ſite, kind of fibers, their conjugation or connexion, heads, bellyes, tendons, oppoſition in action and office. **Differences of muſcles from their ſubſtance.** Some in ſubſtance are nervous, venous, arterious, becauſe they have manifeſt nerves, veines and arteryes, as the Midriffe, the Intercoſtall and Epigaſtricke Muſcles and many more, and that for their difference from other Muſcles, into which neither nerve nor veine, or Arteryes are manifeſtly inſerted, although ſecretly they admit them all for ſenſe and motion, life and nouriſhment; ſuch are the Muſcles of the wreſt, the wormy muſcles of the hands and feet; for if there be any nerves obſerved in them, they are very ſmall. Some had rather make the difference of Muſcles thus, that ſome of them are fleſhy, ſome nervous, others membranous. **Differences of Muſcles from their original.** From their Originall, ſome ariſe from the bones, as theſe which move the hands, armes and Leggs; others from griſtles, as the Muſcles of the throat; others from membranes which inveſt the tendons, as the wormy Muſcles of the hands and feet; others from ligaments as the Extenders of the fingers; others from other muſcles, as the two lower Muſcles of the yard which proceed from the Sphincter Muſcle of the fundament. Others have no originall, as the membrane which we call the fleſhy pannicle aſſumes fleſh in certaine places, and degenerates into a Muſcle; ſuch are the *Cremaſter* or hanging Muſcles of the teſticles, the large Muſcles of the face, and if you pleaſe the Midriffe, as that which is compoſed of two coates, the one incompaſſing the ribbs and the *Peritonæum*, hath fleſh in the midſt betweene the two membranes. And moreover ſome Muſcles have their originall from one onely bone, as theſe which bend and extend the Cubite, others ariſe of many bones as the oblique deſcending, the Dorſall and many Muſcles of the necke, with ariſe together from many ſpondyls and ſides of ſpondyls. There be others according to the opinion of ſome men, both from the bones and griſtles of the *Pubis* at the right or direct Muſcles of the *Epigaſtrium*, yet by their favour I thinke otherwiſe. Becauſe by the Anatomicall and received axiome, A Muſcle is there thought to take his beginnings from whence he receives a nerve; but theſe Muſcles take a nerve from the intercoſtall muſcles, wherefore their originall ought to be referred to the ſides of the breſt-blades, as ſhall be ſhewed in due place.

Where a muſcle hath its originall.

Differences of muſcles from their inſertion

¶From their inſertion ariſe theſe differences, ſome are inſerted into a bone, as thoſe which move the head, Armes and Legs; others into a griſtle, as thoſe of the Throtle, eyelids, noſe and the oblique aſcendant muſcles of the *Epigaſtrium*; ſome into a bone and griſtle both, as the right muſcles of the *Epigaſtrium* and the Midriffe; ſome into the skin, as the muſcles of the lips; others into the Coates as the muſcles of the eyes; others into Ligaments, as the muſcles of the yeard. But theſe differences following may be drawne both from their inſertion and originall. For ſome muſcles ariſing from many parts, are inſerted into ſome one part, as divers of theſe which move the arme, and the ſhoulder, which ariſing from many ſpondiles are inſerted into the bone of the ſhoulder and the ſhoulder blade. Others ariſe from one part, and inſert themſelves into more, as thoſe which ariſe from the bottome of the ſhoulder blades, are extended and inſerted into ſome eight or nine of the upper ribbs, to helpe reſpiration; and the benders and extenders of the fingers and toes; Others ariſing from many bones are inſerted into as many, as ſome of thoſe which ſerve for reſpiration, to wit thoſe which we call the hinder Saw-muſcles and the *Semiſpinatus*, which ſends a tendon into all the ribbs. Others have their originall from many bones, and end in griſtles of the ſeven ribbs, as thoſe two which lye under the *Sternon*. Moreover alſo theſe differences of muſcles may be drawne from the originall and inſertion, that ſome proceed from bones and are inſerted into the next bone, to helpe and ſtrengthen the motion thereof, as the three muſcles of the Hip; others ariſe from an upper bone & are not inſerted into the next, but into ſome other, as the long muſcles. Some are named from the part they move, as the temporall muſcles becauſe they move the temples; others from their office, as the grinding muſcles, becauſe they move the skin as a mill, to grinde aſunder the meale. From their forme or figure, becauſe ſome are like Mice, other like Lizards which have their Leggs cut off, for that they imitate in their belly, body or tendon, the belly or taile of ſuch creatures, & from whence the names of *Muſculus* and *Lacertus* are derived. Such are thoſe which bend the wreſt, and which are faſtened to the bone of the Leg, & which extend the foot; Others are triangular, as that which lifts up the arme, called *Epomis* or *Deltoides*, and that which drawes the arme to the breaſt, called the Pectorall muſcle. Others quadrangular as the Rhomboides, or Lozenge muſcle of the ſhoulder blade and the two hindeſum-muſcles ſerving for reſpiration, and two of the wreſts which turne down the hand; Others conſiſt of more than foure angles, as the oblique deſcending, and that muſcle with joynes it ſelfe to it from the ſhoulder blade; others are round and broad, as the Midriffe, others circular as the *Sphincter* muſcle of the fundament and bladder; others are of a pyramidall figure, as the ſeaventh muſcle of the eye, which compaſſes the opticke nerve in beaſts but not in men. Others have a ſemicirculer forme, as that which ſhuts up the eye ſeated at the leſſer corner thereof. Others reſemble a Monks cowle, or hood, as the *Trapezius* of the ſhoulder blade. Beſides others at their firſt originall are narrow, but broad at their inſertion, as the Saw-muſcle of the ſhoulder and the tranſverſe of the *Epigaſtrium*; others are quite contrary, as the three Muſcles of the Hippe; others keepe an equall breadth or bigneſſe in all places, as the intercoſtall muſcles and theſe of the wreſt; others are long and ſlender, as the long muſcle of the thigh; others are long and broad, as the oblique deſcending muſcles of the *Epigaſtrium*; others are directly contrary, as the Intercoſtall, which are very narrow. From their perforations, for ſome are perforated, as the Midriffe which hath three holes, as alſo the oblique and tranſverſe of the *Epigaſtrium*, that ſo they may give paſſage forth to the preparing ſpermaticke veſſells, and to the ejaculatory veſſells, the Coate *Erythroides* aſſociating and ſtrengthening them; others are not perforated. From their magnitude

Differences of muſcles taken from their figure.

Differences from their perforations.

From their magnitude.

for ſome are moſt large, as the two muſcles of the Hipp, others very ſmall, as the eight ſmall muſcles of the necke, and the proper muſcles of the Throtle, and the wormy muſcles. Others are of an indifferent magnitude.

From their Colour.

From their colour, for ſome are white and red, as the Temporall muſcles, which have Tendons comming from the midſt of their belly; others are livide, as the three greater muſcles of the calfe of the leg, which colour they have by the admixtion of the white, or tendinous nervy coate with the red fleſh, for this coat by its thickneſſe darkning the colour of the fleſh, ſo that it cannot ſhew its redneſſe and freſh colour, makes it ſeeme of that livide colour.

From their ſite.

From their ſcituation, for ſome are ſuperficiary, as thoſe which appeare under the ſkin and fat; others deepe in and hid, as the ſmooth and foure twin muſcles; ſome are ſtretched out and as it were ſpred over in a ſtreight and plaine paſſage, as the muſcles of the thigh which move the legge, except the Ham-muſcle; others oblique, as thoſe of the *Epigaſtrium*; otherſome tranſverſe, as the tranſverſe of the *Epigaſtrium*, where you muſt obſerve, that although all the fibers of the muſcles are direct, yet we call them oblique, and tranſverſe by comparing them to the right muſcles, as which by the concourſe of the fibers make a ſtreight or acute angle.

From their fibers.

From the ſorts of fibers; for ſome have one kinde of fiber; yet the greateſt part enjoy two ſorts running ſo up and downe, that they either are croſſed like the letter X, as happens in the pectorall and grinding muſcles; or elſe doe not concurre, as in the Trapezij. Others have three ſorts of fibers, as the broad muſcle of the face.

From their connexion.

From their coherence and connexion, or their texture of nervous fibers; for ſome have fibers ſomewhat more diſtant and remote immediately at their originall, than in other places, as you may ſee in the muſcles of the buttocks; Others in their midſt and belly, which by reaſon thereof in ſuch muſcles is more big or tumid, their head and taile being ſlender, as happens in moſt of the muſcles of the arme and leg, in which the denſe maſſe of fleſh interwoven with fibers, disjoynes the fibers in ſo great a diſtance; in otherſome the fibers are more diſtant in the taile, as in the greater Saw-muſcle ariſing from the bottome of the ſhoulder blade; in others they are equally diſtant through the whole muſcle, as in the muſcles of the wreſt and betweene the ribbs.

From their head.

From their head; for in ſome it is fleſhy interwoven with few fibers, as in the muſcles of the buttocks; in others it is wholy nervous, as in the moſt-broad-muſcle common to the arme and ſhoulder blade, and in the three muſcles of the thigh proceeding from the tuberoſity of the hucle bone; in ſome it is nervous and fleſhy as in the internall and externall muſcle of the arme. Beſides ſome have one head, others two, as the bender of the elbow and the externall of the legge, others three as the Threeheaded muſcle of the thigh. But wee muſt note that the word nerve or ſinew is here taken in a large ſignification, for a ligament, nerve and tendon, as *Galen* ſaith (*Lib. de Oſſibus*) and moreover we muſt obſerve, that the head of a muſcle, is one while above, another while below, otherwhiles in the midſt as in the Midriffe, as you may know by the inſertion of the Nerve, becauſe it enters the muſcle by its head.

From their belly.

From their belly alſo, there be ſome differences of muſcles taken; for ſome have their belly immediately at their beginning, as the muſcles of the buttocks, others at their inſertion, as the Midriffe. Others juſt at their head, as thoſe which put forth the Calfe of the leg; in others it is ſomewhat further off, as in thoſe which draw backe the arme, and which bend the legge; in others the belly extends even from the head to the taile, as in the intercoſtall muſcles and theſe of the wreſt; in others it is produced even to their inſertion, as in thoſe of the palmes of the hands and ſoles of the feet; ſome have a double belly, diſtinguiſhed by a nervous ſubſtance; as thoſe which open the mouth, and thoſe which ariſe from the roote of the lower proceſſe of the ſhoulder blade.

From their Tendons.

Moreover the differences of muſcels are drawne alſo from the Tendons, for ſome have none, at leaſt which are manifeſt, as the muſcles of the lips and the ſphincter muſcles, the intercoſtall and thoſe of the wreſt; others have them in part, and want them in part, as the Midriffe; for the Midriffe wants a Tendon at the ends of the ſhorter ribs, but hath two at the firſt *Vertebra* of the Loines in which it is terminated.

Others have a Tendon indeede. But ſome of theſe move with the bone, ſome not, as the muſcles of the eyes, and beſides, ſome of theſe have broad and membranous tendons, as the muſcles of the eyes and *Epigaſtrium*, except the right muſcles; in others they are thicke and round, as in the benders of the fingers; in others they are leſſe round, but more broad than thicke, ſuch is the Tendon ariſing from the twin muſcles and *Soleus* of the legge: others have ſhort Tendons, as the muſcles which turne downe the hand; otherſome long, as thoſe of the palmes of the hands and ſoles of the feet; beſides others produce Tendons, from the end of their belly which Tendons are manifeſt, others from the midſt, as the Temporall muſcles.

Beſides alſo others diffuſe many tendons from their belly, as in the hands the benders of the fingers, and the extenders of the feet. Otherſome put forth but one, which ſometimes is devided into many, as thoſe which bend the third articulation of the foot; otherwhile many muſcles by their meeting together make one Tendon, as the three muſcles of the Calfe of the leg, and thoſe which bend the cubit and leg. All tendons have their originall, when the nerves and ligaments diſperſed through the fleſhy ſubſtance of a muſcle, are by litle and litle drawne and meet together, untill at laſt carried to the joynt they are there faſtened for the fit bending and extenſion thereof. From the contrariety of their Actions, for ſome parts have contrary muſcles, benders and extenders; Other parts have none, for the Cods and fundament have onely lifters up. From their function, for ſome are made for direct motions, as thoſe which extend the fingers and toes; others for oblique, as the *Supinators* of the hand and the Pronators; others performe both, as the pectorall muſcle, which moves the Arme obliquely upward and downeward, as the upper and lower fibers are contracted; and alſo out right, if all the fibers be contracted together, which alſo happens to the *Deltoides* and *Trapezius*. I have thought it good to handle particularly theſe differences of muſcles, becauſe that by underſtanding them the prognoſticke will be more certaine; and alſo the application of remedies to each part; and if any occaſion be either to make inciſion, or ſuture, we may be more certaine, whether the part affected be more, or leſſe nervous.

From their Action.

From their function.

Chap. IX.

Of the parts of a Muſcle.

Having declared the nature and differences of a muſcle, we muſt note that ſome of the parts thereof are compound, or univerſall, others ſimple or particular. The compound are the head, Belly and taile. The ſimple are ligaments, a nerve, fleſh, a veine, artery and coate. For the compound parts, by the head we underſtand the beginning and originall of a muſcle, which is one while ligamentous and nervous, otherwhiles alſo fleſhy. By the belly, that portion which is abſolutely fleſhy; But by the taile, we underſtand a Tendon conſiſting partly of a nerve, partly of a ligament promiſcuouſly comming forth from the belly of the muſcle. For aſmuch as belongs to the ſimple, which are ſixe in number, three are called proper, and three common. The proper are a Ligament from a bone, a nerve proceeding from the Braine, or ſpinall marrow, and fleſh compact by the concretion of blood. The Common are, a veine from the Liver or trunke ariſing from thence; an artery proceeding from the Heart, a Coate produced by the nervous & ligamentous fibers ſpreading over the ſuperficies of the muſcle. But for the ſimple uſe of all ſuch parts, the nerve is as it were the principall part of a muſcle, which gives it ſenſe and motion, the Ligament gives ſtrength, the fleſh containes the nervous and ligamentous fibers of the muſcle and ſtrengthens it filling up all the void ſpaces, and alſo it preſerves the native humidity of theſe parts and cheriſheth the heat implanted in them; and to conclude, defends it from all externall injuries; for like a fan it oppoſeth it ſelfe againſt the heat of the Sunne; and is as a garment againſt the cold; and as a cuſhion in all falls and bruiſes, and as a buckler or defence againſt wounding weapons. The veine nouriſhes the muſcle, the arterie gives it life, the coat preſerves the

The compound & ſimple parts of a muſcle.

What uſe each ſimple particle hath in a muſcle.

the harmony of all the parts thereof, leſt they ſhould be any wayes diſioyned or corrupted by purulent abſceſſes breaking into the empty or void ſpaces of the muſcles, as we ſee it happens in a Gangrene, where the corruption hath invaded this membrane by the breaking out of the more acride matter or filth.

Chap. X.

A more particular inquiſition into each part of a muſcle.

The nature of a Ligament.

The threefold uſe of a Ligament.

What a nerve is.

What wee meane by the nervous and Ligamentous fibers.

HAving gone thus farre, it remaines, that we more particularly inquire into each part of a muſcle, that (if it be poſſible,) nothing may be wanting to this diſcourſe. Wherefore a Ligament properly ſo called, is a ſimple part of mans body, next of a bone and griſtle, the moſt terreſtriall, dry, hard, cold, white, taking its originall immediatly, or by the interpoſition of ſome Medium from the Bones, or Griſtles (from whence alſo the Muſcles have their beginning) wherby it comes to paſſe that a ligament is void of ſenſe, unleſſe it receive a nerve from ſome other place; (For ſo the Ligaments which compoſe & ſtrengthen the Tongue and yeard, are partakers of ſenſe) and it inſerts it ſelf into the bone and griſtle that ſo it may bind them together, and ſtrengthen and beautifie the whole joynt or connexion; (for theſe three be the principal uſes of a Ligament) then diffuſing it ſelf into the membranes and muſcles to ſtrengthen thoſe parts. A nerve to ſpeake properly, is alſo a ſimple parte of our body, bred and nouriſhed by a groſſe and Phlegmaticke humor, ſuch as the braine, the originall of all the nerves, and alſo the Spinall marrow endewed with the faculty of feeling and oftentimes alſo of moving. For there be divers parts of the body which have nerves, yet are deſtitute of all voluntary motion, having the ſenſe onely of feeling, as the membranes, veines, arteries, guts and all the entrailes. A nerve is covered with a double cover from the two membranes of the braine, and beſides alſo with a third proceeding from the ligaments which faſten the hinder part of the head to the *Vertebra's*, or elſe from the *Pericranium*. Wee underſtand no other things by the fibers of a nerve, or of a Ligament, than long and ſlender threds, white, ſolid, cold, ſtrong more or leſſe according to the quantity of the ſubſtance, which is partly nervous and ſenſible, partly Ligamentous and inſenſible. You muſt imagine the ſame of the fleſhy fibers in their kind; but of theſe threds ſome are ſtraight for attraction, others oblique for retention of that which is convenient for the creature, and laſtly ſome tranſverſe for the expulſion of which is unprofitable. But when theſe tranſverſe threds are extended in length, they are leſſened in bredth; but when they are directly contracted, they are ſhortened in length. But when they are extended all together as it were with an unanimous conſent, the whole member is wrinkled as contracted into it ſelfe, as on the contrary it is extended when they are relaxed. Some of theſe are beſtowed upon the animall parts, to performe voluntary motions; others upon the vitall to performe the agitation of the Heart and Arteries; others upon the naturall for attraction, retention and expulſion. Yet we muſt obſerve, that the attraction of no ſimular part is performed by the helpe of the foreſaid fibers or threds, but rather by the heat implanted in them, or by the ſhunning of Emptineſſe, or the familiarity of the ſubſtance. The fleſh alſo is a ſimple and ſoft part compoſed of the purer portion of the blood inſinuating it ſelfe into the ſpaces betweene the fibers, ſo to inveſt them for the uſes formerly mentioned. This is as it were a certaine wall and Bulwarke againſt the injuries of heat and cold, againſt all falls and bruiſes, as it were a certaine ſoft pillow or cuſhion yeelding to any violent impreſſion. There be three ſorts of fleſh; one more ruddy, as the muſculous fleſh of perfect creatures and ſuch as have blood; for the fleſh of all tender and young things having blood, as Calves, and alſo of all ſorts of fiſh, is whitiſh, by reaſon of the too much humidity of the blood. The ſecond kinde is more pallid, even in perfect creatures having blood, ſuch is the fleſh of the heart, ſtomacke, weaſond, guts, bladder, wombe. The third is belonging to the entrails, or the proper ſubſtance of each entrail, as that which remaines of the Liver (the veines, arteries and coate being taken away) of the

By what power the ſimular parts principally draw, or attract.

What and of how many ſorts the fleſh is.

bladder of the Gall, braine, kidneys, milt. Some adde a fourth ſort of fleſh which is ſpongy, and that they ſay is proper to the tongue alone.

What a vein is.

A veine is the veſſel, pipe or channel of the blood, or bloody matter; it hath a ſpermaticke ſubſtance, conſiſts of one coate compoſed of 3 ſorts of fibers.

What an artery is.

An Artery is alſo the receptacle of blood but that ſpirituous and yellowiſh, conſiſting in like manner of a ſpermaticke ſubſtance; But it hath two coats, with three ſorts of fibers, the utmoſt whereof is moſt thin, conſiſting of right fibers and ſome oblique: But the inner is five times more thicke and denſe than the utmoſt, interwoven with tranſverſe fibers; and it doth not onely conteine blood and ſpirit, but alſo a ſerous humor, which wee may beleeve becauſe there bee two emulgent Arteryes, aſwell as veines.

Why an Artery is more thicke and denſe than a veine.

But the inner coat of an Artery is therefore more thick, becauſe it may containe blood which is more hot, ſubtle and ſpirituous; for the ſpirit, ſeeing it is naturally more thin and light and in perpetuall motion, would quickly flye away, unleſſe it were held in a ſtronger hold. There is other reaſon for a veine, as that which containes blood groſſe, ponderous and ſlow of motion. Wherefore if it had acquired a denſe and groſſe coate, it could ſcarſe bee diſtributed to the neighbouring parts; God the maker of the univerſe, foreſeeing this, made the coats of the veſſels contrary to the conſiſtance of the bodyes contained in them. The *Anaſtomoſis* of the veines and Arteryes, that is to ſay, the application of the mouthes of the one to the other, is very remarkeable, by benefit of which they mutually communicate and draw the matters contained in them, and ſo alſo transfuſe them by inſenſible paſſages, although that *anaſtomoſis* is apparent in the veine and artery that meet together at the Ioint and bending of the Arme, which I haue ſometimes ſhewed in the Phyſicke ſchooles, at ſuch time as I there diſſected Anatomyes.

The mutuall *Anaſtomoſis* of the veines and arteryes.

Where it is manifeſt.

From whence a muſcle hath its beginning or head.

But the action or function of a muſcle is either to move, or confirme the parte according to our will, into which it is implanted; which it doth when it drawes it ſelfe towards its originall, that is to ſay, it's head. But wee define the head by the inſertion of the nerve, which wee underſtand by the manner of the working of the Muſcle.

CHAP. XI.

Of the Muſcles of the Epigaſtrium, *or lower belly.*

NOw ſeeing that wee haue taught, what a muſcle is, and what the differences thereof are, and what ſimple and compound parts it hath, and what the uſe, action and manner of action in each part is; it remaines that wee come to the particular explication of each Muſcle, begining with thoſe of the lower belly, as thoſe which we firſt meet withall in diſſection.

Eight muſcles of the *Epigaſtrium*.

Theſe are 8 in number, 4 oblique, 2 on each ſide, two right or direct one, on the right, another on the left ſide; and in like manner 2 tranſverſe. All theſe are alike in force, magnitude and action, ſo mutually compoſed, that the oblique deſcendant of one ſide, is conjoined with the other oblique deſcendant on the other ſide, and ſo of the reſt.

The oblique deſcendant.

Their ſubſtance.

Their greatneſſe and figure.

Their compoſure and ſite.

We may adde to this number the 2 little Supplying or Aſſiſting muſcles, which are of a *Pyramidal* forme and ariſe from the ſhare-bone, above the inſertion of the right muſcles; Of the oblique muſcles of each ſide the one aſcends, the other deſcends, whereupon it comes to paſſe, that they are called the Oblique deſcendant and Aſcendant Muſcles. Thoſe oblique which wee firſt meet with, are the deſcendant, whoſe ſubſtance is partly ſanguine, partly ſpermaticke; for they are fleſhy, nervous, ligamentous, veinous, arterious and membranous. Yet the fleſhy portion is predominant in them, out of which reſpect *Hippocrates* is wont to expreſſe the muſcles by the name of fleſhes; their greatnes is indifferent betweene the large and the ſmall muſcles; their figure 3 ſquare. They are compoſed of the fore-mentioned parts, they are two in number; their ſite is oblique taking their beginning, from the touching of the great ſaw Muſcle and from the ſixt and ſeaventh true ribbes, or rather from the ſpaces between the ſixe lower ribbes, and rather on the fore part of the muſcles than of the ribbes themſelues, from whence ſhunning the *Vertebra's* of the loines, the fleſhy parts of them are terminated in the externall and upper eminency of the Haunch-bone, and the Membranous end in the lower eminency of the ſhare-bone and the White-line. Yet *Columbus* diſſenting from this common deſcription of the oblique Muſcles, thinks that they are onely terminated in the White line and not in the ſhare-bone. For (ſaith he) wherefore ſhould they be inſerted into the ſhare-bone which is not moved? But becauſe it would bee an infinite labour and trouble to ſet downe at large the ſeverall opinions of all Authors of Anatomy, I haue thought it ſufficient for me to touch them lightly by the way. Their connexion is with the oblique aſcendant lying vnder them, and with the direct, or right. Their temperament is twofold, the one hot and moiſt by reaſon of the belly and the fleſhy portion of them; the other cold & dry in reſpect of their ligamentous and tendinous portion. Their action is to draw the parts into which they are inſerted towards their originall, or els to unite them firmely. Yet each of theſe privately and properly drawes the hip in an oblique manner towards the *Cartilago Scutiformis* or breſt-blade. Then follow the oblique aſcendant, who haue the ſame ſubſtance, quantity, figure, compoſure, number and temper the deſcendant have. They are ſcituate between the deſcendant and tranſverſe with whom they have connexion, eſpecially by the veſſels which are brought from the parts beneath. All the fleſhy parts ariſe from the rackbones of the Haunch to the ends of the baſtard ribs, which they ſeeme to admit above and below, being fleſhy even to the fourth, and then becomming membranous they take their way to the white line, with a double *aponeurôſis*, which paſſes through the right Muſcles above and below, as wee may plainely ſee from the navill downewards. In their fleſhy part they draw their originall from the ſpine of the Haunch bones a little lower than the deſcendent end in their fleſhy parte. But for their membranous parts, they ariſe before from the ſhare bone, but behinde from the ſpondiles of the Holy bone, and *Vertebra's* of the loines obliquely aſcending vpwards to the white line, into which they are terminated by an *aponeourôſis* or membranous tendon (which ſeemes to penetrate the right Muſcle vpwards and downewards, eſpecially vnder the navil) but by their fleſhy part at the ends of all the baſtard ribbes, which they ſeeme to receive above and below. And becauſe theſe muſcles are terminated in the white line, they have alſo another uſe, yet ſuch as is common to all the muſcles of the *Epigaſtrium*, that is, to preſſe down the Guts. Their action is (if they performe it together) to draw downe the cheſt, and dilate the breſt; but if their actions be ſeparate, they draw the cheſt to the hip with an oblique motion. After theſe follow the right muſcles, ſo called becauſe they deſcend according to the length of the body, & becauſe they have right or ſtreight fibers.

Their connexion.
Their temperament.
Their action.
The oblique aſcendant.
Their ſite and connexion.
Their Action
The right muſcles of the *Epigaſtrium*.

Wee will ſay nothing (to ſhunne prolixitie, which in all other places wee will avoid) of their ſubſtance and other conditions, which they have common with the fore mentioned Muſcles. They are ſcituate in the eminenteſt or extuberating region of the belly, bounding the *Epigaſtrium* taken in generall, (or the ſuperficiary belly,) they are devided by the manifeſt intercourſe of the white line, even to the Navell, in which place they ſeeme to be united even to the place of their inſertion. They draw their originall not from the ſhare bone, as ſome would have it, but according to the inſertion of their nerves, from the ſides of the *Cartilago ſcutiformis* & the ends of the ſixt ſeventh and eight ribbs; but they end in the ſhare bone where they make a common tendon ſufficiently ſtrong and ſhort. *Syluius*, *Veſalius* and *Columbus* thinke they ariſe from the ſhare bone, becauſe they cannot be inſerted into that bone, becauſe it is immoveable. You may perceive in theſe Muſcles certaine nervous & tranſverſe interſections, often times three in number for the ſtrength of theſe Muſcles (of which *Galen* makes no mention, although they may be ſeene in Apes.) And alſo in the inner ſide of theſe muſcles you may ſee foure veines and as many arteryes, of which ſome creepe upwards, others run downwards. The upper called the Mamillary deſcend from the Axillarie by the ſide and lower partes of the *Sternon*, the ſlenderer portions thereof being diſtributed

Their ſite.
Originall.

by the way, to the ***Mediaſtinum***, and about the fourth and fift rib to the Dugges, from whence they take their name.

The meeting together of the Epigaſtrick and mamillary veines and arteryes.

That which remaines breaking out by the ſides of the Breſt-blade inſerts it ſelfe into thoſe muſcles creeping along, euen almoſt to the navell; in which place they are manifeſtly united (that is the veines with the veines, and arteries with the arteryes) with the Epigaſtricke, which aſcend from the vpper part of the Iliackes on each ſide under the ſaid muſcles untill they meet with theſe 4 mamillary veſſels. That you may finde this concourſe of the veines and arteryes about the navill, you muſt follow both the upper and the lower ſomewhat deepe into the fleſh, preſſing the blood on both ſides from above downewards, and from below upward; untill you ſhall finde the exoſculation of theſe veſſels, which will appeare by this, that the blood will flow from this into that and from that into this; otherwiſe you can ſcarce perceiue it, by reaſon of the ſmallnes of ſuch veſſels which want blood. But that by the benefit of ſuch concourſe of the veſſels, the matters may be communicated and tranſported both from the wombe to the dugs, and againe from the dugs to the wombe, appeares in Nurſes, who want their courſes, when the milke comes into their dugs, and on the contrary loſe their milke when their courſes flow plentifully. Otherwiſe to what purpoſe ſhould there be ſuch concourſe betweene the veſſels of the pappes and wombe, for there are veines and arteries diffuſed to the ſides of the wombe from the roote of the Epigaſtrickes; for indeed the Epigaſtrickes which in their aſcent meete with the mamillary, goe not to the wombe, though they be next to them, and ariſe from the ſame truncke with the Hypogaſtricke veine of the wombe. The Action of theſe muſcles is, to move or drawe neere together the parts of the Hypogaſtrium to the *præcordia* or Hypochondryes. Their uſe, in *Columbus* opinion is, to draw the Breſt downewards ſo to dilate it. At the ends of theſe Nature hath produced two other ſmall Muſcles from the upper part of the ſhare bone, of a triangular figure for the ſafety of the thicke and common tendon of the right Muſcles, whereupon they are called *Succenturiati*, or aſſiſters.

Their actions.

Their uſe.

The Pyramidal or aſsiſting muſcles.

Some (moved with I know not what reaſon) would haue theſe two ſmall Muſcles to help the erection of the yeard. *Columbus* thinkes they ſhould not be ſeparated from the right, and that they only are the fleſhy beginnings of the right. But on the contrary *Fallopius* manifeſtly proves them different and ſeparate from the right and ſhewes their vſe. The Tranſverſe remaine to be ſpoken of, ſo called by reaſon of their fibers which make right angles with the fibers of the right Muſcles.

The tranſverſe muſcles of the *Epigaſtrium*.

Their figure and ſite.

They haue a quadrangular figure ſcituate vpon the greateſt part of the *Peritonæum*, to which they ſticke ſo cloſe that they ſcarſe can be ſeparated. They take their originall from the production of the loines, the Eminency of the Haunch-bone, the tranſverſe productions of the *vertebra's* of the loynes and the ends of the baſtard ribs; contrary to the opinion of many, whom the inſertion of the nerve convinces, but they end in the white line, as all the reſt doe.

Their Action.

Their action is to preſſe the guts, eſpecially for the expulſion of excrements.

The common uſe and action of the eight muſcles of the *Epigaſtrium*.

But all the 8 recited Muſcles, beſides their proper uſe, haue another common, that is, they ſtand for a defence or Bulwarke for all the parts lying under them, and ſerve for the expulſion both of the excrements, infant, and vapoures, and alſo for the ſtrengthening of the voice, as experience ſhewes in thoſe who ſound Trumpets and Cornets.

Therefore theſe Muſcles doe equally on every ſide preſſe the Belly; But the Midriffe, the intercoſtall Muſcles aſſiſting it, doth drive from above downewards, from which conſpiring contention followes the excretion of the excrements by the fundament; but unleſſe the Midriffe ſhould aſſiſte, theſe Muſcles would preſſe the excrements no more downewards, than vpward to the mouth.

Why when the mouth is open the excrements go more ſlowly forth.

Although to this excretion of the excrements, it is not ſufficient that the Epigaſtricke, Midriffe and intercoſtall Muſcles preſſe the belly, but the Muſcles of the throtle muſt be alſo ſhut. For the mouth being open the excrements never goe well forth; becauſe the vapours that paſſe out of the mouth, Why when the mouth is open the excrements go more ſlowly forth.

mouth, which being reſtrained and driven to the Midriffe, by ſtretching it powerfully thruſts downe the excrement. Wherefore Apothecaryes when they give gliſters, bid the Patient to open his mouth, that the gliſter may eaſilyer goe up, which otherwiſe would ſcarſely go up, the mouth being ſhut, becauſe ſo we ſhould have no place empty in us, into which the glyſter might be admitted.

G. The Navill which, all the Muſcles being taken away, muſt be kept for the demonſtration of the Vmbilicall Veſſels.

H H. The productions of the *Peritonæum* which contain the Seminarie Veſſels on either ſide.

**. The hole which giveth way to the Seminarie Veſſels of Men.

II. A Veine and an Arterie from the *Epigaſtricke,* which being carried upward under the right Muſcles, doe here hang down, and are diſtributed into the lower part of the *Abdomen.*

KK. A Veine and an Arterie from the internall Mammarie proceeding from under the Bone of the Breaſt, are carried downeward thorough the right Muſcles and are diſſeminated into the upper part of the *Abdomen.*

1,2. The place wherein the right Muſcles ariſe, which being here cut off, do hang down, that their Veſſels may the better be ſcene.

3,4. The *Anaſtomoſis* or inocculation of the foreſaid Veſſels, making the conſent of the *Abdomen* and the Noſe, & of the Wombe with the Breaſts, as ſome think.

LL. Branches of Veines running into the ſides of the *Peritonæum.*

N. *The* place of the Haunch Bone bared, to which the Oblique and the *Tranſverſe* Muſcles doe grow.

Of the white line, and Peritonæum *or Rim of the belly.*

What the white Line is

The white line is nothing els, than the bound and extremities of the Muſcles of the *Epigaſtrium* diſtinguiſhing the belly in the middeſt into two parts, the right and left. It is called white, both of its owne colour, and alſo for that no fleſhy part lyes vnder it, or is placed above it. It is broader above the navill, but narrower below, becauſe the right muſcles doe there grow into one, Now we muſt treat of the Coat or membrane, *Peritonæum* or Rim of the belly; it is ſo called, becauſe it is ſtretched over all the lower belly, and particularly over all the parts conteined in the ventricle, to which alſo it freely lends a common coat. It hath a ſpermaticke ſubſtance as all other membranes have; the quantity of it in thicknes is very ſmall, (for it is almoſt as thin as a ſpiders web) yet differing in divers places in men and women; for men have it more thick and ſtrong aboue the Navil, that ſo it may conteine the extenſion of the ſtomacke, often ſtretched beyond meaſure with meat and drinke. On the contrary women have it ſo thick and ſtrong below their navell that it ſeemes double, that ſo they may more eaſily endure the diſtention of their wombe cauſed by the child conteined in it. But above the navell men and women have the *Peritonæum* of an equall ſtrength, for the ſelfe ſame reaſon. The longitude and latitude of it is knowne by the circumſcription of the belly.

What the *Peritonæum* is.

The ſubſtance and quantity.

The figure.

The figure is round and ſome what long; it puts forth ſome productions, like finger ſtalles, both for the leading and ſtrengthening the ſpermaticke veſſells and the *Cremaſter* muſcles of the Teſticles, and beſides it the eiaculatory veſſels, as alſo to impart a coat to the teſticles and all the naturall parts.

The compoſition.

It is compoſed of ſlender, membranous and nervous fibers, certaine ſmalle branches of veines and arteries concurring with them, which it receiues for life and nouriſhment from the adherent parts.

The number.

Lib. de ſem.

This membrane is one in number, and beſides every where one and equall, although *Galen* would haue it perforated in that place where the ſpermaticke veſſels deſcend to the Teſticles; But in truth we muſt not thinke that a hole, but rather a production as we ſaid before.

The latter Anatomiſts haue obſerved, the Coate *Peritonæum* is doubled below the Navell, and that by the ſpaces of theſe reduplications the vmbilicall arteryes aſcend to the Navell.

The ſite and connexion.

It is ſcituate nere the naturall parts and compaſſes them about, and joined by the coat, which it giues them, as alſo on the ſides, it is ioyned to the *vertebra's* of the loines, from whoſe ligaments, (or rather perioſtium) it takes the originall: on the lower part it cleaves to the ſhare bone, and on the upper to the midriffe whoſe lower parte it wholy inveſts; on the fore or outer parte it ſtickes ſo cloſe to the tranſverſe muſcles, that it cannot bee pluckt from them but by force, by reaſon of the complication and adhæſion of the fibers thereof with the fibers of the proper membrane of theſe muſcles, which membrane in *Galens* opinion proceeds from this Peritonæum, that ſo it is no marvaile that we may more eaſily breake, than ſeparate theſe two coats. It is of temperature cold and dry, as all other membranes are.

Lib. 6. Meth.

Vſe.

It hath many uſes, the firſt whereof is, to inveſt and cover all the parts of the lower belly, ſpecially the kall, leaſt it ſhould be ſqueeſed by great compreſſures and violent attempts into the empty ſpaces of the muſcles, as it ſometimes happens in the wounds of the *Epigaſtrium*, unles the lips of the ulcer bee very well united: for then appeares a tumor about the wound by the Guts and kall thruſting without the *Peritonæum* into thoſe ſpaces of the muſcles; from whence proceeds cruell paine.

Another vſe is to further the caſting forth of the excrements by preſſing the ventricle and guts on the foreſide, as the Midriffe doth above, as one ſhould doe it by both their hands joyned together.

The third uſe is, it prohibites the repletion of the parts with flatulency after the expulſion of the excrements, by ſtraitening and preſſing them downe.

The fourth and laſt is, that it conteines all the parts in their ſeat and bindes them to the backe-bone, principally that they ſhould not flye out of their places by violent motions, as leaping and falling from on high.

Laſtly wee muſt know, that the Rim is of that nature that it will eaſily dilate it ſelfe, as wee ſee in Dropſies, in women with child, and in tumors againſt nature.

CHAP. XIII.

Of the Epiploon, Omentum, *or* Zirbus, *that is the Kall.*

The ſubſtance, magnitude, figure.

AFter the conteining parts, follow the conteined, the firſt of which is the *Epiploon*, (or Kall) ſo called, becauſe it as it were ſwims upon all the guts. The ſubſtance of it is fatty and ſpermaticke, the quantity of it for thickneſſe is diverſe in diverſe men according to their temperament. The latitude of it is deſcribed by the quantity of the gutts. It is in figure like a Purſe, becauſe it is double.

The compoſure.

It is compoſed of veines, arteries, fat and a membrane, which ſliding downe from the gibbous part of the ventricle, and the flat part of the Gut *Duodenum* and ſpleen over the Gutts, is turned backe from the lower belly to the top of the Colon. It is one as wee ſaid covering the Gutts. It hath its cheefe connexion

The connexion.

nexion with the firſt *Vertebra's* of the loines, from which place in beaſts it ſeemes to take a coate, as in men from the hollow part of the ſpleene and gibbous of the ventricle and depreſſed part of the *Duodenum*, from whence doubled it is terminated in the fore and higher part of the Collicke gut. Which moved *Galen* to write that the upper part of the membrane of the Kall was annexed to the ventricle, but the lower, to the laxer part of the Collicke Gut. From the veſſells of which parts it borrowes his, as alſo the nerves, if it have any.

Lib. Anatom. adminiſt.

The temper.

The temper of it in leane bodyes is cold and dry, becauſe their Kall is without fat; but in fat bodyes it is cold and moiſte by reaſon of the fat. The uſe of it is twofold: The firſt is to heat and moiſten the Guts, and help their concoction, although it doe it by accident, as that which through the denſity of the fatte hinders the cold aire from piercing in, and alſo forbiddes the diſſipation of the internall heat. Another uſe is, that in want of nouriſhment in times of great famine, for ſometimes it cheriſhes, and as it were by its dew preſerves the innate heate both of the ventricle and the neighbouring parts, as it is written by *Galen*. Moreover wee muſt obſerve, that in a rupture or relaxation of the *Peritonæum* the Kall falls downe into the *ſcrotum*, from whence comes that rupture wee call, *Epiplocele*. But in weomen that are ſomewhat more fat it thruſts it ſelfe betweene the bladder and the necke of the wombe, and by its compreſſion hinders, that the ſeed comes not with full force into the wombe, and ſo fruſtrates the conception. Beſides, when by a wound or ſome other chance, any part of it be defective, then that part of the belly which anſwers to it, will afterwards remaine cold and raw, by reaſon of the forementioned cauſes.

The uſe twofold.

Chap. XIIII.

Of the Ventricle or Stomacke.

NOw we muſt ſpeake of the Stomacke, the receptacle of the food neceſſarie for the whole body, the ſeate of appetite, by reaſon of the nerves diſperſed into its upper orifice, and ſo into its whole ſubſtance. The ſubſtance thereof is rather ſpermaticke than ſanguine, becauſe that for one fleſhie membrane, it hath two nervous; The quantitie or magnitude of the ventricle is diverſe, according to the various magnitude of bodies, and gluttony of men. The figure of it is round and ſomewhat long, like a Bagpipe. The ſtomacke is compoſed of two proper coates, and one common from the *Peritonaeum*, together with veines, ſinewes, and arteries; the innermoſt of its proper coates is membranous woven with right fibers, for the attraction of meats, it is extended and propagated even to the mouth thereof, whereby it comes to paſſe that the affections of one part may eaſily be communicated to the other by ſympathy, or conſent. This coate hath its originall from the membranes of the braine which accompany the nerves deſcending from the third and fourth conjugation to the mouth thereof. And in like ſort from other productions deſcending by the paſſages of the head, from whence alſo another reaſon may be drawne from that, which they commonly bring from the nerves of the ſixt conjugation; why in wounds of the head, the ſtomacke doth ſo ſoone ſuffer by conſent with the braine. The exterior, or outer is more fleſhie and thicke, woven with oblique fibers, to retaine and expell. It drawes it originall from the *Pericranium*, which as ſoone as it comes to the gullet, takes unto it certaine fleſhie fibers. There be nerves ſent into the ſtomacke from the ſixt conjugation of the braine, as it ſhall be ſhewed in its proper place. Veines and arteries are ſpread into it from the *Gaſtrica*, the *Gaſtrepiploides*, the *Coronaria* and ſplenicke, from the ſecond, third, and fourth diſtribution of the *vena Porta*, or gate-veine; and the third of the deſcendent artery to the naturall parts, as ſoone as it paſſes forth of the midriffe.

What the ventricle is.
The ſubſtance
The magnitude.
The figure.
The compoſure.
The cauſe of the conſent of the mouth and ſtomacke.

It is one in number. The greater part of it is ſituated on the left ſide betweene the ſpleene, the hollowneſſe of the liver, and the guts, that aſſiſted by the heate of ſuch neighbouring parts, it may more cheerefully performe the concoction of the meate. Neither am I ignorant that *Galen* hath written, that a great part of the ſtomacke lies on the left ſide. But inſpection it ſelfe, and reaſon makes me derogate from *Galens* authority, for becauſe there is more emptie ſpace on the left ſide, by reaſon the ſpleene is leſſe than the liver, it was fit it ſhould lie more on the left ſide. The more proper connexion of it is with the gullet and guts, by its two orifices; with the braine by its nerves; with the liver and ſpleene by its veines; with the heart by its arteries; and with all the naturall parts by its common membrane.

The number.
Lib.4. de uſu partium.
The connexion.

The temper of the ventricle in men of good habite, is temperate, becauſe it is almoſt compoſed of the equall commixture of ſanguine and ſpermaticke parts; or according to *Galens* opinion, it is cold of its ſelfe, and by the parts compoſing it; and hot by the vicinitie of the bowels. But in ſome it is hotter, in others colder, according to the diverſe temper and complexion of diverſe bodies. That ſtomacke is to bee thought well tempered, that powerfully drawes downe the meate and drinke, and embraces and retaines them ſo drawne, untill by concoction and elixation, they ſhall be turned into a juyce like creame (which the Greekes call *Chylos*;) and laſtly, which doth ſtrongly ſend from it, and repell the excrements of this firſt concoction.

The temper.
Lib.9. Meth.

The ſtomacke is knowne to be hotter by this, that it better concocts and digeſts courſe and hard meates, as beefe, hard egges, and the like, than ſoft meates eaſie of digeſtion, which it corrupts and turnes into belchings. For ſo a young chickin, is ſooner burnt than well roſted at a great fire. The ſtomacke which is colder, deſires much meate, but is ſlow in concocting them, eſpecially if they be cold and hard of digeſtion, which for that cauſe quickly turne ſowre. The action of a well conditioned ſtomacke, is twofold, one common, another proper. The common is to attenuate mixe and digeſt the meates taken in at the mouth, for the nutrition of it ſelfe and

Notes of a hot ſtomacke.
The action twofold.

and the whole body, after the liver hath performed its dutie, which before it be done, the ventricle onely enjoyes the ſweet pleaſure of the *Chylus*, and comforts its ſelfe againſt the heate and impuritie of the adjacent parts, wherefore it is called the worke-houſe of concoction. Its firſt action is to attract, retaine, and aſſimulate to it ſelfe that which is convenient; but to expell whatſoever ſhall be contrary, either in quantitie, or qualitie, or in the whole ſubſtance.

The two orifices of the ſtomacke.

It hath two orifices, one above, which they commonly call the ſtomacke and heart, the other lower, which is called the *Pylorus*, or lower mouth of the ſtomacke. The upper bends to the left ſide neere the backe bone; it is farre more large and capacious than the lower, that ſo it may more commodiouſly receive meates halfe chewed, hard and groſſe, which Gluttons caſt downe with great greedineſſe; it hath an exquiſite ſenſe of feeling, becauſe it is the ſeate of the appetite, by reaſon of the nerves incompaſſing this orifice, with their mutuall embracings; whereby it happens that the ventricle in that part is endued with a quicke ſenſe, that perceiving the want and emptineſſe of meate, it may ſtirre up the creature to ſeeke foode. For albeit nature hath beſtowed foure faculties on other parts, yet they are not ſenſible of their wants, but are onely nouriſhed by the continuall ſucking of the veines, as plants by juice drawne from the earth.

The ſite.

This orifice is ſeated at the fifth *Vertebra* of the cheſt, upon which they ſay it almoſt reſts. Yet I had rather ſay that it lies upon the twelfth *Vertebra* of the cheſt, and the firſt of the loines; for in this place the gullet perforates the midriffe, and makes this upper orifice. The lower orifice bends rather to the right ſide of the body, under the cavitie of the liver. It is farre ſtraiter than the upper, leſt any thing ſhould

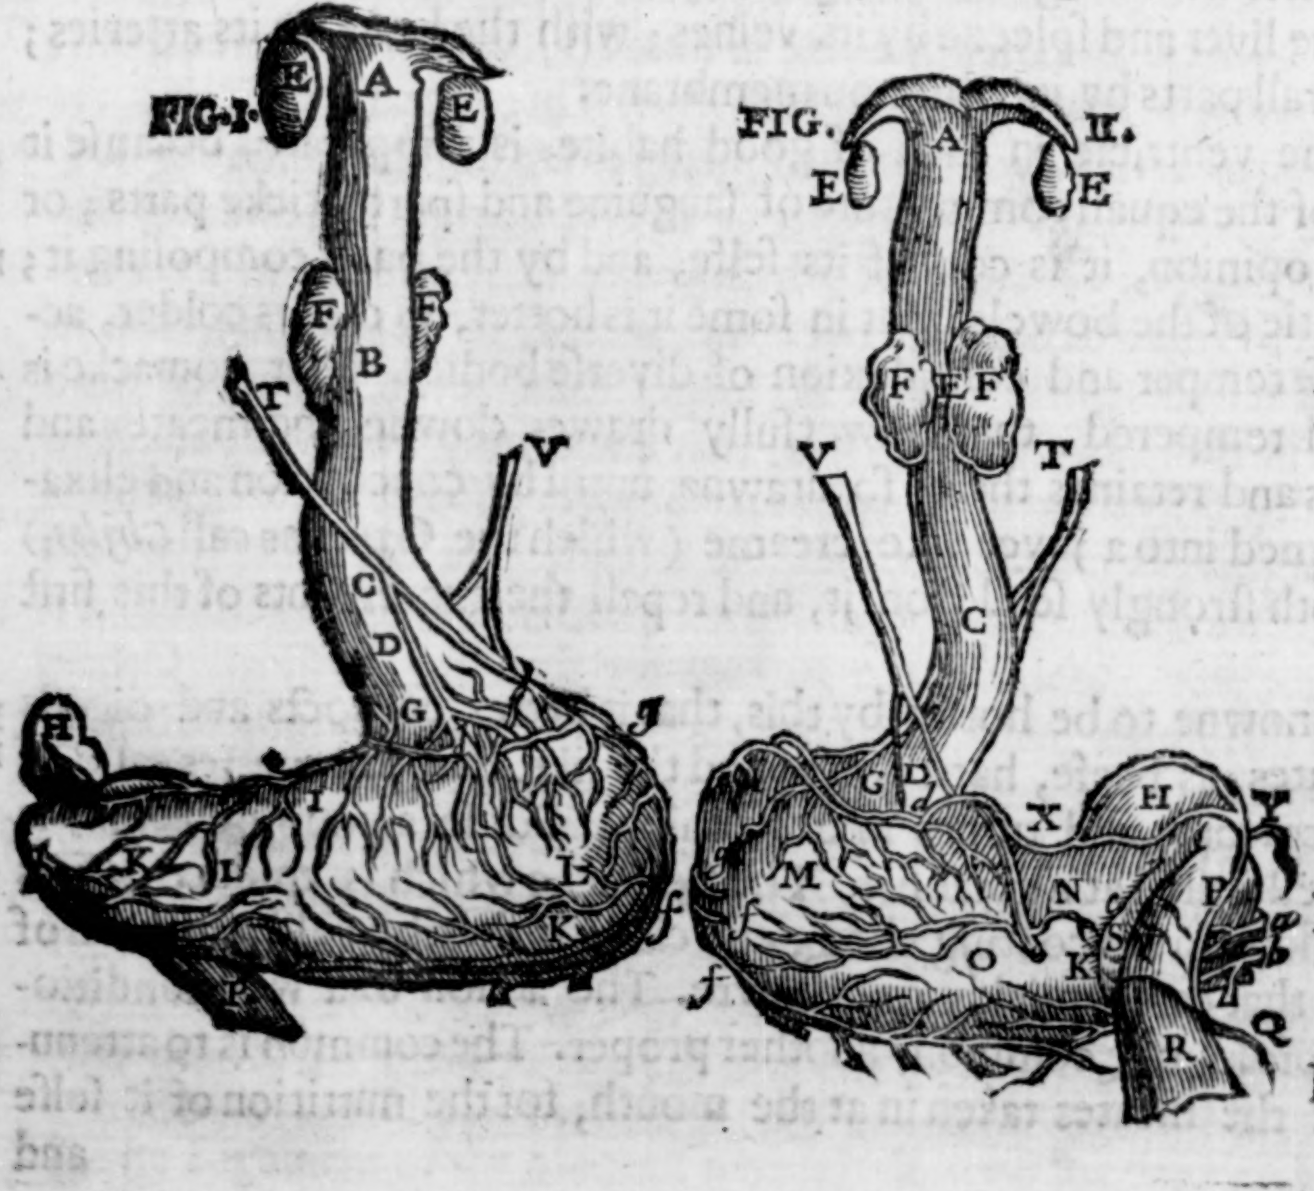
The glandudulous ring of the *Pylorus*.

paſſe away before it bee well attenuated and concocted; and it doth that by the helpe or aſſiſtance of, as it were a certaine ring, like to the ſphincter muſcle of the fundament, which ſome have thought a glandule made by the tranſpoſition of the inner and fleſhie membrane of the ventricle into that which is the outer of the guts. I know *Columbus* laughes at this glandulous ring, but any one that lookes more attentively ſhall perceive that the *Pylorus* is glandulous. The ſtomacke in its lower and inner ſide, hath many folds and wrinckles, which ſerve to hold and containe the meates, untill they be perfectly concocted. In the ventricle wee obſerve parts gibbous and hollow; the hollow is next to the liver and midriffe; the gibbous is to-

The falling downe of the ſtomacke.

wards the guts. Now we muſt note, that the ventricle when it is much reſolved or looſed, may ſlide downe even to the navell neare the bladder, the which wee have obſerved in ſome bodies diſſected after their death.

The third and fourth Figure.



The firſt figuse ſhewes the foreſide of the ſtomacke and gullet.

A. ſheweth the orifice of the gullet cut frō the throate.

B. the ſtraight and direct courſe of the gullet from A. to B.

C. how the gullet above the firſt racke bone of the cheſt, from B. to C. inclineth to the right hand.

D. his inclination to the left hand, from C. to D.

EE. the two glandules called the Almonds, ſet cloſe to the gullet in the end of the throate, called alſo *Pariſtmia, Antiades, Tonſillæ* and *Salviares glandulæ*. FF. Another glandulous body in the midſt of the gullet, about the fifth racke bone, from which place the gullet gives place to the great arterie, ſomewhat declining to the right ſide: *Veſalius, Lib.* 5, *Cap*.3. and *Columbus Cap.vlt.lib.9*. write, that thoſe Glandules are filled with a certaine moiſture, with which the gullet is moiſtened, that the meates may ſlide downe more eaſily into the ſtomacke, as through a ſlippery paſſage. No otherwiſe than the *Glandulæ proſtata*, filled with a kind of groſſe and oily moiſture, ſmooth the paſſage of the urine, that ſo it may flow through it, with a more free and leſſe troubled courſe. R. the paſſage of the bladder of the gall into the *Duodenum* at R. S, a glandulous body growing under the *Duodenum*, bearing up the veſſels. X.Y. a nerve on the left ſide creeping up to the top of the ſtomacke, and ſo running out to the liver.

CHAP. XV.

Of the Guts.

Their ſubſtance.

THe Guts the inſtruments of diſtribution and expulſion, are of the ſame ſubſtance and compoſure with the ſtomacke, but that the ſite of the coates of the ſtomacke is contrarie to thoſe of the guts. For that which is the innermoſt coate of the ſtomacke is the outermoſt of the guts, and ſo on the contrary. The figure of the guts is round, hollow and capacious, ſome more, ſome leſſe according to the diverſe bigneſſe.

Figure.

But for the quantitie of the guts, ſome are ſmall, ſome great, more or leſſe, according to the varietie of bodies. But they are ſixe in number, for there be three ſmall; the *Duodenum*, the *Ieiunum*, or emptie gut, and the *Ilion*. Three great, the Blind, the Collicke, and the Right gut. All which have had their names for the following reaſons; the firſt, becauſe it is extended the length of twelve fingers, like another ſtomacke, without any turning, or winding; of which greatneſſe it is found in great bodied men, ſuch as were more frequenly to be met withall in *Galens* time, than in this time of ours, in which this gut is found no longer than ſeven, eight, or nine fingers at the moſt. The cauſe of this length is, that there may be a free paſſage to the gate veine, comming out of the liver, as alſo to the artery and nerve which runne into it. For ſeeing that this gut may ſometimes riſe to the top of the liver, it would poſſeſſe the ſpace under the bladder of the gall (with which it is often tinctured) if it had any revolutions that way, which is the paſſage for ſuch like veſſels. Others give another reaſon of this figure, which is, that there ſhould bee nothing to hinder the eaſie and fit diſtribution of the perfectly concocted *Chylus* to the liver.

Their number

The *Duodenum*.

The ſecond is called *Ieiunum*, or the empty gut, not becauſe it is abſolutely ſo, but becauſe it containes little in compariſon of the other. There is a triple cauſe of this emptines; the firſt the multitude of the meſeraick veines and arteryes which are about it, whereupon there is a greater and quicker diſtribution of the *Chylus*. The ſecond is the vicinity or neighbourhood of the liver ſtrongly drawing the *Chylus* conteined in it; the third is the flowing downe of the cholericke humor from the bladder

The *Ieiunum*.

Ileon.

Cæcum.

Colon.

Rectum.

of the Gall into it, which ever and anon by its acrimony cleanſes away the filth, and by continuall flowing ſollicites it to expulſion. The third is called *Ileon* becauſe it lyes betweene the *Ilia* or flankes, it differs nothing from the reſt in ſubſtance and magnitude, but in this one thing, that there is more matter contained in it than in the reſt, by reaſon of the paucity of the veſſels terminated in it, that it is no marvell that there can be no exact demonſtration made of them. The fourth is called *Cæcum* or the Blind, becauſe it hath but one paſſage to ſend out and receive in the matter. This gut hath a long and ſtrait production, which according to the opinion of ſome (though altogether erroneous) often falls downe into the *Scrotum* in the rupture, or relaxation of the Rim of the Belly; for that production in the lower belly ſtrongly ſtickes to the *Peritonæum* or Rim, which hinders ſuch falling downe. But *Galen* ſeemes by ſuch a blind gut to haue meant this long and narrow production, and certainely ſo thinkes the common ſort of Anatomiſts, but here *Veſalius* juſtly reprehended *Galen*. Wherefore *Sylvius* that he might free *Galen* of this fault, would haue us by the blind gut to underſtand the beginning of the collicke gut. The fiſt is called *Colon* (or collicke gut) becauſe it is greater and more capacious than the reſt. The ſixt and laſt, the Right gut, by reaſon of the rightnes or ſtraightnes of the paſſage. This in beaſts eſpecially, hath a certaine fatneſſe in it to make the paſſage ſlippery, and leſt the gut ſhould be exulcerated in the paſſage, by the ſharpeneſſe of hard and acrid excrements.

Their ſite.

The ſite of theſe guts is thus, The *Duodenum* upon the backebone bends to the right hand; the *Ieiunum* poſſeſſes a great part of the upper umbilicall region, diffuſes it ſelfe into both ſides with windings, like to theſe of the gut *Ileum*, even to the flankes. The gut *Ileon* is ſituate at the lower part of the umbilicall region, going with many turnings and windings, even to the hollowneſſes of the holy-bone above the bladder and ſide parts of the *Hypogaſtrium*, which they call the flankes.

The Blind bends to the right hand, a little below the kidney, above the firſt and fourth *Vertebra* of the loines. The Colon or Collicke gut is crooked and bent, in the forme of a Scythian bow, filling all the ſpace from the blind gut, below the right kidney, even to the hollownes of the liver, and then it goes by the gibbous part of the ſtomacke above the ſmall guts, even to the hollowneſſe of the ſpleene; from whence ſliding under the left kidney, with ſome turnings, it is terminated upon the *Vertebra's* of the loines.

The diſtinction betweene the collicke and the ſtone in the kidnies. Their connexion.

By all which turnings and windings of the collicke gut, it is eaſie to diſtinguiſh the paine of the ſtone of the kidneies, which remaines fixt in one certaine place, from the collicke wandring through theſe crooked paſſages we mentioned. The right gut tends with an oblique ſite towards the left hand, upon the holy bone even to the very fundament. They have all one and a common connexion; for they are all mutually joined together by their coats, becauſe there is but one way from the gullet even to the fundament, but they are joyned to the principall parts by their nerves, veines, and arteries.

But a more proper connexion is that, where the *Duodenum* on the upper part of it, is joyned with the *Pylorus*; but on the lower part, to the *Ieiunum*, and the parts lying under it, by the coate of the *Peritonæum*. The *Ieiunum*, or emptie gut, is ioyned to the *Duodenum* and *Ileon*. The *Ileum* with the emptie and blind guts. The blind with the *Ileon* and *Colon*, and with the right ſide of the backe bone where it is tied more ſtraitly. The *Colon* with the blind and right guts, and in his middle part, with the kidneies and the gibbous part of the ſtomacke; whereby it comes to paſſe, that being diſtended with wind in the collike, it overturnes and preſſes the ſtomacke, and ſo cauſes vomiting.

Why vomiting happens in the collicke.

The *Sphincter* muſcles of the fundament.

Gal. lib. 5. de uſu partium. cap. 19.

Laſtly, the right gut is annexed with the collicke gut and fundament. At the end whereof there is a muſcle faſtened, of figure round and circular called the *Sphincter*, ariſing from the lower *Vertebra's* of the holy bone and rump, by the benefit of which as of a dore or gate, the excrements are reſtrained at our will, leſt man borne for all honeſt actions, without all ſhame, in every time and place, ſhould be forced every where to eaſe his belly. For ſuch as have loſt the benefit of this muſcle by the palſy, have their excrements goe from them againſt their wills. There is a body ſituate at the end of the right gut, of a middle ſubſtance betweene the ſkinne and fleſh, as it were ariſing from the mixture of them both, like the extremities of the lippes, of the ſame uſe with the *Sphincter*, but that it is not altogether ſo powerfull. But there are alſo certaine veines ſituate about it called the Hæmorrhoidall, of which we will ſpeake in their place.

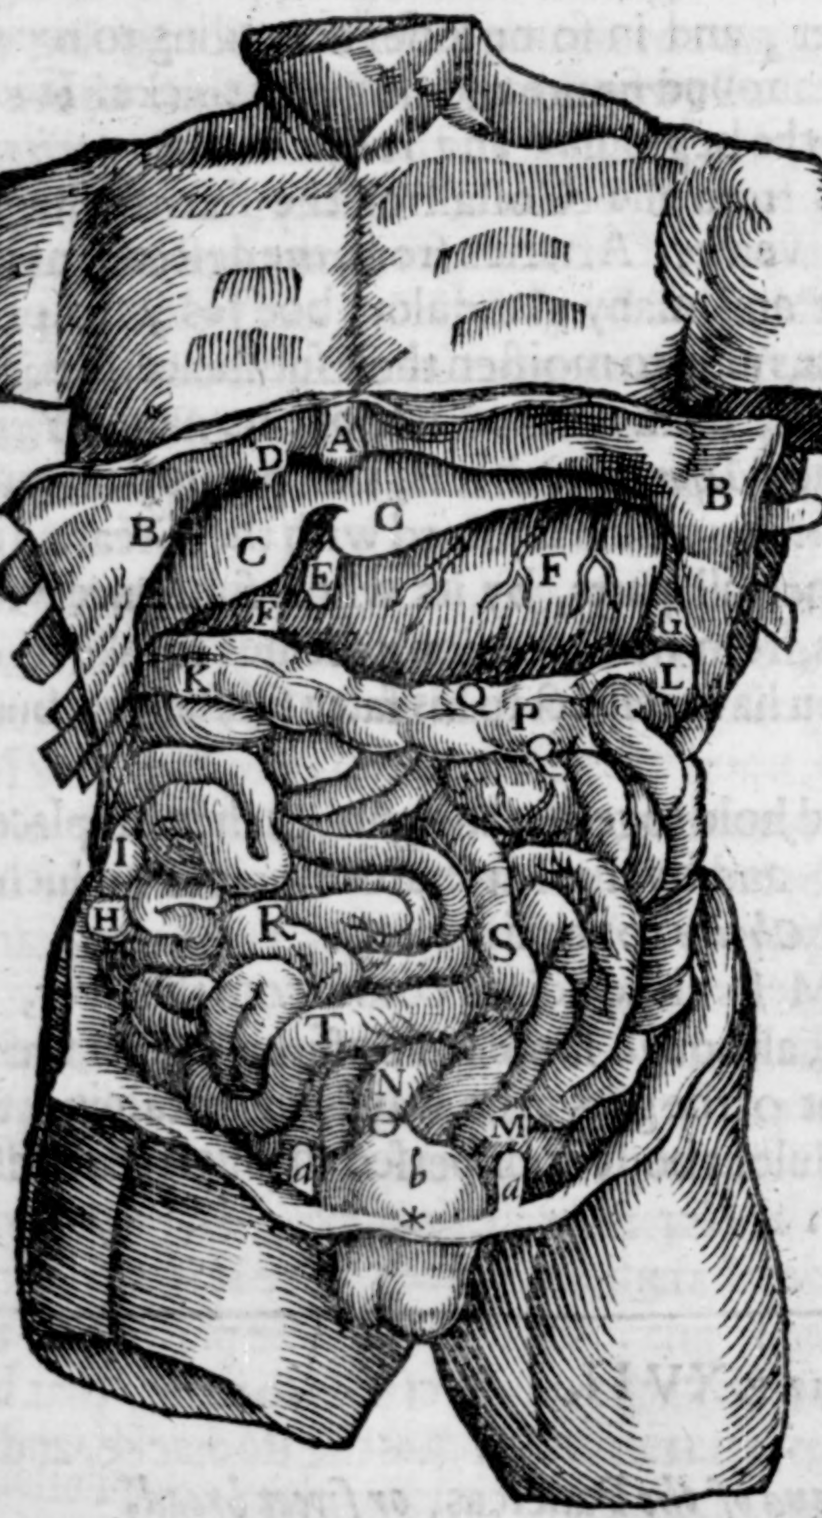
Levatores Ani.

Beſides, there are two other muſcles that deſcend to the end of this gut, being broad and membranous on each ſide, one ariſing from the ſide and inner parts of the ſhare and hippe-bones, which inſerted above the *Sphincter* pull up the fundament falling downe, wherefore they are called *Levatores Ani*, or the lifters up of the fundament. Wherefore when as either they are too weake, or reſolved, or the fundament oppreſſed with the weight of flegmaticke, ſalt, chollericke and ſharpe humors, the gut is ſcarſe reſtored into its place, that there is neede of the helpe of the fingers for that purpoſe.

The action of the guts.

The guts follow the temper of the ſtomacke. Their action is the diſtribution of the *Chylus* by the meſeraicke veines (which of dutie belongs to the three ſmall guts) and the receiving the excrements of the *Chylus*, and retention of them, till a fit time of expulſion, which belongs to the third quarter. Beſides, theſe ſmall guts finiſh up the worke of concoction, begun in the ſtomacke, although they be not altogether made for that uſe. But nature is often accuſtomed to abuſe the parts of the body for ſome better uſe.

The fiſth figure of the lower belly.



A. The breſt blade, *Cartilago Enſiformis.*

BB. The Rim, with the midriffe aud broken ribs bent outwards.

CC. the gibbous part of the liver.

D. a ligament tying the liver to the midriffe.

E. part of the umbilicall veine.

FF. the ſtomack fild full of meate.

G. a part of the ſpleene.

H. the blind gut of the late writers, for the Ancients tooke the toppe of the *colon* for it.

I. the beginning of the great or thicke guts.

I. and ſo to K. ſheweth the paſſages of the collicke gut from the right kidney to the liver. And ſo the collicke and the ſtone on this ſide are in one place, and therefore hardly diſtinguiſhed.

K, to L. the ſame collicke gut lieth under the whole bottome of the ſtomacke, which is the reaſon that thoſe which are troubled with the collicke caſt ſo much.

L. to M. The paſſage of the *Colon* from the ſpleene to the ſhare bone, by the left kidney, a way, which maketh the paine of the ſtone and the Collick on the left ſide very hard to diſtinguiſh. N. The *Colon* ending in the right gut. O. The beginning of the right gut unto the bladder. P. Q. The ſunken or fallen ſide of the *Colon* at P. and his Chambers or Cells at Q. R. S. T. The leſſer guts, eſpecially lying under the Navil. *a. a.* The two umbilicall arteryes. *b.* The bottome of the bladder. * The connexion of the bladder and the *Peritonæum.*

Their fibers.

But we muſt note, that for the compoſure of the guts, they have onely tranſverſe fibers, for expulſions ſake, unleſſe that at the beginning of the *Colon*, and the end of the right gut, you may ſee certaine right fibers added to the tranſverſe to ſtrengthen them, leſt theſe guts ſhould chance to be broken and torne by the paſſage of hard excrements, and the laborious endevour of expulſion (ſpecially in brute beaſts.)

How the guts become fit to retaine.

Their length.

But if any aske, how they have retention, being they want oblique fibers, he may know that the *fæces* are retained in the right gut, by the force of the *Sphincter* muſcle, but oft times in the blind, by their hardneſſe and abundance, whereby they ſticke in the paſſage; but in the reſt, by reaſon of their conformation into many windings and turnings. The length of the guts, is ſeven times more than the length of the whole body; to this length they have windings, leaſt the nouriſhment ſhould quickly ſlide away, and leaſt men ſhould bee withdrawne by gluttony from action and contemplation. For ſo wee ſee it comes to paſſe in moſt beaſts, which have one Gut, ſtretched ſtraight out from the ſtomacke to the fundament; as in the Lynx and ſuch other beaſts of inſatiable gluttony, alwayes, like plants, regarding their food.

CHAP. XVI.

Of the Meſentery.

The ſubſtance magnitude,

Figure, Compoſure,

Number,

The connexion,

AFter the Guts followes the Meſentery, being partly of a fatty and partly of a ſpermaticke ſubſtance. The greatneſſe of it is apparent enough, although in ſome it be bigger, and in ſome leſſer according to the greatneſſe of the body. It is of a round figure and not very thicke. It is compoſed of a double coate ariſing from the beginning and roote of the *peritonæum*. In the midſt thereof it admits nerves from the Coſtall of the ſixt conjugation, veines from the *Vena Porta* or Gate veine; Arteries from the deſcendant artery, over and beſides a great quantity of fat and many glandulous bodyes, to prop vp the diviſion of the veſſels ſpred over it, as alſo to moiſten their ſubſtance. It is in number one, ſcituate in the middle of the guts, from whence it tooke its name. Yet ſome divide it into two parts, to wit, into the *Meſeræum*, that is, the portion interwoven with the ſmall guts, and into the *Meſocolon* which is joined with the Great. It hath connexion by its veſſells with the principall parts, by its whole ſubſtance with the guts, and in ſome ſort with the kidneies, from whoſe region it ſeemes to take its coats.

The temper.

It is of a cold and moiſt temper, if you have reſpect to his fatty ſubſtance; but if to the reſt of the parts, cold and drye.

The action and uſe.

The action and uſe of it is, to bind and hold together the guts, each in his place, leaſt they ſhould raſhly be folded together; and by the Meſeraicke veines (which they terme the hands of the Liver) carry the *Chylus* to the liver.

All the meſeraicke veines come from the liver.

In which you muſt note, that all the Meſeraicke ueines come from the liver, as we underſtand by the diſſection of bodyes; although ſome have affirmed, that there bee ſome veines ſerving for the nouriſhment of the guts, no wayes appertaining to the Liver, but which end in certaine Glandulous bodyes, diſperſed through the Meſentery, of whoſe uſe we will treat hereafter.

CHAP. XVII.

Of the Glandules in generall, and of the Pancreas, or ſweet bread.

Subſtance of the glandules,

Quantitie and figure,

A Glandule is a ſimple part of the body, ſometimes of a ſpongye and ſoft ſubſtance, ſometimes of a denſe and hard. Of the ſoft Glandules are the *Tonſillæ*, or Almonds, like in ſubſtance to blanched Almonds; the *Thymus*, *Pancreas*, *Teſticles*, *Proſtatæ*. But the denſe and hard are the *Parotides* and other like. The Glandules differ amongſt themſelues in quantity and figure, for ſome are greater than other ſome, and ſome are round and others plaine, as the *Thymus* and *Pancreas*.

Compoſition.

Number,

Others are compounded of veines, nerves, arteries, and their proper fleſh, as the Almonds of the eares, the milkie glandules in the breſts and the teſticles. Others want nerves, at leaſt which may be ſeene, as the *Parotides*, the axillarie, or thoſe under the armeholes and others. The number of glandules is uncertaine, by reaſon of the infinite multitude and variety of ſporting nature. You ſhall finde them alwayes in theſe places, where the great diviſions of veſſels are made; as in the middle ventricule of the braine, in the upper part of the Cheſt, in the Meſentery and other lik places.

Connexion.

Temper.

Action and uſe.

The ſubſtence of the *Pancreas*.

The ſite,

Although otherſome be ſeated in ſuch places, as nature thinkes needfull to generate and caſt forth of them a profitable humor to the creature; as the almonds at the roots of the tongue, the kernells in the dugs, the ſpermatick veſſels in the *ſcrotum* and at the ſides of the wombe; or where nature hath decreed to make emunctoryes for the principall parts, as behind the eares, under the armeholes, and in the groines. The connexion of glandules is not only with the veſſels of the parts concurring to their compoſition, but alſo with thoſe, whoſe diviſion they keep and preſerve. They are of a cold temper, wherefore Phiſitions ſay the blood *recrudeſcere*, (i) to become raw againe in the dugs, when it takes upon it the forme of milke. But of theſe ſome have action, as the almonds, which poure our ſpattle uſefull for the whole mouth, the dugs milke, the Teſticles ſeed; others, uſe onely as thoſe which are made to preſerve, vnderprop and fill vp the diviſions of the veſſels. Beſides this we have ſpoken of glandules in generall, we muſt know that the *Pancreas* is a glandulous and fleſh-like body, as that which hath every where the ſhape and reſemblance of fleſh. It is ſituate at the flat end of the liver, under the *Duodenum* with which it hath great connexion, and under the gate-veine, to ſerve as a bulwarke, both to it and the diviſions thereof, whilſt it fills up the emptie ſpaces, betweene the veſſels themſelves, and ſo hinders, that they be not pluckt aſunder, nor hurt by any violent motion, as a fall, or the like.

CHAP. XVIII.

Of the Liver.

What the liver is.

Its ſubſtance and quantity.

Why cowards have great livers.

HAving gone thus farre, order of diſſection now requires, that we ſhould treate of the diſtribution of the gate veine; but becauſe it cannot well be underſtood unleſſe all the nature of the liver from whence it ariſes, be well knowne, therefore putting it off to a more fit place, we will now ſpeake of the Liver. Wherefore the liver (according to *Galens* opinion, *lib. de form. fœtus*) is the firſt of all the parts of the body, which is finiſhed in conformation, it is the ſhoppe and Author of the bloud, and the originall of the veines; the ſubſtance of it, is like the concrete mudde of the bloud, the quantitie of it is diverſe, not onely in bodies of different, but alſo of the ſame ſpecies; as in men amongſt themſelves, of whom one will bee gluttonous and fearefull, another bold, and temperate, or ſober; for hee ſhall have a greater liver than this, becauſe it muſt receive and concoct a greater quantitie of *Chylus*: yet the liver is great in all men, becauſe they have need of a great quantitie of bloud for the repairing of ſo many ſpirits & the ſubſtantificke moiſture, which are reſolved and diſſipated in every moment by action and contemplation. But there may bee a a twofold reaſon given, why ſuch as are fearefull have a larger liver. The firſt, is becauſe in thoſe the vitall facultie (in which the heate of courage and anger reſides) which is in the heart, is weake; and therefore the defect of it muſt be ſupplied by the ſtrength of the naturall facultie. For thus nature is accuſtomed to recompence that which is wanting in one part, by the increaſe and acceſſion of another. The other reaſon is, becauſe cold men have a great appetite, for by *Galens* opinion *In arte parva*, coldneſſe increaſes the appetite; by which it comes to paſſe that they have a greater quantitie of *Chylus*, by which plenty the liver is nouriſhed, and growes larger. Some beaſts, as Dogges, and ſwine, have the liver divided into five or more Lobes, but a man hath but one Lobe, or two, or three at the moſt; and theſe not ſo much diſtinguiſhed, as which cheariſh the upper and hollow region of the ventricle, with embracing to helpe forward the worke of concoction. Therefore the liver is almoſt content with one Lobe, although it is alwayes rent with a ſmall diviſion, that the umbilicall veine pearcing into the roots and ſubſtance of it, may have a free paſſage; but alſo oftentimes there is as it were a certaine ſmall lobe of the liver, laid under that umbilicall veine, as a cuſhion.

The figure. The figure of the liver is gibbous; riſing up and ſmooth towards the Midriffe; towards the ſtomacke is the *ſimous* or hollow ſide of it ſomewhat unequall, and rough by reaſon of the diſtance of the Lobes, the originall of the hollow veine, and the ſite of the bladder of the Gall.

The compoſure. The veſſels. The compoſition of the liver is of veines, nerves, arteryes, the coate and proper ſubſtance thereof which we call the groſſe and concreet blood, or *Parenchyma.* Veines and arteryes come to it from the navell; but nerves immediatly from theſe which are diffuſed over the ſtomack according to *Hippocrates*; yet they penetrate not very deep into its ſubſtance, for it ſeemes not to ſtand in neede of ſuch exact ſenſe, but they are diſtributed upon the coate and ſurface thereof, becauſe this part made for diſtribution over the whole body, keepes to it ſelfe no acrid or maligne humor, for the perception of which it ſhould neede a nerve, although the coate inveſting it, ſends many nervous fibers into its ſubſtance, as is apparent by the taking away of the coate from a boiled liver; we muſt thinke the ſame of the other entrals. The coate of the liver is from the *Peritonæum*, waxing ſmall from the umbilicall veine, when it divides it ſelfe for the generation of the gate and hollow veines, as is obſerved by *Galen, lib. de format. Fætus.* **The number and ſite.** The liver is onely one, ſituate in the greater part on the right ſide, but with the leſſer part on the left, quite contrary to the ſtomacke. **The connexion.** Its chiefe connexion is with the ſtomacke, and guts, by the veines and membranes of the *Peritonæum*; by the howllow veine and artery, with the heart; by the nerve with the braine, and by the ſame ligatures with all the parts of the whole body. **The temper.** It is of a hot and moiſt temper, and ſuch as have it more hot, have large veines and hot bloud; but ſuch as have it cold, have ſmall veines, and a diſcoloured hew. **The action.** The Action of the Liver is the converſion of the *Chylus* into bloud, the worke of the ſecond concoction. For although the *Chylus* entring into the meſeraicke veines, receive ſome reſemblance of bloud, yet it acquires not the forme and perfection of bloud, before it be elaborate, and fully concoct in the liver. **The ligaments** It is bound and tied with three ſtrong ligaments, two on the ſides in the midſt of the baſtard ribs, to beare up its ſides, and the third more high and ſtrong, deſcending from the breaſt-blade, to ſuſtaine its proper part, which with its weight would preſſe the lower orifice of the ſtomacke, and ſo cauſe a falling or drawing downe of the ſternon and coller bone. And thus much may ſuffice for its proper ligaments, for we before mentioned its common, the veines, arteries, nerves, and coate of the *Peritonæum*, by which it is knit to the loines, and other naturall parts. But wee muſt note, that beſides theſe three proper ligaments, the liver is alſo bound with others to the baſtard ribs, os *Sylvius* obſerves in his Anatomicall obſervations, and *Hollerius* in his Practiſe, *Cap. de Pleuritide.*

CHAP. XIX.

Of the bladder of the Gall.

The ſubſtance, greatneſſe, and figure thereof NOw wee muſt come to the bladder of the Gall, which is of a nervous ſubſtance, and of the bigneſſe of a ſmall peare; it is of figure round, with the bottome more large, but the ſides and mouth more narrow and ſtraite. **The compoſition.** It is compoſed of a double coate, one proper, conſiſting of three ſorts of fibers, the other from the *peritonæum.* It hath a veine from the *Porta* or gate veine, and an artery from that which is diffuſed into the liver, and a nerve from the ſixt conjugation. **Number and connexion.** It is but one and that hid on the right ſide under the greater lobe of the liver, it is knit with the touching of its own body, and of the paſſages and channels made for the performance of its actions with the liver, and in like manner with the *Duodenum*, and not ſeldome with the ſtomack alſo, by another paſſage; & to conclude to all the parts by its veines, nerves, arteries, and common coate. **Temper.** It is of a cold temper, as every nervous part is. **Action.** The action of it is to ſeparate from the liver the cholericke humor, and that excrementitious, but yet naturall by the helpe of the right fibers, for the purifying of the bloud, and by the oblique fibers, ſo long to keepe it being drawne, untill it begin to become troubleſome in quantitie, qualitie, or its whole ſubſtance, and then by the tranſverſe fibers, to put it downe into the *Duodenum* to provoke the expulſiue facultie of the guts. I know *Fallopius* denies the texture of ſo many fibers, to be the miniſter of ſuch action to the gall. But *Veſalius* ſeemes ſufficiently to have anſwered him

The channels of the gall.

Lib. 2. de temper.

him. The bladder of the gall hath divers channels, for comming with a narrow necke, even to the beginning of the gate veine, it is divided into two paſſages, the one whereof ſuffering no diviſion is carried into the *Duodenum*, vnleſſe that in ſome it ſend another branch into the bottome of the ſtomack, as is obſerved by *Galen*; which men have a miſerable and wretched life, being ſubject to cholericke vomitings, eſpecially when their ſtomackes are empty, with great paines of their ſtomacke and head, as is alſo obſerved by *Galen Cap.* 74. *Artis Med.* The other comming out of the body of the liver devides it ſelfe into two or three paſſages, againe entering the ſubſtance of the liver, is divided with infinite branches, accompanying ſo many branches of the gate veine through the ſubſtance of the liver, that ſo the blood unleſſe it be moſt elaborate and pure, may not riſe into the hollow veine, all which things Diſſection doth manifeſtly teach.

The ſixth Figure of the bladder of the Gall.

Chap. XX.

Of the Spleene or Milt.

BVt becauſe we cannot well ſhew the diſtribution of the gate veine, unleſſe the ſpleene be firſt taken away, and removed from its ſeate; therefore before we go any further, I have thought good to treate of the ſpleene. Therefore the ſpleene is of a ſoft, rare, and ſpongious ſubſtance (whereby it might more eaſily receive and drinke up the dreggs of the bloud from the liver) and of a fleſh more blacke than the liver. For it reſembles the colour of its muddy bloud, from which it is generated. It is of an indifferent greatneſſe; but bigger in ſome, than in otherſome, according to the diverſe temper and complexion of men. It hath, as it were, a triangular figure, gibbous on that part, it ſtickes to the ribbes and midriffe, but hollow on that part next the ſtomacke. It is compoſed of a coate, the proper fleſh, a veine, artery, and nerve. The membrane comes from the *peritonæum*, the proper fleſh from the *fæces* or dregges of bloud, or rather of the naturall melancholy humor, with which it is nouriſhed. The fourth branch of the *vena porta*, or gate veine, lends it a veine; the firſt branch of the great deſcendant artery preſently after the firſt entrance without the Midriffe, lends it an arterie. But it receives a nerve from the left coſtall, from the ſixt conjugation on the inner part, by the rootes of the ribs; & we may manifeſtly ſee this nerve, not only diſperſing it ſelfe through the coate of the liver, but alſo penetrating with its veſſels the proper fleſh thereof, after the ſelfeſame manner, as we ſee it is in the heart and lungs. It is one in number, ſituate on the left ſide, betweene the ſtomacke and the baſtard ribs, or rather the midriffe which deſcends to their rootes. For it oft times cleaves to the midriffe on its gibbous part, by a coate from the *peritonæum*, as alſo on the hollow part to the ſtomacke, both by certaine veines which ſends it into the ventricle, as alſo by the kall. It hath connexion, either primarily, or ſecundarily, with all the parts of the body, by theſe its veſſels.

The ſubſtance

Magnitude.

Figure.

Compoſition.

Number, and ſite.

Connexion.

Temper and uſe.

It is of a cold and drie temper; the action and uſe of it is to ſeparate the melancholicke humor, which being feculent and droſſie, may be attenuated by the force of many atteries diſperſed through its ſubſtance. For by their continuall motion, and native heate, which they carrie in full force with them from the heart, that groſſe bloud puts off its groſſeneſſe, which the ſpleene ſends away by paſſages fit for that purpoſe, retaining the ſubtler portion for its nouriſhment. The paſſages by which it purges it ſelfe from the groſſeneſſe of the melancholy bloud, are a veine aſcending from it into the ſtomacke to ſtirre up the appetite by its ſoureneſſe, and ſtrengthen the ſubſtance thereof by its aſtriction; and alſo another veine, which ſometimes from the ſpleene branch, ſometimes from the gate veine, plainely under its orifice, deſcends to the fundament, there to make the Hærrhoidall veines.

Chap. XXI.

Of the Vena Porta, or Gate-veine, and the diſtribution thereof.

The ſubſtance and figure.

Compoſitiors. Number end Site.

Temper and Action.

The gate-veine, as alſo all the other veines, is of a ſpermaticke ſubſtance, of a manifeſt largeneſſe, of a round and hollow figure, like to a pipe or quill. It's compoſed of its proper coate, and one common from the *peritonæum*. It is onely one, and that ſituate in the ſimous or hollow part of the liver, from whence it breakes forth (or rather out of the umbilicall veine) into the midſt of all the guts, with which it hath connexion, as alſo with the ſtomacke, ſpleen, *ſphincter* of the fundament and *Peritonæum*, by the coat which it receives from thence. It is of a cold and dry temper. The Action of it is, to ſucke the *Chylus* out of the ventricle and guts, and ſo to take and carry it to the Liver, untill it may carry back the ſame turned into blood for the nutriment of the ſtomacke, ſpleen and guts.

Diviſion thereof into 6 branches of which 4 ſimple.

1

Cyſtica gemella.

2

Gaſtrica.

This Gate veine comming out of the ſimous part of the liver, is divided into ſixe branches, that is 4 ſimple and two compound, againe divided into many other branches. The firſt of the ſimple aſcends from the fore part of the truncke to the bladder of the Gall by the paſſage of the Choller (and are marked with *g. g.*) with a like arterye for life and nouriſhment, and this diſtribution is knowne by the name of the *Cyſtica gemella* or Cyſticke twins. The ſecond is called the *Gaſtrica* or ſtomack veine ariſing in like manner from the fore part of the truncke is carried to the *Pylorus* and the ſimous or backe part of the ſtomacke next to it.

3

Gaſtrepiplois.

The third is called *Gaſtrepiplois*, the ſtomacke and kall veine which comming from the right ſide of the gate veine goes to the gibbous part of the ſtomacke next to the *Pylorus* and the right ſide of the kall.

4

Inteſtinalis.

Two compound.

The fourth going forth from behind and on the right hand of the gate veine, aſcends above the roote of the Meſeraicke branch, even to the beginning of the gut *Ieiunum*, along the gut *Duodenum*, from whence it is called *Inteſtinalis*, or the gut-veine. And theſe are the foure ſimple branches. Now we will ſpeake of the compound.

1

Ramus ſplenicus ſending forth.

1

Coronalis.

The firſt is the ſpleenicke, which is divided after the following manner. For in its firſt beginning and upper part, it ſends forth the *Coronalis*, or crowne veine of the ſtomacke, which by the backe part of the ſtomacke aſcends into the upper and hollow part thereof; to which place, as ſoone as it arrives, it is divided againe into two branches, the one whereof climbs up even to its higher orifice, the other deſcends downe to the lower, ſending forth by the way other branches to the fore and backe parts of the ſtomacke. Theſe engirt and on every ſide incompaſſe the body of the ventricle, for which cauſe they are named the crowne veines.

2

Hæmorrhoidalis interna.

I have ſometime obſerved this comming-forth of the truncke, a little above the orifice of the ſplenicke branch. But this ſame ſplenicke branch on its lower part, produces the branch of the Hæmorroidall veines, which deſcending to the fundament above the left ſide of the loines, diffuſes a good portion thereof into the leaſt part of the collicke gut, and the right gut, at the end whereof it is often ſeene to be divided into five Hæmorrhoidall veines, ſometimes more, ſometimes leſſe.

Sylvius writes that the Hæmorrhoidall branch deſcends from the meſentericke, and truly we have ſometimes obſerved it to have beene ſo. Yet it is more ſutable to reaſon, that it ſhould deſcend from the ſplenicke, not onely for that we have ſeene with our eyes that it is ſo, but alſo becauſe it is appointed by nature for the evacuation of the excrementitious melancholike humor. But this ſame ſplenick branch out of the middle almoſt of its upper part produces the third branch going to the gibbous part of the ſtomacke, and the kall; they terme it the greater, middle and left *Gaſtrepiplois*. But on the lower part towards the ſpleene it produces the ſimple *Epiplois*, or kall-veine, which it diffuſes through the left ſide of the kall. Moreover from its upper part, which touches the liver, it ſends forth a ſhort branch called *vas breve*, or *venoſum*, to the upper orifice of the ventricle for ſtirring up the appetite.

3. *Gaſtrepiplois major ſiniſtra.*

4. *Epiplois ſimplex.*

5. *Vas breve ſeu venoſum.*

Wee have oftentimes and almoſt alwayes obſerved, that this veinie veſſell, which *Galen* calls *vas breve*, comes from the very body of the ſpleene, and is terminated in the midſt of the ſtomacke on the left ſide, but never peirces both the coates thereof. Wherefore it is ſomewhat difficult to find, how the melancholy juyce can that way be powred, or ſent into the capacitie of the ſtomacke. Now the ſplenicke branch, when it hath produced out of it thoſe five forementioned branches, is waſted and diſperſed into the ſubſtance and body of the ſpleene.

Lib. 4. de uſu partium.

Then followes another compound branch of the *vena porta*, called the meſentericke, which is divided into three parts; the firſt and leaſt whereof goes to the blind gut, and to the right and middle part of the collicke-gut, divided into an infinite multitude of other branches. The ſecond and middle is waſted in the *Ileon*; as the third and greater in the *Ieiunum* or empty gut. It is called Meſentericke becauſe it is diffuſed over all the Meſentery; as the ſplenicke is in the ſpleen. And thus much wee have to ſay of the diviſion of the gate veine, the which if at any time thou ſhalt find to be otherwiſe, than I have ſet downe, you muſt not wonder at it; for you ſhall ſcarce finde it the ſame in two bodies, by reaſon of the infinite varietie of particular bodies, which (as the Philoſophers ſay) have each their owne, or peculiar gifts. Our judgement is the ſame of other diviſions of the veſſels. Yet wee have ſet downe that which wee have moſt frequently obſerved.

2 *Ramus meſentericus*, devided into three parts.

CHAP. XXII.

Of the originall of the Artery, and the diviſion of the branch, deſcending to the naturall parts.

THoſe things being thus finiſhed and conſidered, the guts ſhould be pulled aaway, but ſeeing that if we ſhould do ſo, we ſhould diſturbe and looſe the diviſion of the artery deſcending to the naturall parts; therefore I have thought it better to handle the diviſion thereof, before the guts be pluckt away. Therefore we muſt ſuppoſe, according to *Galens* opinion, that as all the veines come from the liver, ſo all arteries proceede from the heart. This preſently at the beginning is divided into two branches, the greater whereof deſcends downewards to the naturall parts upon the ſpine of the backe, taking its beginning at the fifth *vertebra* thereof, from whence it goes into the following arteries. The firſt called the intercoſtall, runnes amongſt the intercoſtall muſcles, and the diſtances of the ribs, and ſpinall marrow, through the perforations of the nerves on the right and left hand from the fifth true, even to the laſt of the baſtard ribs.

The originall of arteries. The diviſion of the great deſcendant artery, is into theſe.

1 *Arteria intercoſtalis.*

This in going this progreſſe makes 7. litle branchings, diſtributed after the forementioned manner, and going forth of the truncke of the deſcendant over againſt each of the intercoſtal Muſcles.

The ſecond being parted into two goes on each ſide to the midriffe, whence it may be called, or expreſſed by the name of the *Diaphragmatica* or *Phrenica* (*i*) the midriffe arterye. The third being of a large proportion, ariſing from the upper part of the artery preſently after it hath paſſed the midriffe, is divided into two notable branches, whereof on goes to the ſtomacke, ſpleene, kall, to the hollow part of the liver

2 *Phrenica.*

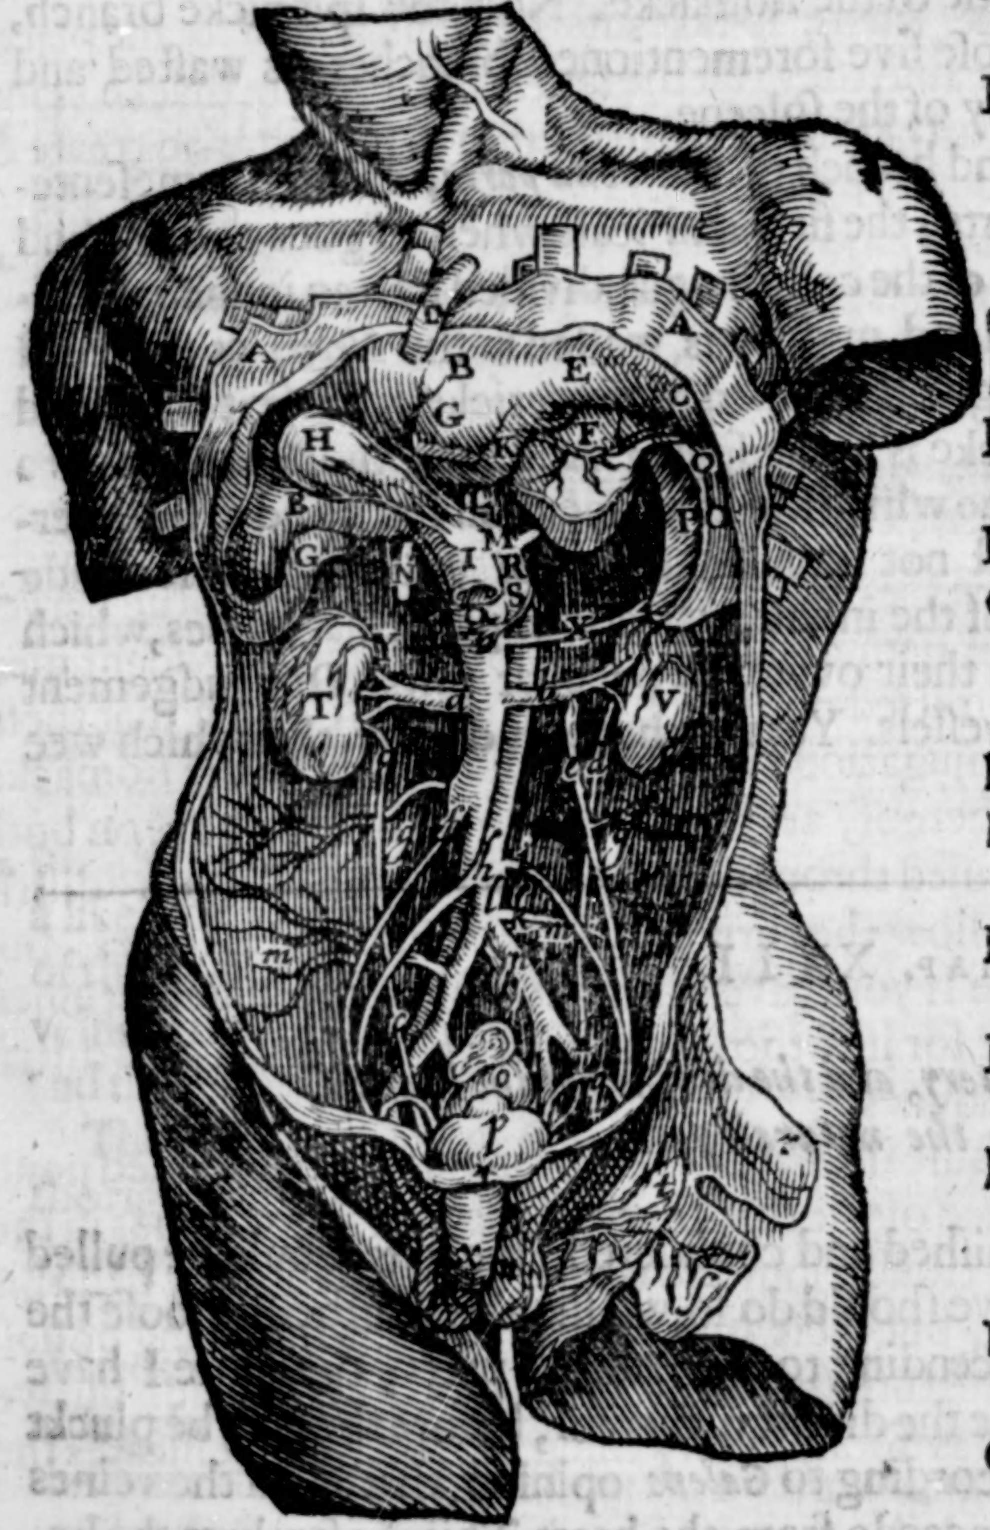
3. *Cœliaca.*

liver and the gall; the other is ſent forth to the meſentery and guts after the ſame manner, as wee ſaid of the meſeraicke veines, wherefore it is called the *Cœliaca*, or ſtomacke arterie. But wee muſt note, all their mouthes penetrate even to the innermoſt coate of the guts, that by that meanes they may the better and more eaſily attract the *Chylus* contained in them.

4. *Emulgent.* The fourth is carried to the reines, where it is named the reinall or emulgent, becauſe it ſuckes fit matter from the whole maſſe of bloud.

5. *Spermatica.* The fifth is ſent to the teſticles with the preparing ſpermaticke veines, whence alſo it is named the ſpermaticke artery, which ariſes on the right ſide, from the very trunke of the deſcendant artery; that it may aſſociate the ſpermaticke veine of the ſame ſide, they runne one above another, beneathe the hollow veine, wherefore wee muſt have a great care whileſt wee labour to lay it open, that wee doe not hurt and breake it.

The ſeventh Figure of the lower belly.



A.A. the midriffe turned backe with the ribs and the *peritonæum*.
BB. the cave or hollow part of the liver, for the liver is lifted up that the hollow part of it may bee better ſeene.
C. the leaſt ligament of the liver.
D. the umbilicall veine.
E. the hollowneſſe in the liver, which giveth way to the ſtomacke.
F. the left orifice of the ſtomacke.
GG. certaine knubs, or knots, and impreſſions in the hollow part of the liver.
H. the bladder of gall.
I. the gate-veine, cut off, and branches which goe to the bladder of gall.
K. a nerve of the liver comming from the ſtomachicall nerve.
L. an artery common to the liver and bladder of gall.
M. a nerve common alſo to them both, comming from the right *coſtall* nerve of the ribs.
N. the paſſage of the gall to the guts cut off.
OO. the hollow of the fore parts of the ſpleene.

P. they line where the veſſels of the ſpleene are implanted. Q. the trunke of the hollow veine. R. the trunke of the great artery. S. the *Cœliacall* artery cut off. T. V. the kidneies yet wrapped in their membrane. X. Y. the fatty veines called *venæ adipoſa*. *a.b* the emulgent veines with the arteries under them. *cc* . *dd*. the ureter from either kidney to the bladder. *e.f.* the ſpermaticall veines to the teſticles, the right from the hollow veine, the left from the emulgent. *g.g.* veines comming from the ſpermaticall to the *peritonæum*. *h.i.* the ſpermaticall arteries. *k.* the lower meſentericall artery. *l.* the aſcending of the great arterie above the hollow veine, and the diviſion of it, and the hollow veine into two trunkes. *m.* the arterie of the loines called *lumbaris*. *n.* the holy artery called *ſacra*. *o.* a part of the right gut, *p.* the bladder of urine. * the connexion of the bladder with the *peritonæum*. *q.* a part of the veſſels which leade the ſeed from the teſticles, is here reflected. *r.ſ.* the *ſcrotum*, or cod, that is, the skinne that inveſts the yard and teſticles. *t.* the fleſhie pannicle or membrane which is under the cod. *u.* the coate which is proper to the teſticles with his veſſels. *x.* a part of the yard excoriated or flayed, and hanging downe.

The

Hæmorrhoidalis ſeu meſenterica inferior.

The ſixth going from the fore and upper part of this deſcendant arterie, deſcends with the Hæmorroidall veines to the fundament; preſently from his beginning, ſending forth certaine branches alongſt the collicke gut, which by *anaſtomoſis* are united with other branches of the *Cœliacall* arteries; for whoſoever ſhall looke more attentively, he ſhall often obſerve that veines are ſo united amongſt themſelves, and alſo arteries, and ſometimes alſo the veines with the arteries. For an *anaſtomoſis* is a communion and communicating of the veſſels amongſt themſelves, by the application of their mouthes, that ſo by mutuall ſupplies they may eaſe each others defects. But they call this the lower meſeraicke arterie.

7 Lumbaris.

The ſeventh proceeding from the truncke with ſo many branches as there be *vertebra's* in the loines, goes to the loines and the parts belonging to them, that is, the ſpinall marrow of that part, and other parts encompaſſing theſe *Vertebra's*, whereupon it is ſtiled the *Lumbaris* or Loine Artery.

8 Iliaca.

The eight maketh the Iliacke arteries, until ſuch time as it departs from the *Peritonæum* where the Crurall Arteryes take their originall. This Iliacke Artery ſends many divarications towards the Holy bone where it takes its beginning, and to the places lying nere the Holy bone, which becauſe they run the ſame courſe as the Iliacke veins, for brevities ſake, we will let paſſe further mention of them, till we come to treate of the Iliacke veines.

CHAP. XXIII.

Of the diſtribution of the Nerves to the naturall parts.

The originall of the nerves which are caryed to the naturall parts.

IT remaines, that before the bowels be taken away, we ſhew the nerves ſent to the entrailes and naturall parts, that as wiſe and provident men we may ſeeme to have omitted nothing. Firſt we muſt know that theſe nerves are of the ſixt conjugation, which deſcend as well to the ſtomacke all alongſt the Gullet and the ſides thereof, as thoſe at the roots of the ribbes on both ſides within. But when they are paſſed through the Midriffe, thoſe which are diſtributed amongſt the naturall parts follow the turnings of the veines and arteryes, but ſpecially of the arteryes. Wherefore if you have a mind to follow this diſtribution of the nerves, you muſt chiefely looke for it in thoſe places, in which the artery is diſtributed amongſt the Guts above the loynes.

Their magnitude and uſe.

Theſe nerves are but ſmall, becauſe the parts ſerving for nutrition, needed none but litle nerves, for the performance of the third duty of the nerves, which is in the diſcerning and knowing of what is troubleſome to them. For unleſſe they had this ſenſe, there is nothing would hinder, but theſe bowels neceſſary for life, being poſſeſſed with ſome hurtfull thing, the creature ſhould preſently fall downe dead; but we have this benefit by this ſenſe, that as ſoone as any thing troubles and vellicates the bowels, we being admoniſhed thereof may looke for helpe in time.

And beſides if they were deſtitute of this ſenſe, they might be gnawne, ulcerated and putrified by the raging acrimony of the excrements falling into and ſtaying in them; but now (by meanes hereof) as ſoone as they find themſelues pricked, or pluckt, preſently by the expulſive faculty they endeavoure to expell that which is troubleſome, and ſo free themſelves of preſent and future dangers.

CHAP. XXIIII.

The manner of taking out the Guts.

WHen the Guts are to be taken out, you muſt begin with the Right Gut. And you muſt divide it, being firſt ſtraitly tyed in two different places, at a juſt diſtance about foure fingers from the end, with a ſharp knife betweene the two ligatures. Then you muſt ſhew its proper coats, and fibers, and that common one which it hath from the *Peritonæum*. This being done, you muſt in like manner binde the truncke of the gate veine as neere the originall as you can; that ſo all his branches being in like manner tyed there may be no feare of effuſion of blood: you muſt doe the like with the Cæliacke Arterye at the left kidney, and in the lower Meſentericke, which deſcends to the Right gut with the Hæmorrhoidall veines. This being done, pul away the guts even to the *Duodenum*, which being in like manner tyed in two places, which ought to be below the inſertion of the *Porus Cholagogus* or paſſage of the Gall, that you may ſhew the oblique inſertion thereof into that gut; for the obliquity of its inſertion is worth obſervation, as that which is the cauſe that the Gall cannot flow backe into its bladder, by the compreſſion of this Gut from below upwards. Then all theſe windings of the Guts may be taken away from the body.

Chap. XXV.

The Originall and diſtribution of the deſcendent Hollow veine.

The originall of the hollow veine. It is divided into two trunkes.

Becauſe the reſt of the naturall parts, do almoſt all depend upon the deſcendent Hollow veine, therefore before we goe any further, we will ſhew its originall and diſtribution. We ſaid before that all veines proceeded from the Liver, but yet in divers places. For the gate veine goes out of the hollow part, and the Hollow veine out of the Gibbous part of the liver, which going forth like the body of a tree, is divided into two great branches, the leſſer of which goes to the vitall and animall parts, and the extremities of theſe parts, as we ſhall ſhew in their place. The greater deſcending from the backe part of the Liver above the *Vertebra's* of the loines to the parts beneath, goes in the manner following. The firſt diviſion thereof is to the membranes of the reines, which come from the *Peritonæum*. Wherefore there it produces the *Venæ adipoſæ*, or fatty veines, ſo called becauſe they bring forth a great quantity of fat in thoſe places; Of theſe fatty veynes, there is a diverſe originall, for the right doth oftentimes ariſe from the right emulgent becauſe it is higher; but the leſſe comes from the very truncke of the hollow veine, becauſe the emulgent on that ſide is lower, and you ſhall ſcarſe ſee it happen otherwiſe.

The diviſion of the greater branch of the hollow veine.

1. *Adipoſa.*

2. *Emulgens.*

The ſecond being the Kidney or Emulgent veines, go to the Reines, Which at their entrance, or a little before, is devided into two branches, like as the Artery is, the one higher, the other lower; and theſe againe into many other through the ſubſtance of the Kidneys, as you may learne better by ocular inſpection, than by booke. They are thick and broad that the ſerous humor may without impediment have freer paſſage. Their originall is different, for the right Emulgent, often times comes forth of the Hollow veine ſomewhat higher than the left; that ſeeing their office and duty is to purge the maſſe of blood from the chollericke and ſerous humor, that if any part thereof ſlide by the one, it may not ſo ſcape, but fall as it were into the other. Which certainly would not have happened if they had bin placed the one juſt oppoſit to the other. For the Serous or wheyiſh humor would have ſtayed as equally ballanced or poiſed, by reaſon of the contrariety of the action and traction, or drawing therof. But we muſt remember that in diſſecting of bodies, I have oft times found in ſuch as have beene troubled with the ſtone, ſeven Emulgent veines and ſo many arteries; foure from the left ſide comming from diverſe places, of which the laſt came from the Iliacke; three from the right hand likewiſe in diverſe places.

3 *Spermatica.*

The third diviſion is called the ſpermaticke or ſeed veine, it goes to the Teſticles; the originall thereof is thus, that the right ariſes on the fore part of the trunck of the hollow veine; but the left moſt commonly from the emulgent. Beſides you ſhall ſometimes finde that theſe have companions with them, to the right emulgent; but to the left another from the hollow veine, in ſome but on one ſide, in others on both. But alſo I have ſometimes obſerved the left emulgent to proceed from the ſpermaticke or ſeed veine.

4. *Lumbaris.*

The forth becauſe it goes to the loynes, is called *Lumbaris*; which in his originall and inſertion is wholy like the Artery of the loines. But there are 4 *Lumbares* or Loine veines on each ſide, that is, one in each of the 4 ſpaces of the 5 *Vertebras* of the loines.

5 Iliacæ, which are divided into.

1 *Muſculoſæ.*

2 *Sacræ.*

The fiſt diviſion makes the Iliacæ, until paſſing through the *Peritonæum*, they take the name of Crurall veines; Theſe are firſt divided into the Muſculous, ſo called, becauſe they goe to the oblique aſcendent and tranſverſe muſcles, and to the *Peritonæum*. Sometimes they have their originall from the end of the Trunck. And then the ſame Iliacæ are devided into the *Sacræ*, or holy, which goe to the ſpinall marrow of the Holy bone, through thoſe holes, by which the nerves generated of this marrow, have their paſſage.

3 *Hypogaſtricæ*, which produce the Hæmorrhoidales externæ.

Thirdly the *Iliacæ* are divided into the *Hypogaſtricæ* ſo called, becauſe they are diſtributed to all the parts of the *Hypogaſtrium*, or lower part of the lower belly, as to the right Gut, the muſcles therof, the muſculous skin, (in which place they often make the externall Hæmorrhoidall, ordained for the purging of ſuch blood as offends in quantity, as thoſe other [that is, the inward Hæmorrhoidall] which deſcend to the right Gut from the Gate veine by the ſpleenicke branch, ſerves for cleanſing of that which offends in qualitie) to the bladder and the necke thereof even to the end of the yard, to the wombe, and even to the necke of the wombe and utmuſt parts of the privities; from whence it is likely the courſes breake forth in weomen with child and virgins. But this ſame veine alſo ſends a portion of it without the *Epigaſtrium* by that perforation which is common to the ſhare and haunch bones, which ſtrengthened by meeting of the other internall Crurall veine deſcends even to the Hamme, but in the meane time by the way it is communicated to the muſcles of the thigh called *Obturatores* and other parts within. Fourthly, the *Iliacæ* produce the *Epigaſtricæ* which on both ſides from below aſcend according to the length of the right muſcles, ſpreading alſo by the way ſome branches to the oblique and tranſverſe muſcles and alſo to the *Peritonæum*. Fiftly, theſe *Iliacæ* produce the *Pudendæ* or veines of the privities becauſe they go in women to their privityes, and into men to the Cods, where they enter that fleſhy coat filled with veines, and goe to the skin of the yeard, they take there beginning under the *Hypogaſtricæ*.

4 *Epigaſtricæ.*

5 *Pudendæ.*

CHAP. XXVI.

Of the Kidneyes or Reines.

NOw follow the Kidneyes, which that they may bee more eaſily ſeene, (after that you have diligently obſerued their ſcituation) you ſhall diſpoile of there fat, if they have any about them, as alſo of the membrane they have from the *Peritonæum*. Firſt you ſhall ſhew all their conditions, beginning at their ſubſtance.

Their ſubſtance.
Magnitude.
Figure.
Compoſition.

The ſubſtance of the Kidneyes is fleſhy, denſe and ſolid, leaſt they ſhould be hurt by the ſharpnes of the urine; Their magnitude is large enough, as you may ſee. Their figure is ſomewhat long and round almoſt reſembling a ſemicircle, and they are lightly flatted above and below. They are partly hollow and partly gibbous; the hollow lyes next the hollow veine, and on this ſide they receive the emulgent veines and Arteryes, and ſend forth the ureters; there gibbous part lyes towards the loines. They are compoſed of a coate comming from the *Peritonæum*, their owne peculiar fleſh, with the effuſion of blood about the proper veſſels (as happens alſo in other entrails) generates a ſmall nerve, which ſpringing from the Coſtall of the ſixt conjugation is diffuſed to each Kidney on his ſide into the coat of the kidney it ſelfe, although others thinke it alwayes accompanies the veine and arterye.

But *Fallopius* that moſt diligent Author of Anatomye hath obſerued, that this nerve is not only oftentimes divaricated into the coat of the kidneyes, but alſo pierces into their ſubſtance. They are two in number that if the one of them ſhould by chance be hurt, the other might ſupply thoſe neceſſityes of nature, for which the Kidneys are made. They lye vpon the loynes at the ſides of the great veſſels, on which they depend by their proper veines and arteries; and they ſticke to them, as it were by a certaine ſecond coate, leſt that they might be ſhaken by any violent motions. Wherfore

Number.

Site.

fore we may ſay that the Kidneyes have two coates, one proper adhering to their ſubſtance, the other as it were comming from the *Peritonæum* on that part they ſticke to it. The right Kidney is almoſt alwayes the higher, for thoſe reaſons I gave, ſpeaking of the originall of the Emulgent veſſels. **Columbus** ſeemes to thinke the contrary, but ſuch like controverſies may be quickly decided by the Eye. They have connexion with the principall veſſels by the veines, nerves and arteries, by the coates with the loines and the other parts of the lower belly, but eſpecially with the bladder by the ureters. They are of a hot and moiſt temper, as all fleſhy parts are. Their action is to clenſe the Maſſe of the blood from the greater part of the ſerous and cholericke humor. I ſaid the greater part, becauſe it is needfull that ſome portion thereof ſhould go with the alimentary blood to the ſollid parts, to ſerve in ſteed of a vehicle leſt otherwiſe it ſhould be too thicke.

Connexion.

Temper. Action.

Their ſtrainer.

Beſides you muſt note that in each kidney there is a cavitye bounded by a certaine membrane, incompaſſed by the diviſion of the emulgent veines and arteryes, through which the urine is ſtrained partly by the expulſive facultie of the kidneies, partly by the attractive of the ureters, which run through the ſubſtance of the kidneyes on the hollow ſide, no otherwiſe than the *Porus cholagogus* through the body of the Liver.

The ninth and tenth figure of the veſſels of ſeed and urine.

Chap. XXVII.

Of the ſpermaticke Veſſells.

Now we ſhould have ſpoken of the ureters, becauſe as wee ſayd before, they are paſſages derived from the Kidneyes to carry the urine to the bladder. But becauſe they cannot be diſtinguiſhed and ſhewed unles by the corrupting and vitiating the ſite of the ſpermaticke veſſels; therefore I have thought it better to paſſe to the explication of all the ſpermatick parts.

Their ſubſtance.
Quantity.

And firſt of all you muſt gently ſeparate them, (that ſo the declaration of them may be more eaſie & manyfeſt) and that from the coat which comes from the *peritonæum*, and the fat which inveſts them even to the ſhare-bone, having diligently conſidered their ſite before you ſeparate them. Then you ſhall teach that the ſubſtance of theſe veſſels, is like to that of the veines and arteryes. Their quantity is ſmall in thicknes, but of an indifferent length, by reaſon of the diſtance of their originall from the Teſticles. They are longer in men than in weomen, becauſe theſe have their Teſticles hanging without their belly, but weomen have them lying hid within their belly. Their figure and compoſure is wholy like the figure and compoſition of the veines and arteries, except in this one thing, that from that place where they goe forth of the great capacity of the *Peritonæum*, they are turned into many intricate windings, like crooked ſwolne veines, even to the Teſticles. That the ſpermaticke matter in that one tracte, which yet is no other than blood, may be prepared to concoction, or rather be turned into ſeed in theſe veſſells, by the irradiation of the faculty of the Teſticles. Theſe veſſells are ſixe in number, foure preparing, and two ejaculatory, of which we will ſpeake hereafter. Therefore on each ſide there be two preparing veſſels, that is, a veine and an artery, ariſing as we told you when we ſpoke of the diſtribution of the hollow veine. They are inſerted into the Teſticles through that coate which ſome call *Epididymis*, others *Darton*. Their ſite is oblique above the loines and flankes, whileſt they runne downe betweene the ends of the ſhare and hanch bone, they are knit to the parts lying under them, both by certaine fibers which they ſend from them, as alſo by the membrane they have from the *Peritonæum*. They have like temperature as the veines and Arteries have. Their action is to carry blood to the Teſticles, for generating of ſeed.

Figure and compoſure.

Number.

Site.

Chap. XXVIII.

Of the Teſticles, or Stones.

Their ſubſtance.
Magnitude and figure.
Compoſition.

The Teſticles are of a Glandulous, white, ſoft and looſe ſubſtance, that ſo they may the more eaſily receive the ſpermaticke matter: their magnitude and figure equall, and reſemble a ſmall pullets Egge ſomewhat flatted; Their compoſure is of veines, arteries, coats and their proper fleſh. Their veines and arteries proceed from the ſpermaticke veſſels, their nerves from the ſixth conjugation, by the roots of the ribbes and out of the holy bone. They are wrapped in foure coats, two whereof are common, and two proper. The common are the *Scrotum* or skin of the Cods, proceeding from the true skin; and the fleſhy coate, which conſiſts of the fleſhy Pannicle in that place receiving a great number of veſſells, through which occaſion it is ſo called. The proper coats are firſt the *Erythroïs* ariſing from the proceſſe of the *Peritonæum*, going into the *Scrotum* together with the ſpermaticke veſſels which it involues and covers; this appeares red both by reaſon of the veſſels as alſo of the Cremaſter muſcles of the Teſticles; Then the *Epididymis* or *Dartos* which takes its originall of the membrane of

The Coat *Erythroïs*

The *Epididymis*, or *Dartos*.

The Cremaſter muſcles.

Temper.

of the ſpermatick preparing veſſels. The fleſh of the Teſticles is as it were a certaine effuſion of matter about the veſſels, as we ſaid of other entrailes. But you muſt obſerve that the *Erythrois* encompaſſes the whole ſtone, except its head, in which place it ſticks to the *Epididymis* which is continued through the whole ſubſtance of the Teſticle. This *Epididymis* or *Dartos* was therefore put about the ſtones, becauſe the Teſticles of themſelves, are looſe, ſpongeous, cavernous and ſoft, ſo that they cannot ſafely be joyned to the ſpermaticke veſſels which are hard and ſtrong. Wherefore Nature that it might joyne extremes by a fit *Medium*, or meane, formed this coate *Epididymis*. This is ſcarſe apparent in weomen by reaſon of its ſmallneſſe. The two forementioned common coats, adhere or ſticke together by their veſſels not only amongſt themſelves, but alſo with the *Erythrois*. You muſt beſides obſerve the Cremaſter muſcles are of the ſaid ſubſtance with other muſcles, ſmall and thin, of an oblique and broad figure, ariſing from the membrane of the *Peritonæum*, which (as wee ſaid before) aſſumes fleſh from the flanks. Their compoſition is like that of other muſcles. They are two, one each ſide on. They are ſituate from the ends of the flanks, even to the ſtones. They have connexion with the proceſſe of the *Peritonæum* and Teſticles. Their temper is like that of other muſcles. Their action is to hang and draw up the Teſticles towards the belly, whence they are called, hanging muſcles. The Teſticles are moſt commonly two in number, on each ſide one, ſometimes there be three, ſometimes one alone, as it happens alſo in the Kidneies; for ſome have but one Kidney. They lye hid in the *Scrotum* at the very roots of the ſhare bone, connexed to the principall parts of their veſſels, with the necke of the bladder and yard; but by their coats they adhere to the parts from whence they have them. They are of a cold and moiſt temper, becauſe they are glandulous; although they may be hot by accident by reaſo[illegible]f the multitude of the veſſels flowing thither. Thoſe whoſe teſticles are more hot are prompt to venery, and have their privities and the adjacent parts very hairy, and beſides their teſticles are more large and compact. Thoſe on the contrary that have them cold are ſlow to venery, neither doe they beget many children, and thoſe they get are rather female than male, their priuities have litle haire upon them, and their teſticles are ſmall, ſoft and flat.

Action.

The action of the teſticles is to generate ſeed, to corroborate all the parts of the body, and by a certaine manly irradiation to breed or encreaſe a true maſculine courage. This you may know by Eunuches or ſuch as are Gelt, who are of a womaniſh nature, and are oftentimes more tender and weake than weomen. As *Hippocrates*, teaches by the example of the Scythians, *lib. de Aëre, locis et aquis.*

Chap. XXIX.

Of the varicous bodyes or Paraſtat's, *and of the ejaculatory veſſels and the glandulous or* Proſtates.

Their ſubſtance.

Here the Author ſpeakes otherwiſe then *Galen*.

Action.

THe varicous *Paraſtatæ* are nervous and white bodyes, like as the nerves, round and cloſe woven amongſt themſelves, they are ſtretched even from the top to the bottome of the teſticles, from whence preſently by their departure they produce the *Vaſa ejaculatoria*, or trading veſſels. But unleſſe we doe very well diſtinguiſh their names, wee ſhall ſcarſe ſhun confuſion. For that which I call *Paraſtatæ*, that is, as it were the head of the teſticle, being as it were like another ſtone, is called *Epididymis* by *Galen lib. 1. de ſemine*. But I by the example and authority of many Anatomiſts, underſtand by the *Epididymis* the proper coate of the teſticles, of which thing I thought good by the way to admoniſh you of. Their Action is by their crooked paſſages to hinder the ſeed from departing out of the preparing into the leading veſſels, before it ſhall be moſt perfectly laboured and concocted in theſe veſſels by the power and force of the teſticles. For in the firſt windings, the blood lookes pure; but in the laſt it is not ſo red, but ſomewhat whitiſh. For Nature commonly doth thus delay the matter in its paſſage either by ſtraitneſſe, or obliquity, which it deſires to make more perfect and elaborate by any new concoction; this we may learne by the foldings of the *Rete mirable*, the windings of the Guts, the wrinckles in the bottome of the ſtomacke, the ſtraitneſſe of the *Pylorus*, the capillary veines diſperſed through the body of the Liver; certainly nature hath intended ſome ſuch thing in the making of the ſpermaticke veſſels. Their quantity is viſible, and figure round tending ſomewhat to ſharpneſſe. They are compoſed of veines, nerves and arteryes (which they enjoy from the veſſels of the teſticles, from the *Epididymis*, or the coat, from the *Peritonæum* and their proper ſubſtance. Their temper is cold and dry. They be two in number, one to each teſticle. But theſe varicous bodyes are called *Paraſtatæ*, Aſſiſters, becauſe they ſuperficially aſſiſt, and are knit to the teſticles according to their length, or long-wayes. Out of the *paraſtatæ* proceed the *Vaſa ejaculatoria*, or leading veſſels, being of the ſame ſubſtance as their progenitors, that is, ſolid, white and as it were nervous. Their quantity is indifferent, their figure round, and hollow, that the ſeed may have a free paſſage through them, yet they ſeeme not to be perforated by any manifeſt paſſage, unleſſe by chance in ſuch as have had a long *Gonnorrhæa*. They have like temper as the *Paraſtats*, betweene which and the Proſtates they are ſeated, immediatly knit with them both; as both in the coat and the other veſſels with the parts from whence they take them.

Their quantity, figure and compoſure.

Their temper and number.

Vaſa ejaculatoria the ejaculatory or leading veſſels.

But we muſt note, that ſuch like veſſels comming out of the *paraſtats* aſcend from the botom of the ſtones even to the top, in which place meeting with the preparing veſſels, they riſe into the belly by the ſame paſſages, and bind themſelves together by nervous fibers, even to the inner capacity of the belly; from whence turning backe, they forſake the preparing, that ſo they may run to the bottome of the ſhare-bone, into the midſt of two glandulous bodies which they call *proſtats* ſcituate at the neck of the bladder, that there meeting together they may grow into one paſſage.

For thus of three paſſages, that is, of the 2 leading veſſels and 1 paſſage of the bladder, there is one common one in men for the caſting forth of ſeed and urine. A Caruncle riſing like a creſt at the beginning of the neck of the bladder argues this uniting of the paſſages, which receiving this ſame paſſage which is ſufficiently large, is oft times taken by ſuch as are ignorant in anatomy for an unnaturall Caruncle, then eſpecially when it is ſwolne through any occaſion. Theſe leading veſſels are two in number, on each ſide one. Their action is to convey the ſeed made by the teſticles to the Proſtats and ſo to the necke of the bladder, ſo to be caſt forth at the common paſſage. But if any aske whether that common paſſage made by the two leading veſſels betweene the two glandulous bodyes be obvious to ſenſe or no? We anſwer it is not manifeſt, though reaſon compell us to confeſſe that that way is perforated by reaſon of the ſpermaticke, groſſe and viſcous matter carryed that way. But peradventure the reaſon why that paſſage cannot be ſeene is, becauſe in a dead carcaſſe all ſmall paſſages are cloſed and hid, the heat and ſpirits being gone, and the great appeare much leſſe, by reaſon all the perforations fade, and fall into themſelves. Yet certainely theſe paſſage muſt needs be very ſtraite, even in a living man, ſeeing that in a dead they will not admit the point of a needle. Wherefore we need not feare, leaſt in ſearching, whileſt we thruſt the *Catheter* into the bladder, it penetrate into the common paſſage of the leading veſſels which runnes within the Caruncle, unleſſe peradventure by ſome chance, as a *Gonnorrhæa*, or ſome great *Phlegmon*, it be much dilated beſides nature. For I have ſometimes ſeene ſuch paſſages ſo open, that they would receive the head of a Spatherne; which thing ſhould admoniſh us, that in ſearching we take great care, that we doe not raſhly hurt this Caruncle, for being ſomewhat raſhly handled with a *Catheter* it caſts forth blood, eſpecially if it be inflamed. But alſo the concourſe of the ſpirits flowing with great violence together with the ſeed, much helps forward ſuch ejaculation thereof performed through theſe ſtraite paſſages by the power of the imaginative faculty in the Act of generation.

Their number and action.

This Caruncle muſt be obſerved and diſtinguiſhed from a *Hyperſarcoſis* or fleſhy excreſcence.

After the leading veſſels follow the *Proſtatæ*, being glandulous bodyes of the ſame ſubſtance and temper that other Glandules are. Their quantity is large enough, their figure round, and ſomewhat long, ſending forth on each ſide a ſoft production of an indifferent length. They are compoſed of veines, nerves, arteries, a coate (which they have from the neighbouring parts) and laſtly their proper fleſh, which they have from

The *Proſtatæ*. Their quantity and figure.

Number and ſite.

An anatomicall axiome.

from their firſt conformation. They are two in number, ſcituate at the roote of the necke of the bladder, ſomewhat ſtraitly bound, or tyed to the ſame, to the leading veſſels, and the parts annexed to them. But alwaies obſerve, that every part which enjoyes nouriſhment, life and ſenſe, either firſt or laſt hath connexion with the principall parts of the body, by the intercourſe of the veſſels which they receive from thence.

Their uſe.

Rond. in methed. med. ad morbos.

The uſe of the Proſtats is, to receive in their proper body the ſeed laboured in the teſticles, and to containe it there, untill it be troubleſome either in quantity or quality or both. Beſides they containe a certaine oily and viſcide humor in their glandulous body, that continually diſtilling into the paſſage of the urine, it may preſerve it from the acrimony and ſharpneſſe thereof. But wee have obſerved alſo on each ſide other Glandules, which *Rondeletius* calls *Appendices glanduloſæ*, Glandulous dependances to ariſe from theſe Proſtats, in which alſo their is ſeed reſerved.

Chap.

Chap. XXX.

Of the Vreters.

Now it ſeemes fit to ſpeak of the *Vreters*, bladder, and parts belonging to the bladder. Therefore the Vreters are of a ſpermaticke, white, denſe and ſolid ſubſtance, of an indifferent bignes in length and thicknes. Their figure is round and hollow. They are compoſed of two coats, one proper conſiſting of right and tranſverſe fibers, which comes from the emulgent veines and arteries; the other common from the *Peritonæum*; beſides they have veines, nerves and arteryes from the Neighbouring parts.

The ſubſtance magnitude, figure and compoſure of the vreters.

They be two in number on each ſide one; They are ſcituate between the Kidneyes (out of whoſe hollow part they proceed) and the bladder. But the manner how the Vreters inſert or enter themſelves into the bladder, and the *Porus Cholagogus* into the *Duodenum*, exceedes admiration; for the ureters are not directly but obliquely implanted neere the orifice of the bladder & penetrate into the inner ſpace thereof; for within they doe as it were divide the membrane or membranous coat of the body of the bladder, and inſinuate themſelves into that, as though it were double. But this is opened at the entrance of the urine, but ſhut at other times, the cover as it were falling upon it, ſo that the humor which is falne into the capacity of the bladder cannot bee forced or driven backe, no not ſo much as the aire blowne into it can come this way out, as we ſee in ſwines bladders blowne vp and filled with aire.

Number and ſite.

For wee ſee it is the Aire contained in theſe which fills them thus, neither canne it bee preſſed forth but with extraordinary force.

For as this skinne or coat turned in by the force of the humor giues way, ſo it being preſſed out by the body conteined within, thruſts its whole body into the paſſage as a ſtopple; like to this is the inſertion of the *Porus Cholagogus* into the Guts.

The ureters have connexion with the above mentioned parts, with the muſcles of the loines; upon which they runne from the Kidneyes to the bladder.

Connexion.

Wherefore nothing hinders, but that the ſtone ſliding through the ureters into the bladder, may ſtupify the thigh as much as it did when it was in the Kidney. They are of a cold and dry temper.

Their uſe is, to ſerve as paſſages, or channels for carrying the urine into the bladder.

Temper and uſe.

Chap. XXXI.

Of the Bladder.

The bladder is of the ſame ſubſtance that the ureters, that is, nervous, that ſo it may bee the more eaſily dilated.

The ſubſtance

It is of a large proportion, in ſome bigger in ſome leſſe, according to the difference of age, and habite of body. It is of a round figure and as it were Pyramidall.

Figure.

It is compoſed of two coats, one proper which is very thicke and ſtrong compoſed of the three ſorts of fibers, that is, in the inner ſide of the direct; without of the tranſverſe; and in the midſt of the oblique.

Compoſition.

The other common Coat comming from the *Peritonæum* hath veines and arteryes on each ſide one, from the *Hypogaſtrick* veſſels above the holy-bone, alſo it hath nerves on each ſide from the ſixt conjugation mixt with the nerves of the holy-bone.

For theſe nerves deſcend from the braine even to the end of the holy-bone.

It is but one and that ſcituate in men in the lower belly upon the right Gut and below the ſhare bone, but in women between the wombe and that bone, to which it cleaves with its membranous ligaments, as it doth to the yard by its neck, and to the right gut by its common coate and proper veſſels. It is of a cold and dry temper.

Temper, uſe or action.

The uſe and action thereof is by the fibers continually to draw the urine, and containe it as long as neede requires, and then to expell it by the necke, partly by compreſſion either of it ſelfe, or rather of the muſcles of the *Epigaſtrium* and Midriffe, becauſe this motion, ſeeing it is voluntary cannot be performed unleſſe by a muſcle which the bladder wants; partly alſo by the dilatation and relaxation of the ſphincter muſcle compoſed of tranſverſe fibers, like the ſphincter of the fundament, after the ſame manner to ſhut up the orifice of the bladder, that the urine flow not out againſt our will. But the bladder as it fils is dilated, but as it is emptied, it is contracted like a purſe. You may eaſily obſerve this Muſcle in a Sowes bladder, it is ſtretched from the orifice of the bladder and beginning of the urinarye paſſage even to the privities even in women; but in men it is terminated in the *Perinæum*, as ſoone as it hath left the right Gut.

Their ſphincter of the bladder.

Beſides, this muſcle is thus farre ſtretched forth, that the urine by its compreſſion ſhould be wholy preſſed out of the bladder, which by too long ſtay would by its acrimony doe ſome harme. This is the common opinion of Anatomiſts concerning the Sphincter of the bladder, which never-the-leſſe *Fallopius* allowes not of. For (ſaith hee) if this muſcle ſhould bee ſcituate beneath the glandulous bodyes, the ſeed in copulation could never be caſt forth without ſome ſmall quantity of urine. Wherefore he thinkes that this muſcle is ſcituate above the *Proſtats*, and that it is nothing els but the beginning of the necke of the bladder, which becoms more fleſhy whileſt it is woven with tranſverſe fibers.

The eleventh figure of the bladder and yarde.

The body of the bladder. R R,3,7. The *Proſtatæ*, into which ſeede when it is perfectly laboured, is led. SS,3,8. Portions of the ureters. T T * 3, Portions of the veſſels which leade downe the ſeed. V V,7,8, The umbilicall arteries. X7,8, The ligament of the bladder cald *Vrachus*. Y,7,8. The navel or *umbilicus*. Z,7,8. The umbilicall veine. *aa* 7, The veine and artery of the yard. *b* 5. The artery diſtributed through the body of the yard.

The necke of the bladder,

For the necke of the bladder it differs nothing in ſubſtance, compoſure, number, and temper from the bladder, but onely in quantity, which is neither ſo large, nor round in figure, but ſomwhat long together with the yarde repreſenting the ſhape of the letter S. It is placed in men at the end of the right Gut and *Perinæum* riſing, upwards even to the roots of the yarde, and with it bending it ſelf downwards; in weomen it is ſhort, broad, and ſtreight, ending at the orifice of the necke of the wombe betweene the nervous bodyes of the *Nymphæ*.

The connexion and uſe thereof,

In men it hath connexion with the bladder, the ejaculatory veſſels, the right gut and yarde, but in weomen onely with the necke of the wombe and privities. The uſe of it is in men to caſt forth ſeed and urine, in weomen onely urine. But wee muſt note that the ſhare bones muſt be divided and pulled aſunder, in that part where they are joyned, that ſo you may the more exactly obſerve the ſcituation of theſe parts. Beſides you muſt note that by the *Perinæum* we underſtand nothing elſe, in men and weomen, than that ſpace which is from the fundament to the privities in which the ſeame is called *Taurus*.

CHAP. XXXII.

Of the yarde.

The ſubſtance quantity and figure of the yarde,

Now followes the declaration of the Privy parts of men and weomen, and firſt wee will treat of mens. The yard is of a ligamentous ſubſtance becauſe it hath its originall from bones, it is of an indifferent magnitude in all dimenſions, yet in ſome bigger, in ſome leſſe; the figure of it is round, but yet ſome what flatted above and beneath.

Compoſure;

It is compoſed of a double coat, Nerves, veines, arteryes, two ligaments, the paſſage of the urine, and foure muſcles. It hath its coats both from the true skin; as alſo from the fleſhy pannicle, but the veines and Arteryes from theſe of the lower part of the lower belly which runne on the lower part of the Holy-bone into the yard, as the ſeminary veſſels runne on the upper part.

The ligaments

The ligaments of the yard proceed on both ſides from the ſides and lower commiſſure of the ſhare-bones; wherefore the yard is immediatly at his root furniſhed with a double ligament, but theſe two preſently runne into one ſpungy one. The paſſage of the urine ſcituate in the lower part of the yarde comes from the neck of the bladder betweene the two ligaments.

The muſcles;

For the foure muſcles, the two ſide ones compoſeing or making a great part of the yard, proceed from the inward extuberancy of the Hip-bone, and preſently they are dilated from their originall, and then grow leſſe againe. The two other lower ariſe from the muſcles of the fundament and accompany the urinary paſſage the length of the *perinæum* untill they enter the yard; but theſe two muſcles cleave ſo cloſe together, that they may ſeeme one haveing a triangular forme.

Their Action;

The action of theſe foure muſcles in the act of generation is they open and dilate this common paſſage of urine and ſeed, that the ſeede may be forcibley or violently caſt into the feild of nature; and beſides they then keepe the yarde ſo ſtiffe, that it cannot bend to either ſide.

The yard is in number one, and ſcituate upon the lower parts of the ſhare bone that it might bee more ſtiffe in erection. It hath connexion with the ſhare-bone and neighbouring parts; by the particles of which it is compoſed. It is of a cold and dry temper. The action of it is to caſt the ſeed into the wombe, for preſervation of mankinde.

The Nut. The *Præputium*, or foreskin.

The head of it begins where the tendons end, this head from the figure thereof is called *Glans* and *Balanus*, that is the Nut, and the skin which covers that head is called *Præputium* that is, the foreskin. The fleſh of this *Glandule* is of a middle nature between the Glandulous fleſh and true skin. But you muſt note that the Ligaments of the yarde are ſpongy contrary to the condition of others, and filled with groſſe and blacke blood. But all theſe ſtirred up by the delight of deſired pleaſure and provoked with a venereall fire, ſwell up and erect the yard.

Chap. XXXIII.

Of the ſpermaticke veſſels and teſticles in weomen.

In what the ſperematicke veſſels in weomen differ from thoſe in men.

Now we ſhould treat of the Privy parts in weomen but becauſe they depend upon the necke and proper body of the wombe, we will firſt ſpeake of the wombe, hauing firſt declared what difference there is betweene the ſpermaticke veſſels and teſticles of men and weomen. Wherefore we muſt know that the ſpermatick veſſels in weomen do nothing differ from thoſe in men in ſubſtance, figure, compoſure, number, connexion, temper, originall and uſe, but only in magnitude and diſtribution; for weomen have them more large and ſhort.

Why they are larger but ſhorter then mens.

It was fit they ſhould be more large, becauſe they ſhould not onely convey the matter fit for generation of young and nouriſhment of the teſticles, but alſo ſufficient for the nouriſhment of the wombe and child; but ſhorter becauſe they end at the teſticles and wombe within the belly in weomen. Where you muſt note that the preparing ſpermaticke veſſels, a litle before they come to the Teſticles, are divided into two unequall branches, of which the leſſer bended, after the ſame manner as wee ſaid in men, goes into the head of the teſticle, through which it ſends a ſlender branch into the coats of the teſticles for life and nouriſhment, and not onely into the coats but alſo into the leading veſſels. But the bigger branch deſcends on each ſide by the upper part of the wombe betweene the proper coate and the common, from the *Peritonæum* where it is devided into divers branches. By this difference of the ſpermaticke veſſels you may eaſily underſtand why weomen caſt forth leſſe ſeed than men.

In what their teſticles differ from mens.

For their Teſticles, they differ litle from mens but in quantity; For they are leſſer and in figure more hollow and flat, by reaſon of their defective heat which could not elevate or lift them vp to their juſt magnitude. Their compoſure is more ſimple, for they want the *ſcrotum* or cod, the fleſhy coate, and alſo according to the opinion of ſome the *Erythroides*, but in place thereof they have another from the *Peritonæum* which covers the proper coat, that is the *Epididymis*, or *Dartos*. *Silvius* writes that womens Teſticles wants the *Erythroides*; yet it is certaine that beſides their peculiar coat *Dartos*, they have another from the *peritonæum*, which is the *Erythroides*, or as *Fallopius* calls it the *Elythroides*, that is as much as the *vaginalis* or ſheath. But I thinke that this error hath ſprung from the miſunderſtanding that place in *Galen* where he writes, that womens teſticles want the *Epididymis*. For we muſt not underſtand that to be ſpoken of the coate, but of the varicous paraſtats (as I formerly ſaid). They differ nothing in number, but in ſite; for in men they hang without the belly at the ſhare bone above the *Peritonæum*; weomen have them lying hide in their belly, nere the bottome at the ſides of the wombe, but yet ſo as they touch not the body of the wombe.

coſtall nerves. They are of a colder Temper than mans. The ejaculatorie, or leading veſſels in women differ thus from mens, they are large at the beginning, and of a veinie conſiſtance, or ſubſtance, ſo that you can ſcarſe diſcerne them from the coate *Peritonæum*, then preſently they become nervous, and waxe ſo ſlender, that they may ſeeme broken or torne, though it be not ſo; but when they come nearer to the hornes of the wombe, they are againe dilated; in their other conditions, they agree with mens, but that they are altogether more ſlender and ſhort. They have a round figure, but more intricate windings than mens; I beleeve, that theſe windings might ſupply the defect of the varicous Paraſtats. They are ſeated betweene the teſticles and wombe, for they proceede out of the head of the teſticle, than preſently armed with a coate from the *Peritonæum*, they are implanted into the wombe by its hornes.

Why they have more intricate windings. Their ſite.

Chap. XXXIIII.

Of the Wombe.

Wherein the privy parts in weomen differ from thoſe in men.

The Wombe is a part proper onely to women, given by nature in ſtead of the *Scrotum*, as the necke thereof, and the annexed parts in ſtead of the yard; ſo that if any more exactly conſider the parts of generation in women and men, he ſhall finde that they differ not mueh in number, but onely in ſituation and uſe. For that which man hath apparent without, that women have hid within, both by the ſingular providence of Nature, as alſo by the defect of heate in women, which could not drive and thruſt forth thoſe parts as in men. The wombe is of a nervous and membranus ſubſtance, that it may be more eaſily be dilated and contracted, as neede ſhall require.

The ſubſtance and magnitude of the wombe.

The magnitude thereof is diverſe, according to the diverſitie of age, the uſe of venery, the flowing of their courſes, and the time of conception. The wombe is but ſmall in one of unripe age, having not uſed venery, nor which is menſtruous; therefore the quantititie cannot be rightly defined.

Figure.

The hornes of the wombe.

Compoſure.

The veines and Arteryes.

The figure of the wombe is abſolutely like that of the bladder, if you conſider it without the productions, which *Herophilus* called hornes, by reaſon of the ſimilitude they have with the hornes of Oxen at their firſt comming forth. It conſiſts of ſimple and compound parts. The ſimple are the veines, arteries, nerves, and coates. The veines and arteries are foure in number, two from the preparing ſpermaticke veſſels, the two other aſcend thither from the *Hypogaſtricke*, after this manner.

Firſt, theſe veſſels before they aſcend on each ſide to the wombe, divide themſelves into two branches, from which otherſome goe to the lower part of the wombe, otherſome to the necke thereof, by which the menſtruous bloud, if it abound from the conception, may be purged.

Nerves.

Nerves come on both ſides to the wombe, both from the ſixt conjugation, deſcending by the length of the backe bone, as alſo from the holy bone, which preſently united and joyned together, aſcend and are diſtributed through the wombe, like the veines and arteries.

The Coats.

The utmoſt or common coate of the wombe, proceeds from the *Peritonæum*, on that part it touches the holy bone; but the proper it hath from the firſt conformation, which is compoſed of the three ſorts of fibers, of the right on the inſide for the attraction of both ſeedes; the tranſverſe without to expell, if occaſion be; the oblique in the midſt for the due retention thereof.

No cels in the wombe.

The wombe admits no diviſion, unleſſe into the right and left ſide, by an obſcure line or ſeame, ſuch as we ſee in the *Scrotum*, but ſcarſe ſo manifeſt; neither muſt we after the maner of the ancients, or imagine any other cels in the womb. For by the law of nature, a woman at one birth can have no more than two. An argument hereof is, they have no more than two dugges. If any chance to bring forth more, it is beſides nature, and ſomewhat monſtrous, becauſe nature hath made no proviſion of nouriſhment for them.

The ſite.

Nature hath placed the wombe at the bottome of the belly, becauſe that place ſeemes moſt fit to receive ſeede, to carrie and bring forth the young. It is placed betweene the bladder and right gut, and is bound to theſe parts much more ſtraitly, by the necke, than by the body thereof; but alſo beſides it is tied with two moſt ſtrong ligaments on the ſides, and upper parts of the ſharebone, on which it ſeemes to hang; but by its common coate from the *Peritonæum*, chiefly thicke in that place, it is tied to the hollow bone, and the bones of the hanch and loines.

The temper and action.

By reaſon of this ſtrait connexion, a woman with child feeling the painefull drawings backe, and as it were conuvlſions of thoſe ligaments, knowes her ſelfe with child. It is of a cold and moiſt temper, rather by accident, than of it ſelfe. The action thereof is to containe both the ſeedes, and to chearish, preſerve, and nouriſh it, ſo contained, untill the time appointed by nature; and alſo beſides, to receive, and euacuate the menſtruous bloud. The compound parts of the wombe are, the proper body and necke thereof. That body is extended in women bigge with child, even to the navell, in ſome higher, in ſome lower.

The *Cotyledones.*

In the inner ſide the *Cotyledones* come into our conſideration, which are nothing elſe than the orifices and mouthes of the veines, ending in that place. They ſcarſe appeare in women, unleſſe preſently after child-bearing, or their menſtrual purgation; but they are apparent in ſheepe, Goates, and Kine, at all times like wheat cornes, unleſſe when they are with young, for then they are of the bigneſſe of haſell nuts: but then alſo they ſwell up in women, and are like a rude piece of fleſh of a finger and a halfe thicke; which begirt all the naturall parts of the infant ſhut up in the wombe; out of which reſpect this ſhapeleſſe fleſh, according to the opinion of ſome is reckoned amongſt the number of coates inveſting the infant, and called *Chorion*, becauſe, as in beaſts, the *Chorion* is interwoven with veines, and arteries, whence the umbilicall veſſels proceede; ſo in women this fleſhie lumpe is woven with veines, and arteries, whence ſuch veſſels have their originall. Which thing, how true and agreeable to reaſon it is, let other men judge.

Columbus juſtly reproved.

There is one thing whereof I would admoniſh thee, that as the growth of the *Cotelidones* in beaſts, are not called by the name of *Chorion*, but are onely ſaid to be the dependants thereof, ſo in women ſuch ſwollen *Cotelidones* merit not the name of *Chorion*, but rather of the dependances thereof,

The orifice of the wombe. The proper orifice of the wombe is not alwayes exactly ſhut in women with child.

This body ends in a certaine ſtraitneſſe which is met withall, in following it towards the privities, in women who have borne no children, or have remained barren ſome certaine time; for in ſuch as are lately delivered, you can ſee nothing but a cavitie and no ſtraitnſſe at all. This ſtraitneſſe wee call the proper orifice of the wombe, which is moſt exactly ſhut after the conception, eſpecially untill the membrane, or coats incompaſſing the child be finiſhed, and ſtrong enough to containe the ſeede, that it flow not forth, nor be corrupted by entrance of the aire; for it is opened to ſend forth the ſeede, and in ſome the courſes and ſerous humors, which are heaped up in the wombe in the time of their being with child.

The necke of the wombe.

From this orifice the necke of the wombe taking its originall, is extended even to the privities. It is of a muſculous ſubſtance, compoſed of ſoft fleſh, becauſe it might be extended and contracted, wrinkled, and ſtretched forth, and unfolded, and wreſted, and ſhaken at the comming forth of the child, and after be reſtored to its former ſoundneſſe and integritie. In proceſſe of age it growes harder, both by uſe of venery, and alſo by reaſon of age, by which the whole body in all parts thereof becomes drie and hard. But in growing, and young women, it is more tractable and flexible for the neceſſitie of nature.

Its magnitude.
Compoſition,

The magnitude is ſufficiently large in all dimenſions, though divers, by reaſon of the infinite varietie of bodies. The figure is long, round, and hollow. The compoſition is the ſame with the wombe, but it receives not ſo many veſſels as the wombe; for it hath none but thoſe which are ſent from the *Hypogaſtricke* veines, by the branches aſcending to the wombe. This necke on the inſide is wrinckled with many creſts, like the upper part of a dogges mouth, ſo in copulation to cauſe greater pleaſure by that inequalitie, and alſo to ſhorten the act.

Number and ſite.

It is onely one, and that ſituate betweene the necke of the bladder and the right gut, to which it cloſely ſticketh, as to the wombe by the proper orifice thereof, and to the privities by its owne orifice; but by the veſſels to all the parts from whence they are ſent.

Temper.
No *Hymen*.

It is of a cold and drie temper, and the way to admit the ſeede into the wombe, to exclude the infant out of the wombe, as alſo the menſtruall evacuation. But it is worth obſervation, that in all this paſſage there is no ſuch membrane found, as that they called *Hymen*, which they feigned to be broken at the firſt coition. Yet notwithſtanding *Columbus*, *Fallopius*, *Wierus*, and many other learned men of our time think otherwiſe, and ſay, that in Virgins a litle above the paſſage of the urine, may be found and ſeene ſuch a nervous membrane, placed overtwhart as it were in the middle way of this necke, and perforated for the paſſage of the courſes. But you may finde this falſe by experience; it is likely the Ancients fell into this error through this occaſion, becauſe that in ſome a good quantitie of bloud breakes forth of theſe places at the firſt copulation.

From whence the blood proceeds that breaks forth in ſome virgins in the firſt coition.

But it is more probable, that this happens by the violent attrition of certaine veſſels lying in the inward ſuperficies of the necke of the wombe, not being able to endure without breaking ſo great extention as that nervous necke undergoes at the firſt coition. For a maide which is marriageable, and hath her genitall parts proportionable in quantitie and bigneſſe to a mans, ſhall finde no ſuch effuſion of bloud, as we ſhall ſhew more at large in our Booke of Generation.

This necke ends at the privities, where its proper orifice is, which privy parts we muſt treate of, as being the productions and *appendices* of this necke. This *Pudendum*, or privitie, is of a middle ſubſtance, betweene the fleſh and a nerve; the magnitude is ſufficiently large, the figure round, hollow, long. It is compoſed of veines, arteries, nerves, deſcending to the necke of the wombe, and a double coate proceeding from the true skinne and fleſhie pannicle; both theſe coates are there firmely united by the fleſh comming betweene them; whereupon it is ſaid, that this part conſiſts of a muſculous coate. It is one in number, ſituate above the *Perinæum*. It hath connexion with the fundament, the necke of the wombe and bladder, by both their peculiar orifices.

Alæ.
πτερυγώματι.

It hath a middle temper, betweene hot, and cold, moiſt and drie. It hath the ſame uſe as a mans *Præputium* or fore-skinne, that is, that together with the *Numphæ* it may hinder the entrance of the aire, by which the wombe may be in danger to take cold. The lips of the privities called by the Greekes πτερυγώματι, by the Latines *Alæ*, containe all that region which is inveſted with haires; and becauſe we have falne into mention of theſe *Nymphæ*, you muſt know that they are as it were productions of the muſculous skinne, which deſcend on both ſides, from the upper part of the ſhare-bone downewards, even to the orifice of the necke of the bladder, oft times growing to ſo great a bigneſſe, that they will ſtand out like a mans yard. Wherefore in ſome they muſt be cut off in their young yeares, yet with a great deale of caution, leſt if they be cut too raſhly, ſo great an effuſion of bloud may follow, that it may cauſe, either death to the woman, or barrenneſſe of the wombe by reaſon of the refrigeration by the too great effuſion of bloud. The latter Anatomiſts, as *Columbus* and *Fallopius* beſides theſe parts, have made mention of another particle, which ſtands forth in the upper part of the privities, and alſo of the urinary paſſage, which joynes together thoſe wings wee formerly mentioned. *Columbus* cals it *Tentigo*, *Fallopius Cleitoris*, whence proceeds that infamous word *Cleitorizein*, (which ſignifies impudently to handle that part.) But becauſe it is an obſcene part, let thoſe which deſire to know more of it, reade the Authors which I cited.

CHAP.

CHAP. XXXV.

Of the Coats containing the Infant in the wombe, and of the Navell.

Their ſubſtance, magnitude, figure, and compoſure.

THe membranes or coates containing the infant in the wombe of the mother, are of a ſpermaticke and nervous ſubſtance, having their matter from the ſeede of the mother. But they are nervous that ſo they may be the more eaſily extended, as it ſhall be neceſſary for the child. They are of good length and bredth, eſpecially neare the time of deliverance, they are round in figure like the wombe.

Their compoſition is of veines, arteries, and their proper ſubſtance. The veines, and arteries, are diſtributed to them (whether obſcurely, or manifeſtly, more or fewer) from the wombe by the *Cotyledones*, which have the ſame office, as long as the child is contained in the wombe, as the nipples or pappes of the nurſes after it is borne. For thus the wombe brings the *Cotyledones*, or veines, degenerating into them, through the coates like certaine paps to the infant ſhut up in them.

Their number.

Theſe coates are three in number according to *Galen*; one called the *Chorion*, Secundine, or afterbirth; the other *Allantoides*; the third *Amnios*. I find this number of coates in beaſts, but not in women, unleſſe peradventure any will reckon up in the number of the coats, the *Cotyledones* ſwollen up, and grown into a fleſhie maſſe, which many skilfull in Anatomy doe write, which opinion notwithſtanding we cannot receive as true. I could never in any place finde the *Allantoides* in women with child, neither in the infant borne in the ſixth, ſeventh, eight, or in the full time, being the ninth moneth, although I have ſought it with all poſſible diligence, the Midwives being ſet apart, which might have violated ſome of the coates.

But thus I went about this buſineſſe, I devided the dead body of the mother croſſwiſe upon the region of the wombe, and taking away all impediments, which might either hinder, or obſcure our diligence, with as much dexteritie as was poſſible, wee did not onely draw away that receptacle or den of the infant, from the inward ſurface of the wombe, to which it ſtucke by the *Cotyledones*, but we alſo tooke away the firſt membrane which we called *Chorion*, from that which lies next under it, called *Amnios*, without any rending or tearing; for thus we powred forth no moiſture, whereby it might be ſaid, that any coate, made for the containing of that humor, was rent, or torne. And then we diligently looked, having many witneſſes and ſpectators preſent, if in any place there did appeare any diſtinction of theſe two membranes, the *Allantoides*, and *Amnios*, for the ſeparating the contained humors, and for other uſes which they mention.

But when we could perceive no ſuch thing, we tooke the *Amnios* filled with moiſture on the upper ſide, and having opened it, two ſervants ſo holding the apertion, that no moiſture might flow out of it into the circumference of the *Chorion* or womb; then preſently with ſpunges we drew out by little and little all the humiditie contained in it, the infant yet contained in it, which was fit to come forth, that ſo the coate *Amnios* being freed of this moiſture, we might ſee whether there were any other humor contained in any other coate beſides. But having done this with ſingular diligence and fidelity, we could ſee no other humor, nor no other ſeparation of the membranes beſides.

He ſhewes by three ſeverall reaſons that there is no *Allantoides*.

So that, from that time I have confidently held this opinion, that the infant in the wombe, is onely wrapped in two coates, the *Chorion* and *Amnios*. But yet not ſatisfied by this experience, that I might yet be more certaine concerning this *Allantoides*, having paſſed through the two former coates, I came to the infant, and I put a quill into its bladder, and blew it up as forceably as I could, ſo to trie, if by that blowing I might force the aire into that coate which we queſtioned, as ſome have written. But neither thus could I drive any aire from hence, through the navell into the controverted coate, but rather I found it to flie out of the bladder by the privities. Wherefore I am certainely perſwaded that there is no *Allantoides*. Moreover I could never finde nor ſee in the navell that paſſage called the *urachus*, which they affirme to be the beginning and originall of the coate *Allantoides*. But if it be granted that there is no ſuch coate as the *Allantoides*, what diſcommoditie will ariſe hereof? ſpecially ſeeing the ſweate and urine of the infant may eaſily and without any diſcommoditie be received, collected and contained in the ſame coate, by reaſon of the ſmall difference which is betweene them. But if any object that the urine by its ſharpeneſſe and touching will hurt the infant; I will anſwer, there can be no ſo great ſharpeneſſe in the urine of ſo ſmall an infant, and that, if that there be any, it is tempered by the admixture of the gentle vapour of ſweat.

Beſides, if you conſider, or have regard to the uſe of ſuch an humor (which is to hold up the child, leſt by its weight it breakes the ties, by which it is bound to the wombe;) wee ſhall finde no humour more fit for this purpoſe than this ſerous, as which by its thickneſſe is much more fit to beare up a weight, than the thinne and to liquide ſweate. For ſo we ſee the ſea or ſalt water carries greater weights without danger of drowning, than freſh rivers doe. Wherefore I conclude that there is no neede, that the urine ſhould be kept and contained in one coate, and the ſweate in another. The Ancients who have writ otherwiſe, have written from obſervations made in beaſts. Wherefore we make but onely two coats the *Chorion* and *Amnios*, the one of which ſeeing it containes the other, they both ſo encompaſſe the child, that they veſt it on every ſide.

Fallopius in ſome ſort ſeemes to be of this opinion; for he onely makes two coates; the *Chorion* and *Amnios*, but hee thinkes the infant makes the water into a certaine part of the *Chorion*, as you may perceive by reading of his Obſervations. Both theſe coates are tied betweene themſelves by the intercourſe of moſt ſlender nervous fibers, and ſmall veſſels penetrating from the outer *Chorion* to the inner *Amnios*. Wherefore unleſſe you warily handle theſe coates you may eaſily teare the *Amnios* in ſeparating it. They are of the ſame temper with other membranes. Their uſe is differens, for the *Chorion* is made both for the preſervation of the veſſels, which it receives from the wombe for the generating of the umbilicall veines and arteries, as alſo, to keepe whole and ſafe the parts which it inveſts.

Their temper and uſe.

But the *Amnios* is to receive and containe the excrementitious and ſerous humors, which the child ſhut up in the wombe is accuſtomed to evacuate. But this coate is very thinne and ſoft, but ſtrong and ſmooth, leſt by its touch it might hurt the infant, whereupon it is called the Lamb-kinne coate.

Chap. XXXVI.

Of the Navell.

THe Navell followes theſe coates; It is a white body ſomewhat reſembling the wreathen cord, or girdle of the *Franciſcan Friers*, but that it hath not the knots ſtanding ſo farre out, but onely ſwelling in certaine places, reſembling a knot, onely lifted up on one ſide; it ariſes and takes its originall from a fleſhie maſſe which we expreſſed by the name of ſwelling *Cotyledones*, and goes into the midſt of the lower belly of the infant, yea verily into the midſt of the whole body, whoſe roote it is therefore ſaid to be. For even as a tree by the roote, ſucks nouriſhment from the earth, ſo the infant in the wombe drawes its nouriſhment by the navell. The greatneſſe of it in breadth and thickneſſe, equall the bigneſſe of the little finger. But it is a foote and a halfe long, ſo that children are brought forth with it, encompaſſing their middle, necke, armes, or legges. The figure of it is round. It is compoſed of two arteries, one veine and two coates. It hath theſe veſſels from that great multitude of capillary veines and arteries, which are ſeene diſperſed over the *Chorion*. Wherefore the veine entring in at the navell, penetrates from thence into the hollow part of the liver, where divided into two, according to *Galens* opinion, it makes the gate and hollow veines. But the arteries, caried by themſelves the length of the navell, caſt themſelves into the *Iliaca*, which they

What the navell is.

Their Navell is the Center of the body.

The figure and compoſure.

Lib. de format. fœtus in utero.

they make, as alſo all other, that from thence the vitall ſpirit may be carried by them over all the infant. It hath its two coates from the *Chorion*.

But ſeeing they are mutually woven and conjoyned without any *medium*, and are of a ſufficient ſtrength and thickneſſe over all the navell, they may ſeeme to make the infants externall skinne and fleſhie pannicle. I know very many reckon two umbilicall veines, as alſo arteries, and the *urachus* by, or through which the urine flowes into the coate *Allantoides*. But becauſe this is not to be found in women, but onely in beaſts, I willingly omit it, becauſe I doe not intend to mention any parts, but ſuch as belong to humane bodies. Yet if there be any, which can teach me, that theſe parts, which I thinke proper to brute beaſts, are to be found in women, I will willingly confeſſe, and that to his credit, from whom I have reaped ſuch benefit.

There is onely one veine in a childs navill, but no *Vrachus*.

The other things that may be required concerning the navell as of its number, ſite, connexion, temper, and uſe, may eaſily appeare by that we have ſpoken before. For we hove apparently ſet downe the uſe, when we ſaid the navell was made for that purpoſe, that the infant may be nouriſhed by it, as the tree by the roote, by reaſon of the continuation of the veſſels thereof, with the preparing ſpermaticke veſſels, made by God for that purpoſe, to whom be honour and glory for ever and ever. Amen.

The End of the third Booke.

THE FOURTH BOOKE TREATING OF THE Vitall parts contained in the Cheſt.

The Preface.

HAving finiſhed the firſt Booke of our Anatomy, in explanation of the naturall parts contained in the lower belly, now order requires, that we treat of the Breſt; that ſo the parts in ſome ſort already explained (I meane the veines and arteries) may bee diſpatched after the ſame order and manner, without interpoſition of any other matter.

And beſides alſo that we may the more exactly and cheerefully ſhew the reſt of the parts which remaine, as the head and limbs, knowing already the originall of thoſe veſſels which are diſperſed through them. To this purpoſe, we will define what the Cheſt is, and then we will divide it into its parts. Thirdly, in theſe we will conſider which parts containe, and which are contained, that ſo we may more happily finiſh our intended diſcourſe.

CHAP. I.

What the Thorax, *or the Cheſt is; into what parts it may be devided, and the nature of theſe parts.*

THe *Thorax* or Cheſt is the middle belly, terminated or bounded above with the coller-bones, below with the midriffe, before with the *Sternū* or breſt, behind, with the twelve *Vertebra's* of the backe on both ſides, with the true and baſtard ribs, and with the intercoſtall and intercartilagineous muſcles. Nature hath given it this ſtructure and compoſition, leſt that being a defence for the vitall parts againſt externall injuries, it ſhould hinder reſpiration; which is no leſſe needfull for the preſervation of the native heate, diffuſed by the vitall ſpirits, and ſhut up in the heart, as in the fountaine therof, againſt internal injuries, than the other forementioned parts againſt externall. For if the cheſt ſhould have bin all bony, verily it had beene the ſtronger, but it would have hindred our reſpiration or breathing, which is performed by the dilating, and contracting thereof. Wherefore leſt one of theſe ſhould hinder the other, nature hath framed it, partly bony and griſtlely, and partly fleſhie. Some render another reaſon hereof, which is, that nature hath framed the cheſt, that it might here alſo obſerve the order uſed by it in the fabricke of things, which is, that it might conjoine the parts much diſagreeing in their compoſure, as the lower belly, altogether fleſhie, and the head all bony, by a *medium* partaker both of the bony and fleſhie ſubſtance; which courſe wee ſee it hath obſerved in the connexion of the fire and water, by the interpoſition of the aire; of the earth and aire, by the water placed betweene them.

The conteining parts of the Cheſt.

Why nature hath made the Cheſt partly bony, partly griſtlely.

The number of the bones of the *Sternon*.

The Cheſt is divided into three parts, the upper, lower, and middle: the collar bones containe the upper, the midriffe the lower, and the *Sternon* the middle. The *Sternon* in *Galens* opinion is compoſed of ſeven bones, I beleeve by reaſon of the great ſtature of the people that lived then. Now in our times you ſhall oft finde it compact of three, foure, or five bones, although we will not deny but that we have often obſerved it, (eſpecially in young bodies) to conſiſt of ſeven or eight bones.

Wherefore thoſe who have fewer bones in number in their *Sternon*, have them larger, that they might be ſufficient to receive the ribbes. This is the common opinion of the *Sternon*. Yet *Fallopius* hath deſcribed it farre otherwiſe, wherefore let thoſe who deſire to know more hereof, looke in his obſervations.

Cartilago ſcutiformis, the breſt-blade.

At the lower part of the *Sternon* there is a griſtle, called commonly *Furcula*, and *Malum granatum*, or the Pomegranate, becauſe it reſembles that fruite; others call it *Cartilago ſcutiformis*, that is, the breſt-blade.

It is placed there to be as it were a bulwarke or defence to the mouth of the ſtomacke, endued with moſt exquiſite ſenſe; and alſo that it ſhould doe the like to that part of the midriffe, which the liver beares up in that place, ſituate above the orifice of the ventricule by the ligament comming betweene, deſcending from the lower part of the ſame griſtle into the upper part of the liuer.

The common people thinke that this griſtle ſometimes fals downe. But it ſo adheares, and is united to the bones of the *Sternon*, that the falling thereof may ſeeme to be without any danger, although oft times it may bee ſo moiſtened with watery and ſerous humidities, with which the orifice of the ſtomacke abounds, that as it were ſoaked and drunke with theſe, it may be ſo relaxed, that it may ſeeme to be out of its place; in which caſe it may be preſſed and forced by the hand, into the former place and ſeate, as alſo by applying outwardly, and taking inwardly aſtringent and drying medicines to exhauſt the ſuperfluous humiditie.

This griſtle at its beginning is narrow, but more broad and obtuſe at its end, ſomewhat reſembling the round or blunt point of a ſword, whereupon it is alſo called *Cartilago Enſiformis* or the ſwordlike griſtle. In ſome it hath a double, in others a ſingle point.

In old people it degenerates into a bone. Now becauſe we make mention of this griſtle, we will ſhew both what a griſtle is, and how many differences thereof there be, that henceforward as often as wee ſhall have occaſion to ſpeake of a griſtle, you may underſtand what it is.

What a Griſtle is.

A griſtle is a ſimilar part of our bodies, next to a bone moſt terreſtriall, cold, drie, hard, weighty and without ſenſe, differing from a bone in drieneſſe onely, the which is more in a bone. Wherefore a griſtle being loſt cannot be regenerated, like as a bone without the interpoſition of a *Callus*.

The differences thereof.

The difference of theſe are almoſt the ſame with bones, that is from their conſiſtence, ſubſtance, greatneſſe, number, ſite, figure, connexion, action, and uſe. Omitting the other for brevitie ſake, I will only handle thoſe differences which ariſe from ſite, uſe, and connexion. Therefore griſtles, either adhere to the bones, or of, and by themſelves make ſome part, as the griſtles of the eyelids called *Tarſi*, of the *Epiglottis* and throatle. And others which adhere to bones, either adhere by the interpoſition of no *medium*, as thoſe which come betweene the bones of the *Sternon*, the collar bones, the ſhare and hanch bones and others; or by a ligament comming betweene, as thoſe which are at the ends of the baſtard ribs to the *Sternon* by the meanes of a ligament, that by thoſe ligaments being ſofter than a griſtle, the motions of the cheſt, may be more quickly and ſafely performed. The griſtles which depend on bones, doe not onely yeeld ſtrength to the bones, but to themſelves, and the parts contained in them, againſt ſuch things as may breake and bruiſe them. The griſtles of the *Sternon*, and at the ends of the baſtard ribs are of this ſort.

Their twofold uſe.

By this we may gather that the griſtles have a double uſe, one to poliſh and levigate the parts to which that ſlippery ſmoothneſſe was neceſſary for performance of their dutie; and for this uſe ſerve the griſtles which are at the joynts, to make their motions the more nimble. The other uſe is to defend thoſe parts upon which they are placed, from externall injuries, by breaking violent aſſaults, by ſomewhat yeelding to their impreſſion, no otherwiſe than ſoft things oppoſed againſt cannon ſhot. Wee will proſecute the other differences of griſtles in their place, as occaſion ſhall be offered and required.

CHAP. II.

Of the containing, and contained parts of the Cheſt.

The diviſion of the cheſt into its parts.

THe containing parts of the cheſt are both the skinnes, the fleſhie pannicle, the fat, the breaſts, the common coate of the muſcles, the muſcles of that place, the forementioned bones, the coate inveſting the ribbes and the *Diaphragma* or midriffe. The parts contained are the *Mediaſtinum*, the *Pericardium* or purſe of the heart, the heart, the lungs & their veſſels. Of the containing parts, ſome are common to all the body, or the moſt part thereof, as both the skins, the fleſhie pannicle and fat. Of which being we have ſpoken in our firſt Booke, there is no neede now further to inſiſt upon; Others are proper to the cheſt, as its muſcles, of which we will ſpeake in their place, the breſts, the forementioned bones, the membrane inveſting the ribs, and the *Diaphragma* or midriffe.

Wee will treate of all theſe in order, after we have firſt ſhewed you the way, how you may ſeparate the skinne from the reſt of the cheſt. Putting your knife downe even to the perfect diviſion of the skinne, you muſt draw a ſtraite line from the upper part of the lower belley, even to the chinne; then draw another ſtraight line, overtwhart at the collar bones even to the ſhoulder-blades; and in the places beneath the collar-bones (if you deſire to ſhunne prolixitie) you may at once ſeparate both the skinnes, the fleſhie pannicle, the fat, and common coate of the muſcles; becauſe theſe parts were ſhewed and ſpoken of in the diſſection of the lower belley.

Yet you muſt reſerve the breſts in diſſecting of the bodies of women; wherefore from the upper parts of the breaſts, as artificially as you can, ſeparate onely the skin from the parts lying under it, that ſo you may ſhew the Pannicle which there becommeth fleſhie and muſculous, and is ſo ſpred over the necke, and parts of the face, even to the rootes of the haires.

CHAP. III.

Of the Breaſts or Dugges.

Their ſubſtance.

THe Breaſts, as wee ſaid, when we ſpoke of the nature of glandules, are of a glandulous ſubſtance, white, rare, or ſpongious, in maides, and women that doe not give ſucke, they are more ſolid and not ſo large.

Magnitude. Figure. Compoſure.

Wherefore the bigneſſe of the Dugges is different, although of a ſufficient magnitude in all. Their figure is round, ſomewhat long, and in ſome ſort Pyramidall. Their compoſure is of the skinne, the fleſhie pannicle, glandules, fat, nerves, veines, and arteries, deſcending to them from the *Axillaris* under the *Sternon* betwixt the fourth and fifth, and ſometimes the ſixth of the true ribbes.

And there they are divided into infinite rivelets by the interpoſition of the glandules and fat, by which fit matter may be brought, to be changed into milke by the facultie of the dugges.

Which glandules have nerves and which have none.

Wee will ſpeake no more of the nature of glandules, or kernels, as having treated of them before; onely we will add this, that ſome of the glandules have nerves, as thoſe of the breſts, which they receive from the parts lying under them, that is, from the intercoſtall, by which it comes to paſſe that they have moſt exquiſit ſenſe.

Others want a nerve, as thoſe which ſerve onely for diviſion of the veſſels, and which have no action, but onely uſe.

They be two in number, on each ſide one, ſeated at the ſides of the *Sternon* upon the fourth fifth and ſixth true ribs.

Their Connexion.

Wherefore they have connexion with the mentioned parts with their body, but by their veſſels with all other parts, but eſpecially with the wombe by the reliques of the mamillary veines and arteryes, which deſcend downe at the ſides of the breſt-blade; in which place theſe veines inſinuating themſelves through the ſubſtance of the muſcles, are a litle above the navill conjoined with the *Epigaſtricks*, whoſe originall is in ſome ſort oppoſite to the *Hypogaſtrickes*, which ſend forth branches to the wombe. By the meeting of theſe it is more likely that this commerce ſhould ariſe, than from other and thoſe almoſt capillary branches, which are ſometimes ſeene to deſcend to the wombe from the *Epigaſtrick*.

How the breſts and wombe communicate each with other.

Their temper.

They are of a cold and moiſt temper, wherefore they ſay that the blood by being converted into milke * becomes raw, flegmaticke and white by the force of the proper fleſh of the dugs. Their action is to prepare nouriſhment for the new borne babe, to warme the heart from whence they have received heat, and to adorne the breſt.

Recrudeſcere.

Their action and uſe.

By this you may know that ſome Glandules have action, others uſe, and ſome both. At the top of the dugs there are certaine hillockes, or eminencies called teats or nipples, by ſucking of which the child is nouriſhed through certaine ſmall and crooked paſſages; which though they appeare manifeſt to the ſight, whileſt you preſſe out the milke by preſſing the dug, yet when the milke is preſſed out they doe not appeare, nor ſo much as admit the point of a needle, by reaſon of the crooked wayes, made by nature in thoſe paſſages, for this uſe, that the milke being perfectly made ſhould not flow out of its owne accord againſt the nurſes will. For ſo the ſeed is retained and kept for a certaine time in the Proſtats.

The Nipples.

CHAP. IIII.

Of the Clavicles, or Coller bones and Ribs.

IF we ſhould handle theſe parts after the common order, we ſhould now treat of the Muſcles of the Cheſt which move the arme, and ſerve for reſpiration, and which firſt offer themſelves to our ſight.

But for that they cannot be fitly ſhewed, unleſſe wee hurt the muſcles of the ſhoulder blade and necke, therefore I thinke it better, to deferre the explanation of theſe muſcles untill ſuch time as I have ſhewed the reſt of the contained and containing parts, not onely of the cheſt, but alſo of the head, that having finiſhed theſe we may come to a full demonſtration of all the reſt of the muſcles, beginning with thoſe of the head, which wee firſt meet with, and ſo proſequuting the reſt even to the muſcles of the feet, as they ſhall ſeeme to offer themſelves more fitly to diſſection, that ſo, as much as lyes in us, we may ſhunne confuſion.

Wherefore returned to our propoſed taske, after the foreſaid muſcles come the Collar bones, the *ſternon* and ribs.

But that theſe parts may be the more eaſily underſtood, wee muſt firſt know what a bone is, and whence the differences thereof are drawne.

What a Bone is.

Therefore a bone is a part of our body moſt terreſtriall, cold, dry, hard, wanting all manifeſt ſenſe, if the teeth be excepted.

A double ſenſe

Lib. 1. de Locis affectis.

I ſaid manifeſt ſenſe, that you may underſtand that the parts have a double ſenſe of touching, the one manifeſt, ſuch as reſides in the fleſh, skin, membranes, nerves, Teeth and certaine other parts; the other obſcure, yet which may ſuffice to diſcerne the helping and hurting tactile qualityes, ſuch ſenſe the bowels and bones have; for very ſmall fibers of the nerves are diſſeminated to theſe parts by mediation of their coat, or membrane, I ſay ſo ſmall, that they canne ſcarce be diſcerned by the eyes, unleſſe (as *Galen* ſaith) by plucking ſuch coats away from the parts.

But it is no marvaile if nature would have theſe parts in like manner to have ſuch ſmall veines, contrary to the lungs and moſt part of the Muſcles, onely to yeild ſo much nouriſhment to the part, as ſhould be needfull; for ſeeing the ſubſtance of the bones is cold, hard, denſe and ſolid, it waſtes the leſſe.

Why the bones have ſuch ſmall veine..

Wherefore they need not ſo much blood for their nouriſhment, as the hot and ſoft parts; and beſides the leſſer bones have neither veines, nor arteries, but draw fit nouriſhment, onely by the force of the attractive faculty implanted in them.

The differences of bones are taken from many things, as from their *Apophyſes*, *Epiphyſes*, griſtles, necks, heads, ſolidity, cavity, eminencies, marrow, conſiſtence, bignes, number, figure, ſite. Wee will proſecute all theſe as they ſhall offer themſelves in the demonſtration of the bones; to which doctrine we will give a beginning at the Clavicles or collar bones.

Whence the difference of bones may be taken.

The Clavicles are two very hard and ſolid bones, without any great or notable cavity, ſcituate on each ſide betwixt the ſide and upper part of the *ſternon* and top of the ſhoulder-blade, for the ſtrength and ſtability of theſe parts, whence they take the name of *Clavicula* Clavicles (from the Greeke κλεὶς, which ſignifies a key or any other bar or faſtning of a doore.) They carry the ſhape of a ſurgeons Levatory.

The Clavicles or collar bones

But you muſt note that the Clavicles ſeemes to be faſtned to the *ſternon* by the mediation of a griſtlely bone. Moreover the ſpace and cavity contained within the Collar bones is called by the Latines *Iugulum*, by the French the upper *furcula*, becauſe the jugular veines paſſe that way; it ſticks to the upper proceſſe of the ſhoulder by a Griſtle which *Galen* calls the ſmall griſtle bone, although it be nothing elſe but a production of the *Os Iuguli*.

Lib.13. du uſu part.Cap.11.

For the *ſternon*, which we ſaid is framed of diverſe bones, as ſometimes 3, ſomtimes 4, 5, 6, 7, and ſometimes 8, you muſt note they are very ſpongy and full of pores, and of a farre ſofter conſiſtence than the coller bones, wherefore more ſubject to corruption; beſides they are mutually joined by interpoſition of muſcles. Their uſe is to be as a ſhield to defend the vitall parts.

The Ribs are 24. in number, on each ſide 12, ſeaven of theſe are called true or perfect ribs, becauſe they make a circle, at the one end joined to the *ſternon*, on the other to the *vertebra's*; the other are called baſtard or ſhort ribs becauſe they fal ſhort in their way and come not to the *ſternon*; but they are faſtened on the fore-ſide to the *ſternon* by griſtles and ligaments, but on the back part to the tranſverſe *vertebra's* of the backbone, and to the ſides of the ſaid *vertebra's*. But the ſhort ribs are onely knit to the *vertebra's*, wherefore that part of the *vertebra's* is called the root of the ribs.

The Ribs.

The exteriour or fore-part of the Baſtard or ſhort ribs is griſtely, that they ſhould not be broken, and that they might be the eaſier lifted up in the diſtenſions of the ſtomack filled with meat. They are of a conſiſtence ſufficiently hard, yet more towards their root, than at the *ſternon*, where they come nearer together, and are more hardly broken; they are ſmooth both within and without, but in the midſt they have ſome ſigne of being double, or hollow to receive the veines and arteryes, which nouriſh their bony ſubſtance; they are faſhoned like a bow; their uſe is the ſame with the *ſternon*, and beſides to carry and ſtrengthen the muſcles ſerving for reſpiration.

Their conſiſtance.

Chap. V.

The Anatomicall Adminiſtration of the Sternon.

THe Coate inveſting the ribs, which the common Anatomiſts call *Pleura*, is the laſt of the containing parts of the Cheſt, which becauſe it lies hid in the inner part therof, it cannot be ſhowne unleſſe by pulling aſunder of the Sternon; wherefore wee muſt now ſhew the manner of opening the *Sternon*, that hereby we may not violate the originall or inſertion of any of the muſcles. Wherefore firſt you muſt underſtand that he which will ſhew in their proper place the originall and inſertion of the pectorall muſcles, of the *Maſtoides*, of the two muſcles of the bone *Hyois*, of the Muſcles *ſubclavii* and *intercar-*

tilaginei, ought firſt of all to ſeparate all the pectorall muſcles from the *ſternon* and the griſtles from the true ribs; then to cut the ligaments, next the bones themſelves, even from the ſixth true rib to the clavicles.

And then ſhewing the *Mediaſtinum* ſtretched under the *ſternon* all the length thereof, he muſt ſeperate the *ſternon* with his knife and bend it up to the clavicles, and there cut it, reſerving together with it the foure muſcles, that is, the two *Maſtoides* and the two moving the bone *Hyois*, becauſe they either wholy or for the moſt part ariſe from the *ſternon*.

Laſtly the Clavicles being ſomewhat thruſt upwards, the Griſtles muſt on each ſide be turned outwards towards the arme; that ſo the containing parts of the cheſt may not onely lye open to veiw and be eaſily ſhewed, but alſo the muſcles may bee contained in their place, untill they come to be ſhewed in their order.

And becauſe the Collar bones muſt be lifted up very high, that the recurrent nerves may be more eaſily ſeene and the diſtribution of the veines and arteries, the two ſmall ſubclavian muſcles one on each ſide muſt bee ſhowne by the way, who have their originall from the inner and fore part of the Clavicles, and an oblique deſcent to the *ſternon* towards the griſtle of the firſt rib.

For the Clavicles cannot be thus ſeparated, but that theſe muſcles muſt be violated and ſpoiled. Alſo you may divide the *ſternon* in the midſt, that you may ſhew the inward pectorall muſcles whole, having ſeparated the muſcles which ariſe from the upper part. All which things being performed as they ought, we muſt come to the Coat inveſting the ribs and then to the *Mediaſtinum* as ariſing from it.

Chap. VI.

Of the Pleura, *or coat inveſting the Ribs.*

What the membrane inveſting the Ribs is.

THe *Tunica ſubcoſtalis*, or coat inveſting the ribs being the laſt of the containing parts of the Cheſt, is a large and a broad membrane anſwerable in proportion of uſe and action to the *Peritonæum* of the lower belly. For as the *Peritonæum* generally and particularly covers all the naturall parts, binding and holding them in their places, ſo this coat inveſts all the vitall parts in generall becauſe it is ſtretched over all the inſide of the Cheſt, but in particular, whilſt it gives each a coate from it ſelfe.

Its originall.

It hath its originall from the *Perioſtium*, (or as others will have it from the *pericranium*,) inveſting the *vertebra's* of the Cheſt at the roots of the ribs. Wherefore it ſtickes very faſt to the ribs, ſcarce to be ſeparated, as alſo to all the parts bounding the Cheſt, and contained in it.

Veſalius reprehends *Galen*, becauſe he ſaid, that this was double on both ſides; yet *Columbus* defends *Galen*, and verily it is ſeene to be double in the inner part of the Cheſt, under the ribs and the muſcles of the ribs, that in that ſpace there may bee way for the veines, arteryes and nerves.

Whether, as there is a two fold pleuriſie, ſo alſo a double *Pleura*

Some have made it two fold, and divided it into the internall and externall; as thoſe which have made two ſorts of pleuriſyes, the true and baſtard; placing the externall above the Ribs and intercoſtall muſcles; but the internall under the Ribs, muſcles, *Diaphragma* and *ſternon*.

But we to ſhun ambiguity, intend only to proſequute thoſe things which are manifeſt to the eyes; wherefore we ſay that the ribs are lined on the inſide with a double coate; one which immediatly and firmely ſtickes to them on every ſide called the *Perioſtium*, which is common to them and other bones.

The Magnitude and figure.

The other which lyes upon that *Perioſtium* and on the inſide inveſts all the ribs, whence it is called the *ſubcoſtalis tunica*. The ſubſtance, temper and compoſure are the ſame, as in other membranes. The magnitude in length, as alſo the figure is the ſame with the compaſſe of the inner part of the cheſt; the thickneſſe of it is very little. This coat is commonly called the *Pleura* from the name of the part which it covers or lines (for the Greekes call the ribs πλεύραι,) and in like manner which happens betwixt the *Perioſtium* and this *Pleura*, is called either a true or baſtard Pleuriſye.

CHAP. VII.

Of the Mediaſtinum

The ſubſtance and magnitude.

NOw wee muſt ſpeake of the parts contained in the Cheſt, ſeeing we have already handled the containing, beginning with the *Mediaſtinum* as being a part which in diſſection firſt preſents it ſelfe to our ſight. The *Mediaſtinnm* is of the ſame ſubſtance, thicknes, compoſure, number, temper as the *Pleura*. For the ſubſtance of the *Mediaſtinum* is membranous, and though it be ſtretched all the length of the Cheſt, yet it is of a ſmall thicknes, receiving veines, nerves and arteryes from all the parts to which it is knit, like as the *Pleura* doth; but eſpecially from the mamillary veſſels deſcending under the *ſternon*.

It is in number one, but it is made of two membranes produced from the ſubcoſtall, for this aſcending on each ſide by the hollowneſſe of the cheſt to the *ſternon*, and then at right angles it is reflected to the bodyes of the *vertebra's*, whence the *Pleura* hath its originall.

In that reflection there is ſo much diſtance between each membrane, as may bee ſufficient to receive 2 fingers. For otherwiſe, ſeeing that they cannot penetrate through the hart, it was fit each ſide of the *Pleura* ſhould turne to the *Pericardium*, that ſo they might arive at the appointed place without offence. Nether yet is that ſpace void and empty, but woven with many ſmall nervous fibers; *Columbus* adds, that, that place is often filled with a certaine humor beſides nature, which you may draw out, or evacuate by opening the *ſternon*.

The figure.

Yet I would gladly learne of *Columbus*, by what ſignes we may know that ſuch an humor is conteined there. For the figure, the *Mediaſtinum* with the *Pleura* on each ſide repreſents the figure of a Leather bottle, whoſe flat ſide is the *Mediaſtinum*, whoſe other ſide the *Pelura*; the bottome that part of the *pleura* which is next the Midriffe, the mouth the upper part of the *Pleura* at the firſt ribs. We ſhewed the ſite and connexion of the *Mediaſtinum*, when we declared its originall.

The uſe.

The uſe thereof is to ſeparate the vitall parts, as it were into 2 cells, the right and left, that if peradventure it happen that the one be hurt, the creature may live by the benefit of the other.

And it hath another uſe which is to prop and hold up the *Pericardium*, that it fall not uppon the heart with its waight, but toſſed with the motions of the heart and Cheſt, it may move to this or that ſide.

CHAP. VIII.

Of the Diaphragma *or Midriffe.*

What the midreffe is.

ALthough the Midriffe may ſeeme to be accounted rather a part containing than contained, yet for commodities ſake we have deferred the demonſtration thereof till now. Therefore it is a muſcle round and long, terminating the lower part of the Cheſt.

Its ſubſtance, compoſition &c.

It is of the ſame ſubſtance, compoſition and temper, as the muſcles of the *Epigaſtrium*, it is made of two coats the lower whereof is from the *Peritonaeum*, and the upper from the *Pleura*. Which getting to them fleſh but not there, but in their circumference, by the benefit of the blood brought thither by the veines and arteries diſtributed through it, turne into a muſcle, whoſe middle is nervous and membranous, but the extremityes by which it is inſerted, one while fleſhy as in that part next to the baſtard ribs; another while tendonous, as where it touches the firſt & ſecond *vertebra's* of the loines, for it ends in them by 2 tendons manifeſt enough. It is one in number, interpoſed with an oblique ſite betwixt the naturall and vitall parts.

Connexion. It hath connexion with the lower part of the *ſternon* and ſhort ribs, and the two firſt *vertebra's* of the loines, but by its coats and veſſels with the parts from whence it received them.

Quantity. The extent thereof is equall to the compaſſe of the lower part of the Cheſt. The length of it is from the breſt blade even to the firſt and ſecond *vertebra* of the loines. The thicknes is diverſe, for it is far thicker in its fleſhy extremity, than in its nervous originall.

Action. The Action thereof is to helpe the expulſion of the Excrements by the mutuall aſſiſtance of the *Epigaſtrick* muſcles, but the chiefe uſe is for reſpiration, of which it is one of the prime inſtruments. This partition the Ancients called *Phrenes*, becauſe the inflammation thereof cauſed like ſymptomes as the inflammation of the Braine, by reaſon of the large nerves on each ſide one which come to it directly & primarily from the third, fourth and fifth *vertebra* of the neck. This muſcle differs from other muſcles, ſpecially in figure. It is preforated in three places, to giue way or paſſage to the aſcendent Hollow-veine, to the Artery *Aorta*, and the Gullet.

Why the *Diaphragma* was called *Phrenes*.

Chap. IX.

Of the Lungs.

Their ſubſtance. quantity. The Lobes thereof. THe Lungs are of a ſoft ſubſtance and fleſh, rare and like a ſponge, of a various colour pale red, their quantity is ſufficiently large; for moſt commonly they are divided into 4 lobes disioined with a manifeſt and viſible diviſion, on each ſide two, whereby they may be the more eaſily opened and contracted, and the aire may the better enter.

Beſides alſo in large bodyes, who have a very great cheſt, there is found a fifth lobe, ariſing from the ſecond lobe of the right ſide, as a cuſhion, or bolſter to beare up the hollow veine aſcending from the midriffe to the heart.

In little men who have a ſhorter Cheſt, becauſe the Heart is ſo neere as to touch the *Diaphragma*, this Lobe is not ſeene, yet it is alwayes found in Dogges.

Figure. The Lungs repreſent the figure or ſhape of an Oxes foot, or hoof, for like it they are thicker in their *baſis*, but ſlenderer in their circumference, as you may ſee in blowing them up, by the weazon, with your mouth or a paire of bellowes. Compoſition. They are compounded of a coate comming from the *Pleura*, which on each ſide receives ſufficient number of nerves from the ſixth conjugation; and alſo of the *Vena arterioſa* comming from the right ventricle of the heart, and the *Arteria venoſa* from the left, as ſhall be ſhewed in the Anatomy of the heart; beſides the *Aſpera arteria* or Weazon comming from the throat, and laſtly its owne fleſh, which is nothing elſe than the concretion of cholerick blood poured out like foame about the diviſions of the foreſaid veſſels, as we have ſaid of other parts.

The body of the Lungs is one in number, unleſſe you will divide it into two, by reaſon of the variety of its ſite, becauſe the Lobes of the Lungs ſtretched forth into the right & left ſide doe almoſt involve all the heart, that ſo they may defend it againſt the hardnes of the bones which are about it; they are tyed to the heart, cheifly at its *baſis*, but to the roots of the ribs and their *vertebra's* by the coat it hath from thence; but by the veſſels to theſe parts from whence they proceed. The ſticking of the lungs to the Ribs. But oft times preſently from the firſt and naturall conformation they are bound to the circumference of the ribs by certaine thin membranous productions which deſcend from thence to the Lungs, otherwaies they are tyed toe the ribs by the *Pleura*.

Their nouriſhment. The nouriſhment of the Lungs is unlike to the nouriſhment of other parts of the body; for you cannot find a part equally rare, light and full of aire, which may be nouriſhed with blood equally thin and vaporous. In temper they incline more to heat than to cold, whether you have regard to their compoſure of cholerick blood, or their uſe, which is to prepare and alter the aire that it hurt not the heart by its coldnes. The Lungs is the inſtrument of voice and breathing by the Weazon or windpipe. For the Lobes are the inſtruments of voice, and the ligaments, of reſpiration. But the

Larinx or Throtle is the chiefe inſtrument of the voice, for the Weazon firſt prepares the voice for the Throtle, in which it being in ſome meaſure formed is perfected in the Pallate of the mouth, as in the upper part of a lute, or ſuch like inſtrument, by the help of the *Gargareon* or *uvula* as a certaine quill to play withall.

But as long as one holds his breath, he cannot ſpeak; for then the muſcles of the *Larinx*, Ribs, the *Diaphragma* and the *Epigaſtrick* muſcles are preſſed downe, whence proceeds a ſuppreſſion of the vocall matter, which muſt be ſent forth, in making or uttering a voice.

Why the lungs are light,

Nature would have the Lungs light for many reaſons, the firſt is that ſeeing they are of themſelves immoveable, they might be more obſequious and ready to follow the motion of the cheſt, for when it is ſtraitened, the Lungs are ſtraitened and ſubſide with it; and when it is dilated, they alſo are dilated, and ſwell ſo big that they almoſt fill up all the upper capacity thereof.

Another cauſe is that by this their rarity they might more eaſily admit the entring Aire, at ſuch times as they have much, or ſuddaine neceſſity, as in running a race.

And laſtly, that in Pleuriſies and other purulent abſceſſes of the Cheſt the *Pus* or matter poured forth into the capacity of the Cheſt may be ſuckt in by the rare ſubſtance of the Lungs, and by that meanes the ſooner ſent forth and expectorated.

The uſe of Reſpiration, or breathing.

The uſe of reſpiration is to coole and temper the rageing heat of the Heart. For it is cooled in drawing in the breath by the coole aire, and in ſending out thereof by avoiding the hot fuliginous vapour. Therefore the Cheſt performes two contrary motions, for whileſt it is dilated it drawes in the encompaſſing aire, and when it is depreſſed it expels the fuliginous vapour of the Heart; which any one may eaſily perceive by the example of a paire of Smithes bellowes.

Chap. X.

Of the Pericardium or purſe of the Heart.

Whence it hath its matter

THe *Pericardium* is as it were the houſe of the Heart, which ariſeing at the *baſis* thereof (either the ligaments of the *vertebra's* ſituate there or els the veſſels of the heart yeilding it matter) is of a nervous, thick and denſe ſubſtance without any fibers. It retaines the figure of the Heart, and leaves an empty ſpace for the heart to performe its proper motions. Wherefore the bignes of the *Pericardium* exceeds that of the heart.

It conſiſts of a double coate, one proper of which wee have ſpoken, another common coming from the *pleura*; and alſo of veines, arteries and nerves; the veſſels partly comming from the mamillary, partly from the *Diaphragma*, chiefly there where it touches it; the nerves come on each ſide from the ſixt conjugation.

Number and connexion.

It is onely one, placed about the heart and annexed to it at the *Baſis* thereof by its membranes, to the originall of the Lungs, and the *vertebra's* lying under them, and by the veſſels to the parts from whence it received them. It is of a cold and dry temper as every membrane is.

Vſe.

The uſe thereof is to cover the heart, and preſerve it in its native humidity, by a certaine naturall moyſture contained in it, unles you had rather ſay that the moiſture we ſee contained in the *Pericardium*, is generated in it after death by the condenſation and concretion of the ſpirits. Although this ſeemes not very likely; becauſe it growes and is heaped up in ſo great quantity in liveing bodyes, that it hinders the motion of the heart, and cauſes ſuch palpitation or violent beating thereof; that it often ſuffocates a man.

From whence the matter of the watery humor conteined in the *Pericardium*.

For this Palpitation happens alſo to hearty and ſtout men, whoſe harts are hot, but blood thin and wateriſh by reaſon of ſome infirmity of the ſtomack or Liver; and this humour may be generated of vapours which on every ſide exhale into the *pericardium* from the blood boileing in the ventricules of the heart, where kept in by the denſity thereof, they turne into yellowiſh moiſture, as we ſee it happens in an Alembeck.

The Conſiſtence.

Nature would have the *pericardium* of a denſe and hard conſiſtence, that by the force thereof the heart might bee kept in better ſtate; for if the *Pericardium* had beene bony, it would have made the heart like iron by the continuall attrition; on the contrary, if it had beene ſoft and fungous, it would have made it ſpongy and ſoft like the Lungs.

CHAP. XXX.

Of the Heart.

What the heart is, and of what ſubſtance.

THe Heart the chiefe manſion of the Soule, the organe of the vitall faculty, the beginning of life, the fountaine of the vitall ſpirits, & ſo conſequently the continuall nouriſher of the vitall heate, the firſt living and laſt dying, which becauſe it muſt have a naturall motion of it ſelf, was made of a denſe ſolide and more compact ſubſtance than any other part of the body.

The three ſorts of fibers of the Heart.

The fleſh thereof is woven with three ſorts of fibers, for it hath the right in the inner part deſcending from the *baſis* into the point, that they might dilate it, and ſo draw the blood from the hollow veine into the receptacles thereof, and the breath or aire from the lungs by the *Arteria venoſa*; it hath the tranſverſe without, which paſſe through the right at right angles, to contract the Heart, and ſo drive the vitall ſpirits into the great Artery *Aorta*, and the cholericke blood to the Lungs by the *vena arterioſa*, for their nouriſhment; It hath the oblique in the midſt to containe the Aire and blood drawne thither by the forementioned veſſels untill they be ſufficiently elaborate by the heart.

All theſe fibers doe their parts by contracting themſelues towards their originall, as the right from the point of the heart towards the *baſis*, whereby it comes to paſſe that by this contraction of the fibers the heart dilated becomes ſhorter, but broader, no otherwiſe than it is made more long and narrow by the contraction of the tranſverſe, but by the drawing of the oblique it is leſſened in that part which lookes towards the *vertebra's*, which chiefly appeares in the point thereof.

The magnitude

It is of an indifferent bignes, but yet in ſome bigger, in ſome leſſe according to the diverſe temper of Cold or hot men, as wee noted in the liver.

Figure.

The figure thereof is Pyramidall, that is, it is broader in the *baſis*, and narrower at his round point.

Compoſition

It is compoſed of the moſt denſe fleſh of all the body, by the affuſion of blood at the diviſions and foldings of the veſſels, and there concrete; as it happens alſo to the other Entrailes. For the blood being there a litle more dryed, than that which is concrete for the making of the Liver, turnes into a fleſhy ſubſtance more denſe than the common fleſh, even as in hollow ulcers, when they come to a cicatrize.

The proper veſſels.

It hath the Coronall veines and arteryes, which it receives either on the right ſide from the hollow veine, or on the left from the *baſis* at the entranc of the Artery *Aorta*.

The Nerves,

You cannot by your Eye diſcerne that the Heart hath any other Nerves than thoſe which come to it with the *Pleura*.

Yet I have plainely enough obſerved others in certaine beaſts, which have great Hearts, as ſwine; they appeared ſeated under the fat which covers the veſſels, and *baſis* of the heart, leſt the humid ſubſtance of theſe parts ſhould be diſſolved and diſſipated by the burning heat of the Heart. Whereby you may perceive that the heat of the heart is different from the Elementary heat, as that which ſuffers fat to grow about this Entraile, where otherwiſe it doth not concrete unleſſe by cold or a remiſſe heat, which thing is chiefly worth admiration.

Number and ſite.

The Heart is one alone, ſcituate moſt commonly upon the fourth *Vertebra* of the Cheſt, which is in the midſt of the Cheſt. Yet ſome thinke that it inclines ſomewhat to the left ſide becauſe we there feele the motion or beating thereof; but that happens by reaſon of its left ventricle, which being it is filled with many ſpirits, and the beginning of the arteryes, it beats far more vehemently, than the right. It required that ſeat by the decree of Nature, becauſe that Region is the moſt ſafe and armed, and beſides it is here on every ſide covered as it were with the hands of the Lungs.

Connexion.

It hath connexion with the fore mentioned *Vertebra's*, but by the parts compoſeing it, with thoſe parts from whence it hath them; with the Lungs by the *Vena arterioſa*, and the *Arteria venoſa*, and laſtly with all the parts of the body by the Arteries which it ſends to them all.

Temper and action.

What the vitall ſpirit is.

It is of a hot and moiſt temper, as every fleſhy part is. The action thereof is, firſt to prepare the blood in its right ventricle, for the fit nouriſhment of the Lungs, for from hence it is that *Galen* ſaith; this right ventricle was made for the neceſſity of the lungs. Secondly to generate the vitall ſpirits in its left ventricle for the uſe of the whole body. But this ſpirit is nothing els than a certaine middle ſubſtance between aire and blood fit to preſerve and carry the native heat, wherefore it is named the vitall, as being the author and preſerver of life. In the inner parts of the heart there preſent themſelves to our conſideration the ventricles and the parts contained in the ventricles and between them; ſuch are the *Valvulæ* or valves, the veſſels and their mouthes, their diſtribution into the lungs, the wall or partition, and the two productions or Eares of the heart; which becauſe they are doubtfull, whether they may be reckoned amongſt the externall or internall parts of the heart, I will here handle in the firſt place.

The *Auriculæ Cordis*, or eares of the heart.

Therefore theſe *Auriculæ* or Eares are of a ſoft and nervous ſubſtance, compact of three ſorts of fibers, that ſo by their ſoftneſſe they might the more eaſily follow the motions of the heart, and ſo breake the violence of the matters entring the heart with great force when it is dilated. For otherwiſe by their violent and abundant entrance they might hurt the heart, and as it were overwhelme and ſuffocate it; but they have that capacity which we ſee given by nature, that ſo they might as it were keep in ſtore the blood and aire, and then by litle and litle draw it forth for the uſe or neceſſity of the heart. But if any enquire, if ſuch matters may be drawne into the heart by the only force of the *Diaſtole ad fugam vacui*, for avoiding of emptineſſe; I will anſwere that that drawing in, or attraction is cauſed by the heat of the heart; which continually drawes theſe matters to it no otherwiſe than a fire drawes the adjacent Aire, and the flame of a candle the tallow which is about the weake for nouriſhments ſake. Whileſt the heart is dilated it drawes the aire, whileſt it is drawne togeather or contracted, it expells it. This motion of the heart is abſolutely naturall, as the motion of the Lungs is animall. Some adde a third cauſe of the attraction of the heart; to wit, the ſimilitude of the whole ſubſtance. But in my judgment, this rather takes place in that attraction which is of blood by the *venæ coronales* for the proper nouriſhment of the heart, than in that which is performed for attraction of matters for the benefit of the whole body.

Their magnitude and number.

Their uſe.

Theſe eares differ in quantity, for the right is far more capacious than the left becauſe it was made to receive a greater aboundance of matter. They are two in number, on each ſide one, ſcituate at the *Baſis* of the heart; The greater at the entrance of the hollow veine into the heart, the leſſe at the entrance of the *veinous* and of the great Artery with which parts they both have connexion. We have formerly declared what uſe they have; that is, to break the violence of the matters, and beſides to bee ſtayes or props to the *Arteria venoſa* and great Arterye, which could not ſuſtaine ſo rapid and violent a motion as that of the Heart by reaſon of their tenderneſſe of ſubſtance.

Of the ventricles of the Heart.

The partitio betweene the ventricules of the Heart.

THe ventricles are in number two, on each ſide one, diſtinguiſhed with a fleſhy partition ſtrong enough, having many holes in the ſuperficies, yet no where pearcing through.

Why the right ventricule is more capacious and leſſe compact.

The right of theſe ventricles is the bigger and incompaſſed with the ſofter and rarer fleſh; the left is the leſſer but is engirt with a threefold more denſe and compact fleſh; for the right ventricle was made for a place to receive the blood brought by the hollow veine, and for diſtributing of it, partly by the *vena arterioſa* into the Lungs for their nouriſhment, partly into the left ventricle, by ſweating through the wall or partition, to yeild matter for the generation of the vitall ſpirits.

Why the right ventricle is more capacious and leſſe compact.

Therefore becauſe it was needfull there ſhould be ſo great a quantity of this blood, it was likewiſe fit that there ſhould be a place proportionable to receive that matter. And becauſe the blood which was to bee received in the right ventricle was more thicke, it was not ſo needfull, that the fleſh to containe it ſhould be ſo compact; but on the contrary the arterious blood and vitall ſpirit have need of a more denſe receptacle, for feare of waſting and leſt they ſhould vaniſh into aire; and alſo leſſe roome that ſo the heat being united might become the ſtronger, and more powerfully ſet upon the elaboration of the blood and ſpirits.

The action of the right ventricle.

Therefore the right ventricle of the heart is made for the preparation of the blood appointed for the nouriſhment of the Lungs, and the generation of the vitall ſpirits, as the lungs are made for the mitification, or quallifying of the Aire. Which works were neceſſary, if the Phyſicall Axiome bee true; That like is nouriſhed by like, as the rare and ſpongious lungs with more ſubtle blood; the ſubſtance of the heart groſſe and denſe, with the veinous blood as it flowes from the Liver, that is groſſe.

And it hath its Cororall veines from the Hollow veine, that it might thence drawe as much as ſhould be ſufficient.

The action of the left ventricle.

But the left ventricle is for the perfecting of the vitall ſpirit, and the preſervation of the native heat.

Of the Orifices and Valves of the Heart.

The uſes of the foure orifices of the Heart.

THere be foure Orifices of the heart, two in the right, & as many in the left ventricle; the greater of the two former gives paſſage to the veine, or the blood carried by the hollow veine to the heart; the leſſer opens a paſſage to the *vena arterioſa* or the cholerick blood carryed in it for the nouriſhment of the lungs.

The larger of the two other makes a way for the diſtribution of the Artery *Aorta* and the vitall ſpirit through all the body; but the leſſer gives egreſſe and regreſſe, to the *Arteria venoſa*, or to the aire and fuliginous vapours. And becauſe it was convenient that the matters ſhould bee admitted into their proper ventricles by theſe orifices, by the *Diaſtole*, to wit, into the right ventricle by the greater orifice, and into the left by the leſſer, and becauſe on the contrary it was fit that the matters ſhould be expelled by the *ſyſtole* from their ventricles by the fore-mentioned orifices.

The valves.

Therefore nature to all theſe orifices hath put eleaven valves, that is to ſay, ſixe in the right ventricle, that there might bee three to each orifice; five in the left, that the greater orifice might have three, and the leſſer two, for the reaſon we will preſently give.

How they differ.
Action.
Site.
Figure.
Subſtance.

Theſe valves differ many wayes; firſt in action; for ſome of them carry in matter to the heart, others hinder that which is gone out that it come not back againe; Secondly they differ in ſite, for thoſe which bring in have membranes without, looking in; thoſe which carry out have them within looking out. Thirdly in figure, for thoſe which carry in, have a pyramidall figure, but thoſe which hinder the comming back againe are made in the ſhape of the Roman letter C. Fourthly in ſubſtance, for the former for the moſt part are fleſhy, or woven with fleſhy fibers into certaine fleſhy knots ending towards the point of the heart. The latter are wholy membranous.

Number.
Motion.

Fiftly they differ in number, for there be only five which bring in, three in the right ventricle at the greater orifice, and two in the left at the leſſer orifice; thoſe which prohibite the comming back are ſixe in each ventricle, three at each orifice. Laſtly they differ in motion; for the fleſhy ones are opened in the *Diaſtole* for the bringing in of blood and ſpirit, and contrarywiſe are ſhut in the *ſyſtole*, that they may containe all or the greater part of that they brought in. The membranous on the contrary are opened in the *ſyſtole* to give paſſage forth to the blood and ſpirits over all the body, but ſhut in the *Diaſtole*, that that which is excluded might not flow backe into the Heart. But you ſhall obſerve that nature hath placed onely two valves at the Orifice of the *Arteria Venoſa*, becauſe it was needfull that this Orifice ſhould bee alwayes open, either wholy, or certainely a third parte thereof; that

Why there be onely two valves at the Arteria venoſa the Aire might continually be drawne into the heart by this orifice in inſpiration, and ſent forth by exſpiration in the contraction of the heart. Whereby we may gather this, that there is but one third part of that Aire we draw into the heart in breathing, ſent forth againe in the forme of vapour in exſpiration, becauſe nature would have but one third part of the orifice to ly open for its paſſage out. Therefore the exſpiration or breathing out, and the *ſyſtole* of the heart and arteryes, is ſhorter than the inſpiration, ſo that we may truely ſay, that the inſpiration, or drawing the breath in, is equally ſo long as the exſpiration is together with the reſt, which is in the middeſt between the two motions.

CHAP. XII.

Of the Diſtribution of the Vena arterioſa, *and the* Arteria venoſa.

HAving hitherto ſhewed the originall of each of the veſſels of the Heart, we muſt now ſpeake of their diſtribution. The *Vena arterioſa*, or the arterious veine, and the *arteria venoſa* or the *veinous arterie* each proceeding out of his proper ventricle, that is, the right and left, are divided into two large branches; one of which goes to the right and the other to the left hand, the one lying croſſe wayes over the other, the veine alwaies riding over the arterye, as you may underſtand better by the ſight of your eyes, than by reading of bookes. Theſe branches at their entrance of the lungs are divided into two other large branches, and each of them goe to his peculiar Lobe of the lungs; and theſe againe runne almoſt into infinite other branches, diſperſed in three places over the Lungs.

The Artery alwayes lyes under the veine.

Theſe veſſels have acquired their names by reaſon of that tranſmutation of conſiſtence, whereby the compoſure of a veine degenerates into an arterye, and that of an arterye into a veine, for the commodity of life. For this is a miracle of prudent nature to change the coats of the veſſels of the lungs; producing a veine which in its body ſhould imitate an arterye, and an arterye which ſhould repreſent a veine: For if the *vena arterioſa* ſhould have retained its proper conſiſtence, the arterious blood which is carried by it from the heart to nouriſh the lungs, might by reaſon of its ſubtility penetrate through, and flow away by reaſon of the rarity of the veinous texture: and ſo nature ſhould never have attained her conceived end, that is, to nouriſh the Lungs, by reaſon of the continuall motion of their contraction and dilatation.

A twefold reaſon why the veine was made Arterious, or like an Artery.

For nouriſhment cannot be aſſimulated to the part, unleſſe it be put and cleave to it. Wherefor it was fit, that nature ſhould make the body of this veine ſolid, that it might be immoveable, unſhaken and ſtubborne (in reſpect of a veine which by its ſoftneſſe would have been too obſequious and yeilding to the agitation of the Lungs) that ſo it might have nouriſhment, which might be diffuſed into all parts thereof, and which might neither bee drawne by its *Diaſtole*, nor driven back into the heart by its *ſyſtole*. But the arterye hath the conſiſtence of a veine, that by that veinous ſoftneſſe according to the neceſſity of nature it might be the more readily contracted and dilated, to bring the Aire in and carry the vapours forth of the heart. Here wee meet with a difficulty, which is, by what way the blood is carried out of the right into the left ventricle of the heart.

Why the Artery was made like a veine.

Galen thinkes that there be certaine holes in the partition made for that purpoſe, and verily there are ſuch, but they are not perforated. Wherefore *Columbus* hath found out a new way, which is, that the blood is carried to the lungs by the *vena arterioſa*, and there attenuated; and carried from thence together with the aire by the *Arteria venoſa* to the left ventricle of the heart; this he writes truely very probablely. *Botallus* in his treatiſe *De Catarrho* hath found out a third way, to wit a veine, which he calls *Arteriarum nutrix*, that is, The nurſe of the Arteryes, which creepes a litle above the Coronall to the right eare of the Heart, and then goes into the left eare thereof. But yet I am very much afraid, that this veine obſerved by *Botallus*, is that veſſell obſerved by *Fallopius*, whereby the *Vena arterialis* is joined to the *Aorta*, & by which all the vitall blood is carryed for the forming and nouriſhment of the lungs

By what way blood may paſſe out of the right into the left ventricle.

The veine called the nurſe of the Arteries

Fallop. initio obſer. Arteriarum.

Gal.lib.15 de uſu part.cap.6.

whileſt the infant is yet in the wombe. Of which alſo *Galen* makes mention, but it had laine hid from his time to this day, but that *Fallopius* raiſed up the memory of it againe.

Chap. XIII.

The diſtribution of the aſcendent Hollow veine.

Gal.lib.de form.fœtus.

The greater deſcendent branch of the hollow veine.

The upper branch of the hollow veine is the leſſe.

Venæ phrenicæ, Coronales.

Vena Arterioſa

Vena Azygos, or ſine pari.

This *Azygos* ſometimes two

How the matter of a pleuriſie may be evacuated by vrine.

Intercoſtalis.

Mammariæ.

Cervicalis.

Muſculoſa.

In what place cupping glaſſes may be fitly applyed in a baſtard Pleuriſie.

THe Hollow veine riſeing out of the gibbous part of the Liver, and reſembling (according to *Galen*) the body of a tree, is divided into two notable branches, but not of a like bignes. For the greater, by the hind part of the Liver upon the back bone and by the way, receives certaine other branches from the ſubſtance of the Liver which entred not into the great trunck with the reſt. You may often ſee this deſcendent branch even to the backe bone upon which it lyes in this its deſcent, covered with the ſubſtance of the liver, ſo that it may ſeeme that branch proceeds not from that common trunck together with the aſcendant, although indeed it alwayes doth. But the leſſer branch aſcends to the upper parts, and is diſtributed after this manner following. For firſt ariſeing into the midriffe it beſtowes two ſmall veines upon it, on each ſide one, which from that part are called *Phrenicæ*. But from thence when it arrives at the right Eare of the Heart, it makes the *Coronales*, the Coronall or Crowne veines, which compaſſe the *baſis* of the heart in manner of a Crowne. Thirdly entring ſomewhat more deeply into its right Eare, in its greater part it produces the *vena arterioſa*. Fourthly lifted up above the heart, on the right ſide it produces the veine *Azygos* or *ſine pari* (that is, without a fellow) which deſcending to the fourth rib, (reckoning from above downewards) nouriſheth the intercoſtall muſcles and alſo the membranes of the 8 lower ribs, on both ſides, ſending a branch into each of the muſcles at the lower part of the rib, which may bee ſufficient for their nouriſhment. Beſides alſo oftentimes, eſpecially in little men, this veine *Azygos* nouriſhes all the ſpaces between all the ribs by the like branches, which it ſends in the ſame manner to the foure upper ribs. Moreover alſo this *Azygos* ſometimes, though but ſeldome, is found double, that is, on each ſide one. Here you muſt chiefly obſerve, that this veine after it hath nouriſhed the ſpaces between the lower ribs, in its remainder deſcends under the *Diaphragma* and is joined on the left ſide to the Emulgent vein; by which it is manifeſt how an Abſceſſe, may be critically evacuated by the urine, in a pleuriſye. But this ſame *Azygos* is more depreſſed on the right ſide, and meets with the *Venæ lumbares*, but eſpecially with one of them, which goes downe to the thigh, whereby *Fallopius* gathers that it is very convenient in the beginnings of Pleuriſyes to open the *vena poplitis*, the veine of the Ham. Fifthly above the *Azygos* (when it is wanting there) it ſends forth the branch called *Intercoſtalis* to the other ſpaces between the upper ribs; although this is ſometimes ſeene to come from the *Axillares*, which *Sylvius* calls the *ſubclaviæ*. Sixtly it brings forth the *Mammariæ* ſo called, becauſe in their greater part they run to the dugs between the fourth and fifth ribs, for the uſes formerly mentioned; men and women have on each ſide one of theſe comming from the *Subclaviæ*. They are ſometimes found to proceed by a certaine common orifice from the hollow veine, before it be divided into the *Subclavian* branches, but it is rather in beaſts than in men; theſe veines deſcending by the ſides of the *ſternon* yeild nouriſhment to the 2 inner muſcles of the cheſt, to the 7 intercoſtall muſcles of the true ribs, to the *ſternon* it ſelfe and to its ligaments and griſtles, as alſo to the *Mediaſtinum* and the upper part of the right muſcles, and the adjacent parts. Seaventhly it produces the *Cervicalis* which on both ſides through the holes of the productions of the *Vertebra's* of the necke, aſcends to the head, ſending many ſmall branches into the ſpinall marrow through the holes by which the nerves paſſe, and alſo into the membranes, ligaments, griſtles, bones, and neighbouring muſcles. Eightly the *Muſculoſa* or muſculous, which alſo ariſeing out of the *Subclaviæ* is devided into two other branches; the one whereof goeth upon the breſt to the paps, nouriſhing the foremoſt muſcles; wherefore in a baſtard pleuriſie Cupping glaſſes may be fitly applied in this place.

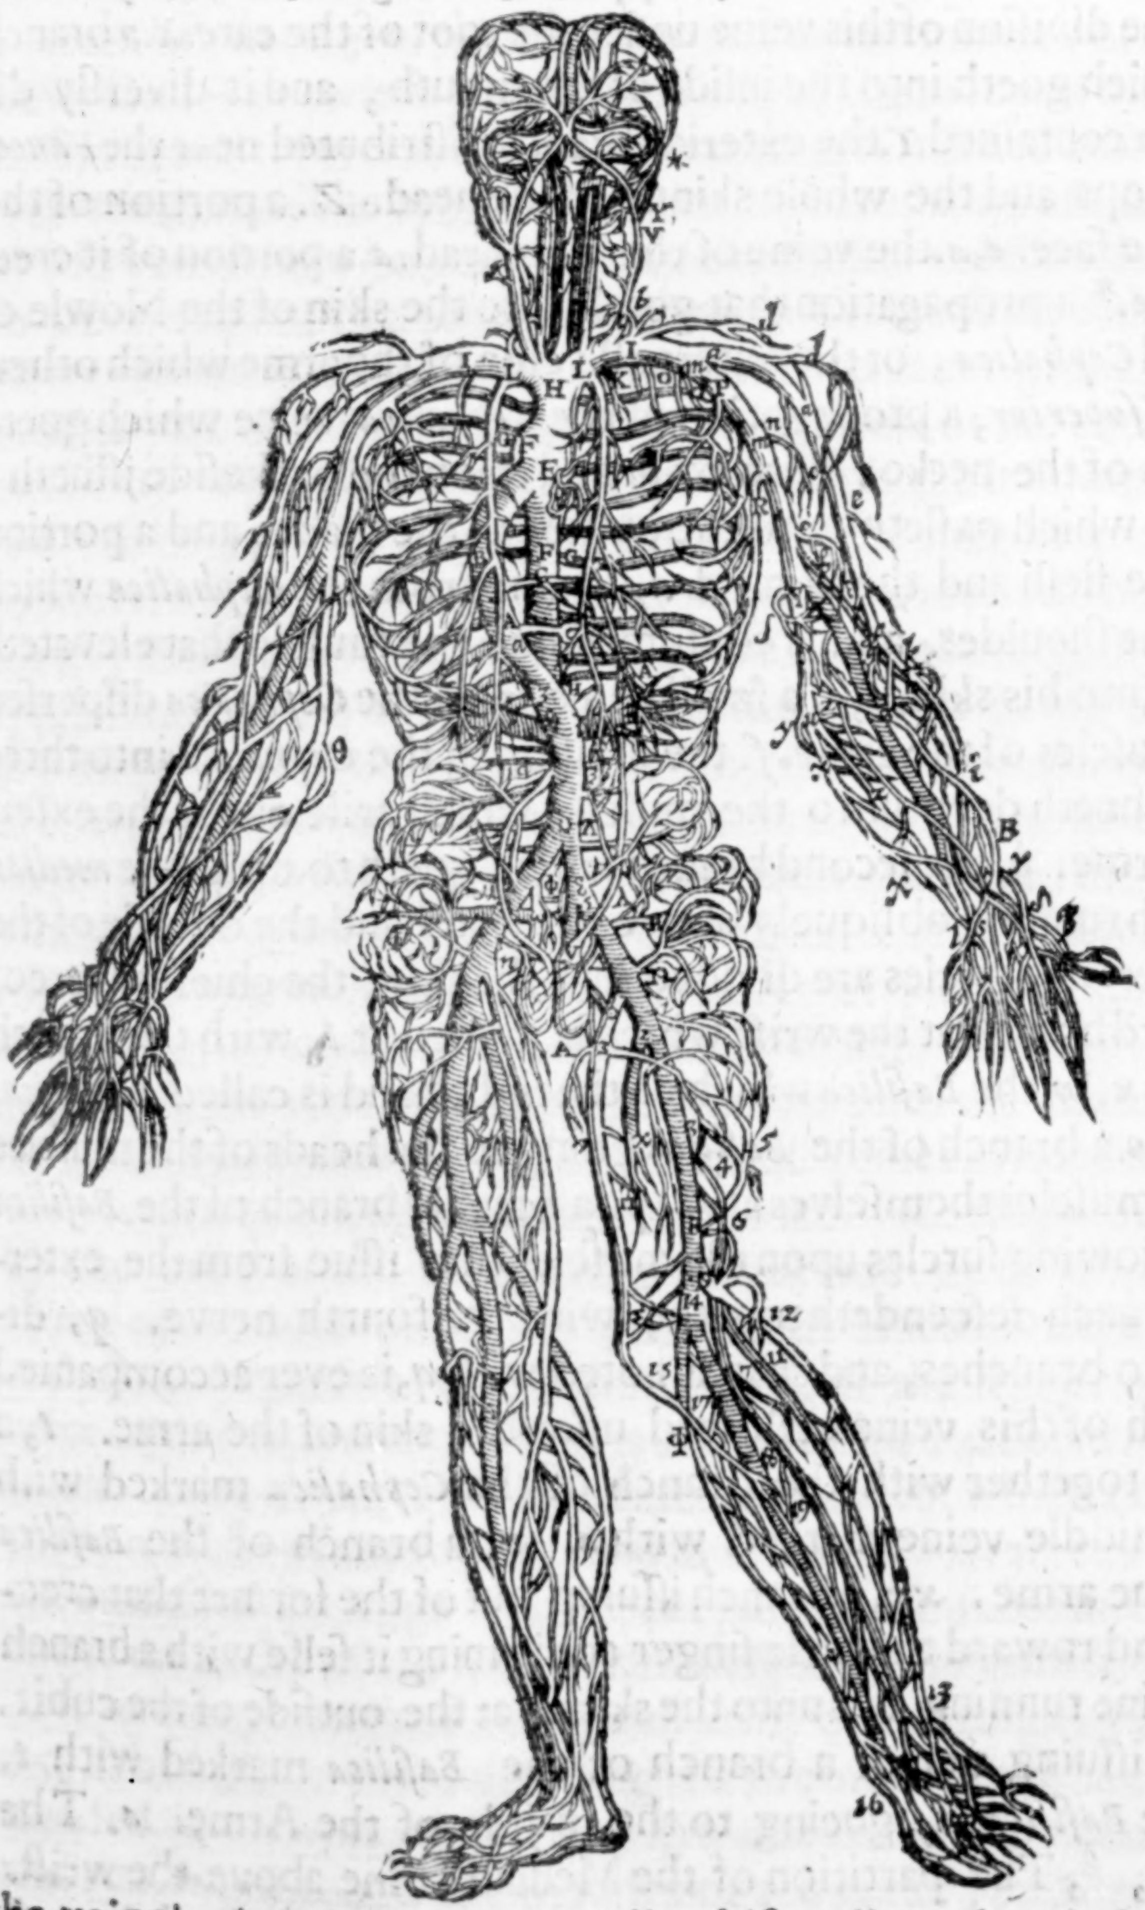
The

Axillaris.
Humeralis.
Iugularis interna, et externa.
Into what parts the *Iugularis interna* goes.

The other branch deſcends to the upper muſcles of the cheſt, but ſpecially to that which is called *Latisſimus*. The tenth is the *Axillaris*. The eleventh the *Humeralis*, of which wee will treat in their place. The twelfth and laſt is the *Iugularis* properly ſo called, which is twofold, the internall and externall. The internall being the leſſer doth preſently on both ſides from this very beginning aſcend by the ſides of the *Aſpera Arteria* or weazon even to the mouth and skull, yeilding nouriſhment to the parts by which it paſſes, as to the next membranes and nerves. But when it comes to the *baſis* of the *Cranium* it is divided into two branches, the greater whereof going back along the *baſis* of the *Cranium* to the hind part thereof, ſending a branch to the long muſcle ſcituate upon the *æſophagus*, it enters the *Cranium* with the ſmall *Carotides* through the hole of the nerves of the ſixth conjugation, where they become one common veſſell. The leſſer ſending a ſlippe to the organe of hearing by the hole called *Cæcum* (or the blind) alſo enters the *Cranium* and is ſpent in the thicker *meninx* nere to the hole of the third and fourth conjugation of nerves. The externall Iugular veine being greater and fairer, moſt commonly ſimple, yet ſometimes double, either preſently at his beginning, or a little after, aſcends ſuperficially on both ſides of the neck, between the broad muſcle or fleſhy pannicle, being there eaſie to be diſcerned, and other muſcles ſcituate at the ſides of the neck, into which as alſo into the skin it ſends certaine branches for nouriſhment.

Into what parts the *Iugularis externa* goes.

The Figure of the hollow veine whole and freed from the reſt of the body.



A, The trunke of the hollow veine. the lower

AA, At this place of the Liver, is ſeated the left part of the veine, and diſtributeth branches to the left ſide.

B, Sheweth how the trunke of the hollow veine in the cheſt (to give way to the heart) is curved or bowed to the right hand.

Betwix A. and B. that part of the hollow veine which is betwixt the gibbous ſide of the Liver and the Midriffe.

C. the left midriffe veine called *Phrenica ſiniſtra*, from which ſurcles doe run in a man unto the purſſe of the heart, for the midriffe and it doe grow together.

D, The orifice of the hollow veine which groweth unto the heart.

E, the crown-veine called *coronaria*, which like a crowne compaſſeth the baſis of the heart, and ſprinkleth his ſurcles on the outſide therof as far as to the cone or point.

FF, The trunke of the veine, *Azygos* or *non parill*, deſcending along the right ſide of the racke-bones unto the loynes. *GG*, the lower intercoſtall veines, to the branches of the veine *Azygos*, which go unto the diſtances betwixt the ribs, & afford ſurcles unto the muſcles which lye upon the ribs & the racke-bones, & the membranes of the cheſt. *H*, the diviſion of the hollow vein into two ſubclavian trunks neare the Iugulum under the breſt-bone. *II*, the ſubclavian branch tending on either ſide unto the arme; called by ſome *Axillaris*. *K*, the upper intercoſtall veine which commonly ſendeth three ſlips unto the diſtances of the upper ribs, unto which the firſt intercoſtall veine ſent no branches. *LL*, the deſcending mammary veine: this deſcendeth under the breſt-bone unto the right muſcles of the *Abdomen*, & affoordeth ſurcles to the diſtances of the griſtles of the true ribs, to the Mediaſtinum, the muſcles that lye upon the breaſt and the skin of the *Abdomen*. *M*, the coniunction of the mammary with the Epigaſtricke vein aſcending about the navill under the right muſcles. *N*, the veine of the necke called *Ceruicalis*, aſcending toward the Scull, which alloweth ſurcles to thoſe muſcles that lye upon the neck. *O*, the veine called *Muſcula*, which is propagated with many ſurcles into the muſcles that occupy the lower parts of the necke and the upper parts of the cheſt. *P*, *Thoraeica* ſuperior, the upper cheſt veine which goeth to the muſcles lying uppon the cheſt, to the skinne of that place and to the dugges. *Q*, the double *Scapularis* diſtributed into the hollow part of the ſhoulderblade and the neighbour muſcles: ſo alſo betwixt *P* and *R*, ſometimes ſmall veines doe reach unto the glandules that are in the arme-holes. *R*, *Thoracica inferior* running downward along the ſides of the cheſt, and eſpecially diſtributed into the muſcle of the arme called *Latiſsimus*. *S*, the inner Iugular veine which entreth into the Scull after it hath beſtowed ſome ſurcles uppon the rough artery. *T*, the externall Iugular veine. *V*. the diviſion of this veine under the root of the eare. *X*. a branch of the externall Iugular which goeth into the inſide of the mouth, and is diverſly divided into the parts therein contained. *Y*. the exterior branch diſtributed near the *Fauces* into the muſcles of the chops and the whole skinne of the head. *Z*. a portion of the branch, *y*, reaching unto the face. *a*, *a*. the veine of the fore-head. *a*. a portion of it creeping through the temples *a*.* a propagation that goeth unto the skin of the Nowle or *Occiput*. *a a*. the veine called *Cephalica*, or the externall veine of the arme which others call *Humeraria*. *b*. *Muſcula ſuperior*, a propagation of the *Cephalica* veine which goeth unto the backward muſcles of the necke. Betwixt *b*. and *d*. on the backeſide iſſueth a branch from the *Cephalica* which paſſeth unto the outſide of the blade, and a portion thereof runneth betwixt the fleſh and the skin. *d*. *d*, a veine from the *Cephalica* which attaineth unto the top of the ſhoulder, and is conſumed into the muſcle that elevateth or lifteth up the arme and into his skin. *e*, *e*. a ſmall veine from the *Cephalica* diſperſed through the skin and the muſcles of the arme. *f*. the diviſion of the *Cephalica* into three parts. *g*. the firſt branch runneth deep unto the muſcles which ariſe out of the externall Protuberation of the arme. *h*. the ſecond branch which goeth to make the *median* veine. *i*. *i*. the third branch running obliquely above the wand and the outſide of the arme. *k*. from this branch certaine circles are divided into the skin, the chiefe whereof is marked with *k*. *l*. the third branch at the wriſt which is joyned at *l*, with the branch of the *Baſilica* marked with *x*. *m*. the *Baſilica* which on the right hand is called *Hepatica*, on the left hand *Lienaris*. *n*. *o*. a branch of the *Baſilica* going to the heads of the muſcles of the cubit at *n*, and to the muſcles themſelves at *o*. *p*, a notable branch of the *Baſilica* running obliquely, and beſtowing ſurcles upon the muſcles that iſſue from the externall protuberation. This branch deſcendeth together with the fourth nerve. *q*, diviſion of the *Baſilica* into two branches, and that is noted with *q*, is ever accompanied with an arterye. *ſ*, a branch of this veine beſtowed upon the skin of the arme. *t*, a branch of the *Baſilica* which together with the branch of the *Cephalica* marked with *h*, makes the *mediana* or middle veine marked with *a*. *u*, a branch of the *Baſilica* going to the inner head of the arme. *xx*, a branch iſſuing out of the former that creepeth along unto the wriſt and toward the little finger conjoining it ſelfe with a branch of the *Cephalica*. *y*, A veine running out unto the skinne at the outſide of the cubit. Vpper *ζ*. A propagation iſſuing out of a branch of the *Baſilica* marked with *t*. Lower *z*. A branch of the *Baſilica* *x*, goeing to the in-ſide of the Arme. *α*. The *Median* or common veine, *β*, The partition of the Median veine above the wriſt: This diviſion ſhould have beene made above *γ*. *γ*. The Externall branch of the partition which goeth to the outſide of the head. δ, From which iſſueth a ſmall branch to the inſide. ι, The internall branch under ε, which toward the middle and the ring finger is eſpecially diſpoſed. φ, The veine of the thumbe diſperſed into the mountenet or hillock, which is conjoyned with the branch noted with δ. ζ, the trunke of the hollow veine from which iſſue branches unto the parts ſeated under the liver. η, The fatty veine called *Adipoſa ſiniſtra*, which goeth unto the fat of the kidnies. θ ι, The two Emulgents which leade wheyey bloud unto the kidnies. λ μ, the two ſpermaticall veines leading the matter of the ſeede unto the teſticles. *V*, the beginning of the bodden veſſell called *vas varicoſum*. ξ, the veines of the loynes called *Lumbares* which are ſent in the knots or knees to the rackebones, to the marrow of the backe, to the muſcles that lies upon the loines, and to the *Peritonæum*. ο, the bifurcation of the hollow veine into the Iliacke branches, which bifurcation is not unlike Λ. π, *Muſcula ſuperior*, a tranſverſe branch going to the muſcles of the *Abdomen*, and to the *Peritonæum*. ρ σ, the diviſion of the left Iliacke veine, into an inner branch at ρ, and an utter at σ. τ, *Muſcula media* the utter propagation of the branch ρ, diſtributed through the muſcles of the *coxa* and the skin of the buttockes. υ, An inner propagation of the ſame branch ρ which goeth unto the holes of the holy bone. φ, the veine called *Sacra*, which goeth to the upper holes of the holy bone. χ ψ, the veine *Hypogaſtrica* diſtributed to the bladder, to the muſcles of the fundament, and the neck of the womb. ω, A veine ariſing from the utter branch marked with σ which is ioyned with ſome branches of the internall veine, neare the holes or perforations of the ſhare bone. ει, A veine which when it hath paſſed the ſhare bone diſtributeth one branch into the cup of the *coxendix* and to the muſcles of that place. κ, Another ſmall branch which runneth under the skinne at the inſide of the thigh. χ, The congreſſe or meeting of the foreſaid veine, with a branch marked with char. 2. and diſtributed into the legge. Γ, The *Epigaſtricke* veine, a propagation of the utter branch σ perforating the *Peritonæum*, whereto as alſo to the muſcles of the *Abdomen*, and the skinne it offereth branches, the chiefe branch of this veine is joyned with the deſcending mammary above the navell at *M*. Δ, *Pudenda* an inner propagation of the branch σ, running overthwart unto the privities. Θ, *Saphæna* or the ancle veine or the inner branch of the crurall trunke, which creepeth through the inſide of the legge under the skinne unto the tops of the toes. Λ, the firſt interior propagation of the *Saphæna* offered to the groine. Ξ, The utter propagation thereof divided to the foreſide or outſide of the thigh. Π, The ſecond propagation of the *Saphæna* going to the firſt muſcle of the legge. Σ, The third propagation of the *Saphæna* going to the skinne of the whirlebone, and unto the hamme. Φ, The fourth propagation of the *Saphæna* diſperſing his muſcles forward and backward. Ψ, Branches from this unto the foreſide of the inner ankle, to the upper part of the foote, and to all the toes. Ω, *Iſchias minor* called alſo *muſcula interior*, the utter branch of the crurall trunke divided into the muſcles of the *coxendix*, and to the skinne of that place. 1,2, And this alſo may be called *muſcula*. 1, the exterior and leſſer which paſſeth into ſome muſcles of the legge: 2, the interior greater and deeper unto the muſcles of the thigh. 3,4. The veine called *Poplitea*, made of two crurall veines divided under the knee. 5, From this a ſurcle is reached upward unto the skinne of the thigh. 6. But the greater part runnes by the bent of the knee under the skinne as farre as the heele. 7, Alſo to the skinne of the outward ankle. 8, The veine called *Suralis* or calfe veine, becauſe it runneth unto the muſcles that make the calfe of the legge. 9, The diviſion of the Surall veine into an exterior trunke 9, and an interior 14. 10, 11, The diviſion of the exterior trunke under the knee into an externall branch, which along the brace attaineth unto the muſcles of the foot 11, and in internall. 12,13, 12,13, Which deſcending along the outſide of the legge to the upper part of the foote is cloven into divers branches, and in the backe of the foot mixeth it ſelfe with *Poplitea*, or the hamme veine 20. 14, The interior branch of the Surall veine which runneth into the backſide of the leg. 15, A branch hereof deſcending to the inſide of the heele and the great toe, and is divided into divers ſurcles. 17, *Iſchias maior* iſſuing out of the internall trunke at 14, and running through the muſcles of the calfe. 18, A propagation hereof derived unto the upper part of the foot, & affoording two ſurcles to every toe. 19, the remainder of the inner trunke 14, behind the inner ankle, approcheth to the bottome of the foote and is conſumed into all the toes. 20, the commixtion of the veine *Poplitea* with the ſurall or calſe-branch at 13.

Where the external Iugular veine may be fitly opened in inflammations of the parts of the mouth.

But when it arives to the baſis of the lower part of the head, it is divided into more branches, one wherof is carried to the muſcles of the bone *Hyois*, the *Larinx*, the tongue and the lower part of the tongue (in which place it is commonly opened in ſquinancies, and other inflammations of the mouth) and to the coate of the noſe. Another is carried to the *Dura mater*, paſſing on both ſides through a hole ſituate under the bone *maſtoides*, and beſides, aſcending to the bone of the backe part of the ſcull, it comes obliquely to the upper part of the ſuture *lambdoides*, where theſe branches meeting together, paſſe into the reduplication of the *Dura mater*, deviding the forepart of the braine, that ſo joined and united, they may make the *torcular*; the third aſcendent is diſtributed upon the backe part and *baſis* of the lower jaw, to the lippes, the ſides of the noſe, and the muſcles thereof: and in like manner to the greater corner of the eyes, to the forehead and other parts of the face, and at length by meeting together of many branches, it makes in the forehead the veine which is called *vena recta* or *vena frontis*, that is, the forehead veine. The fourth, aſcending by the glandules behind the eares, after it hath ſent forth many branches to them, is divided into two others, one whereof paſſing before, and the other behind the eare, are at length ſpent in the ſkinne of the head. The fifth and laſt wandring over all the lower part of the head, going to the backe part thereof, makes the *vena pupis*, which extended the length of the head by the ſagitall ſuture, at the length goeth ſo farre, that it meets with the *vena frontis*, which meeting is the cauſe, that a veine opened in the forehead, is good in griefes of the hinder parts of the head, and ſo on the contrary. But wee muſt obſerve that in the *Cranium* of ſome, the *vena pupis* by one or more manifeſt paſſages ſends ſome portion thereof to the inner part of the head, ſo that the *vena pupis* being opened may make revulſion of the matter which cauſeth the internall paines of the head.

Vena recta.

Vena pupis.

Chap. XIIII.

The diſtribution of the nerves, or ſinewes of the ſixth coniugation.

Three paire of nerves of the ſixt coniugation.

BEcauſe the Diſtribution of the arteries cannot be well ſhewed, unleſſe wee violate thoſe nerves which are carried over the Cheſt, therefore before we ſhew the diſtribution of the arteries, we will as briefely as we can, proſecute the diſtribution of theſe nerves.

Now the ſixth conjugation brings forth three paire of nerves; for paſſing out of the skull, as it comes downe to the Cheſt, it by the way ſends forth ſome branches to certaine muſcles of the necke, and to the three aſcendant muſcles of the *Larinx* on each ſide of the *Sternon* and upon the clavicles. Then the remainder deſcending into the Cheſt, is divided on each ſide into theſe three paire. The firſt paire makes the *Ramus coſtalis*. The ſecond, the *Ramus recurrens*. The third paire, the *Ramus ſtomachicus*. The *Ramus coſtalis*, or coſtall branch is ſo called, becauſe deſcending by the roots of the ribs, even to the holy bone, and joyning themſelves to theſe which proceede from each of the *Vertebra's* of the ſpine, they are carried to all the naturall parts.

Ramus Coſtalis

Recurrens.

The *Recurrens*, or recurrent is alſo called, becauſe as it were ſtarting up from the cheſt, it runs upwards againe, but theſe two Recurrent nerves doe not run backe from the ſame place; but the right from below the artery, called by ſome the axillarie, by others Subclavian, and the left from beneath the great artery, deſcending to the naturall parts. But each of them on each ſide aſcending along by the weazon, even to the *Larinx*, and then they inſinuate themſelves by the wings of the *Cartilago ſcutiformis*, and *Thyroydes* into the proper muſcles, which open and ſhut the *Larinx*.

An anatomical *Axiome*.

By how much the nerves are nearer the originall, to wit, the braine, or ſpinall marrow, they are by ſo much the ſofter. On the contrary, by how much they are further abſent from their originall, they are ſo much the harder and ſtronger, which is the reaſon, that Nature would have theſe recurrent nerves to runne backe againe upwards, that ſo they might be the ſtronger to performe the motions of the muſcles of the *Larinx*. But the *Stomachicus* or ſtomacke-branch is ſo called, becauſe it deſcends to the ſtomacke or ventricle. For this branch deſcending on both ſides by the ſides of the gullet, ſends many branches from it into the inner ſubſtance of the lungs, into the coate thereof, into the *Pericardium* and heart; and then comming into the upper orifice of the ſtomacke, it is ſpent in many branches, which folded after divers manners and wayes, chiefely makes that mouth or ſtomacke, which is the ſeate of the Animall apetite (as they terme it) and hunger, and the judger of things convenient or hurtfull for the ſtomacke. But from thence they are diverſely diſſeminated over all the body of the ventricle.

Why nature would have the vocall nerves recurrent.

Ramus ſtomachicus.

Moreover, the ſame branch ſends forth ſome ſmall branches to the liver and bladder of the gall, giving each part by the way, ſo much ſenſe as ſhould be ſufficiently neceſſary for it. Here you muſt note, the ſtomacke branch deſcends on each ſide one, knit to the gullet, and by the way they divide themſelves into two branches, each of which goes to the oppoſite ſide, that it may there joine it ſelfe to the nerve of that ſide. To which purpoſe the right is carried above the gullet, the left below it, ſo that theſe two ſtomaticke become foure, and againe theſe foure preſently become two.

CHAP. XV.

The diviſion of the Arteries.

THe Artery ariſing forth of the left ventricle of the heart, is preſently (the two Coronall arteries being firſt ſpred over the ſubſtance of the heart) divided into two unequall branches. The greater whereof deſcends to the lower parts, being diſtributed, as we formerly mentioned in the third Booke, and 22. Chapter. The leſſer aſcending to the upper parts, is againe divided into two other unequall branches, the leſſer of which aſcending towards the left ſide, ſends forth no artery from it, untill it arive at the firſt rib of the Cheſt, where it produces the ſubclavian artery, which is diſtributed after the manner following.

The left brench of the aſcendant artery is leſſe then the right.

The diſtribution of the left ſubclavian artery, into the,

First, it produces the intercoſtall, and by it imparts life to the three intercoſtall muſcles of the foure upper ribs, and to the neighbouring places.

1 *Intercoſtalis,*

Secondly, it brings forth the Mammillary branch, which is diſtributed as the Mammillary veine is.

2 *Mammaria.*

Thirdly, the *Cervicalis*, which aſcends along the necke by the tranſverſe productions to the *Dura mater*, being diſtributed as the *vena cervicalis* is.

3. *Cervicalis.*

Fourthly, paſſing out of the Cheſt, from the backe part of the Cheſt, it ſends forth the *muſculoſa*, whereby it gives life to the hinde muſcles of the necke, even to the backe part of the head.

4 *Muſculoſa.*

Fiftly, having wholy left the Cheſt, it ſends forth the two *Humerariæ*, or ſhoulder arteries, the one whereof goes to the muſcles of the hollow part of the ſhoulder blade, the other to the joint of the arme and the muſcles ſituate there, and the gibbous part of the ſhoulder blade.

5 *Humeraria duplex.*

Sixthly and laſtly, it produces the *Thoracica*, which alſo is twofold, for the one goes to the fore muſcles of the Cheſt, the other to the *Latsſimus*, as we ſaid of the veine, the remnant of it makes the *Axillaris* of that ſide.

6 *Theracica duplex.*

The other greater branch likewiſe aſcending by the right ſide, even to the firſt ribbe of the Cheſt, makes alſo the ſubclavian, of that ſide, which beſides thoſe diviſions it makes on this ſide, like thoſe of the left ſide, hath alſo another which makes the right and left *Carotides* or ſleepy arteries, which aſcending undivided with a nerve of the ſixth conjugation and the internal jugular veine, by the ſides of the *Aſpera Arteria* or windpipe, when they come to the *Pharinx*, they are divided on each ſide into two branches, the one internall, the other externall. The internall and greater

The diſtribution of the right ſubclavian Artery.

The *Carotides*, or ſleepy arteries.

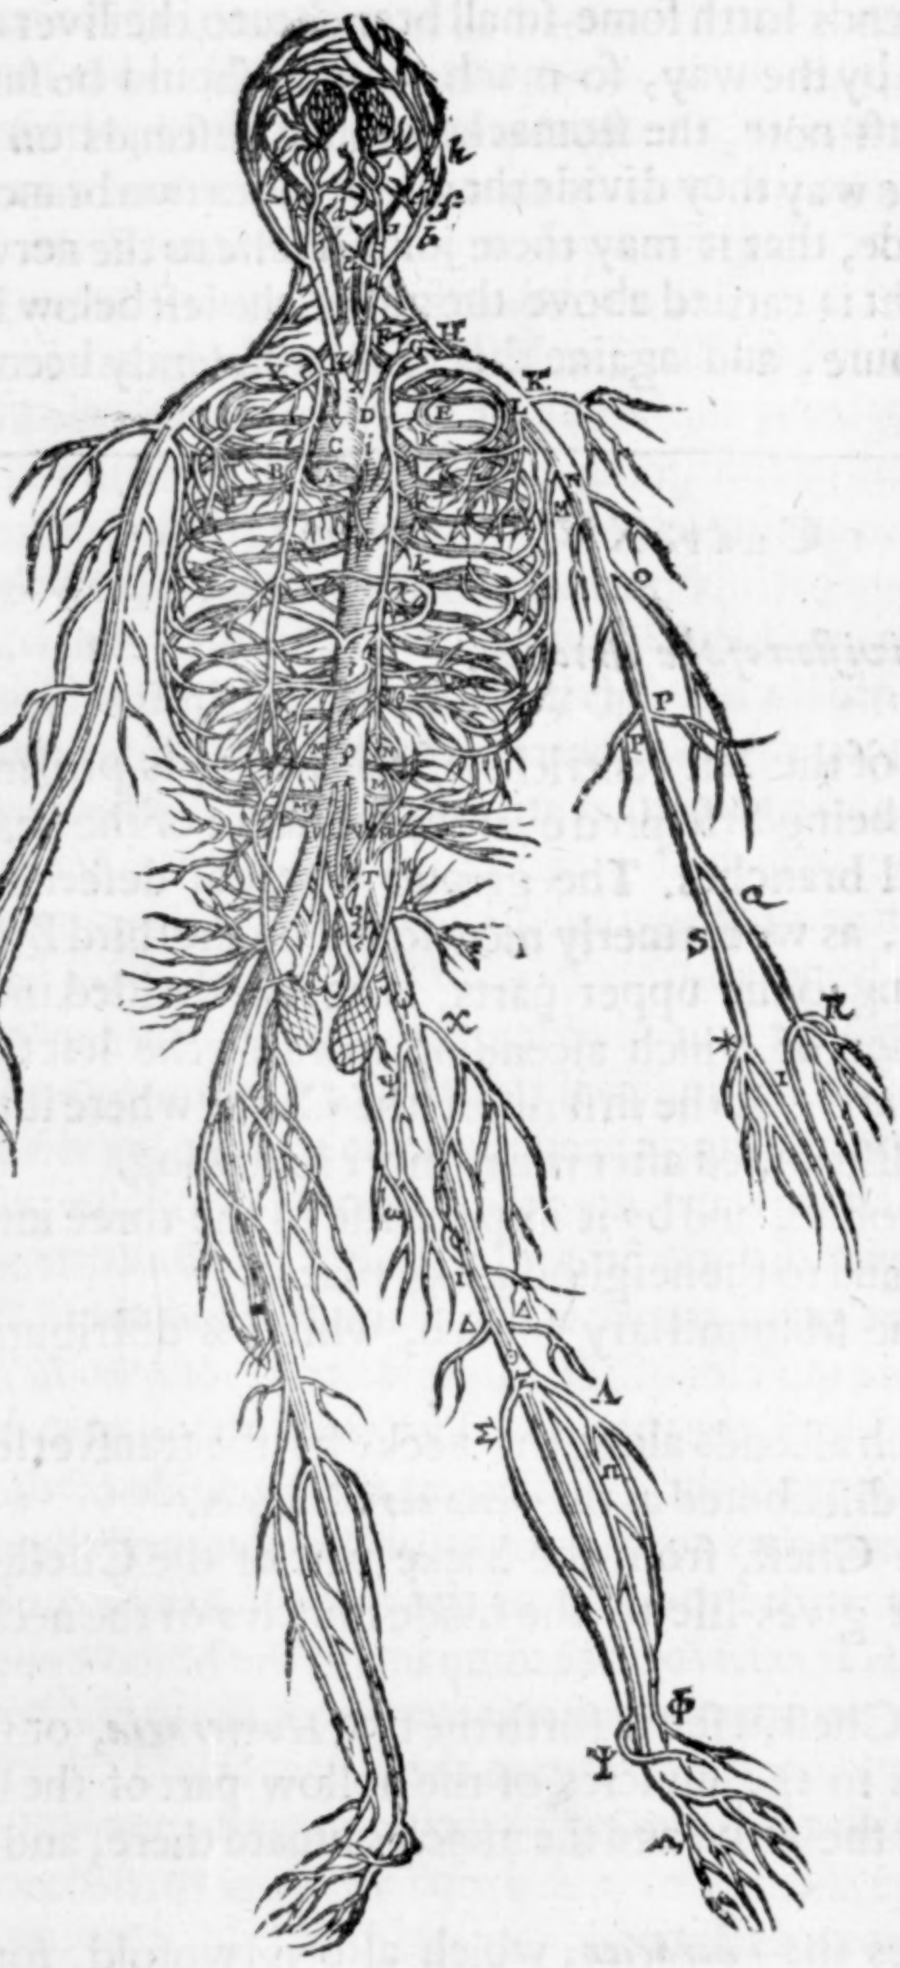
Their diviſion.

The diſtribution of the internall branch of the ſleepy arteries.

ter is ſent to the ***Pharinx***, ***Larinx*** and tongue; then entring into the head by the long hole, and the backe part of the upper jaw, it ſends many branches to the noſe, eyes, the inſide of the temporall muſcles and to the ***Craſſa meninx***, or ***Dura mater*** : the remainder of this branch going by the ſide holes of the ſame, that it might there make the ***Plexus admirabilis*** as we ſee. And then it is ſpent upon the baſis of the braine abundantly diffuſed over the ***tenuis meninx*** or ***Pia mater***, and the membrane or ***Plexus Choroides***. The externall or leſſer branch of the ſleepy arteries goes to the cheekes, the temples, and behind the eares; laſtly, it ſends a branch into the long muſcle of the necke, with which the internall Iugular veine inſinuates it ſelfe into the ***Dura mater***, entring by the hole of the nerves of the ſixth conjugation.

To what parts the externall branch of the ſleepy artery arrives.

The Figure of the Arteries.



A. The orifice of the great Arterie, or the beginning thereof, where it iſſueth out of the heart.

B, ***Coronaria***, ſo called, becauſe like a crowne it compaſſeth the baſis of the heart.

C. The diviſion of the great arterie into two trunkes V *i*.

D. the left ſubclavian climbing obliquely upward unto the ribs.

E. the upper intercoſtall artery, or a branch which beſtoweth foure propagations unto the diſtances of the lower rib.

F. the necke arterie which through the tranſverſe proceſſes of the rackebones of the necke, attaineth to the ſcull, beſtowing ſurcles unto the marrow and his neighbour muſcles.

G. the left Mammary artery running under the breaſtbone, and to the navell. It diſtributeth ſurcles to the ***Mediaſtinum***, the muſcles of the breſt, and of the ***Abdomen***.

H. ***Muſcula***, or a branch attaining to the backeward muſcles of the necke.

I. the ***Scapular*** arteries which goe unto the hollowneſſe of the blade, and of the muſcles that lie thereon.

K. ***Humeraria*** which climbeth over the top of the ſhoulder. L. ***Thoracica ſuperior***, ſprinkled unto the forward muſcles of the Cheſt. M. ***Thoracica inferior***, which paſſing along the ſides of the Cheſt, attaineth to the ***broad*** muſcles of the arme. N. the axillarie artery running out into the arme and affording branches unto the muſcles thereof. O. A branch reaching to the outſide of the cubit lying deepe. PP. Branches to the ioynt of the cubit with the arme. Q. the upper branch of the artery running along the ***Radius*** and offering ſurcles to the thumbe, the fore-finger and the middle finger. *k* A ſurcle creeping unto the outſide of the hand and led betwixt the firſt bone of the thumbe and that of the after-wriſt, ſupporteth the fore-finger where wee uſe to feele the pulſe. S. the lower branch of the artery running along the *Vlna* and communicating ſurcles to the little finger, the ring finger, and the middle finger. * A little branch unto the muſcles about the little finger. T. the diſtribution of the upper and lower branches into the hand and the fingers V. the trunke of the great artery aſcending to the *Iugulum*, and the diviſion thereof in that place into *X, Y, Z. X*, the left *Carotis* or ſleepy artery. *Y*, *Subclavian dextra* is divided into branches, as the right is divided. *Z. Carotis dextra*, called alſo *Apoplectica* and *Lithargica*. *a*, The diviſion of the left *Carotis* in the chops. *b*, the exterior branch of that diviſion going into the face, the temples, and behind the eares. *c*, the inner branch going to the throttle, the choppes and the tongue. *d*, the diviſion hereof at the baſis of the ſcull, into two branches which enter the *ſinus* of the *Dura mater*. *e*, A propagation of the branch *b*, unto the muſcles of the face. *f*, the diſtribution of the branch *b*, under the roote of the eare. *g*. the fore-branch hereof creeping up the temples. *h*. the backe branch running on the backeſide of the eare under the skinne. *i*, the trunke of the great artery, deſcending unto the ſpondels of the backe. *kkk*, the lower *Intercoſtall* arteries which goe unto the diſtances of the eight lower ribbes, from which are offered ſurcles to the marrow, and to the muſcles that grow to the backe and to the Cheſt. *l*, the artery of the midriffe called *Phronica* or *Diaphragmatica*. ζ, *Meſenterica Superior*, but you muſt note that above ζ, the trunke of the *Cœliacall* artery is taken away, leſt the multitude of letters in ſo ſmall a Table ſhould breed obſcuritie. η, θ, the right and left emulgents running from the *Aorta* or great artery unto the kidneies. ιι, κκ, the ſpermaticall arteries on either ſide going to the teſticles. λ, the lower Meſentericall artery on the left below μ, running eſpecially into the Collicke gut on that ſide. μμ, the arteries called *Lumbares* which runne overthwart and like knees, affording ſurcles to the muſcles that grow to the loynes, and to the *Peritonæum*. μ, the lower; *Muſcula ſuperior* running into the ſides of the *Abdomen* and the muſcles. νν, the byfurcation of the great artery into two *Iliacke* trunkes, and at the ſides, but ſomewhat inward are branches which make thoſe that are called *Sacræ*. T, the diviſion of the left *Iliacke* trunke into an inner branch at ξ and an utter at φ. ξ, the inner *Iliacke* branch. ο, *Muſcula inferior*, the utter propagation of the inner branch going unto the muſcles which cover the branch bone and the *Coxendix*. ϖ, *Hypogaſtrica*, the inner propagation of the inner branch going to the bladder, the yard and the necke of the womb. ρρ, the umbilicall artery. ς, the remainder of the branch ξ, aſſuming an addition from the utter branch neere φ, and ſo falling through the hole of the ſhare bone into the legge. τ, *Epigaſtrica*, it aſcendeth upward unto the right muſcle of the *Abdomen*, and about the navell is ioyned with the mammary artery. υ, *Pudenda*, it creepeth overthwart the ſhare bone. φ, the *Crurall* trunke without the *Peritonæum*. χ, *Muſcula cruralis exterior*, going into the fore muſcles of the thigh. ψ, *Muſcula cruralis interior*, going unto the muſcles of the inſide of the thigh. ω, The conjunction of this arterie with the branches. Γ, *Poplitæi*, going to the muſcles on the backſide of the thigh. ΔΔ, which communicateth ſmall branches to the ioynt of the knee, and the muſcles that make the calfe of the legge. Θ, the diviſion of the *Crurall* artery under the hamme into three branches. Λ, *Tibiæa exterior*, it accompanieth the brace-bone, and is conſumed into the muſcles. Ξ the chiefe part of the *crural* artery. Σ, the upper & backer *Tibiæa*. ΠΦ, the lower and backer *Tibiæa* running unto the upper ſide of the foote at Φ. Ψ, A propagation of the crurall artery going to the inner and upper ſide of the foote, and ſprinkling a branch unto the ankle. Ω, A propagation unto the lower part of the foote which affordeth ſurcles to each toe.

But we muſt note that there be more veines in a mans body, than arteries, and beſides that the veines are farre thicker. For there is no need for preſerving the native heat in the parts themſelves, either of ſo many, or ſo large inſtruments of that kinde. Therefore you may often finde veines without arteries, but never arteries without veines.

But we underſtand that an artery is a companion to a vein, not only when it touches it, or adheres to it by common membranes, as uſually it happens; but alſo when it is appointed together with the veine for the uſe of the ſame part.

CHAP. XVI.

Of the Thymus.

What the *Thymus* is. The uſe. The magnitude.

THe *Thymus* is a glandule of a ſoft, rare, and ſpongeous ſubſtance, of large bigneſſe, ſituate in the furtheſt and higheſt part of the Cheſt, amongſt the diviſions of the ſubclavian or Iugular veines and arteries, as yet contained in the Cheſt, for this uſe; that it might ſerve theſe veſſels for a defence againſt the bony hardneſſe of the Cheſt, and beſides, that as it were by this prop or ſtay, the diſtributions of theſe veſſels might become the ſtronger; for ſo we ſee that nature hath provided for others, eſpecially ſuch as are the more noble and worthy. This glandule appeares very large in beaſts and young men, but in ſuch as have attained to full growth it is much leſſe, and ſcarſe to be ſeene.

CHAP. XVII.

Of the Aſpera Arteria, *the rough Arterie or Weazon.*

The ſubſtance.

THe *Aſpera Arteria* or Weazon ſeeing it is the inſtrument of voice and reſpiration, is of a griſtly, ligamentous, and wholy various ſubſtance. For if it had beene one rough, and continued body with the *Larinx* or throttle, it could be neither dilated, nor compreſſed; opened, nor ſhut, neither could it order the voice according to our deſire.

Compoſure.

It is compoſed of veines from the internall Iugular, of arteries ariſing from the *Carotides*, and of nerves proceeding from the Recurrent branch, of a double membrane, of which the externall comes from the *Peritonæum*; the internall, which is the ſtronger and woven with right fibers, from the inner coate of the mouth, the which is common with the inner coate of the *æſophagus* or gullet. And alſo it conſiſts of round griſtles, yet not drawne into a perfect circle, compoſed in manner of a channell, and mutually joined together in order, by the ligaments that proceede from their ſides and ends.

Why the back part of the weazon is ligamentous. Why the fore-part is griſtlely.

Theſe ſame ligaments perfect the remnant of the circle of this *Aſpera Arteria*, on that part next the gullet; which is thought to be done to this end; that that ſoftneſſe of a ligament, might then give place, when wee ſwallow harder and greater gobbets of meate. Of the two ſorts of ligaments which are annexed to the griſtles of the weazon, ſome tie and faſten together the rings or circles, which give meanes both to it, and theſe circles to be drawne out in length; otherſome bring theſe griſtles into a perfect circle, which alſo yeeld them meanes of dilatation. Theſe ligaments cover the inner ſuperficies, but the griſtles are placed without, to reſiſt the incurſion of externall injuries. But wee muſt note, that by this communion of the inner coates of the weazon and gullet, wee reape this benefit in the commodiouſneſſe of the action, that one of theſe parts being depreſſed, the other is lifted up, like a rope running in a wheele or pully. For thus whileſt the gullet is depreſt to ſwallow any thing, the weazon is lifted up; and on the contrary when the ſtomacke riſes up in vomiting, the weazon is depreſt.

The number and ſite. The diviſion of the weazon through the Lobes of the Lungs.

It is onely one, and that ſeated betweene the *Larinx* (from which it takes its beginning) and the lunges in which it ends; firſt dividing it ſelfe into two large branches, the right and the left, and beſides each of theſe entring into the ſubſtance of the lungs, is againe divided into two others; to each of the Lobes one; and to conclude, theſe be ſubdivided into infinite others, through the ſubſtance of the Lobes.

All theſe branches are griſtlely even to the ends. They are ſituate betweene the ends of the *Arteria venoſa*, and the *Vena arterioſa*, that the entrance of the aire into the heart by the *arteria venoſa* might be ſpeedier, as alſo the paſſage out of the vapour, by the *vena arterioſa*. Thus it hath connexion with theſe in the ends, or utmoſt parts thereof, but by the other parts compaſſing it, with the members from whence it takes them. The temperament thereof is cold and drie. The action is to carry the aire to, and vapours from the lungs; that by dilating, but this by preſſing the griſtles together.

The temper and action.

CHAP. XVIII.

Of the Gullet.

The ſubſtance

THe OEſophagus, or Gullet which is the paſſage of the meat and drinke, is of a middle ſubſtance betweene the fleſh and ſinewes, becauſe it conſiſts of one nervous membrane and another fleſhy. The nervous is placed the innermoſt, and is continued to the inner Coate of the mouth even to the Lipps (whereby it comes to paſſe,) that the Lipps tremble in diſeaſes which are ready to be judged by a criticall vomiting and to the inner part of the *Aſpera Arteria*; it conſiſts of right Fibers for the attraction of the meat, which we ſee is ſometimes ſo quicke and forcible in hungry people, that they have ſcarſe time to chaw it, before they find it, to be pluckt downe, as it were with a hand. The fleſhy Coate placed without is woven with tranſverſe fibers, to haſten

Attractive force thereof.

The compoſure.

the going of the meat into the ſtomacke, and for expulſion in vomiting and breaking of winde. Theſe two coats are continued with the two coats of the ſtomacke, and have the like ſite. Beſides, the Gullet hath theſe parts compoſing it, as a veine from the Gate and Hollow aſcendent veine, a nerve from the ſixt conjugation, an Artery from that which creepes alongſt the bottome of the ſtomacke with the *vena Gaſtrica*, or elſe from the Arteryes aſcending the hollow part therof; but alſo beſides all theſe veſſels it may have a third coat from the membrane inveſting the Ribs, or *Pleura*.

The magnitude.
The figure.
Site.

The magnitude of the Gullet is large enough, yet ſome be bigger, ſome leſſe according to the variety of bodyes. The figure of it is round, that ſo it might be more large to ſwallow meat, and leſſe ſubject to offence. It is placed betweene the backe bone and the weazon from the roots of the tongue even to the ſtomacke. But as it diſcends alongſt the backe bone, when it comes to the fourth *Vertebra* of the Cheſt, it turnes to the right ſide, to give way to the great Artery *Aorta* and the deſcendent Artery, then it turnes to the left ſide to the ſtomacke, or mouth of the ventricle. Nature hath faſtened it to the *Diaphragma* with ſtrong membranous tyes, leſt that, if it had laine upon the Artery it ſhould have hindred the paſſage of the vitall ſpirit to the lower parts. It is onely one and that tyed to the forementioned parts, both by its veſſels and membranes.

Temper and action.

It is of temper rather cold than hot, as all thoſe parts, which are more nervous than fleſhy, are. The Action thereof is to draw and carry downe the meat, and to caſt forth ſuch things by vomit as trouble the ſtomacke.

Why we cannot ſup and blow at one time.

Here you muſt note, that whileſt we ſwallow downe, the Gullet is drawne downewards, and the weazon upwards, which is the cauſe that wee cannot ſup and blow, ſwallow and breathe together at the ſame inſtant; which wee muſt thinke to happen by Gods ſingular providence; to whoſe name be glory for everlaſting, Amen.

The End of the fourth Booke.

THE

THE FIFTH BOOKE OF THE ANIMALL parts contained in the Head.

CHAP. I.

A Generall deſcription of the Head.

HAving hitherto declared two generall parts of mans body, that is, the Naturall and vitall, it is now fit to betake our ſelves to the laſt, that is, the Animall, beginning with the head.

Whreſore we will firſt define the head, then divide it into its parts; thirdly deſcribe each of theſe parts; fourthly demonſtrate them after the order they offer themſelves to our ſight in diſſection.

The head therefore is the ſeat of the ſenſes, the Pallace and habitation of reaſon and wiſedome, from whence as from a fountaine infinite actions and commodities ariſe. It is ſeated above the reſt of the body, that the Animall ſpirit from thence, as from a tower, may governe and moderate the whole body, and performe all actions according to the præſcript of nature. By the head we underſtand all that which is contained from the Crowne of the head to the firſt *vertebra* of the neck.

What the head is.

Why ſeated in the higheſt place.

The beſt figure of the head is round, lightly flatted on each ſide, *extuberating* ſomething to the fore and hinde part thereof. For from hence is taken an argument of the goodneſſe of the ſenſes; on the contrary, thoſe which are exactly round, or acuminate, and ſharp towards the top, are not thought good. The head is devided into the face, forehead, temples, the forepart, the crowne and hinde part.

The figure.

The diviſion thereof.

By the face we underſtand, whatſoever is contained between the Eye-browes and the lower part of the chin. By the forehead, all the ſpace from the eye-browes even to the Coronall ſuture. By the temples, whatſoever is hollowed from the leſſer Corner of the eye, even to the eares. By the forepart of the head, whatſoever runnes in length from the top of the forehead, or the Coronall ſuture, even to the ſuture *lambdoides*, and on each ſide to the *Oſſa petroſa*, the ſtony bones, or ſcaly ſutures. By the Crowne we ſignifie a certaine point exquiſitely in the midſt of the Sagittall ſuture, which is ſufficiently knowne. By the *Occiput* or hindepart of the head, that which is terminated by the ſuture *lambdoides*, and the firſt *vertebra* of the neck.

Of all theſe parts there be ſome ſimple, ſome compound, beſides ſome are containing

The cōtaining parts of the head.

taining, ſome contained. Of the containing ſome are common to all the parts of the head, as the ſkinne, the fleſhy pannicle and *pericranium*; others are proper to certaine parts, as the fleſhy panicle to the neck, face, forehead, and skin covering the *Cranium*, the common coat of the muſcles to the fat and face; The ſkull and both the *Meninges* to the braine.

The parts conteined.

The parts contained are the ſubſtance of the braine, the foure ventricules, and the bodyes contained in them, the nerves, the mamillary proceſſes; the *Plexus Choroides* or *Rete Admirabile*, the *Glandula Baſilaris*, and others of which we will ſpeak hereafter.

Wee muſt now ſpeak of the containing parts beginning with the ſkinne; for the order of teaching requires that we take our *Exordium* from the more ſimple, but firſt we will ſay ſome thing of the haires.

What the haire is.

The uſe thereof.

The haire is nothing els than an excrement generated and formed of the more groſſe and terrene portion of the ſuperfluities of the third concoction, which could not be waſted by inſenſible tranſpiration. The benefite of it is, that conſuming the groſſe and fuliginous or ſooty excrements of the braine it becomes a cover and ornament for the head.

This haire of the head and eye-browes have their originall from the firſt conformation of the infant in the wombe, the reſt of the haires of the body ariſe and grow forth as the body growes and becomes more dry, of which ſort are the haires which cover the Chin, armeholes, groines and other parts of our bodyes.

Chap. II.

Of the muſculous skinne of the Head, (commonly called the hairy ſcalpe) and of the Pericranium.

What the hairy ſcalpe is.
Its connexion.

* Our Author with *Fallopius* and *Laurentius* confoundes the *pericranium* and *perioſtium*; but *Veſalius Bauhinus* and *Bartholinus* diſtinguiſh them making the *pericranium* thin and ſoft, and the *perioſtium* moſt thin and nervous, and of moſt exquiſite ſenſe.

THe skinne which covers the Scull, and is covered with the haire, is farre more fleſhy, thick, hard and dry than any other part of the body, eſpecially which wants haire. The skinne hath almoſt the like condition of quality as thoſe parts have, which it doth ſimply cover, but is as it were loſt in them, or growne into one with them, as in the lips and forehead with the fleſhy pannicle, wherefore it is there called muſculous; in other places it adheres to the griſtles, as on the ſides of the noſethrilles and corners of the Eyes, whereupon it is there called griſtlely.

Why the wounds thereof muſt not be neglected.

It hath connexion with the *Pericranium* becauſe joined to it, it receives nerves from the firſt and ſecond *vertebra* of the necke, and from the third conjugation of the braine which are diſſeminated through all its ſubſtance, whereby it comes to paſſe, that the wounds, contuſions, and impoſtumes that happen in or upon this ſkinne, are not to be neglected.

The *Pericranium* and *perioſtium* of the ſame nature.
Whence all the membranes proceed.

The * *Pericranium* (but I ſuppoſe it ſhould be the *Perioſtium*) is a moſt thin membrane, which next and immediately covers all the bones of the body, and this on the head is called by a peculiar name the *Pericranium* by reaſon of the excellency of the *Cranium* or ſkull, in other bones it is tearmed the *Perioſtium*: And as the *Pericranium* takes its originall from the *Craſſa meninx* propagating it ſelfe by certaine ſtrings or threds ſent forth by the ſutures and holes of the ſkull, ſo all other membranes of the body have their originall either from this *Pericranium*, or the *Craſſa meninx*, ſending forth their productions, as well by the holes or paſſages of the head, as by theſe of the ſpinall marrow or back bone it ſelfe, even to the Holy bone.

Why when any membranous part is hurt in any part of the body, the head is affected by conſent.

Of which this is an argument, for in what part ſoever of the body a membrane is hurt, preſently the hurt or ſenſe thereof comes to the *Craſſa meninx*. For ſo thoſe who have but their litle Toe hurt when they ſneeſe, or cough, perceive an increaſe of their paine, by the paſſage thereof to the braine.

The uſe of the *Pericranium*.

The vſe of this *Pericranium* is to cover the ſkull, and to give notice of things hurtfull, by the power of the quick ſenſe which it is endued withall, and the *Perioſtium* doth the like in other bones. Beſides it ſuſtaines and faſtens by the ſutures the *Craſſa meninx* to the ſkull; leaſt it ſhould fall by reaſon of its weight upon the *Pia mater*, and ſo hurt it; and hinder the pulſation of the braine and arteryes that are plenteouſly ſpread through both the *Meninges*. Wherefore the *Pericranium* hath moſt ſtrait connexion with the *Craſſa meninx*, becauſe it takes the originall from thence.

We muſt thinke the ſame of the other membranes of the body, which thing is very notable in the ſolution of the continuity of the membranes.

Chap. III.

Of the Sutures.

THe Sutures do ſew or faſten together the bones of the ſkull; theſe be 5 in number. Three are true and legitimate, two falſe and ſpurious. The Coronal, the firſt of the true ſutures, is ſeated in the forepart of the head, deſcending downewards overtwhart the forepart of the head to the midſt of the temples; it is ſo called, becauſe *Corollæ*, that is, wreaths, crownes or garlands, are ſet upon that place.

Their uſe and number.

The ſecond is called the *Sagittalis*, or right ſuture, as that which running through the crowne devides the head into two equall parts, as with a ſtraigth line, running the length of it from the Coronall to the *Lambdoides* or hinde ſuture.

But this third ſuture *Lambdoides*, is ſo called becauſe it repreſents this Capitall greek letter Lambda, Λ. You muſt underſtand this deſcription of the ſutures, not as alwaies but as for the greater part to be thus. For there be ſome ſkulls that want the foremoſt ſuture, otherſome the hind, & ſomtimes ſuch as have none of the true ſutures, but only the falſe & ſpurious. But alſo you ſhal ſomtimes find the Sagittal to run to the noſe.

Some ſculls want Sutures.

And oft times there be three or foure ſutures in the backe part of the head, ſo that indeed the number of the ſutures is not certaine. Which alſo we find obſerved by *Cornelius Celſus*, where he writes, that *Hippocrates* was deceived by the ſutures by chance, for that he conjectured that the bones of the backe part of the head, were broken, becauſe his Probe thruſt to the roughnes of the ſecond ſuture *Lambdoides*, ſtaied as at a Cleft made in the bone by a ſtroake.

Celſ. lib. 8. Cap. 4.

The other two are called the falſe, ſtony and ſcaly ſutures, by reaſon they are made by a ſcaly conjunction of the bones, but not by a toothed ſaw or combe-like connexion. But if any aske, why the head conſiſts not of one bone, that ſo it might be the ſtronger: I anſwere it is, that ſo it might be the ſafer both from internall and externall injuries. For the ſcull being as it were the tunnel of the chymney of this humane fabrick, to which all the ſmoky vapours of the whole body aſcend, if it had beene compoſed of one bone, theſe vapours ſhould have had no paſſage fourth.

Why the ſcull conſiſts of divers bones.

Wherefore the groſſer vapours paſſe away by the ſutures, but the more ſubtile by the pores of the ſcull; ſome have their ſutures very open, but others on the contrary very cloſe.

Therefore nature hath otherwiſe compendiouſly provided for ſuch as want ſutures; For it hath made one or two holes, ſome two fingers bredth from the *Lambdoides*, through which the *Vena pupis* enters into the ſkull, and they are of that largenes that you may put a points tagge into them, that ſo the vapours may have free paſſage forth, otherwiſe there would be danger of death; thus nature hath beene careful to provide for man againſt internall injuries; and in like manner againſt externall, for it hath made the head to conſiſt of diverſe bones, that when one bone is broken the other may be ſafe, the violence of the ſtroak being ſtayed in the diviſion of the bones.

In what bodies and by what meanes the *Vena pupis* ſometimes enters into the parts within the ſcull.

Whereby you may know, that if the ſkull chance to be broken in the oppoſite ſide to that which received the blow, that it happens either by reaſon of the defect of Sutures, or elſe becauſe they are unperfect, and too firmely cloſed; otherwiſe it is unpoſſible ſuch fractures ſhould happen by reaſon of the ſeparation of the bones, which breakes the violence of the blow that it can goe no further.

In what men one part of the head being ſtriken, the oppoſite is broken.

And certainely as it is rare to find a ſkull without Sutures, ſo it is rare to find ſuch kinde of fractures. Therfore Chirurgions muſt diligently obſerve the Sutures and ſite of them, leaſt they bee deceived and take them for fractures, or unawares apply a

Why we muſt not apply a Trepan to the Sutures.

Trepan to them, whence by breaking the veines, arteryes and nervous fibers by which the internall parts communicate with the externall, there may enſue increaſe of paine, a violent defluxion of blood upon the *Craſſa meninx*, and the falling thereof upon the braine, (the fibers being broken by which it ſtuck to the *Pericranium*) and ſo conſequently a deadly interception of the pulſation of the Braine.

CHAP. IIII.

Of the Cranium, *or Skull.*

What the *Cranium* or ſcull is.

THe *Cranium*, or Skull covering the braine like an Helmet, is compoſed and conſiſts of ſeaven bones, of which ſome are more denſe, thick and hard than other ſome. The Firſt is the *Os occipitis*, or Nowle bone ſeated in the back part of the head, more hard and thicke than the reſt, becauſe we want hands and eyes behind, whereby we may keep or ſave our ſelves from falling.

Why the nowle bone is harder than the reſt.

This bone is circumſcribed, or bounded by the ſuture *Lambdoides*, and the * *Os baſilare*. The eminencies and as it were heads of this bone are received into the firſt *vertebra*; for upon this the head is turned forwards and backwards, by the force of foureteene muſcles and ſtrong ligaments, which firmely tye theſe heads of the Nowle bone in the cavityes of this firſt *vertebra*.

* My Author meanes by the *Os Baſilare* in this place the wedge bone: but ſome Anatomiſts make it a *Synonima* of this *Os occipitis*.

The fore-head bone, next to the nowle bone is harder than the reſt.

The Second bone of the ſkull is in the forepart, and is called the *Os coronale* or *Os frontis* the forehead bone, it hath the ſecond place in ſtrength and thickneſſe. It is bounded by the Coronal ſuture, and the ends of the wedgebone: in this forehead bone there is often found a great cavity under the upper part of the eye-browes, filled with a glutinous, groſſe, viſcide and white matter or ſubſtance, which is thought to helpe to elaborate the aire for the ſenſe of ſmelling.

A Cavity to be obſerved in the forehead bone.

Chirurgions muſt take ſpeciall notice of this cavity, becauſe when the head chances to be broken in that place, it may happen, that the fracture exceeds not the firſt table; wherefore they being ignorant of this cavity, and moved with a falſe perſwaſion that they ſee the braine, they may thinke the bone wholy broken, and to preſſe the *Meninges*, whereupon they will dilate the wound, apply a Trepan and other inſtruments to lift up the ſecond table of the bone, without any need at all, and with the manifeſt danger of the life of the patient.

Oſſa parietalia and *bregmatis*.

The third and fourth bones of the Skull are the *Oſſa parietalia*, or *Bregmatis*, having the third place of denſity and thicknes; although this denſity and thicknes be different in diverſe places of them. For on the upper part of the head, or crowne, (where that ſubſtance turnes not to a bone in children untill they have all their teeth, ſo that it feeles ſoft in touching, and through it you may feele the beating of the braine) theſe bones are very tender, ſo that oft times, they are no thicker than ones naile, that ſo the moiſt and vapourous excrements of the braine, ſhut up where the greater portion of the braine reſides, may have a freer paſſage by the Braines *Diaſtole* and *Syſtole*. Theſe two ſquare bones are bounded above with the Sagittall ſuture, below with the ſcaly, on the forepart with the coronall, and on the hinde part with the *Lambdoides*.

Oſſa petroſa, or the ſcaly bones

The fiſth and ſixth bone of the ſkull are the two *Oſſa petroſa* ſtony or ſcaly bones which are next to the former in ſtrength. They are bounded with the falſe or baſtard Suture, and with part of the *Lambdoides*, and wedgebone.

Os Sphenoides, or the wedge-bone.

The ſeaventh is the *Os ſphenoides*, *baſilare* or *Cuneiforme* that is, the wedgebone. It is called *Baſilare*, becauſe it is as it were the Baſis of the head. To this the reſt of the bones of the head are fitly faſtened in their places. This bone is bounded on each ſide with the bones of the forehead, the ſtony bones, and bones of the Nowle and pallate. The figure repreſents a Batte, and its proceſſes her wings.

Os Ethmoides or *cribroſum*.

There is beſides theſe another bone at the Baſis of the forehead bone, into which the mamillary proceſſes end, the Greekes call it ἠθμοειδὲς, the Latines *Cribroſum* and *Spongioſum*, the Spongy bone, becauſe it hath many holes in it not perforated in a direct paſſage, as in a ſive, but winding and anfractuous, that the aire ſhould not by the force of attraction preſently leap or aſcend into the braine, and affect it with its qualityes, before it be elaborated by its lingring in the way. There are beſides alſo ſixe other little bones lying hid in the ſtony bones, at the hole, or Auditory paſſage; on each ſide three, that is to ſay, the *Incus* or Anvill, the *Malleolus* or Hammer, and the *Stapes* or ſtirrop, becauſe in their figure they repreſent theſe three things; the uſe of theſe we will declare hereafter.

The three bones of the Auditory paſſage.

But alſo in ſome skuls there are found ſome diviſions of bones, as it were collected fragments to the bigneſſe almoſt of ones thumbe, furniſhed and diſtinguiſhed by their proper commiſſures, or ſutures, which thing is very fit to be known to a Chyrurgion in the uſe of a Trepan.

Verily he may give a conjecture hereof, whileſt he ſeparates the ***Pericranium*** from the skull, for the *pericranium* is with greater difficulty pluckt away from the ſutures, becauſe the *Craſſa meninx* hath ſtraiter connexion therewith by his nervous fibers ſent forth in ſuch places. The Skuls in women are ſofter and thinner than in men, and in children more than in women, and in young men more then in men of a middle age. Alſo the Æthiopians or Blackamoores, as alſo all the people inhabiting to the South, have their ſculles more hard and compoſed with fewer ſutures.

By what meanes a Chirurgion may conjecture, that there are extraordinary ſutures in certaine places of the ſcull.

The ſculls of ſuch as inhabite the Southren countries are more hard and denſe.

Therefore as it is written by ***Hippocrates***, ſuch as have their Skulls the ſofter, the Symptomes in fractures are more dangerous and to be feared in them. But the skull by how much the ſofter it is, by ſo much it more eaſily and readily yeilds to the perforating Trepan. Moreover in ſome skuls, there bee bunches ſtanding out beſides nature, made either round, or cornered, which the Chirurgion muſt obſerve for two cauſes; the firſt is for the better conſideration of a blow or fracture. For in theſe bunches, or knots, the ſolution of the continuity cannot be, if it ſeeme to be ſtretched in length, but that the wound muſt penetrate to the inner parts. For in a round body there can be no long wound; but it muſt be deepe, by the weapon forced the deeper; becauſe as a round body touches a plaine but onely *inpuncto* in a prick or point, ſo what-ſo-ever falls only lightly or ſuperficially upon it, onely touches a point thereof. But on the contrary a long wound muſt be upon a plaine ſurface, which may be but only ſuperficiall.

We muſt obſerve the extuberancies beſides nature which are in ſome ſculls.

A nother cauſe is, becauſe ſuch bunches change the figure and ſite of the Sutures. And the Chirurgion muſt note that the skuls hath two tables, in the midſt whereof the *Diploe* is; which is a ſpongy ſubſtance into which many veines and arteryes & a certaine fleſhyneſſe are inſerted, that the skull ſhould not be ſo heavy, and that it might have within it ſelfe proviſion for the life thereof; and laſtly that there might be freer paſſage out for the fuliginous vapours of the braine.

The ſite and ſubſtance of the *Diploe*.

The upper table is thicker, denſer, ſtronger and ſmoother than the lower. For this as it is the ſlenderer, ſo it is the more unequall, that it may give place to the internall veines and arteryes (which make a manifeſt impreſſion into the ſecond table on the inſide thereof) from which branches enter into the skull by the holes which containe the eyes. Which thing faſtens the ***Craſſa meninx*** to the skull, and is therefore very worthy to be obſerved.

For in great contuſions when no fracture or fiſſure appeares in the skull by reaſon of the great concuſſion or ſhaking of the braine, theſe veſſels are often broken, whence happens a flux of blood between the skull and membranes, and laſtly death. But it is fit the Chirurgion take good heed to the tender and ſoft ſubſtance of the *Diploe*, that when he comes to it, having paſſed the firſt table, he may carefully uſe his Trepan, leaſt by leaning too hard, it run in too violently, and hurt the membranes lying underneath it, whence convulſion and death would follow. To which danger I have found a remedy, by the happy invention of a Trepan, as I will hereafter more at large declare in handeling the wounds of the head.

There may be a deadly rupture of the veſſells of the braine without any fracture of the Scull.

Caution to be had in the uſe of the Trepan

Chap. V.

Of the Meninges, *that is, the two membranes called* Dura Mater *and* Pia Mater.

Why the bone *Ethmoides* is perforated.

The *Craſſa meninx* is one of the firſt and principall membranes of the body; it goes forth by the ſutures and the holes of the nerves that proceed out of the skull; and it paſſes forth by the bone *Ethmoides* perforated for that purpoſe, to carry ſmels to the Braine, and purge it of excrementitious humors. This ſame *Craſſa meninx* inveſts the inner coate of the Noſe; alſo it paſſes forth of the great hole through which the ſpinall marrow paſſes, veſted with this *Craſſa meninx*, with all the nerves and membranes. For which cauſe, if any membrane in the whole body be hurt, by reaſon of that continuation which it hath with the *Meninges*, it ſtraight communicates the hurt to the head by conſent.

The conſiſtence of the *Craſſa meninx*

The *Craſſa meninx* is thicker and harder than all other membranes in the body; whereupon it hath got the name of the *Dura mater*, beſides alſo it begirts, produces, and defends the other membranes.

The uſe.

The uſe of it is to involue all the braine, and to keepe it when it is dilated, that it be not hurt by the hardneſſe of the Scull. For the courſe of nature is ſuch, that it alwayes places ſome third thing of a middle nature, betwixt two contraryes. Alſo the *Craſſa meninx*, yeelds another commodity, which is, that it carryes the veines and arteryes entring the Scull for a long ſpace. For they inſinuate themſelves into that part, where the duplicated or folded *Meninges* ſeparate the braine from the *Cerebellum*, and ſo from thence they are led by the ſides of the *Cerebellum*, untill they come, as it were, to the toppe thereof; where being united they inſinuate themſelves into that other part of the *Craſſa meninx*, where in like manner being duplicated and doubled, it parts the braine at the top into the right and left; Theſe united veines run in a direct paſſage even to the fore-head, after the manner of the Sagittall ſuture; They have called this paſſage of the mutually infolded veines, the *Torcular*, or Preſſe, becauſe the blood which nouriſhes the braine is preſſed and drops from thence by the infinite mouthes of theſe ſmall veines. Therefore alſo here is another uſe of the *Craſſa meninx*, to diſtinguiſh the braine by its duplication, being it thruſts it ſelfe deepe into its body, into two parts, the fore and hind, and preſently to ſeparate the ſame into the right and left; that one part being hurt, the other may remaine ſafe and ſound, performing its duty to the creature, as we ſee in ſome that have the Palſey. *Columbus* obſerved that this *Meninx* was double, and verily I have found it true by my owne ſight.

What the *Torcular* is.

One part of the braine being hurt the other keepes the creature alive.

The conſiſtence of the *Pia mater*.

The other *Meninx* or membrane of the braine, called *Pia mater*, is moſt ſlender interchaſed with divers veines and arteryes, for its owne and the braines nouriſhment and life. This doth not onely involve the Braine, as the *Craſſa meninx* doth, but alſo more deeply penetrates into the anfractuous paſſages thereof, that it may every where joyne and bind it to it ſelfe, not eaſily to be drawne from thence, by many ſmall fibers whereby it deſcends even to the cavities of the ventricles thereof. Wherefore you muſt ſee it abſolutely in the ſite as wee have mentioned, and not plucke it away unleſſe with the ſubſtance of the Braine.

The ſenſe of the *Meninges*.

Theſe membranes when they are hurt or afflicted, cauſe greivous and moſt bitter torment and paine; wherefore I dare ſay, that theſe membranes are rather the authors of ſenſe than the braine it ſelfe, becauſe in diſeaſes of the Braine, as in the Lethargie, the party affected is troubled with litle or no ſenſe of paine.

CHAP. VI.

Of the Braine.

NOw followeth the Braine, the beginning of the nerves and voluntary motion, the inſtrument of the firſt and principall faculty of the Soule, that is, the Animall and Rationall. Man hath this part in greater plenty then any other Creature, for it almoſt fills the whole Scull. But if it ſhould have filled it all, the Braine could not be moved, that is, dilated and contracted in the Scull. It is of a cold and moiſt Temperature. The laudible temper of the braine is knowne by the integrity and perfection of the internall and externall ſenſes, the indifferency of ſleepe and waking, the Maturity or ripeneſſe of judgment, and conſtancy of opinions, from which, unleſſe it meet with better and more probable, it is not eaſie to be moved.

What the braine is.

The quantity

Temper,

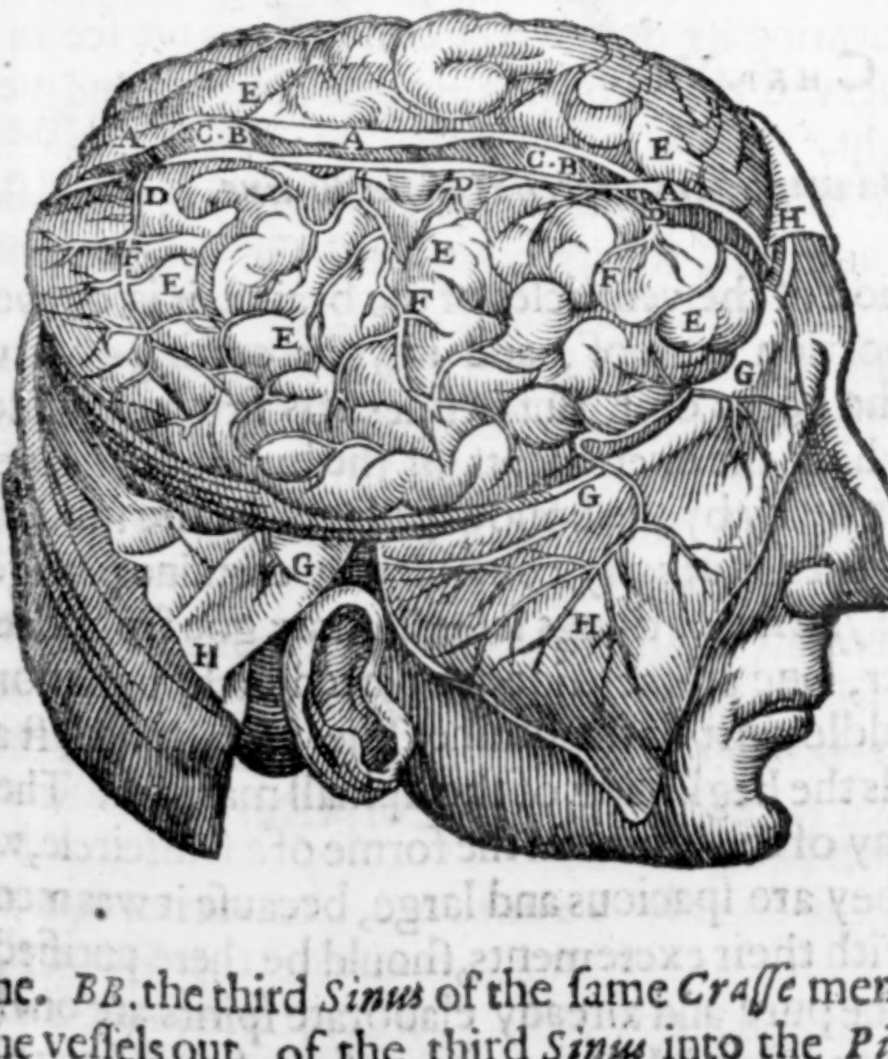

Fig. 2.

AAA. A part of the *Craſſe meninx* dividing the braine. **BB.** the third *Sinus* of the ſame *Craſſe* membrane opened. **CC.** the beginning of the veſſels out of the third *Sinus* into the *Pia mater*. **DDD.** the propagation of branches of theſe veſſels. **EEE.** the *Pia mater* or thin *meninx* immediately compaſſing

ſing the braine. *FFF.* Certaine veſſels running through the convolutions or branches of the braine. *GGG.* Certaine branches of veines running through the ſides of the *dura meninx.* *HHH.* The thicke membrane reflected downeward.

You ſhall know the braine is more hott, by the quickneſſe of the ſenſes and motions of the body, by ſhortneſſe of ſleepe, the ſuddaine conceiving of opinions and change of them, by the ſlippery and failing memory, and laſtly by eaſily receiving hurt from hot things, as the Sunne and Fire. Such as have a cold braine, are ſlow to learning, and to conceive other things, but they do not eaſily put away their once conceived opinions. They have ſlow motion to action, and are ſleepy. Thoſe who have a dry braine, are alſo ſlow to learne; for you ſhall not eaſily imprint any thing in dry bodyes, but they are moſt conſtant reteiners of thoſe things they have once learned; alſo the motions of their bodyes are quicke and nimble. Thoſe who have a moiſt braine doe eaſily learne, but have an ill memory, for with like facility as they admit the ſpecies of things and imprint them in their minds, doe they ſuffer them to ſlide and ſlip out of it againe. So Clay doth eaſily admit what Character or impreſſion ſoever you will, but the parts of this Clay which eaſily gave way to this impreſſion, going together againe, mixes, obliterates and confounds the ſame. Therefore the ſenſes proceeding from a cold braine are dull, the motions ſlow, the ſleepe profound.

The Action. — The Action of the braine is to elaborate the Animall Spirit and neceſſary ſenſe ſerving the whole body, and to ſubject it ſelfe as an inſtrument to the principall faculties, as to reaſon. Number. — The braine is twofold, the fore and hinde. The hinde by reaſon of its ſmallneſſe is called the *Cerebellum*, (the litle or After-braine). But the fore by reaſon of its magnitude hath retained the abſolute name of the braine. Againe this fore-braine is two-fold, the right and left, parted by that depreſſion, which wee formerly mentioned, of the *Meninges* into the body of the braine. But this diviſion is not to be here ſo abſolutely taken, as though the Braine were exactly divided and ſeparated into ſo many parts, but in the ſenſe, as we ſay the Liver and Lungs are divided a pretty way, whereas at their *Baſis* they have one continued body. The outward ſurface of the Braine is ſoft, but the inward hard, callous and very ſmooth; when on the contrary, the outward appeares indented and unequall with many windings, and creſted as it were with many wormelike foldings.

Chap. VII.

Of the ventricles and mamillary proceſſes of the Braine.

The ſubſtance of the braine is porous and ſweats forth blood. — For the eaſie demonſtration of the ventricles of the braine, it is convenient you cut away a large portion thereof, and in your cutting obſerve the blood ſweating out of the pores of it. But beſides, it is fit you conſider the ſpongy ſubſtance by which the excrements of the braine are heaped up, to be preſently ſtrained out, and ſent away by the hollow paſſage. The foure ventricles thereof. — In the ſubſtance of the braine you muſt obſerve 4 ventricles, mutually conjoined by certaine paſſages, by which the ſpirits endued with the *ſpecies* of things ſenſible, may goe from one into another. The firſt and two greater, one on each ſide are placed in the upper braine. The third is under them in the middle part of the braine. The fourth and laſt at the fore ſide of the *Cerebellum*, towards the beginning of the ſpinall marrow. The magnitude of the upper ventricles of the braine. — The two formoſt are extended the length way of the braine in the forme of a ſemicircle, whoſe hornes looke or bend outwards. They are ſpacious and large, becauſe it was meet the Spirits contained there together with their excrements, ſhould be there purified and clenſed; but in other ventricles, the pure and already elaborate ſpirits are onely received. Theſe ventricles are white and ſmooth in their inner ſuperficies; but that on each ſide they have an exuberancy at the midſt of the ſemicircle, ſcituate at the baſis of the Pillar of the middle ventricle towards the noſe under the *Septum lucidum* or cleere partition, ſevering or parting in ſunder theſe two ventricles.

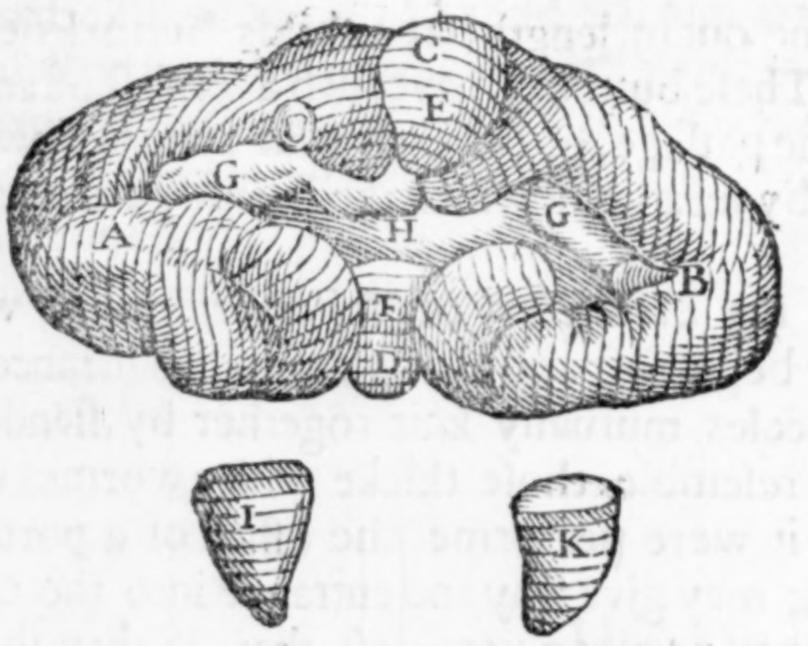
The *Septum Lucidum*,

This *Septum lucidum*, or cleare or thin partition, is nothing elſe than a portion of the braine indifferently ſolide, but very cleere, that ſo through this partition the animall ſpirits contained in theſe two ventricles may mutually paſſe and bee communicated, and yet no other groſſer ſubſtance may peirce the thin denſity thereof.

Why the Palſie of one ſide is not preſently communicated to the other.

Wherefore it is not to be feared, that the water contained in one of the ventricles may paſſe to the other through this partitiō, as I have oft times obſerved to the great admiration of the ſpectators in the dead bodyes of ſuch as dyed of the Palſy, in which I have found the ventricle of that ſide which was taken with the palſy much dilated, according to the quantity of the water contained therein, the other being either wholy empty and without any; or certainly no fuller than in any other, dead through any other occaſion. For ſome affirme that there is a certaine kind of wateriſh moiſture alwaies to be found in the ventricles, which may be made by the condenſation of the Animall ſpirits by the force of the deadly cold. But theſe two firſt ventricles of the braine goe into one common paſſage, as both the bellowes of a fornace, whereby the ſpirit inſtructed with the ſpecies of things goes into the under, or middle ventricle from the former. In theſe ſame firſt ventricles the *Plexus Choroides* is to be conſidered, and in like manner the paſſage by which the groſſer excrements are driven or ſent into the pituitary Glandule.

The Third Figure repreſents the Cerebellum *with the wormy proceſſes ſeparated from it.*



AB, The right and left part of the After-braine. *CD*, The *anterior* and *poſterior* regions of the middle part of the After braine. *E*, The *anterior* wormy proceſſe. *F*, The *poſterior* wormy proceſſe. *GG*, In this place the After-braine did grow to the ſpinall marrow. *H*, The cavity in the ſpinall marrow maketh the forth ventricle. *IK*. The *anterior* and *poſterior* proceſſes of the braine, called *vermi-formes* or the wormy proceſſes.

The *Plexus Choroides*.

This *Plexus Choroides* is nothing elſe, but a production of the *Pia mater* diverſly folded with the mutuall implication of veines and arterys woven in the forme of a net. Theſe veſſels are of magnitude and capacity ſufficient, both to yeild life and nouriſhment to that particle to which they are faſtened, as alſo for the generation of the Animall ſpirits, as which take fit matter from the veines ſtretched fourth into this ſame *Plexus*, the hinde artery and veine *Torcular*; and alſo from the aire entring into the braine by the mamillary proceſſes. But the mamillary proceſſes are certaine common waies for conveyance of the aire and ſmels into the braine, and carrying of excrements from the braine.

The *Proceſſus Mammillares*.

For thus in them who have the Catarrhe and *Coriza* or poſe, neither the aire, nor ſmels can penetrate into the braine; whence frequent ſneeſings enſue, the braine ſtrongly moving it ſelfe to the expulſion of that which is troubleſome to it. But of the excrements of the braine, whether bred there, or proceeding from ſome other part, ſome are of a fumide and vaporous nature which breathe inſenſibly through the Sutures of the ſkull; Others are groſſe and viſcide, of which a great part is expelled by both theſe productions,or through each of them. For thus in the Poſe you may ſee ſome who have one of their noſthrils ſtopt, the other running, and ſome who have both obſtructed. The moſt proper benefit of the two firſt ventricles of the braine is to entertaine the Phantaſie as in a convenient ſeat and habitation, ſeeing the minde there eſtimates and diſpoſes in order the ſpecies of things brought in from the externall ſenſes,that ſo it may receive a true judgement of them from reaſon which reſides in the middle ventricle.

The uſe of the upper ventricles of the Braine.

The ſeat of the third ventricle of the braine. The parts to be conſidered in it.

The third ventricle is ſeated betweene the hindermoſt extremityes of the former ventricles, and the laſt ventricle of the *Cerebellum*. In this ſixe parts preſent themſelves to our conſideration, that is the *Pſalloides* or Arch, the *Conarium*, or pine Glandule,the Buttockes, wormelike productions, the Baſon and paſſage which is from this middle into the laſt and hindemoſt ventricle. The *Pſalloides* or arch is nothing els, but the cover of the middle ventricle, reſembling a roofe borne up with three ſtayes or pillars,the one whereof is extended to the noſe under the *Septum lucidum*, the two other on each ſide one,looke towards the backe part of the braine. This is the reaſon of this figure which is outwardly convexe and inwardly concave, to wit, that there might be free ſpace for that motion which the Animall ſpirit inwardly produces, and beſides that it might more eaſily ſuſtaine the burden of the braine lying upon it. For an arched figure is the moſt convenient of all other to ſuſtaine a waight.

What the *fornix* or Arch is,and the uſe thereof.

What the *Conarium* or pine Glandule is.

The *Conarium* or Pine glandule, is a ſmall Glandule of the ſame ſubſtance with the braine, round and ſomewhat long, like a pine Apple, from whence it hath the name; this Glandule is ſeated over againſt a ſmall hole which deſcends to the loweſt ventricle. It hath this uſe, to ſtrengthen the diviſion of the veſſells led thither with the production of the *Pia mater* for the generation of the animall ſpirits, and the life and nouriſhment of the braine.

What the *Nates* or Buttocks are.

The *Nates* or Buttocks are ſubjected or placed under this Glandule, that is,bodies of a ſolid and white ſubſtance drawne out in length like a childs buttocks,eſpecially in beaſts, and cheifly in a ſheepe. Theſe buttocks have ſuch a ſolid ſubſtance, that ſo they may keepe open and free the paſſage, or channell that runnes downe from the middle to the lower ventricle, by meanes of which the Braine participates with the *Cerebellum*.

What the worme is.

The worme is a production of the *Cerebellum* or After-braine, to wit a portion of the ſame being in the top or beginning and as it were in the entrance thereof, being like many litle circles or wheeles mutually knit together by ſlender membranes; and it is ſo called becauſe it reſembles thoſe thicke white wormes which are found in rotten wood. It doth as it were performe the office of a porter to the formerly mentioned paſſage, that it may give way and entrance into the *Cerebellum* to a neceſſary quantity of ſpirits, when need requires; leſt that, if they ſhould ruſh with a ſuddaine violence into the *Cerebellum*, they might confound the imprinted notions of things to be remembred.

Here the *Pelvis* or Baſon is confounded with the Tunnell.

The *Pelvis* or Baſon is a paſſage appointed for the carrying away of the groſſe excrements by the palate, and is ſo called becauſe it hath the ſimilitude and uſe of a baſon or Tunnell:it deſcends from the third ventricle into the Glandule which is ſeated betweene the proceſſes of the wedge-bone called the ſaddle thereof,as you may perceive by putting in a ſpatherne. Now there remaines the laſt of the ſixe parts propoſed to our conſideration in the third ventricle, that is,the Channell or paſſage running from this third ventricle into the fourth, for the uſe formerly mentioned.

The Channell from the third into the fourth ventricle.

This Channell deſcending in its originall from the Baſon,goes from thence under the buttocks into the laſt ventricle, the *Meninges* being perforated; which that you may ſhew,it is fit you put the end of a ſpatherne through it. The benefit of the third ventricle is; that it may be as a Tribunall or judgment ſeate to the Reaſoning faculty,when the minde will draw concluſions from things ſeene.

The fourth ventricle of the Braine.

The fourth ventricle is ſeated in the place we formerly mentioned; it is leſſe than the reſt, but more ſolide; leſſe as that which was not to receive the ſpirit before it was purified,and clenſed from all impurities; but more ſolid that it might containe it the ſafer. The uſe therof is,to be as a Treaſury and ſtore-houſe of the opinion, and judgments which reaſon ſhall decree, that when neede requires, wee may fetch and draw them from thence as laid up in ſtore. I know *Galen*, and the Greeke Phyſitions have not ſo diſtinguiſhed in places the three fore-mentioned facultyes; but have written, that they all are all over confuſed through the whole ſubſtance of the braine, which opinion alſo *Fernelius* in his *Pathologia* hath renewed. Yet I had rather follow this opinion, as commonly received and celebrated by the Arabian Phyſitions.

The uſe of the Mammillary proceſſes.

The Mammillary proceſſes are the inſtruments and paſſages of ſmelling, being of the ſame ſubſtance with the braine, and like nerves, which runne out from the hinde hornes of the upper or foremoſt ventricles of the braine to the *Ethmoides* and ſpongy bones of the noſe, that hence they may receive the divers kinds of ſmells, and carry them into the Braine. But although they be like nerves, yet they are not accounted nerves becauſe they go not out of the ſcull.

The Fourth and Fiſt figures of the Braine.

Parts of the opticke nerves. *CD*, The ſleepy arteries. *E*, The Baſon or Tunnell hanging downe. *F*, A hole or perforation of the *dura meninx*, through which the Tunnell reacheth unto the glandule. *GG*, Parts of the ſecond conjugation of ſinnewes. *Figure* 12. *A*, The Glandule. *B*, The Baſon or Tunnell called *Peluis* or *Infundibulum*. *CDEF*, The foure holes thorough which the phlegmaticke excrement iſſueth.

Chap. VIII.

Of the 7. conjugations of the Nerves of the Braine, ſo called, becauſe they alwayes ſhew the Nerves conjugated and doubled, that, is on each ſide one.

What a Nerve or Sinew is.

Its ſubſtance.

Whether the nerves have a third membrane from the Ligaments of the *Vertebra's*.

The nerves are the waies and inſtruments of the animall ſpirit and facultyes of which thoſe ſpirits are the vehicles, as long as they are contained in the braine; they conſiſt of the only and ſimple marrowey ſubſtance of the braine; or ſpinall marrow. But paſſing forth of the braine, they have another membranous ſubſtance which involves them joined with them from the two membranes of the braine; and according to the opinion of ſome Anatomiſts, they have alſo a third from the ligaments drawen as well from divers others, as from theſe by which they are tyed to the *Vertebra's*; Yet this opinion ſeemes abſurd to me, ſeeing ſuch a membrane, as that which is inſenſible, wholy repugnes the condition of a nerve, which is to give ſenſe to the parts to which it is inſerted.

Their magnitude.

Their figure.

Their uſe.

Their number

The magnitude of the nerves is different, according to the divers neceſſity of ſenſe incident to the parts into which they are inſerted. Their figure is round, and long like to a conduit pipe to carry water in; the membranes of the braine, with which the nerves are covered, being dilated and ſtretched over them, after the ſame manner that the proceſſes of the *Peritonæum* involves the ſpermatick veſſels, with which they goe downe to the Teſticles, and take life and nouriſhment by the capillary veines and arteryes, which deſcend to them with the membranes. They are made for this uſe, that they may impart ſenſe to the ſenſitive parts, and motion to theſe that are fit to be moved. All the nerves deſcend from the braine either mediatly, or immediately; their Number is ſeaven and thirty paire, or conjugations, whereof ſeaven have their originall immediately from the braine, the other thirty from the ſpinall marrow.

The firſt conjugation of nerves.

The firſt conjugation of the nerves of the braine is thicker than all the reſt, and goes to the eyes, to carry the viſive ſpirit to them. Theſe ariſeing from diverſe parts of the braine, in the middle way before they goe out of the skull meet together croſſewiſe like the Iron of a Mill (which is faſtened in the upper ſtone) going into one common paſſage with their cavityes not viſible to the eye; that ſo the ſpirits brought by thoſe two nerves may be communicated, and they are mutually joyned and meet together ſo, that being driven back from one eye they may flie backe into the other. An argument whereof may be drawn from ſuch as aime at any thing, who ſhutting one of their eies, ſee more accurately; becauſe the force of the neighbouring ſpirits united into one eye, is more ſtrong than when it is diſperſed into both. This conjugation when it comes into the glaſſie humour, is ſpent in the ſtructure of the net-like coate which containes this humor on the backe part.

The ſecond conjugation,

The ſecond conjugation goes into many parts, at its paſſing forth of the skull, and in the bottome of the circle of the eye it is diſtributed into the ſeaven muſcles moveing the eyes.

The Seventh figure ſhewing the eight conjugations of the Nerves of the braine.

FIG.I.

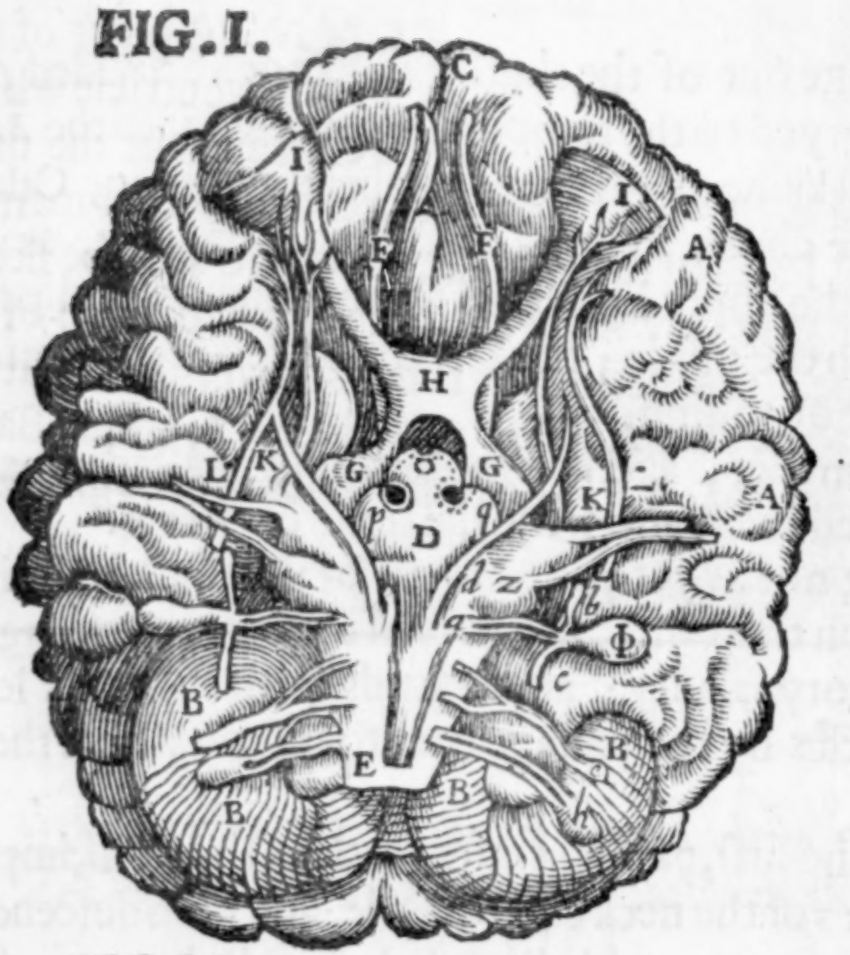

FIG.II.

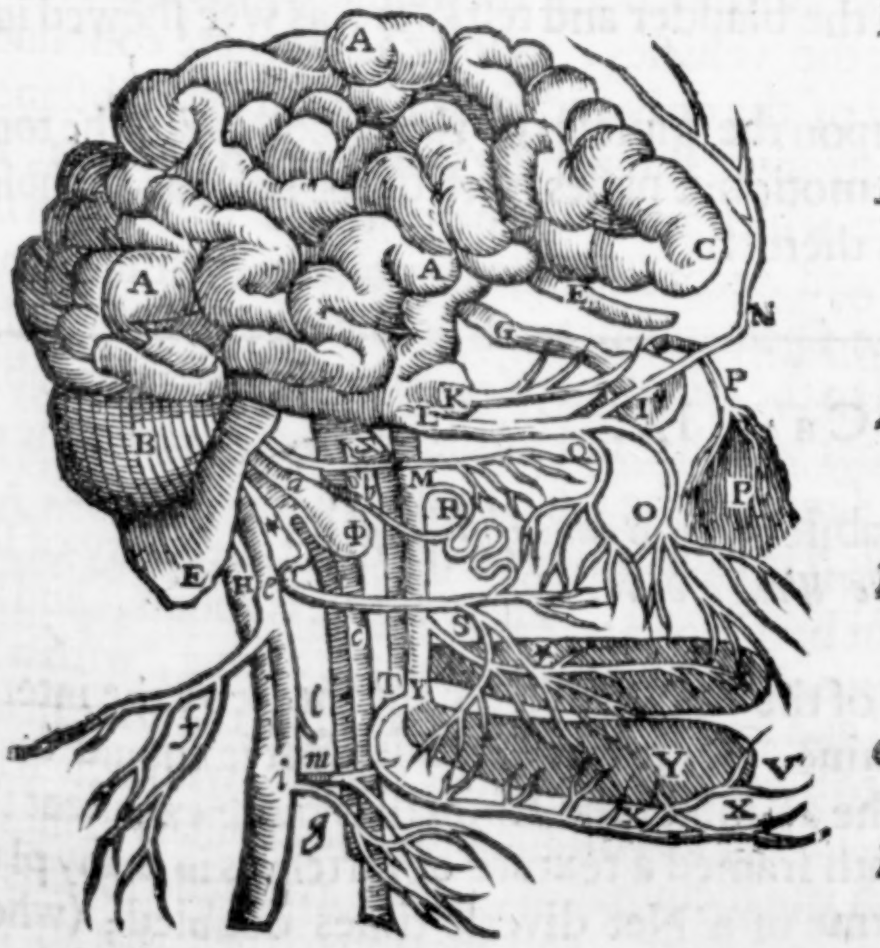


A A, 2. The braine.
BB 1, 2. The After-braine.
CC 1, 2, the ſwelling of the braine which ſome call the mammillary proceſſes.
D 1, the beginning of the ſpinall marrow out of the Baſis of the braine.
E 1, 2, a part of the ſpinall marrow when it is ready to iſſue out of the skull.
FF 1, 2, the mammillary proceſſes which ſerve for the ſence of Smelling.
GG 1, 2, the opticke nerves.
H 1, the coition or union of the opticke nerves.
II 1, 2, the coate of the eye whereinto the optick nerves is extended.
KK 1, 2, the ſecond paire of the ſinews, ordained for the motion of the eyes.
LL 1, 2, the third paire of ſinewes, or according to the moſt Anatomiſts, the leſſer roote of the third paire.
MM 1, 2, the fourth paire of ſinewes, or the greater roote of the third paire.
N 2, a branch of the third conjugation derived to the muſculous skin of the forehead.
O 2, a branch of the ſame to the upper jaw.
PP 2, another into the coate of the noſethrils.
Q 2, another into the temporall muſcles. *R* 2, a branch of the fourth conjugation crumpled like the tendrill of a vine. *S* 2, a branch of the ſame reaching unto the upper teeth and the gummes. *T* 2, another of the ſame to the lower jaw. *V* 2, a Surcle of the branch T, to the lower lip. *XX* 2, another ſurcle from the branch T, to the rootes of the lower teeth.

YY 2, the aſſumption of the nerves of the fourth conjugation unto the coate of the tongue. *Z* 1,2, the fourth paire are vulgarly ſo called which are ſpent into the coats of the pallat. *a* 1,2. the fift paire of ſinewes which belong to the hearing. Φ, the *Auditory* nerve ſpred abroad into the cavity of the ſtony bone. *, a hard part of the fift conjugation above, the * which may be counted for a diſtinct nerve. *b* 1,2, a ſmall branch derived from this harder part of the firſt paire. *c* 1, 2, a lower branch from the ſame originall. *d* 1,2, this nerve is commonly aſcribed to the fift paire, but indeed is a diſtinct conjugation which we will call the Eight, becauſe we would not interrupt the order of other mens accounts. *e* 1,2, the ſixt paire of ſinewes. *f* 2, a branch from them derived to the neck and the muſcles couched thereupon. *g* 2, another branch to the muſcles of the Larinx or throttle, *h* 1,2, the ſeventh paire of ſinewes. *i* 1, the union of the ſeventh paire with the ſixt. *l* 2, a propagation of the ſeventh paire to thoſe muſcles which ariſe from the Appendix called *Styloides*. *m* 2, Surcles from the ſeventh conjugation to the muſcles of the tongue, the bone *Hyois* and the Larinx. *o p q* 1, three holes; through the hole *o* the phlegme yſlueth out of the third ventricle of the braine to the Tunnell, and at *p q*, is the paſſage of the *Soporary* arteries to the ventricles of the Braine.

The third conjugation.

The third is two-fold, in the paſſage out of the skull it is like-wiſe divided into many branches, of which ſome are carryed to the temporall muſcles, into the *Maſſeteres* or Grinding muſcles, into the skinne of the face, forehead and noſe; Otherſome are ſent into the upper part of the cheek, and the parts belonging to it, as into the teeth, gummes and the muſcles of the upper lippe; and thoſe which are called the round which incompaſſe the mouth on the inſide; the laſt are waſted in the coate of the tongue, to beſtow upon it the ſenſe of taſting.

The fourth conjugation.

The fourth conjugation is much ſmaller, and is almoſt wholy waſted upon the coate of the Pallate of the mouth, to endue it alſo with the ſenſe of taſting.

The fift conjugation.

The fift at its originall and having not as yet paſſed forth of the skull, is divided into two, and ſends the greater portion thereof to the hole of the eare, or paſſage of hearing, that it may ſupport the auditory faculty; and it ſends forth the other leſſer portion thereof to the temporall muſcles by the paſſage next to it; by which the ſecond conjugation paſſes forth.

The ſixt conjugation.

The ſixt being the greateſt next to the firſt, paſſing entire forth of the skull, imparts ſome ſmall branches to certaine muſcles of the neck and throttle, and then deſcending into the cheſt, it makes the recurrent nerves, and diſperſed over all the parts of the two lower bellyes, it paſſes even to the bladder and teſticles, as wee ſhewed in the former booke.

The ſeventh conjugation.

The ſeventh is inſerted and ſpent upon the muſcles of the bone *Hyois*, the tongue and ſome of the throtle, to give them motion; it paſſes forth of the skull by the hole of the nowle bone at the extuberancies thereof.

Chap. IX.

Of the Rete Mirabile, *or wonderfull Net, and of the Wedge bone.*

The exiſtence of the Animall ſpirit.

What the *Rete Mirabile* is.

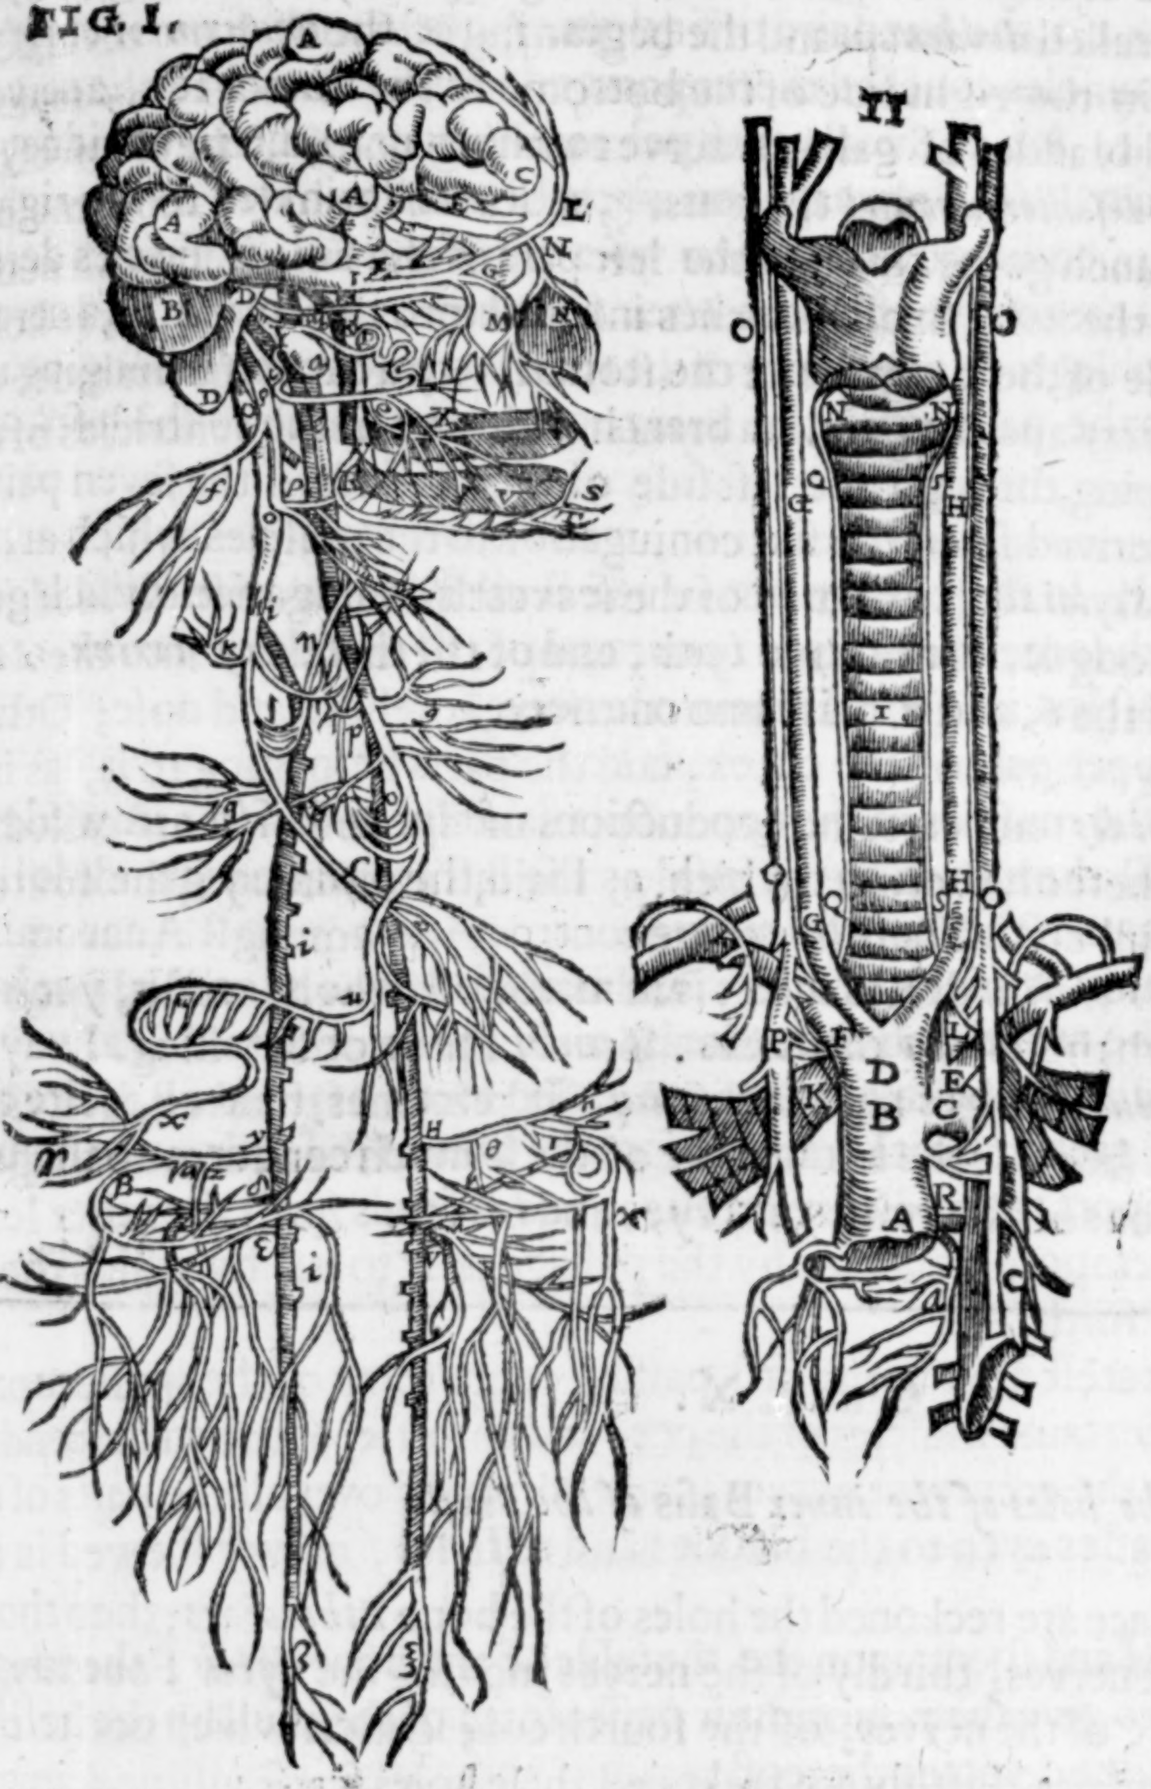
THe Animall ſpirit is made of the vitall, ſent from the heart by the internall ſleepy Arteryes to the braine. For it was requiſite that it ſhould be the more elaborate, becauſe the action of the Animall is more excellent than that of the vitall; nature hath framed a texture of Arteryes in many places running croſſe one another, in the forme of a Net diverſe times doubled; (whereupon it had the name of the wonderfull Net) that ſo the ſpirit by longer delay in theſe Labyrinthean or maze-like turnings, might be more perfectly concocted and elaborate, and attaine to a greater fitneſſe to performe the Animall functions.

The ſite, and number.

This wonderfull Net ſcituate at the ſides of the *Apophyſes clinoides* or productions of the wedgebone, is twofold; that is, divided by the pituitary Glandule which is ſcituate betweene the ſaid *Apophyſes Clinoides*, having the wedgebone lying under them, next to the *Craſſa Meninx*, being perforated on the right and left ſide, next to which lye bones as rare as a ſponge even to the Pallate, by which the Phlegme is purged by the mouth and noſe; and therehence, I thinke, that ſpattle flowes, which ſuch as have a moiſt braine, continually ſpit out of their mouth.

The Eight figure of the braine.

FIG. I.



A, The Braine.
B, The *Cerebellum* or after-braine.
C, A proceſſe of the brain, but not that which is called *Mammillaris*.
D D, The marrow of the backe as it is yet within the skul.
E, The *Mammillary* proceſſe or inſtrument of ſmelling.
F, The opticke nerve.
G, The coate of the eye into which the opticke nerve is ſpread.
H, The nerve that moveth the eye or the ſecond payre.
I, The third conjugation, or the harder and leſſer branch of the nerves of the third conjugation brought forward.
K, The fourth conjugation or the greater and thicker nerve of the third payre bending downward.
L, A branch of the nerve marked with *I*, which goeth to the fore-head.

M, Another branch of the nerve *I*, reaching to the upper jaw, *NN*, A nerve proceeding from the branch *I*, intexed or woven with the coat of the noſe. *O*, The nerve of the temporall muſcle iſſuing from the branch *I*. *P*, A nerve contorted of the nerves *K* and *b*. *Q*, A nerve proceeding from the branch *K*, to the ſockets of the upper teeth. *R*, A nerve creeping from the nerve *K*, to the lower jaw. *S*. A ſurcle of the branch *R*, offered to the lower lip. *T T*, Other ſurcles from the branch *R*, attaining to the lower teeth, *V V*, A branch of the nerve *K*, diffuſed into the coate of the tongue. *X X*, The fourth paire of ſinews which goe into the coat of the pallat. *Y*, The fifth paire of ſinews which are the nerves of hearing. *a*, the membrane of the eare, unto which that fifth nerve goeth. *b c*, two ſmall branches of the fifth conjugation uniting themſelves with the nerve *P*. *d*, the eight conjugation or a nerve of the fifth paire attaining unto the face. *ee*, the ſixt paire of nerves. *f*, A branch from the nerve *e*, reaching to the muſcles of the neck. *g*, Small branches derived unto the throttle or *larynx*. *h*, the byfurcation of the nerve into two branches. *iii*, An inner branch hanging to the rackbones, and ſtrengthning the *intercoſtall* nerves, and is therfore called *Intercoſtalis*. *kk*, Surcles of the utter branch going to the heads of the muſcles, to the breaſt-bone and to the coller-bones. *lm*, branches of the right nerve *l*, making the right Recurrent nerve.

mn,the inſertion of the recurrent ſinews into the muſcles of the *larinx*. *op*, branches of the left nerve making the left recurrent ſinew *p*. *qq*, branches from the ſixt conjugation going to the coate of the lungs. *r*, ſmall nerves of the heart and of the purſe thereof called the *Pericardium*, as alſo ſome approaching to the coats of the lungs. *ſ*,nerves on either ſide ſent to the ſtomack.*t*,the right ſtomacke nerve going to the left orifice of the ſtomack.*u u*, the left ſtomack nerve going to the right orifice of the ſtomack.*x*,a nerve from the branch *u*,paſſing into the hollownes of the liver.*y*, the nerve belonging to the right ſide of the kell. *z*, the nerve belonging to the collick gut. α,a nerve creeping to the gut called *duodenum* and the beginning of the *ieiunum* or empty gut. β,a nerve implanted in the right ſide of the bottome of the ſtomacke. γ,a nerve belonging to the liver and bladder of gall. δ,a nerve reaching unto the right kidney. ε, a branch reaching the *Meſenterium* and the guts. ζ, a branch ſprinkled to the right part of the bladder. η,a branch going through the left part of the kel. θθ, ſurcles derived to the collick gut and the kel.κ,ſmall branches inſerted into the ſpleen. λλ,a nerve approaching to the left ſide of the bottome of the ſtomack. μ, a branch belonging to the left ſide of the *Meſentery* and the guts. ν, a branch which attaineth to the left kidney. ξ, ſmall nerves creeping through the left ſide of the bladder. ο, the ſeven paire of ſinewes. ϖ, a branch derived from the ſixt coniugation to the muſcles which ariſe from the proceſſe called *Styloides*. ρ, a branch of the ſeaventh coniugation which goeth to the muſcles of the tongue, of the bone *hyois*, and of the throtle or *larinx*. ς, A coniunction or coition of the 6. and 7. paire into one nerve.

What the *Apophyſes Clinoides* are.

Whether the *Rete mirable* differ from the *Plexus choroides*.

Theſe *Apophyſes clinoides* are certaine productions of the *Os baſilare* or wedge-bone,(called the Saddle thereof,) between which, as I ſaid,the pituitary glandule lies with part of the wonderfull net. There is a great controverſie amongſt Anatomiſts concerning this part; for *Veſalius* denies that it is in man, *Columbus* admits it, yet hee ſeemes to confound it with the *Plexus Choroides*. Truely I have obſerved it alwayes after the manner, as *Sylvius* alledges againſt *Veſalius*. It remaines, that we recite the perforations of the skull, becauſe the knowledge of theſe much conduces to the underſtanding of the inſertions of the veines,arteryes and nerves.

Chap. X.

Of the holes of the inner Baſis *of the Scull.*

IN the firſt place are reckoned the holes of the bone *Ethmoides*; then thoſe of the optick nerves; thirdly of the nerves moving the eyes. Fourthly of that portion, of the nerves, of the fourth conjugation which goe to the temporall muſcles. Fifthly are reckoned,theſe holes ſcarſe viſible,ſcituate under the pituitary glandule, by which the ſpettle is evacuated. Sixthly that hole which is in the wedge bone made for the entrance of the internall ſleepy Arteries, compoſing the wonderfull Net, and then paſſing into the braine by a great ſlit. That perforation which we reckon in the ſeventh place is commonly double, made for the entrance of one of the branches of the internall Iugular veine. The eight hole is ſomewhat long,of an ovall figure,by which,part of the third conjugation and all the fourth conjugation paſſes forth. The ninth are the auditory paſſages. The tenth are very ſmall holes,and give way to the veine and artery going to the auditory paſſage, above the *foramen cæcum*. In the eleaventh place are reckoned the perforations which yeild paſſage forth to the ſixth paire of nerves, to part of the ſleepy Arteries, and of the internall jugular. In the twelvth thoſe which yeild a way out to the ſeventh conjugation; The great hole of the Nowle bone through which the ſpinall marrow paſſes is reckoned the thirteenth. The fourteenth is that, which moſt commonly is behinde that great hole,by which the Cervicall veines and arteries enter in.

CHAP. XI.

Of the perforations of the externall Baſis *of the Braine.*

THere is a hole on each ſide at the Eye-browes, by which paſſes a ſmall nerve from the third conjugation comming out of the cavity of the Orbe of the eye, and going by the forehead bone to the eye-browes, that it may give motion to the two muſcles of the upper eye-brow and forehead. Yet oftentimes the hole is but to bee ſeene on one ſide, oft times there is a cleft inſtead thereof, otherwhiles it is not perforated nor cleft at all. The ſecond, is the perforation of the greater corner of the eye, by which a portion of the nerves of the third coniugation deſcends to the coate of the noſe; in this hole the *Glandula Lachrymalis* is ſeated. The third is ſeated under the eye, that it may give way to the other portion of the nerves of the third coniugation going to the parts of the face, and the teeth of the upper jaw. The fourth is at the beginning of the pallate, amongſt the cutting or ſhearing teeth, through which a veine, an artery and the coate of the pallate paſſes out. In the fifth order are reckoned the perforations of the pallate, by which the nerves deſcend from the fourth coniugation, to give, or cauſe the taſte. In the ſixt order are rancked the holes of the pallate ſerving for reſpiration, and the flegme falling from the braine by the noſethrils. And there is a cleft under the yoake bone aſcending into the Orbe of the eye, by which there is a way, as wel for the nerves of the third coniugation to the Temporall muſcles, as alſo for certaine veines and arteryes. But alſo there is noted another hole at the mammillary proceſſe, which is not perforated in the iudgement of the ſenſe. Beſides there is thought to be another at the hinde roote of the ſame proceſſe, by which a certaine ſmall veine paſſes from the Iugular to the *Torcular*. But I have onely noted theſe three paſſages by the way, becauſe there is ſo much variety in them, that nothing can be certainely ſaid of them.

CHAP. XII.

Of the Spinall Marrow, or Pith of the Backe.

What the Spinall marrow is.

THe ſpinall Marrow is like a River running from the fountaine of the braine. This ſends nerves for ſenſe and motion to all the neighbouring parts under the head, ſpreading its branches as from the body of a tree. Theſe branches, as we ſhall hereafter ſhew, are on each ſide thirty. This ſame ſpinall marrow is covered with the two membranes inveſting the braine, diſtinguiſhed by no diſtance of place, as in the braine. But alſo it hath another membrane added to theſe, being very hard and denſe, which keeps it from being broken and violated by the violent bending of the body forewards and about. The diſeaſes of this marrow doe almoſt cauſe the like Symptomes, as the diſeaſes of the braine; For they hurt the ſenſe and motion of all the parts lying beneath them, as for example; If any of the vertebra's of the back bone, be moved out of their place, there followes a diſtortion or wreſting aſide of the Marrow; but then eſpecially if it happen that one of the vertebra's be ſtrained, ſo ſharpe and bitter a compreſſion urges the marrow by reaſon of the bony body of the vertebra, that it will either rend it, or certainely hinder the paſſage of the ſpirit by it. But by theſe ſame holes of the vertebra's the veines and arteryes goe to the ſpinall marrow for to give life and nouriſhment to it, as the nerves by them paſſe forth into all the lower parts of the body.

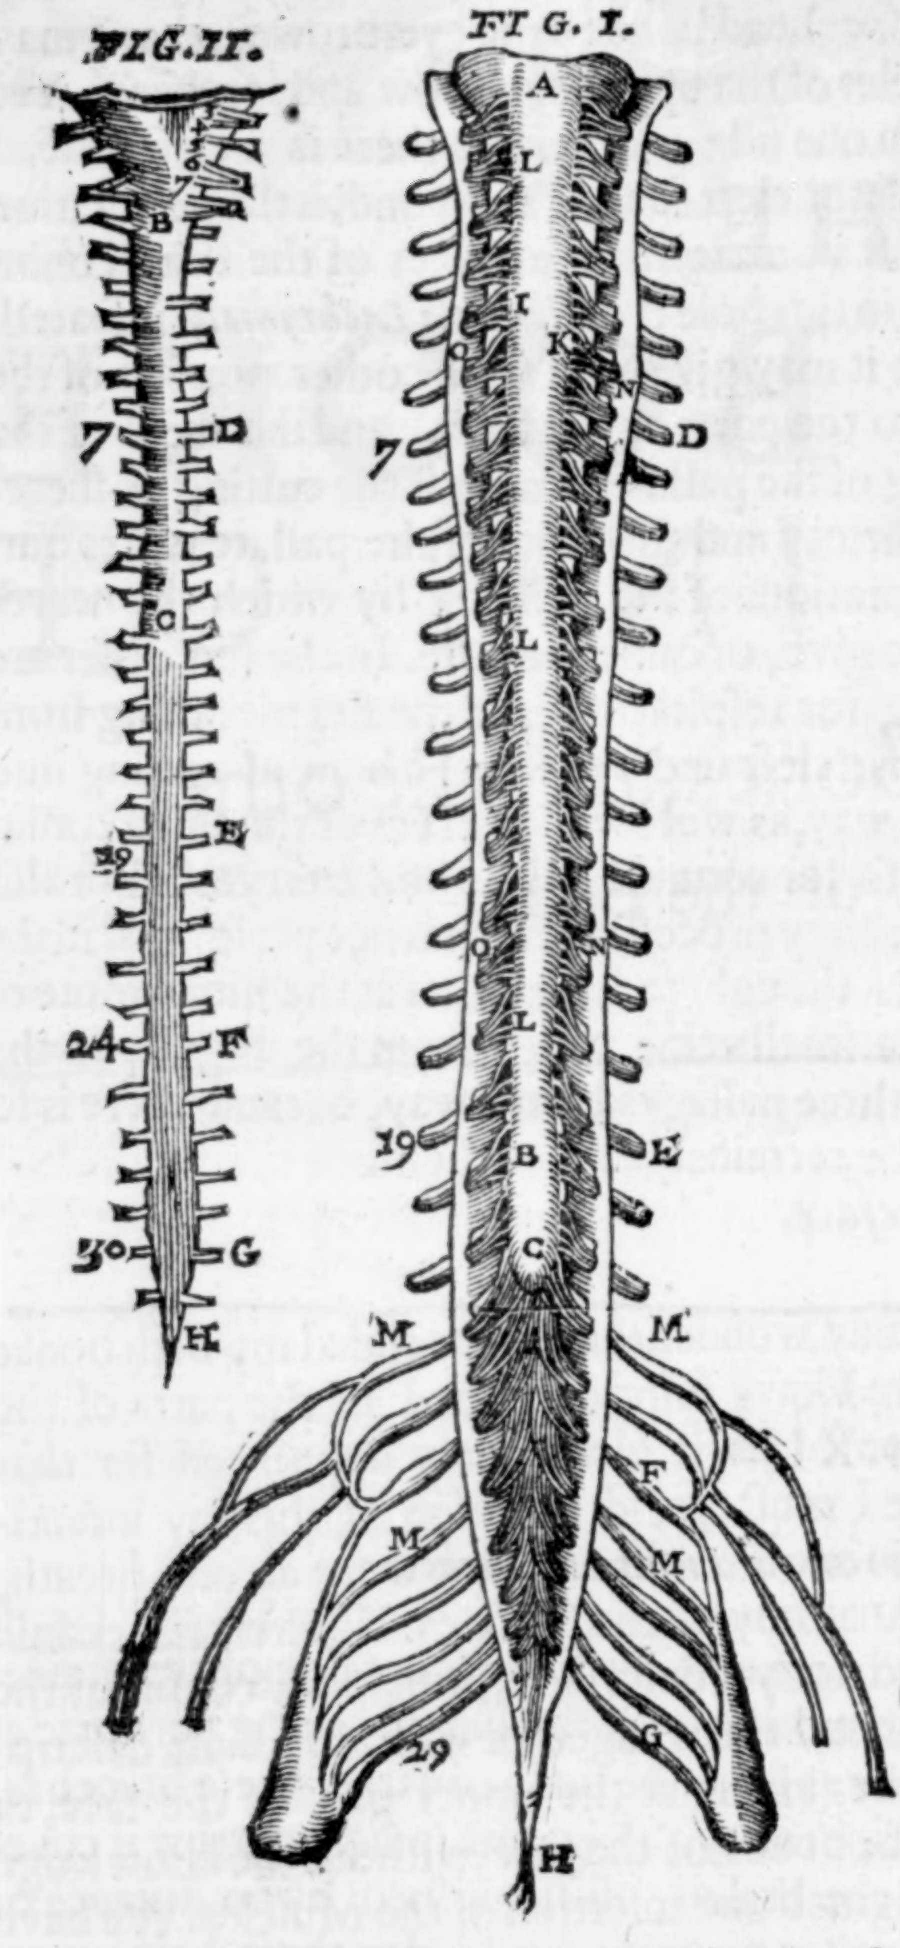
The coats of the ſpinall marrow.

The diſeaſes from the hurting of the ſpinall marrow.

Figure 1. ſheweth the forme of the ſpinall marrow properly ſo called, with its membranes, and the nerves proceeding from it.

Figure 2. The ſpinall marrow naked and bare, together with its nerves, as moſt part of Anatomiſts have deſcribed it.

The tenth figure of the ſpinall marrow.



A, The beginning of the ſpinall marrow where it fals out of the ſkull.

B, The thickneſſe thereof in the ſpondels or rack-bones of the loynes.

C, The diviſion thereof into ſtrings, or hairy threds.

D, the ſeven nerves of the necke.

From *D* to *E* or from 7, to 19, ſhew the nerves of the backe.

From *E* to *F*, the nerves of the loynes.

From *F* to *G*, the nerves of the *os ſacrum* or holy bone.

H, the end of the marrow.

IKL, do ſhew how the nerves doe iſſue from the marrow in ſtrings.

MM, the knots of the ſinewes made of the conjunction of thoſe ſtrings.

NO, the membranes that inveſt the marrow.

Figure 2.

A, The beginning of the ſpinall marrow in the ſcull.

3, 4, 5, 6, 7, Theſe Characters ſhew (according to *Veſalius* opinion) how the conjugations of the nerves of the braine doe take their originall from the marrow remaining yet within the Skull.

B, The egreſſe of the ſpinall marrow out of the ſkull.

C, The cords or ſtrings whereinto it is divided.

D 7, The marrow of the necke and ſeven paire of ſinewes. *E* 19, twelve paires or conjugations of nerves proceeding from the marrow of the Cheſt. *F* 24, The marrow of the loynes and 5. paire of ſinewes. *G* 30. the marrow of the holy-bone and 6, paire of ſinewes. *H*, the extremity or end of the ſpinall marrow.

The End of the Fifth Booke.

THE

THE SIXTH BOOKE TREATING OF the Muſcles and Bones, and the other Extreme parts of the Body.

The Preface.

PEradventure ſome may wonder, that I have ended my fifth booke of Anatomie, before I have fully deſcribed all the parts of the head, the which ſeemed as it were onely appointed for that purpoſe. Therefore I muſt yeeld a reaſon of this my intention. I have a deſire in one Treatiſe and as it were at one breath, to proſequute the Anatomy of the Muſcles. Wherefore becauſe the parts of the head not yet deſcribed, principally conſiſt of the Muſcles, therefore I deſired to comprehend them together with this ſame deſcription of the extreme parts of the body; beginning at the upper part of the face, to wit, the eyes: but having firſt deſcribed the bones of the face, without the knowledge of which it is impoſſible to ſhew the originall and inſertion of the Muſcles. We have formerly noted that by the face is meant whatſoever lyes from the Eye-browes even to the Chin. In which there is ſuch admirable induſtry of nature, that of the infinite multitude of men you cannot finde two ſo like, but that they may be diſtinguiſhed by ſome unlikeneſſe in their faces; alſo it hath adorned this part with ſuch exquiſite beauty, that many have dyed by longing to enjoy the beauty deſired by them. This ſame face albeit it little exceeds halfe a foote, yet it indicates and plainely intimates by the ſuddaine changes thereof, what affections and paſſions of hope, feare, ſorrow and delight poſſeſſe our minds; and what ſtate our bodyes are in, ſound, ſicke or neither. Wherefore ſeeing the face is of ſo much moment, let us returne to the Anatomicall deſcription thereof, which that wee may eaſily and plainely performe wee will begin with the bones thereof, whereby, as we formerly ſayd, the originall and inſertion of the Muſcles may be more certaine and manifeſt to vs.

The deſcription of the bones being unknowne, it muſt neceſſarily follow that the originall and inſertion of the muſcles muſt be ſo alſo

The endowments of the face.

The countenance is the bewrayer of the will.

CHAP. I.

Of the bones of the Face.

Bones in each orbe of the Eye.

What the *Zygoma* is and what uſe it hath.

The *Ægylops*.

The two bones of the noſe.

The two inner bones of the palate.

The bones of the face are 16, or 17, in number. And firſt, there be reckoned 6 about the Orbs of the eyes, that is 3 to each orbe, of which one is the bigger, another leſſer, and the third between both; each of theſe touch the forehead bone in their upper part. Beſides, the greater is joyned with a ſuture to the proceſſe of the ſtony bone, and ſo makes the *Zygoma*, that is, the *Os Iugale* or yoake bone, framed by nature for preſervation of the temporall muſcle. The leſſer is ſeated at the greater corner of the eye, in which there is a hole perforated to the noſe, and in this is the glandule in which the Ægylops doth breed. The middle is in the bottome, or inner part of the orbe, very ſlender & as it were of a membranous thinneſſe: then follow the two bones of the noſe which are joyned to the forehead bone by a ſuture, but on the foreſide between them ſelves by harmony. But on the backe or hinde part with two other bones, on each ſide one, which deſcending from the bone of the forehead (to which alſo they are joyned by a ſuture) receive all the teeth. Theſe two in *Galens* opinion are ſeldome found ſeparated. But theſe are the thickeſt of all the bones of the face hitherto mentioned, knit by a ſuture with the greateſt bone of the Orbe, on the backe part with the wedge-bone, on the inner ſide with the two little inner bones of the pallate, which on the inſide make the extremity thereof, whereby it comes to paſſe, that we may call theſe bones the hinder, or inner bones of the pallate. They reckon one of theſe bones the eleventh and the other the twelfth bone of the head; theſe two little bones on their ſides next to the winged productions of the wedge-bone, receive on each ſide one of the nerves of the fourth conjugation, which in the former booke, we ſaid were ſpent upon the membrane of the pallate.

The two bones of the Iaw.

Two productions on each ſide of the lower Iaw.

And in *Galens* opinion there be other two in the lower Iaw, joined at the middle of the chin; although ſome thinke it but one bone, becauſe by the judgement of ſenſe there appeares no diviſion or ſeparation therein. But you may ſee in children how true this their ſuppoſition is, for in men of perfect growth it appeares but one bone; theſe two are reckoned for the thirteenth and fourteenth bones. Now theſe two bones making the lower Iaw, have in their back part on each ſide two productions, as they lye to the upper Iaw, the one of which repreſents the point of a ſword, and is called the *Corone*; the other is obtuſe and round, which is inſerted into the cavity ſeated at the root of the proceſſe of the ſtony bone, nere to the paſſage of the eare.

The Luxation of the lower Iaw.

This may be ſtrained to the forepart by violent gaping, by retraction of the muſcles ariſing from the wing-like proceſſes, and ending at the lower angles of the broader part of the ſame Iaw.

The lower Iaw filled with a marrowy humor.

How the teeth feele.

Why the teeth have a beating paine.

This Iaw is hollow as alſo the upper, eſpecially in the back-part, being filled with a white and glutinous humor, conducing to the growth of the teeth. This humor hath its matter from the blood brought thither by the veſſels, veines, Arteryes and nerves from the third coniugation entring in here by a paſſage large enough. Whereby it comes to paſſe, that this part is not only nouriſhed and lives, but alſo the teeth receive ſence by the benefit of the nerves entring thither with the veine and artery, by ſmall holes to be ſeene at the lower roots of the teeth; and thence it is that a beating paine may be perceived in the tooth-ach, becauſe the defluxion may be by the arteryes; or rather becauſe the humor flowing to the roots of the teeth may preſſe the artery in that place; beſide alſo you may ſee ſome apparance of a nervous ſubſtance in the root of a tooth newly pluckt out.

The nerves of the Lower Iaw muſt be obſerved.

But alſo you muſt conſider, that this Iaw from its inner capacity produces at the ſides of the chin two nerves of a ſufficient magnitude, over againſt the lower dog-teeth and the firſt of the ſmaller grinding teeth, as I have noted in the deſcription of the nerves of the third coniugation. I have thought good to put thee in minde of theſe, that when thou ſhalt have occaſion to make inciſion in theſe places, thou maieſt warily and diſcreetly handle the matter, that theſe parts receive no harme.

The bone of the noſe above the pallate, or the partition of the noſe.

There remaines another bone ſeated above the pallate, from which the griſtlely partition of the noſe ariſes, being omitted of all the Anatomiſts; for as much as I know. Now therefore that you may the better remember the number of the bones of the face, I will here make a repetition of them.

There are ſixe of the orbs of the eyes, at each three. The ſeventh and eight wee may call the Naſall, or noſe bones. The ninth and tenth the Iaw-bones. The eleventh and twelfth are called the inner bones of the pallate. The thirteenth and fourteenth the bones of the lower Iaw. The partition of the noſe may be reckoned the fifteenth.

Now it remaines having ſpoken of theſe bones, that wee treate of the teeth, the Eye-browes, the skinne, the fleſhy pannicle, the Muſcles, and laſtly the other parts of the face.

Chap. II.

Of the Teeth.

The teeth are bones.

The ſhearing teeth.

The Dogteeth

THe Teeth are of the number of the bones, and thoſe which have the moſt have thirty two, that is, ſixeteene above, and ſo many belowe; of which in the forepart of the mouth there are foure above and as many beneath, which are called *Inciſorij* cutting or ſhearing teeth, to cut in ſunder the meat, and they have but one root. To theſe are ioyned two in each Iaw, that is, on each ſide of the other one, which are called *Canini dentes*, Dogges-teeth, becauſe they are ſharp and ſtrong like dogges teeth; theſe alſo have but one roote, but that is farre longer than the other have.

The Grinding teeth.

Why the upper grinding teeth have more rootes.

The uſe of the teeth.

follow the *Molares* or Grinders, on each ſide five, that is, tenne above and as w, that they may grinde, chaw and breake the meat, that ſo it may be the cocted in the ſtomack; for ſo they vulgarly thinke, that meat well chawed cocted; thoſe grinders which are faſtened in the upper jaw, have moſt com- ee roots, and oft times foure. But theſe which are faſtened in the lower, have roots, and ſometimes three, becauſe this lower jaw is harder than the up- nat it cannot be ſo eaſily hollowed, or elſe becauſe theſe teeth being fixed and y ſeated, needed not ſo many ſtayes as the upper, which as it were hang out of ſeats. The ſhearing teeth cut the meat becauſe they are broad and ſharp; the -teeth break it becauſe they are ſharp pointed and firme; but the grinders being , broad and ſharp, chaw and grind it aſunder. But if the grinders had beene ſmooth, ey could not fitly have performed their duty, for all things are chawed and broken aſunder more eaſily by that which is rough and unequall.

Wherefore they ſharpen their Milſtones when they are ſmoother than they ſhould be, by picking them with a ſharp Iron. The teeth are faſtened in the jawes by *Gomphoſis*, that is, as a ſtake or naile, ſo are they fixed into the holes of their jawes; for they adhere ſo firmely thereto in ſome, that when they are pluckt out, part thereof followes together with the tooth; which I have often obſerved to have beene alſo with great effuſion of blood. This adheſion of the teeth faſtened in their jawes is beſides ſtrengthened with a ligament, which applyes it ſelfe to their roots together with the nerve and veſſels. The teeth differ from other bones; becauſe they have action whileſt they chaw the meat; becauſe being loſt they may be regenerated, and for that they grow as long as the party lives, for otherwiſe by the continuall uſe of chawing they would be worne and waſted away by one another. You may perceive this by any that have loſt one of their teeth, for that which is oppoſite to it becomes longer than the reſt, becauſe it is not worne by its oppoſite. Beſides alſo they are more hard and ſolide than the reſt of the bones, and indued with a quick ſenſe by reaſon of the nerves of the third conjugation which inſert themſelves into their roots; for if you rub, or grind a tooth newly pluckt out, you may ſee the remaines of the nerve; they have ſuch quick ſenſe, that with the tongue they might judge of taſtes. But how feele the teeth, ſeeing they may be filed without paine? *Fallopius* anſweres, that the teeth feele not in their upper or exterior part, but only by a membrane which they have within. And

The teeth are faſtened in the Iawes by *Gomphoſis*.

The faſtening of the teeth into the Iawes is to be obſerved.

Wherein the teeth differ from the other bones.

For what uſe the teeth have ſenſe.

The foreteeth helpe for the articulation of the voyce.

the teeth have another uſe, eſpecially the fore-teeth, which is, they ſerve for diſtinct and articulate pronuntiation; for thoſe that want them faulter in ſpeaking, as alſo ſuch as have them too ſhort, or too long, or ill rancked. Beſides, children ſpeak not diſtinctly before they have their foreteeth. And you muſt note that the infant as yet ſhut up in its mothers womb hath ſolide and bony teeth; which you may perceive by diſſecting it preſently after it is borne.

But even as there are two large cavities, in the forehead bone at the eye-browes, filled with a viſcous humor, ſerving for the ſmelling; and in like manner, the aire ſhut up in the mamillary proceſſes is for hearing; ſo in the jawes there be two cavities furniſhed with a viſcide humor for the nouriſhment of the teeth.

Chap. III.

Of the Broade Muſcle.

NOw we ſhould proſecute the containing parts of the face, to wit the skin, the fleſhy pannicle and fat; but becauſe they have beene ſpoken of ſufficiently before, I will onely deſcribe the fleſhy pannicle, before I come to the diſſection of the eye, that wee may the more eaſily underſtand, all the motions performed by it, whether in the face or forehead.

Firſt that you may more eaſily ſee it, you muſt curiouſly ſeparate the skin in ſome part of the face. For unleſſe you take good heed, you will pluck away the fleſhy pannicle together with the skinne, as alſo this broad muſcle to which it immediatly adheres, and in ſome places ſo cloſly and firmely, as in the lips, eye-lids and t ole forehead, that it cannot be ſeparated from it. Nature hath given motion ing force to this broad muſcle, that whileſt it extends, or contracts it ſerve to ſhut and open the eye. It will be convenient to ſeparate the mu from the skin, beginning from the forepart of the clavicles even to th ing in a right line, and then turning backe as far as you can; for thus how it mixes it ſelfe with the skinne and the muſcles of the lips.

There are no particular muſcles appointed to open and ſhut the eye, for that is the worke of the broad muſcle onely. Divers reaſons to that purpoſe.

When thou ſhalt come to the Eyes, thou ſhalt teach how the eye is ſhu by this one muſcle, becauſe it is compoſed of the three ſorts of fibers; the opinion of all who have hitherto written of Anatomy, thoſe actions be performed by the power of two muſcles appointed for that purpoſe; one is at the greater corner on the upper part, the other reſembling a ſemicircle leſſer corner, from whence extending it ſelfe to the midle of the griſtle *Tarſus* meets with the former ending there, but they are in part extended over all the eye, whereby it commeth to paſſe that it alſo in ſome ſort becometh moveable. But although in publike diſſections theſe two muſcles are commonly wont to be ſolemnly ſhewed, after the manner I have related; yet I thinke, that thoſe which ſhew them know no more of them, than I doe. I have grounded my opinion from this, that there appeares no other muſculous fleſh in theſe places, to thoſe which ſeparate the fleſhy pannicle, or broad muſcle, than that which is of the panicle it ſelfe, whether you draw your inciſion knife from the forehead downewards, or from the cheeke upwards.

Why you muſt take heede of making a tranſverſe inciſion upon the eye-browes.

Beſides when there is occaſion to make inciſion on the eye-browes, we are forbidden to doe it tranſverſe, leaſt this broad muſcle falling upon the eye, make the upper Eye-lid unmoveable: but if ſuch a cut be received accidentally, we are commanded preſently to ſtitch it up; which is a great argument that the motion of the upper eye-lid is not performed by its proper muſcles, but wholy depends and is performed by the broad muſcle. Now if theſe ſame proper muſcles which we have deſcribed ſhould be in the upper eye-lid, it ſhould be meet, (becauſe when one of the muſcles is in action, the other which is its oppoſite or Antagoniſt, reſts or keeps holiday,) that when that which is ſaid to open the eye is imployed, the oppoſite thereof reſting, the upper eye-lid ſhould be drawne towards its originall, as we ſee it happens in convulſions: becauſe the operation of a muſcle is the collection of the part which it moves towards its originall.

The action of a muſcle.

Therefore ſeeing ſuch a motion or collection appears not any where in the eye-lid, I thinke it therefore manifeſt that all the motion of this upper eye-lid depends upon this broad muſcle, and that it alone is the author of the motion thereof.

The originall of this broad muſcle is from the upper part of the *Sternon*, the clavicles, the ſhoulder blades, and all the ſpines of the *vertebra's* of the neck: but it is inſerted into all theſe parts of the head which want haire, and the whole face, having diverſe fibers from ſo various an originall. by benifit of which it performes ſuch manifold motions in the face (for it ſo ſpreads it ſelfe over the face, that it covers it like a vizard) by reaſon of the variety of the originall and the production of the divers fibers of this muſcle. But I have not in the deſcription of this muſcle proſecuted thoſe nine conditions, which in the firſt booke of my anatomy I required in every part, becauſe I may ſeeme to have ſufficiently declared them in the deſcription of the muſcles of the *Epigaſtrium*. Wherfore hence forward you muſt expect nothing from me in the deſcription of muſcles beſides their originall, inſertion, action, compoſition, and the deſignation of their veſſels.

The originall of the broad muſcle.

The inſertion and reaſon why we expreſſe ſo many motions with the face.

Chap. IIII.

Of the Eye-lids and Eye-browes.

Becauſe wee have fallne into mention of the Eye-lids and Eye-browes, and becauſe the order of diſſection alſo requires it, we muſt tell you what they are, of what they conſiſt, and how and for what uſe they were framed by nature. Therefore the Eye-browes are nothing els, than a ranck of haires ſet in a ſemicircular forme upon the upper part of the orbe of the Eye, from the greater to the leſſer corner thereof, to ſerve for an ornament of the body and a defence of the eyes againſt the acrimony of the ſweat falling from the forehead.

What the eye-browes are.

Their uſe.

But the Eye-lids on each ſide two, one above and another below, are nothing els than as it were certaine ſhuttings appointed and made to cloſe and open the eyes when need requires, and to containe them in their orbes. Their compoſure is of a muſculous skin, a griſtle and haires ſet like a pale at the ſides of them to preſerve the eyes when they are open, chiefly againſt the injuries of ſmall bodyes, as motes, duſt & ſuch like. Theſe haires are alwaies of equall and like bigneſſe, implanted at the edges of the griſtly part, that they might alwaies ſtand ſtraight and ſtiffe out. They are not thick, for ſo they ſhould darken the eye. The griſtle in which they are faſtened is encompaſſed with the *pericranium* ſtretched ſo far before it produce the *Coniunctiva*. It was placed there, that when any part thereof ſhould be drawne upwards or downewards by the force of the broad muſcle or of the two proper muſcles, it might follow entirely and wholy by reaſon of its hardnes. They call this ſame griſtle, eſpecially the upper, *Tarſus*. The upper and lower eye-lid differ in nothing, but that the upper hath a more manifeſt motion, and the lower a more obſcure; for otherwiſe nature ſhould have in vaine encompaſſed it with a muſculous ſubſtance.

What the eye-lids are.

Their compoſure and uſe.

What the Tarſus is.

Chap. V.

Of the Eyes.

The Eyes are the inſtruments of the faculty of ſeeing, brought thither by the viſive ſpirit of the opticke nerves, as in an aqua-ducte. They are of a ſoft ſubſtance, of a large quantity, being bigger or leſſer according to the bigneſſe of the body. They are ſeated in the head, that they might overlooke the reſt of the body, to perceive and ſhun ſuch things as might endanger, or endamage the body; for the action of the eyes is moſt quick, as that which is performed in a moment, which is granted to none of the other ſenſes. Wherefore this is the moſt excellent ſenſe of them all. For by this wee behold the fabricke and beauty of the

What the eyes are.

Their ſite.

The quicknes and excellency of their action.

heavens and earth, diſtinguiſh the infinite varietyes of colours, we perceive and know the magnitude, figure, number, proportion, ſite, motion and reſt of all bodyes. The eyes have a pyramidall figure whoſe baſis is without, but the Cone or point within at the opticke nerves. Nature would have them contained in a hollow circle, that ſo by the profundity and ſolidity of the place they might be free from the incurſions of bruiſing and hurtfull things.

Figure.

Compoſition.

They are compoſed of ſix muſcles, five coats, three humors, and a moſt bright ſpirit, (of which there is a perpetuall afflux from the braine) two nerves, a double veine, and one artery, beſides much fat, and laſtly a Glandule ſeated at the greater angle thereof, uppon that large hole which on both ſides goes to the noſe, and that, leſt that the humours falling from the braine ſhould flow by the noſe into the eyes, as we ſee it fares with thoſe whoſe eyes perpetually weep, or water, by reaſon of the eating away of this glandule, whence that affect is called, the *Fiſtula lachrymalis*, or weeping Fiſtula.

Glandula Lachrymalis.

Fiſtula Lachrymalis.

Why fat is placed about the eyes.

But there is much fat put between the muſcles of the eye, partly that the motion of the eyes might be more quick, in that ſlipperines of the fat, as alſo that the temper and complexion of the eyes, and chiefly of their nervous parts, might be more conſtant and laſting, which otherwiſe by their continuall and perpetuall motion would be ſubject to exceſſive dryneſſe. For nature, for the ſame reaſon hath placed Glandules flowing with a certaine moiſture, neere thoſe parts which have perpetuall agitation.

Chap. VI.

Of the Muſcles, Coats and humors of the Eye.

The number, ſite and action of the muſcles.

There are ſixe muſcles in the eye, of which foure performe the foure direct motions of the eye: they ariſe from the bottome of the orbe, and end in the midſt of the eye encompaſſing the opticke nerve. When they are all moved with one endevour, they draw the eye inwards. But if the upper only uſe its action, it drawes the eye upwards; if the lower, downewards; if the right, to the right ſide; if the left, to the left ſide.

The two other muſcles turne the eye about, the firſt of which being the longer and ſlenderer, ariſes almoſt from the ſame place, from which, that muſcle ariſes which drawes the eye to the right ſide to the greater corner. But when it comes to the utmoſt part of the inner angle, where the *Glandula lachrymalis* is ſeated, it ends in a ſlender Tendon, there peircing through the middle membrane which is there, as through a ring; from whence it preſently going backe is ſpent in a right angle towards the upper part of the eye, betwixt the inſertions of thoſe 2 muſcles, of the which one draws the eye upwards, the other directly to the outward corner, as it is obſerved by *Fallopius* or rather, which I remember I have alwaies obſerved, they turne between the muſcles which move the eye upwards, and to the inner corner.

This fifth muſcle when it is drawne in towards its beginning, ſo drawes the eye with its circular tendon, that it carries it to the greater corner.

The ſixt muſcle is contrary to that; for it hath its originall from the lower part of the orbe at a ſmall hole, by which a nerve of the third conjugation paſſes forth; and being that it is moſt ſlender, whileſt it aſcends tranſverſely to the outward corner, it involves the eye ſo alſo, that it is inſerted in it by a ſmall Tendon, ſo that the Tendons of them both are oftentimes taken but for one. That thou maieſt truely and accurately obſerve this anatomicall deſcription of the eye; the eye muſt not be pluct out of its orbe, but rather the orbe it ſelfe muſt be broken and ſeparated.

For thus thou ſhalt certainlie and plainelie ſee the forementioned originall of the muſcles. For the five coats, the firſt which is firſt met with in diſſection, comes from the pericranium, and is extended over all the white of the eye, even to the *Iris* or Rain-bow. The duty of it is to ſtrengthen, bind and containe the eye in its orbe, wherefore it had the name *Coniunctiva*, others call it *Adnata*, or *Epipephyces*.

The 5 coats of the eye.

1 *Conjunctiva, or Adnata.*

The

2. *Cornea*, or the Horny coate.

The ſecond is called the *Cornea*, becauſe it reſembles a horne in colour and conſiſtence; this coat differs and varyes from it ſelfe, for in the forepart, as far as the *Iris* goes, it is clear and perſpicuous, but thick & obſcure in the hinde part, by reaſon of the diverſe poliſhing. On the fore-part it is denſe that it may preſerve and containe the Chriſtalline and wateriſh humor, but withall tranſparent ſo to give the object a freer paſſage to the Chryſtalline. It hath its originall from the *Craſſa meninx*, proceeding forth from the inner holes of the orbe of the eye, for it compaſſes the eye on every ſide.

3 *Vvea*, or the grapye coate.

The third is called the *Vvea* or Grapy coat, becauſe in the exterior part it repreſents the colour of a black grape; it ariſes from the *Pia mater*, and encompaſſes all the eye, except the *pupilla* or apple of the eye, for here being perforated, it adheres to the horny coate by the veines and arteries which it communicates to it for life and nouriſhment. But when it arives at the *Iris*, then forſaking the *Cornea*, it deſcends deep into the eye, and in ſome ſort is turned about the Chriſtalline humour, to which alſo it moſt firmely adheres, ſo bounding the wateriſh humor, and alſo prohibiting that the Albugineous humor doe not overwhelme the Chriſtalline. This grapy coate is as it were dyed on the inſide with divers colours, as black, browne, blew, or green like a raine-bow, and that for theſe enſuing benifits.

Why the grapy coate reſembles divers colours.

The firſt is, if that it had beene tinctured with one colour, all objects would have appeared of the ſame colour, as it comes to paſſe when we looke through green or red glaſſe. But it muſt be coloured, that ſo it may collect the ſpirits diſſipated by the Sunne and ſeeing.

Thirdly it was convenient it ſhould be painted with infinite variety of colours for the preſervation of the ſight. For as the extreame colours corrupt and weaken the ſight, ſo the middle refreſh and preſerve it, more or leſſe as they are neerer, or further remote from the extremes. It was fit it ſhould be ſoft, that ſo it might not hurt the Chriſtalline humor uppon whoſe circumference it ends; and perforated in the part objected to it, leaſt by its obſcurity it ſhould hinder the paſſage of the objects to the Chriſtalline, but rather that it might collect by its blacknes as a contrary, the great and as it were diffuſed varietye of colours, no otherwiſe than wee ſee the heat is ſtrengthened, by the oppoſition of cold; ſome call this coat *Choroides*, becauſe it is woven with many veines and arteries, like the coat *Chorion* which involves the infant in the wombe.

4 *Amphibliſtroides* or *Retiformis*, Net-like coate.

Now followes the fourth coate called *Ampibliſtroides* or *Retiformis*, the Net-like coate, becauſe proceeding from the opticke nerve dilated into a coate, it is woven like a net with veines and arteries which it receives from the grapy coate, both for the life and nouriſhment both of its ſelfe, as alſo of the glaſſie humor which it encompaſſes on the back part. The principall commodity of this coate is, to perceive when the Chriſtalline humor ſhall be changed by obiects, & to leade the viſive ſpirit inſtructed or furniſhed with the faculty of ſeeing, by the mediation of the glaſſie humor, even to the Chriſtalline being the principall inſtrument of ſeeing. It is ſofter than any other coate, leaſt the touch of it ſhould offend that humor. Wherein thou wilt admire the ſingular order of nature, which as in other things it paſſes not from one extreme to another unleſſe by a *Medium*, ſo here it hath not fitted the hard horny coate to the ſoft humors, but by interpoſition of divers *media* of a middle conſiſtence. For thus after the harder coats *Adnata* and *Cornea* it hath placed the Grapy coate, by ſo much ſofter then theſe two, as the Net-like coat is ſofter then it, that thus it might paſſe from extreme to extreme as it were by theſe degrees of hardnes and ſoftnes.

An anatomicall Axiome.

5 *Arachnoides*, *ſive Araneoſa*, the Cowebs coate.

The fifth and laſt coate is called *Arachnoides*, becauſe it is of the conſiſtence of a ſpiders web. And wee may well reſemble this coate, to that skin of an union which exceeds the other in clearneſſe, whiteneſſe and thinneſſe. This *Araneoſa* or Cobweb-like coate encompaſſes the Chriſtalline humor on the fore ſide, peradventure that ſo it might defend it, as the chiefe inſtrument of ſeeing, if the other humors ſhould at any time bee hurt. It hath its originall from the excrementitious humidity of the Cryſtalline humor, hardened into that coate by the coldnes of the adjacent parts; abſolutely like the thin skin which encompaſſes the white of an Egge.

The 3 humors of the Eye.

1 *Aqueus*, or watery.

The firſt humor of the eye is called the *Aqueus* or wateriſh, from the ſimilitude of water; it is ſeated betweene the tranſparent part of the Horny coate, the portion

of

of the Chriſtalline humor lying towards the apple of the eye, and that reflection of the Grapy coate which comes from the *Iris* to the circumference of the Chryſtalline humor, that filling the empty ſpace it may diſtend the *Cornea*, and ſo hinder the falling thereof upon the Chryſtalline which would ſpoyle the ſight; as alſo that by its moiſture it might hinder the drying of the Chryſtalline humor. Peradventure it is made of the whayiſh humor ſweating out of the veſſells of the coats, having their orifices for the moſt part in that place, where this wateriſh humor reſides. The ſecond humor and middle moſt in ſcituation is called the Chryſtalline becauſe it imitats Cryſtall in the brightneſſe and colour; if ſo be that we may attribute any colour to it. For indeed it was fit that none of the three humors ſhould be tinctured with any colour, as thoſe which ſhould be the inſtruments of ſight, leſt they might beguile us in ſeeing as Red and greene ſpectacles doe; for that is true which wee have read written by the Philoſopher; That the Subject or matter appointed for the reception of any forme ſhould want all impreſſion thereof. Hence Nature hath created a formeleſſe matter, the humors of the eyes without colours, waxe without any figure, the minde without any particular knowledge of any thing, that ſo they might be able to receive all manner of formes. The figure of the Cryſtalline humor is round, yet ſomwhat flatted on the foreſide, but yet more flatted behinde that ſo the objects might be the better retained in that, as it were, plane figure, and that they might not fly backe as from a Globe, or round body, in which they could make but ſhort ſtay; leſt it might be eaſily moved from its place, by the force of any thing falling or hitting againſt it, becauſe that body which is exactly round touches not a plane body but onely in a point or pricke. Halfe this humor ſwims in the Glaſſy humor, that ſo it may be nouriſhed from it by tranſpoſition of matter; or rather (ſeeing it is encompaſſed on every ſide with the fiſt coate, that the matter cannot eaſily be ſent from the one into the other) by the benefit of the veſſels produced even unto it as well by the Net-like coate, as by the Grapye; but it is filled with a bright ſpirit on the forepart, which lyes next to the wateriſh humor, and the ſpace of the Apple of the eye.

2 Cryſtallinus, Cryſtalline.

A Philoſophicall Axiome.

Gal. Cap. 5 lib. 10. de uſu part.

Of which thing this is an argument, that as long as a man remaines alive, wee ſee the eye every way full, and ſwollne, but lanke and wrinkled when he is dead; beſides alſo one of the eyes being ſhut, the *Pupilla* of the other is dilated by the ſpirit compelled to fly thither. And alſo for the ſame cauſe the horny coate is wrinkled in very old men, and the *Pupilla* is ſtraitned by the wrinkles ſubſiding into themſelves, which is the cauſe that they ſee litle, or not at all; for by age and ſucceſſe of time the humor is conſumed by litle and litle, the implanted ſpirit vaniſhes away, and ſmaller quantitie of ſpirits flow from the braine, as from a fountaine which is alſo exhauſted. The Horny coate at his originall, that is, in the parts next the *Iris*, ſeemeth to be very nigh the Cryſtalline Humor, becauſe all the coates in that place mutually cohere as touching one another, but as it runnes further out to the *Pupilla*, ſo it is further diſtant from the Criſtalline. Which you may eaſily perceive by Anatomicall diſſection, and the operation of touching or taking away a Catarrhact: for whereas a Catarrhact is ſeated betweene the horny coate, and Cryſtalline humor, the needle thruſt in, is carried about upwards, downewards, and on every ſide through a large and free ſpace, neither touching the horny coate nor Cryſtalline humor, by reaſon theſe bodies are ſevered by a good diſtance filled with ſpirit and a thin humor. The uſe of it is, that it may be like a looking-glaſſe to the facultie of ſeeing carried thither with the viſive ſpirit.

In what place Catarrhacte or ſuffuſion breeds.

3 *Vitreus ſeu Albugineus*, that is Glaſſie, or like the white of an Egge.

The third and laſt humor is the *Vitreus* the glaſſie, or rather Albugineous humor, called ſo, becauſe it is like molten glaſſe, or the white of an Egge. It is ſeated in the hind part of the Cryſtalline humor that ſo it may in ſome ſort breake the violence of the ſpirit flowing from the braine into the Cryſtalline humour, no otherwiſe than the watry humor is placed on the foreſide of the Cryſtalline to hinder the violence of the light and colours entering that way. This glaſſie humor is nouriſhed by the net-like coate.

The veines of the eye.

We have formerly ſpoken ſufficiently of the nerves of the eye: Wherefore it remaines that we ſpeake of the veines. Some of theſe are internall, carried thither with the

What veines may be opened in what inflammations of the eyes.

the coats of the veſſels of the braine; other ſome externall ſtretched over the externall parts of the eye, as the Muſcles, and coat *Adnata*, and by theſe veines inflammations and reddneſſe often happen in the externall parts of the eye: for which the *Vena pupis* muſt be opened, and cupping glaſſes and hornes muſt be applied to the nape of the necke and ſhoulders; as in the internall inflammations of the eye the cephalike veine muſt be opened to avert and evacuate the morbificke humor.

Chap. VII.

Of the Noſe.

THe Noſe is called in Greeke *Ris*, becauſe the excrements of the Braine flow forth by this paſſage, thou maieſt underſtand it hath a divers ſubſtance by compoſition. The quantity, figure and ſite are ſufficiently knowne to all. But it is compoſed of the skinne and muſcles, bones, griſtles, a membrane or coate nerves, veines and arteryes. The skin and bones both contained and containing, have formerly beene explained, as alſo the nerves, veines and arteries. The griſtles of the Noſe are ſixe in number; the firſt is double ſeperating both the noſe-thrils in the top of the noſe extended even to the bone *Ethmoides*. The ſecond lyes under the former. The third and fourth are continued to the two outward bones of the noſe. The fifth & ſixth being very ſlender and deſcending on both ſides of the noſe, make the wings or moveable parts thereof. Therefore the uſe of theſe griſtles is, that the noſe moveable about the end thereof, ſhould be leſſe obnoxious to externall injuryes, as fractures & bruſes, and beſides more fit for drawing the aire in & expelling it forth in breathing. For nature for this purpoſe hath beſtowed foure muſcles upon the noſe, on each ſide two, one within, and another without.

The Griſtles of the noſe.

The muſcles thereof.

The Externall taketh its originall from the cheeke, and deſcending obliquely from thence and after ſome ſort annexed to that which opens the upper lip, is terminated into the wing of the noſe, which it dilates.

The internall going on the inner ſide from the jaw bone, ends at the beginning of the griſtles that make the wings, that ſo it may contract them. The coate which inwardly inveſts the noſe-thrils and their paſſages, is produced by the ſive-like bones from the *Craſſa meninx*, as the inner coate of the Palate, throtle, weazon, Gullet and inner ventricle, that it is no mervaile, if the affects of ſuch parts be quickly communicated with the braine. This ſame coate on each ſide receives a portion of a nerve from the third conjugation, through the hole which deſcends to the noſe by the great corner of the eye.

The temper, action and uſe.

The noſe in all the parts thereof is of a cold and dry temper. The Action and profit thereof is to carry the aire and oft times ſmells to the mammillary proceſſes, and from thence to the foure ventricles of the braine, for the reaſons formerly ſhewed. But becauſe the mammillary proceſſes being the paſſages of the aire and ſmells are double, & for that one of theſe may be obſtructed without the other, therfore nature hath alſo diſtinguiſhed the paſſage of the noſe with a griſtly partitiõ put between, that when the one is obſtructed, they aire by the other may enter into the braine for the generation and preſervation of the animall ſpirit. The two holes of the noſe firſt aſcend upwards; and then downewards into the mouth, by a crooked paſſage, leſt the cold aire, or duſt ſhould be carryed into the lungs. But the noſe was parted into two paſſages as we ſee, not onely for the forementioned cauſe, but alſo for helping the reſpiration and vindicating the ſmell from externall injuryes, and laſtly for the ornament of the face.

Why the noſe was parted in two.

Chap. VIII.

Of the muſcles of the face.

There number.

NOw we muſt deſcribe the muſcles of the face pertaining as well to the lips as to the lower jaw. Theſe are 18. in number, on each ſide nine, that is, foure of the lips, two of the upper, and as many of the lower. But there belong five to the lower jaw. The firſt of the upper lip being the longer, and narrower, ariſeing from the yoake-bone deſcends by the corner of the mouth to the lower lip, that ſo it may bring it to the upper lip, and by that meanes shut the mouth. The other being shorter and broader, paſſing forth of the hollownes of the cheeke, or upper jaw (by which a portion of the nerves of the third conjugation deſcends to theſe two muſcles, and other parts of the face) ends in the upper part of the ſame upper lip, which it compoſes together with the fleshy pannicle and skin, and it opens it by turning up the exteriour fibers towards the noſe, and shuts it by drawing the internall inwards towards the teeth.

The firſt of the lower lip being the longer and ſlenderer, entring out of that region which is between the externall perforation of the upper jaw (through which on the inner part of the ſame, a nerve paſſeth forth to the ſame muſcles) and the muſcle *Maſſeter,* (of which hereafter) then aſcending upwards by the corner of the mouth, it ends in the upper lip, that ſo it may draw it to the lower.

The other broader and ſhorter begins at the lower part of the Chin and the hollownes thereof, and ends at the lower lip which it makes, opening it within and without by its internall and externall fibers, as we alſo ſaid of its oppoſite. And that I may ſpeake in a word, Nature hath framed three ſorts of Muſcles for the motion of the mouth, of which ſome open the mouth, others shut it, and otherſome wreſt it and draw it awry; but you muſt note that when the muſcles of one kind joyntly performe their functions (as the 2 upper which we deſcribed in the firſt place, on each ſide one which draw the lower lip to the upper, and the muſcles oppoſite to them) they make a right or ſtraight motion; but when either of them moves ſeverally, it moves obliquely, as when we draw our mouth aſide. But theſe muſcles are ſo faſtened and fixed to the skin, that they cannot be ſeperated; ſo that it is no great matter whether you call it a muſculous skin, or a skinny muſcle (Which alſo takes place in the palmes of the hands and ſoles of the feet) but theſe muſcles move the lips, the upper jaw being not moved at all.

Chap. IX.

Of the Muſcles of the lower Iaw.

Their number

The Temporall Muſcle.

WE have ſaid theſe muſcles are five in number, that is, foure vvhich ſhut it, and one which opens it, and theſe are alike on both ſides. The firſt and greater of theſe foure muſcles vvhich ſhut the Iavv is called *Crotophita* or Temporall muſcle; it ariſes from the ſides of the forehead and *Bregma* bones, and adhering to the ſame and the ſtony bone, it deſcends under the yoak-bone, from vvhence it inſerts it ſelfe to the proceſſe of the lovver Iavv vvhich the Greeks call *Corone*, that it may dravv it directly to the upper, ſo to ſhut the mouth.

Why the wounds of the temporall Muſcle are deadly.

But you muſt note, that this muſcle is tendinous even to his belly, and that it fils and makes both the temples. It is more ſubject to deadly wounds than the reſt by reaſon of the multitude of nerves diſperſed over the ſubſtance thereof, which becauſe they are nere their originall, that is, the braine, they inferre danger of ſuddaine death by a convulſion which uſually follows the affects of this muſcle; but alſo in like manner it cauſes a fever, the Phrenzy and *Coma.*

The Figure of the chiefe muſcles of the Face.

B. *The Temporall muſcle.*

α.β.γ. *his ſemicircular originall.*

D. *The muſcle of the upper lip.*

G. *The yoake-bone under which the temporall muſcles paſſe.*

I. *The Maſſeter, or Grinding Muſcle.*

K. *The upper griſtle of the noſe.*

M. *A muſcle forming the cheekes.*

N. *The muſcle of the lower lip.*

O. *A part of the Fifth muſcle of the lower Iaw called* Digaſtricus, *that is, double bellied.*

Q. R. *The firſt muſcle of the bone* Hyoides *growing unto the rough Artery.*

S. *The ſecond muſcle of the bone* Hyoides *under the Chin.*

T. *The third muſcle of the bone* Hyoides *ſtretched to the Iaw.*

T.K. *the ſeveneth muſcle of the head and his inſertion at* T.

V.V. *The two venters of the fourth muſcle of the bone* Hyoides.

Φ. *The place where the veſſells paſſe which go to the head, and the nerves which are ſent to the Arme.*

Therefore that it ſhould be leſſe ſubject or obvious to externall injuryes, Nature hath, as it were, made it a retiring place in the bone, and fortified it with a wall of bone raiſed ſomewhat higher about it. The other Muſcle almoſt equall to the former in bignes, being called the *Maſſeter*, or grinding muſcle, makes the Cheeke, it deſcends from the loweſt part of the greateſt bone of the orbe (which bends it ſelfe as it were back, that it may make part of the yoake bone) and inſerts it ſelfe into the lower Iaw, from the corner thereof to the end of the root of the proceſſe *Corone*, that ſo it may draw this Iaw forward and backward, and move it like a hand-mill.

The *Maſſeter*, or grinding muſcle.

Wherefore nature hath compoſed it of two ſorts of fibers, of the which ſome from the neeke (the cheek in that place under the eyes ſtanding ſomewhat out like an aple ariſing from the concourſe of the greater bones of the orbe and upper jaw) deſcend obliquely to the corner and hinder part of the lower jaw, that it may move it forwards. Otherſome ariſe from the lower part of the ſame yoak-bone, and deſcending obliquely interſect the former fibers after the ſimilitude of the letter X, and inſert themſelves into the ſame lower jaw at the roots of the proceſſe *Corone*, that ſo they may draw it back. Truely by reaſon of theſe contrary motions it is likely this muſcle was called the *Maſſeter* or grinder.

The third, which is the round Muſcle, ariſes from all the Gums of the upper jaw, and is inſerted into all the gummes of the lower, inveſting the ſides of all the mouth with the coate, with which it is covered on the inſide, being otherwiſe covered on the outſide with more fat than any other muſcle. The action thereof is, not onely to draw the lower Iaw to the upper, but alſo as with a Shovell to bring the meat diſperſed over all the mouth under the teeth, no otherwiſe then the tongue drawes it in.

The round muſcle.

The fourth being ſhorter and leſſe than the reſt ariſing from all the hollownes of the winged proceſſe of the Wedge-bone, is inſerted within into the broadeſt part of the lower Iaw, that ſo in like manner it may draw the ſame to the upper. This is the muſcle through whoſe occaſion, we ſaid this lower iaw is ſometimes diſlocated.

The leſſer muſcle of the lower Iaw.

The fifth and laſt muſcle of the lower jaw from the proceſſe *ſtyloides* of the ſtony bone, aſcends to the forepart of the Chin, nere to the connexion of the two bones of this Iaw, to draw this Iaw downewards from the upper in opening the mouth. This muſcle is ſlender and Tendinous in the midſt, that ſo it might be the ſtronger, but it is fleſhy at the ends. All theſe Muſcles were made by the ſingular providence of nature and ingrafted into this part for the performance of many uſes and actions, as biting aſunder, chawing, grinding and ſevering the meat into ſmall particles, which the tongue by a various and harmeleſſe motion puts under the teeth. Thus much I thought good to ſay of the parts of the face, as well containing as contained.

The fift and laſt muſcle.

The uſe of the ſe mentioned muſcles.

B. *The Temporall muſcle.*

Chap. X.

Of the Eares and Parotides *or kernels of the Eares.*

The Eares are the Organs of the Senſe of hearing. They are compoſed of the skin, a little fleſh, a griſtle, veines, arteries and nerves. They may be bended or folded in without harme, becauſe being griſtlely, they eaſily yeild and give way; but they would not doe ſo, if they ſhould be bony, but would rather break. That lap at which they hang pendants and Iewels, is by the ancients called *Fibra*; but the upper part *pinna*. They have beene framed by the providence of nature into twining paſſages like a Snailes ſhell, which as they come neerer to the *foramen cæcum*, or blind hole, are the more ſtraitened, that ſo they might the better gather the aire into them, & conceive the differences of ſounds and voices, and by little and little leade them to the membrane.

The nature and compoſition of the eares.

What the *Fibra* and *pinna* are.

The figure and the reaſon thereof.

This membrane which is indifferently hard hath growne up from the nerves of the fifth conjugation, which they call the auditory. But they were made thus into crooked windings, leaſt the ſounds ruſhing in too violently ſhould hurt the ſenſe of hearing. Yet for all this we oft find it troubled and hurt by the noiſe of thunder, Guns and Bels. Other wiſe alſo leſt that the aire too ſodainely entring in ſhould by its qualitys, as cold, cauſe ſome harme: and alſo that little creeping things and other extraneous bodys as fleas & the like, ſhould be ſtaied in theſe windings and turnings of the waies, the glutinous thicknes of the cholerick excrement or eare-waxe hereunto alſo conduceing, which the braine purges and ſends forth into this part, that is, the auditory paſſage framed into theſe intricate Mæanders.

For what uſe the eare-waxe ſerves.

The Figure of the eares and bones of the auditory paſſage.

Fig. 5. ſheweth a portion of the bone of the temples which is ſeen neere the hole of Hearing divided through the middeſt, whereby the Nerves, Bones and Membranes may appeare as Veſalius of them conceiveth.

Fig. 6. ſheweth the Veſſels, Membranes, Bones and holes of the Organ of hearing, as Platerus hath deſcribed them.

Fig. 7, and 8. ſheweth the little bones of the hearing of a man and of a Calfe, both ioyned and ſeparated.

Fig. 9. ſheweth the Muſcle found out by Aquapendens.

For the particular declaration ſee *D. Crookes* Anatomie, pag. 577.

For what uſe the membrane ſtretched under the auditory paſſage ſerves.

But that we may underſtand how the hearing is made, we muſt know the ſtructure of the organ or inſtrument hereof. The membrane which we formerly mentioned to conſiſt of the auditory nerve, is ſtretched in the inſide over the auditory paſſage like as the head of a Drum. For it is ſtretched and extended with the Aire, or auditory ſpirit implanted there, & ſhut up in the cavity of the mammillary proceſſe and *foramen cæcum*, that ſmitten upon by the touch of the externall aire entring in, it may receive the object, that is the ſound, which is nothing elſe then a certaine quality ariſing from the aire beaten or moved by the colliſion, and conflict of one or more bodyes.

What ſound is.

Such a colliſion is ſpred over the aire, as the water which by the gliding touch of a ſtone produces many circles and rings one as it were riſing from another. So in rivelets running in a narrow channel, the water ſtrucken and as it were, beaten back in its courſe againſt broken, craggy and ſteep rocks, wheels about into many turnings: this colliſion of the beaten aire flying back diverſe waies from arched and hollow roofed

The cauſe of an echo.

roofed places, as Dens, Ciſterns, Wells, thick Woods and the like, yeilds and produces a double ſound, and this reduplication is called an Echo. Wherefore the hearing is thus made by the aire, as a medium, but this aire is twofold, that is, externall and internall.

The 3 bones of the auditory paſſage.

The exteriour is that which encompaſſes vs, but the interiour is that which is ſhut up in the cavity of the mammillary proceſſe and *foramen cæcum*, which truly is not pure and ſole aire, but tempered and mixed with the auditory ſpirit. Thence proceeds the noiſe or beating of the Eares, when vapours are there mixed with the aire inſteed of ſpirits, whereby their motion or agitation is perturbed and confuſed. But neither doe theſe ſuffice for hearing, for nature for the more exact diſtinction of ſounds hath alſo made the little bones, of which one is called the *Incus* or anvill, another the *Malleolus* or hammer, the third the *Stapes* or ſtirrop, becauſe the ſhape thereof reſembles a German ſtirrop. Alſo it may be called *Deltoides*, becauſe it is made in the ſhape of the Greeke letter Δ.

Their uſe.

They are placed behind the membrane; wherefore the anvill and hammer moved by the force of the entrance of the externall aire, and beating thereof againſt that membrane, they more diſtinctly expreſſe the difference of ſounds, as ſtrings ſtretched within under the head of a Drum; as for example, theſe bones being more gently moved repreſent a low ſound to they common ſenſe & faculty of hearing, but being moved more vehemently and violently, they preſent a quick and great ſound; to conclude, according to their diverſe agitation, they produce diverſe and different ſounds.

whence the difference of ſounds.

The Glandules ſhould follow the Eares in the order of Anatomy, as well thoſe which are called the emunctoryes of the braine, that is, the *Parotides* (Which are placed as it were at the lower part of the eares) as theſe which lye under the lower Iaw, the muſcles of the bone *Hyoides* & the tongue, in which the *Scrophulæ* and other ſuch cold abſceſſes breed. It ſhall here ſuffice to ſet dovvne the uſe of all ſuch like Glandules.

Therefore the *Parotides* are framed in that place by nature, to receive the virulent and maligne matter ſent forth by the ſtrength of the braine, by the veines and arteries ſpred over that place. The reſt ſerve to ſtrengthen the diviſion of the veſſels, to moyſten the ligaments and membranes of the Iaw, leſt they shoud be dryed by their continuall motion. Their other conditions and uſes are formerly handled in our firſt booke of Anatomy.

Chap. XI.

Of the bone Hyoides, *and the muſcles thereof.*

The reaſon of the name.

The compoſition.

THe Subſtance of the Bone *Hyoides* is the ſame with that of other bones, The figure thereof imitates the greek letter *υ* from whence it took the name, (as alſo the name ὑψιλοειδὴς; and from the letter λ it is in like ſort called λαμβδοειδὴς; by ſome it is ſtiled *Os Gutturis* and *os Linguæ*, that is, the Throat bone and Tongue bone. The compoſition thereof conſiſts of many bones joyned into one by the interpoſition of griſtles.

The ſite.

This bone is bigger in beaſts and compoſed of more bones, and that not only by the intercourſe of griſtles, but alſo of ligaments. It is ſeated with its baſis (being gibbous on the forepart for conſtancy, and arched on the inſide that it might receiue and containe the root of the tongue) upon the upper part of that griſtle of the throtle which is called *ſcutiformis* or Sheild-like, (for this ſeemes to prop it up by the ſtrength of two proceſſes riſing at the baſis thereof) and the root of the tongue. From this baſis it ſends forth two hornes to the ſides of the tongue on each ſide one, which in men are tyed to the Appendix *ſtyloides* by ligaments ſent from it ſelfe. Contrary then it is in beaſts, who have it of many bones united as we ſaid, by the intercourſe of ligaments even to the root of the *ſtiloides*. Wherefore this bone hath connexion with the forementioned parts, and other hereafter to be mentioned. It hath the ſame temper as other bones have. The uſe of it is, to miniſter ligaments to certaine muſ-

The temper and uſe.

cles of the tongue, and inſertion as well to the two foremoſt and upper muſcles of the throtle, as to its owne, of which we will now treat.

The muſcles of the bone *Hyoides*.

The muſcles of the bone *Hyoides*, according to the opinion of ſome are eight, on each ſide foure; of which there be two, one of which *Galen* refers to the common muſcles of the *larinx* or throtle; and the other to thoſe which move the Shoulder-blade upwards. Howſoever it be, the firſt of the foure before mentioned ariſes from the Appendix *Styloides*, and paſſing over the Nervous ſubſtance of the muſcle opening the lower Iaw, is inſerted into the hornes of the bone *Hyoides*. This muſcle is very thin, yet ſomewhat broad, the which in that reſpect may eaſily be cut, unleſſe you have a care in ſeparating the muſcle which opens the lower Chap. The ſecond aſcends obliquely from the upper part of the ſhoulder-blade nere the production thereof called *Coracoides*, to the beginnings of the hornes of the ſaid bone *Hyoides*. This is round and nervous in the midſt that ſo it might be the ſtronger, as that is which we formerly ſaid opens the lower Iaw; and it is referd by *Galen* amongſt thoſe which move the ſhoulder-blade upwards. The third ariſes from the upper part of the *ſternon*, and is inſerted at the roote and baſis of the bone *Hyoides*; yet *Galen* refers it to the common muſcles of the *Larinx*; whoſe opinion takes place rather in beaſts, than in man, ſeeing in man this muſcle cannot be found either to proceed, or be inſerted into the throtle, as it is in beaſts. The fourth and laſt deſcends within from the chin to the root of the bone *Hyoides*. The firſt of theſe muſcles with its companion or partner moves the bone *Hyoides* upwards; the ſecond downewards; The third backwards; and the fourth forewards. I would declare whence theſe muſcles have their veſſells, had I not abundantly ſatisfied that thing, when I treated of the diſtribution of the nerves, veines and arteries.

The action of theſe muſcles.

Chap. XII.

Of the Tongue.

What kinde of fleſh the tongue hath.

THE tongue is of a fleſhy, rare, looſe and ſoft ſubſtance; it enjoyes fleſh of a different kind from the reſt of the fleſh, as chiefly appeares when you cut it from the firſt originall of the muſcles thereof; which thing hath moved ſome, that they have made a fourth kind of fleſh proper to the tongue and different from the reſt, *viz.* the Fibrous, muſculous, and that of the bowells. The quantity thereof is ſuch that it may be conteined in the mouth, and eaſily moved to each part thereof. The figure of it is triangular, which it rather expreſſes in the baſis, which is at the root of the bone *Hyoides*, than in its point, or forepart, where from a triangle it becomes more dilated. It is compoſed of a membrane (which it hath from that which lines all the inſide of the mouth) muſcles 4. nerves two on each ſide, the one whereof is ſent from the third conjugation, into the coate thereof; the other from the ſeaventh is ſent into the muſculous ſubſtance even to the end thereof for motions ſake; ſo that thoſe ſenſificke nerves from the third conjugation onely give to judge of taſtes, compoſe the coate, and touch or enter not the fleſh. Beſides it is compoſed of veines and arteries on each ſide one, which it receives from the externall Iugular and *Carotides*, running manifeſtly to the end thereof on the lower ſide, that ſo they might be eaſily opened in the diſeaſes of the mouth and throtle; they commonly terme theſe the *Venæ nigra* or blacke veines.

The quantity.

The figure.

Compoſure.

The nerves.

The muſcles of the tongue.

The muſcles of the tongue are abſolutly ten, on each ſide five. The firſt narrow at the beginning, and broader at the end, deſcends into the upper ſide of the tongue from the Appendix *Styloides*, and together with its copartner drawes it upwards. The ſecond hath its originall within from the lower jaw about the region of the Grindinge teeth, and is inſerted into the lower ſide of the tongue, the which with its partner drawes it downeward. The third proceeds from the inner part of the Chin and goes to the root of the tongue, that when need requires it may put it forth of the mouth. The fourth the greateſt and broadeſt of them all, compoſed of all ſorts of fibers, paſſes forth from the baſis of the bone *Hyoides*, and ends at the lower part of the tongue, which with its companion plucks it backe into the mouth. The fiſt & laſt moſt uſually ariſes from the upper part of the hornes of the bone *Hyoides* and goes to the roots of the tongue betweene the two firſt, that it may move it to the ſides of the mouth. The temper thereof, as of all other fleſh, is hot and moiſt. The firſt action & commodity therof is, to be the organ of the ſenſe of taſting, wherfore it was made fungous & ſpongy, that by reaſon of the rarity of it, it might more eaſily admit the taſts conjoyned with the ſpettle, as a vehicle. Another to be an inſtrument to diſtinguiſh the voice by articulate ſpeech, for which it was made movable into each part of the mouth. The third is to be a helpe to chaw & ſwallow the meat. For which cauſe it is like a ſcoope or diſh with which wee throw backe the corne into the mill, which hath ſcaped grinding. And becauſe, when the tongue is dry, it is leſſe nimble & quicke to performe its motions, as appeares by thoſe which can ſcarſe ſpeake by reaſon of thirſt, or a burning ſeaver: therefore nature hath placed very ſpongy glandules at the roots therof, on each ſide one, which like ſponges ſucke and receive, both from the braine & other places a wateriſh and ſpettlely humor, with which they humect and make more glib, not onely the tongue, but alſo the other parts of the mouth, as the throate and jawes; theſe glandules are called the *Tonſillæ*, or Almonds of the throate.

The temper, action, and manifold uſe of the tongue.

The uſe of the glandules placed at the roots of the tongue.

CHAP. XIII.

Of the Mouth.

THe mouth is that capacity which bounded with the cheekes & lips containes within its precincts the teeth, tongue, and the beginnings of the throttle and gullet. Therfore the uſe of the mouth is to conteine the tongue, & ſerve it in the fitter performance of its actions; & although many parts hereof have bin formerly handled, as the lips, teeth, Iawes, tongue, almonds, & paſſages of the palate comming from the noſe, yet it remaines, that we declare, what the palate, the *Gargareon*, or Vvula the *Pharinx*, & *fauces* or Chops are. The palate (or as it is commonly called, the Roofe of the mouth) is nothing elſe but the upper part of the mouth bounded with the teeth gums & upper Iaw. In which place the coate common to the whole mouth, is made rough with divers wrincles, that the meats put up & down between the tongue & the Palate might be broken & chawed more eaſily by that inequality and roughnes. If any would finde the nerves, which deſcend into the palat from the fourth conjugation, let him ſeparate that coat & caſt it from the fore to the hind part of the mouth; for ſo he ſhal find them at the ſides & hinde parts of the bones of the Palate, which incompaſſe the palate, & at the beginning of the inner holes of the mouth, which deſcend from the noſe, & region of the productions of the wedgbone called the Saddle. Theſe holes or paſſages are open, that we may breath the better when we ſleep, & that when the noſe is not well, the excrements which ſeeke their paſſage by it, may be eaſilier drawn away by the mouth. This ſame coate is woven with nervous fibers, that, like the tongue, it might judge of taſts; theſe fibers cõpoſe a coat that hath a middle conſiſtence betwixt ſoft & hard. For if it ſhould have beene any harder, like a bone or griſtle, it would have been without ſenſe, but if ſofter hard, acride and ſharpe meats would have hurt it.

What it is.
The uſe.

What the palat is.

The nerves thereof.

Why the holes of the palate are open.

What kinde of coate the palat hath.

CHAP. XIIII.

Of the Gargareon, *or Vvula.*

BY the *Gargareon* we underſtand a fleſhy & Spongy body, in ſhape like a pine apple, hanging directly down at the further end of the palate & baſis of the bone *Ethmoides* where the two holes of the palate come from the noſe, above the entrãce of the throttle. This little body is ſcituate in this place, to breake the violence of the aire drawne in by breathing, & that by delay it might in ſome ſort tẽper & mitigate it by the warmeneſſe of the mouth. Beſides, that it might be as it were the *Plectrũ*, or quil of the voice, ſo to diffuſe the fuliginous vapour ſent forth in breathing that it may be diſperſed over al the mouth, that reſounding from thence it may be articulate, & by the motion of the tongue diſtinguiſhed & formed, into a certaine voice. Which uſe is not ſmall, when we ſee by experience that ſuch as have this particle cut away, or eaten or corrupted by any accident, have not onely their voyce vitiated and

What the *Gargareon*, or Vvula is.

The ſite and manifold uſe thereof.

The diſcommodities that enſue the loſſe of the Vvula.

What the *Pharinx* and *fauces* are.

depraved, but ſpeake ill favouredly, and as they ſay, through the noſe; and beſides, in proceſſe of time they fall into a conſumption by reaſon of the cold aire paſſing downe before it be qualified. This ſame particle, is alſo a meanes to hinder the duſt from flying downe through the weazon into the Lungs. By the ***Pharinx*** and *fauces* is ment the inner & backe part of the mouth, ſet or placed before the entrance of the Throttle & Gullet; being ſo called, becauſe that place is narrow & ſtraite, that as it were by theſe ſtraits, the aire drawn in by the mouth might be forced downe by the Throtle, and the meat into the Gullet.

CHAP. XV.

Of the Larinx *or Throttle.*

What is ment by the *Larinx.*

The magnitude, figure and compoſure.

The deſcription of the 3 griſtles of the *Larinx.*

Whence the infinite variety of voices proceed.

The muſcles of the *Larinx.* Their number

A notable hiſtory.

FIrſt we muſt ſhew what is ment by the *Larinx* or throttle, then proſequute the other cõditions of it after our accuſtomed maner. Therfore by the *Larinx* we underſtand nothing els in this place, than the head & extremity of the rough Artery, or weazon, which comes neerer to Griſtlely ſubſtance, then to any other. The quantity therof is ſufficiently large, yet divers according to the diverſity of bodies. It reſembles in ſhape the head of a Germane pipe. The compoſure of it conſiſts of 18. muſcles, on each ſide nine, which as they are like in quantity, ſo alſo in ſtrength & action; of three griſtles, veines, arteries and nerves, as we ſhewed, when we ſpoke of the diſtribution of the veſſels; as alſo of a double coate, the one externall, the other internall, as we ſhewed when we ſpoke of the weazon. Theſe three Griſtles are joyned together by certaine Ligaments & muſcles; the formoſt griſtle, which alſo is the greater is called by the Greekes θυρεοειδὴς, in Latine commonly *Scutiformis*, that is ſheild-like, becauſe it reſembles a ſheild. The ſecond being the hinder and middle in magnitude, wants a name, wherfore it is called the *innominata* or nameles griſtle. The laſt & leaſt which notwithſtanding may be parted into two, ſo lyes upon the edges of the other, that it reſembles the mouth of an oyle pot, or a pitcher, wherupon the Greekes call it *Arytenoides*. Theſe griſtles thus fitted amongſt themſelves utter a diſtinct voice, by the benifit of the *Epiglottis*, or After tongue, & alſo of the muſcles opening & ſhutting, dilating & cõpreſſing them, whence proceed infinite varieties of voyces. For thus when they are opened and dilated they yeeld a heavy, or dull ſound; when they are ſhut or drawn together, a quick, or ſharpe ſound, and to conclude, they make it infinite wayes different according to the infinite variety of the dilatation, or conſtriction thereof. Therfore becauſe it was fit theſe griſtles ſhould be moveable, eſpecially the *Arytenoides*, & Thyroides, nature hath put to them on each ſide 9 muſcles, of which three are common and 6 proper. The firſt of the common lying hid under the third muſcle of them that move the bone *Hyoides*, ariſes from the root of the ſame bone, & by an oblique deſcent inſerts it ſelfe at the baſis of the ſhield-like griſtle, to dilate it upwards & downwards. The ſecond aſcends obliquely from the inner part of the *ſternon* according to the length of the weazon (whence it is called *Bronchius*) to the bottom & ſides of the ſame ſhield-like griſtle, that it may open and dilate it with its wings. This muſcle is ſeen from the firſt originall therof, even a great part of the way ſtraitly to cohere with the third muſcle of the bone *Hyoides*; therfore under each of the muſcles, there is a glãdulous body ſpred about the fore & upper part of the weazon, on that place where it applies it ſelf to the throttle; this body although it reſemble a fleſhy ſubſtance, yet it is a glandule, which being pluckt away by a certaine Emperike taking upon him to cure the kings evil, cauſed a defect of voice on one ſide, becauſe be pulled away the recurrent nerve lying upon that glandule as it goes to the throttle, as *Galen* reports, *Lib. de locis affectis*. The third & laſt ariſes from the part of the *Vertebra's* of the neck lying tranſverſly upon the ſides of the gullet, & ends at the wings & ſides of the ſhield-like griſtle, that it may tye it more ſtraitly to the ſecond Griſtle. But theſe three are called cõmon muſcles, becauſe they take their original from ſome other place than ÿ throttle that ſo they may be inſerted into ſome part therof; for they are called the proper muſcles which ariſe from the Throttle it ſelf, which we have ſaid to be 6. on each ſide. The firſt of which ariſing from the fore part of the ſecond griſtle, makes a circle under the baſis of the ſheld-like griſtle; whileſt aſcending obliquely to the baſis therof, it is afterwards inſerted in a part of it, ſo to ſtrengthen and dilate it. The ſecond in like manner ariſing from the ſecond griſtle, from that place where it adheres to the firſt, it runnes obliquely croſſing the firſt to the inner and forepart of the griſtle *Thyroides* neere to the baſis thereof, that it may joyne it to the ſecond. The third from the hinde baſis of the ſecond griſtle aſcends directly to the baſis of the third griſtle *Arytenoides*, that with the ſecond muſcle it may open & ſhut it. The fourth aſcends from the ſides of the ſecond griſtle, neere the originall of the ſecond muſcle, to the ſides of the *Arytenoides*, that with the ſecond muſcle it may open and ſhut it. The fift ariſes from the inner midle of the ſheild-griſtle, and ends in the fore part of the *Arytenoides* at the inſertion of the fourth muſcle, that ſo it may preſſe down the ſaid griſtle.

The ſixt and laſt aſcends by the hinde baſis of the *Arytenoides* to the fore baſis of the ſame, to preſſe it downe. But you muſt note, that all ſuch muſcles, as ariſe from below upwards, receive branches from the recurrent, but eſpecially thoſe who open and ſhut the griſtle *Arytenoides*. But the ſite, temper, connection, and uſe of the throtle may eaſily be knowne by that we have ſaid before: Although it be a thing very full of difficulty to ſearch out and demonſtrate all the conditions of the organicall parts, by reaſon of the diverſitie of their compoſition. Wherefore hence forward concerning the ſubſtance, temper, and other circumſtances of ſuch parts as we ſhall omit; you may have recourſe to thoſe things which we have written in the Demonſtration of the ſimple and ſimular parts, of which theſe organicall are compoſed; as if any ſhould aske of what temper the *Larinx* is, you ſhall anſwere, of a colde, dry, and hot, and moiſt, becauſe it conſiſts both of a griſtlely and fleſhly ſubſtance. Hee which reckons up all the parts of the mouth, muſt not omit that griſtlely and membranous body which ariſes from the roots of the tongue, which that it might be more quicke for motion, that is, whereby it might be more eaſily erected and depreſſed (for thoſe things which are more ſoft doe continually ſlide away, but thoſe which are too hard cannot be bended) it was convenient it ſhould be neither too hard nor too ſoft, that it might be erected whileſt we breath, but depreſſed when wee ſwallow. It is a principall inſtrument of the voyce, for it cannot be well articulated unleſſe the way were ſtraite. Therefore it ſtraitens that way, and the paſſage of the griſtles of the throttle, but ſpecially the *Arytenoides*; it is alwayes moiſt by a certaine native, and inbred humiditie; wherfore if it happen to be dried by a fever, or any other like accident the ſpeach is taken away. It is bound on both ſides by the common membrane of the mouth to the ſides of the *Arytenoides* even to the backe part thereof, that ſo like a cover it may open and ſhut the orifice of the throtle, that none of the meat and drinke in ſwallowing may fall into the weazon, in ſuch aboundance as may hinder the egreſſe and regreſſe of the aire. For we muſt not thinke that this body doth ſo cloſely ſhut the orifice of the throttle, but that ſome ſmall quantitie of moiſture alwayes runnes downe by the inner ſides, as the walles thereof, to moiſten the lungs; otherwiſe *Eclegma's* ſhould be of no uſe in the diſeaſes of the Cheſt. And becauſe that this litle body is partaker of voluntarie motion, therefore according to the opinion of ſome there are foure muſcles beſtowed upon it, two which may open it and two that ſhut it, on each ſide one. The opening muſcles deſcend from the roote of the bone *Hyoides*, and in their inſertion growing into one they are terminated in the roote of this body, that is, the *Epiglottis* in the backe part thereof. The ſhutting muſcles (in thoſe creatures where they are found) ariſe on the inſide betweene the coate & griſtle thereof. Truly I could never obſerve and finde theſe foure muſcles in a man, though I have diligently and earneſtly ſought for them, but I have alwayes obſerved them in beaſts. Therefore ſome have boldly affirmed that this litle body in ſwallowing lyes not upon the orifice of the Throttle, unleſſe when it is preſſed downe by the heavines of ſuch things as are to be ſwallowed; but that, at all other times by reaſon of the continuall breathing it ſtands upright, the Throttle being open. There remaine as yet to be conſidered, two ſmall boſomes, or cavities, or rather fiſſures which nature hath hollowed in the very throttle under the *Epiglottis*, on each ſide one, that if by chance any of the meat or drink ſhould fal, or ſlip aſide in the *Larinx*, it might be there ſtayed & reteined. Beſide that, the Aire too violently entring, ſhould be in ſome ſort broken by theſe clifts, or chinkes, no otherwiſe than the blood and ſpirit entring into the heart through the *Auriculæ* or Eares thereof.

Whence the muſcles of the Throttle have their nerves.

The *Epiglottis* or After-tongue.

Of potable things ſome-what alwayes falls upon the Lungs.

The muſcles of the *Epiglottis*.

The uſe of the cavities or fiſſures of the Throttle.

Chap. XVI.

Of the Necke and the parts thereof.

First we will define what the neck is, then proſequute the parts therof aſwel proper, as common, eſpecially thoſe of which we have not as yet treated. For it were ſuperfluous to ſpeake any more of the skin, the fleſhy pannicle the veines, arteries, nerves, gullet, weazon & muſcles aſcending & deſcending to the parts into which they are inſerted alongſt the necke; wherefore you muſt not expect that we ſhould ſay any thing of the neck, more than to deſcribe the *Vertebra* or rack-bones, being the proper parts therof, & the ligaments aſwell thoſe proper to the neck, as thoſe which it hath in common with the head; & laſtly the muſcles, aſwel thoſe it hath in common with the head & cheſt, as thoſe of its own. Therfore the neck is nothing elſe, then a part of the head, which is conteined between the nowle bone & the firſt *vertebra* of the back. Firſt in the neck the *Vertebra's* muſt be conſidered, & we muſt ſhew what they have proper & peculiar, & what common amongſt themſelves, that we may the more eaſily ſhew the originall and inſertion of the muſcles growing out of them & ending in them. The neck conſiſts of ſeven *Vertebræ* or Rack-bones, in which you muſt conſider their proper body; and than the holes by which the ſpinall marrow paſſes; thirdly the *Apophyſes* or proceſſes of the *Vertebræ*; fourthly the holes through which the nerves are diſſeminated into other parts from the ſpinal marrow, & beſides the perforations of the tranſverſe productions by which the veines, & arteries which we cal *Cervicales* aſcend alongſt the necke, & laſtly the connexion of theſe ſame *vertebræ* or Rack-bones. For the firſt, by the body of the *vertebræ*, we underſtand the forepart therof upon which the gullet lyes. For the hole, that is not alwaies the largeſt in thoſe *vertebræ* which are nigheſt the head; but it is alwayes encompaſſed with the body of the *vertebra*, & beſides with three ſorts of proceſſes, except in the firſt Rack-bone, that is right, tranſverſe & oblique. By right we underſtand theſe extuberancies in the Racke-bones of the necke which are hollowed directly in the upper part of them & riſe up creſted on each ſide to ſuſteine and receive the baſis of the Rack-bone which is ſet upon it. By the oblique proceſſes, wee underſtand the bunchings out by which theſe Rack-bones are mutually knit together by *Ginglymos*; theſe are ſeated between the right & tranſverſe proceſſes. By the tranſverſe we underſtand the protuberations next the body, which devide the *Vertebra* or Rackbone in a ſtraight line. Theſe proceſſes are perforated that they may give way to the before deſcribed veines & arteries, which entring the Spinall marrow by the holes of the nerves nouriſh the Racke-bones & parts belonging to them. Beſides you muſt note that the perforations of the Rack-bones of the neck by which the nerves proceed from the ſpinall marrow to the outward parts, are under the tranſverſe proceſſe, that is growing or made by the upper & lower *vertebra*, contrary to all the other which are in the reſt of the Rack-bones. For the connexiõ of the Rack-bones, you muſt know that all the *Vertebræ* of the ſpine have ſix connexions, two in their own bodies, and 4 in their oblique proceſſes. By the two firſt connexions they are ſo mutually articulated in their owne bodies that each are joyned with other both above and below. But by the 4 other, by their oblique aſcendent & deſcendent proceſſes, on each ſide 2, they are ſo mutually inarticulate that as the fourth Rack-bone of the neck by its oblique aſcendent proceſſes, is received of the deſcendent proceſſes of the third Racke-bone; ſo it receives the oblique aſcendent proceſſes of the firſt, by its oblique deſcendents, for alwayes the oblique aſcendents are received, and the deſcendents receive. Yet wee muſt except the firſt Rack-bone of the neck which is conteined with 4 connexions by his lower oblique proceſſes, & by its upper by which it receives the oblique proceſſes both of the nowle bone, & of the ſecond Rack-bone. The ſecond *Vertebra* or Rack-bone muſt alſo be excepted which is holden by 5 connexions, that is to ſay, foure by its oblique proceſſes, & the fifth by its own body, by which it is knit to the body of the third *Vertebra*. But we muſt note, that wheras nature hath not given a Spine to the firſt Rack-bone, yet it hath given it a certaine bunch or extuberancy inſtead therof; in like manner, ſeing it makes no common paſſage with the ſecond *Vertebra* for the paſſage forth of the nerve, it is perforated at the ſides of its body, and it is made very thin on the fore ſide, as if it were without body, that it might receive the fore proceſſe raiſed in the upper body of the ſecond

Racke-bone,

What the necke is.

What to be conſidered in the vertebræ of the necke.

Which be the right proceſſes of the *vertebra*.

Which the oblique.

Which the tranſverſe.

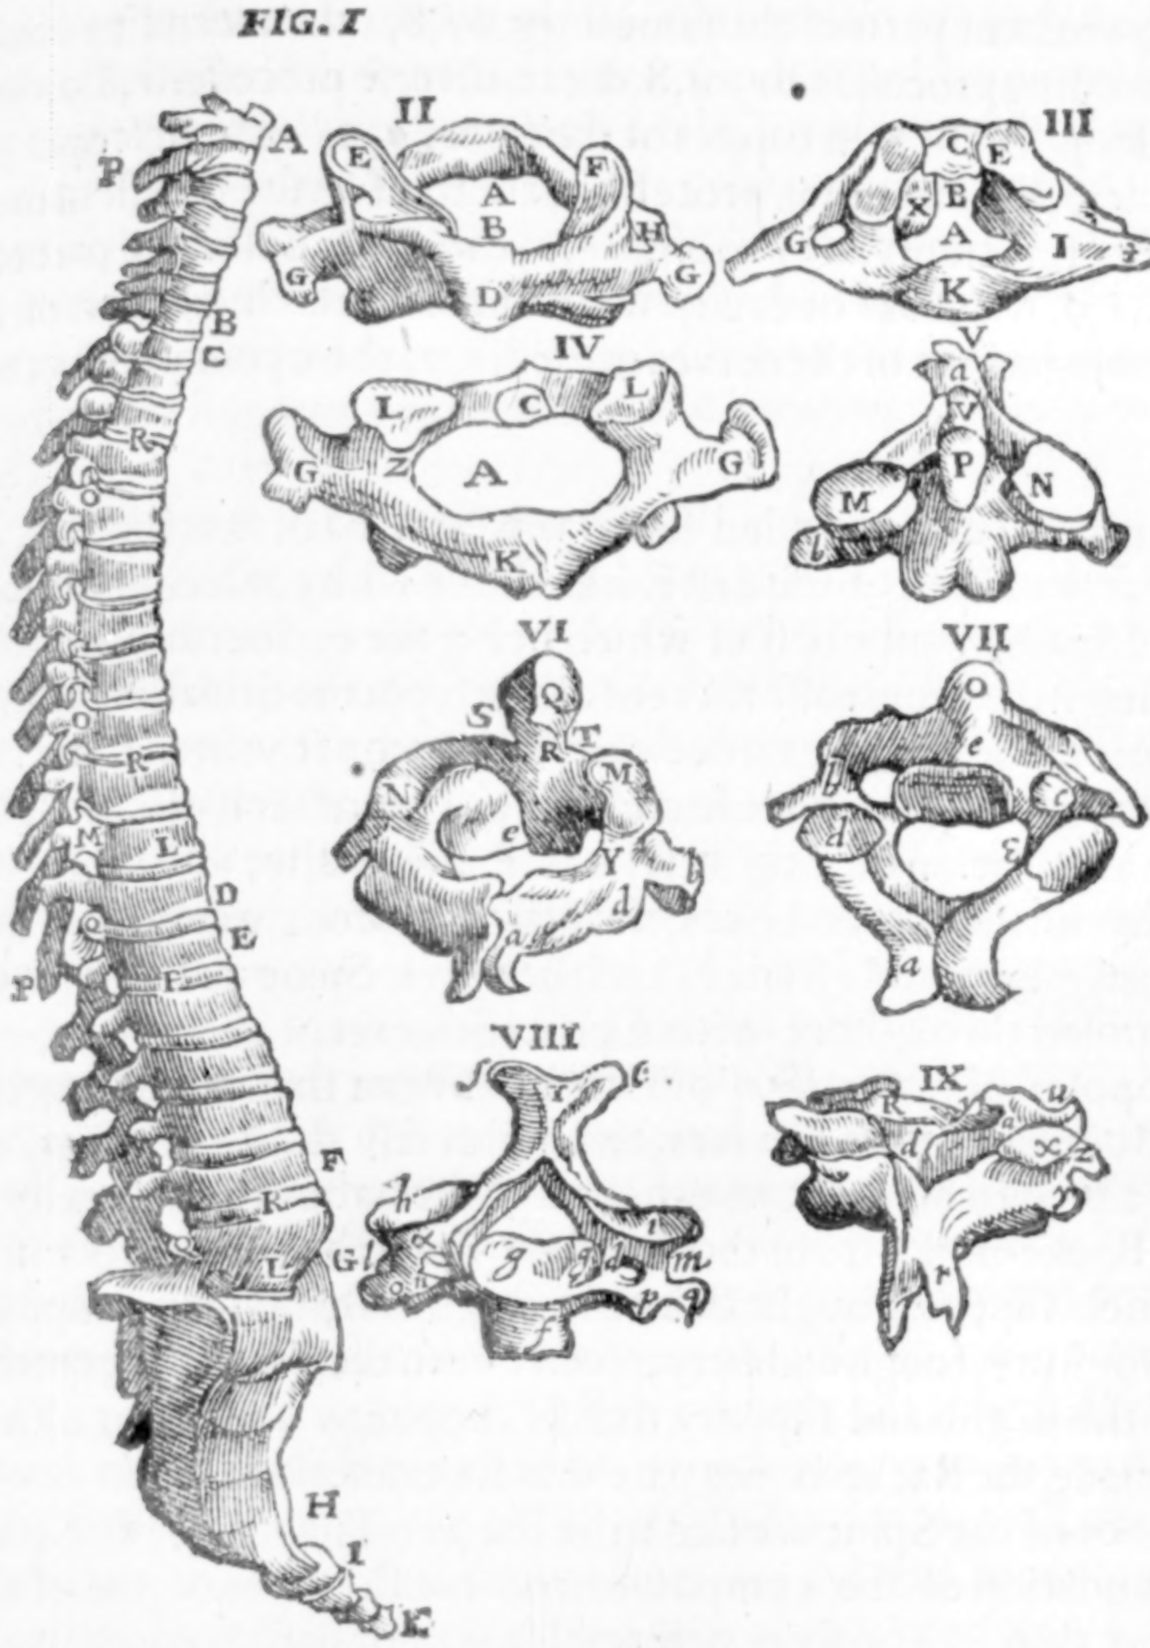
The connexions of the *vertebra of the necke*.

The proceſſe called the tooth.

Racke-bone, which **Hippocrates** calles the tooth, to which the principall Ligament of the head is faſtened, which deſcends within from the hinde part of the head under the *Apophyſes clinoides* or proceſſes of the wedge-bone.

Table 20. Figure 1. *Sheweth all the racke-bone of the backe knit together.*
Figure 2. Sheweth the fore and upper face of the necke, &c. See *D. Crooke*, pag. 398.

FIG. I



From, *A*, to *B*, the ſeven *vertebres* of the necke.

From *C*, to *D*, The twelve *vertebres* of the cheſt.

From *E*, to *F*, The five rack-bones of the Loynes.

From *G*, to *H*, The *Os ſacrum* or Holy-bone conſiſting commonly of 6. *vertebra*.

From *I*, to *K*, The bone *Coccyx* or the rump-bone according to the late writers.

LL, The bodies of the *vertebra*.

M, The tranſverſe proceſſes of the *vertebra*.

N, The deſcendent proceſſes.

OO, The aſcendent proceſſes.

PP, The backward proceſſes.

QQ, The holes that are in the ſides of the *vertebra* through which the nerves are tranſmitted.

RR, A griſtly Ligament betwixt the *vertebræ*.

A, 2, 3, 4, The hole whereout the marrow of the backe iſſueth.

B, 2, 3, The cavity which admitteth the root of the ſecond rack-bone.

C, 3, 4, A cavity or *Sinus* in the ſame place cruſted over with a griſtle.

D, 2, A prominence in the outward region of this *Sinus*.

EF, 2, 3. The *Sinus* or cavity of the firſt racke-bone which admitteth the 2. heads of the nowle-bone.

GG, 2, 3, 4. the tranſverſe proceſſe of the 1. *Vertebra*.

H, 1, The hole of this tranſverſe proceſſe.

I, 3. The *Sinus*, which together with the cavity of the nowle-bone marked with *E*, maketh a common paſſage prepared for the nerves.

K, 3, 4, A rough place where the ſpine of the firſt racke is wanting.

LL, 4, Two cavities of the firſt racke receiving the 2. bunches of the ſecond racke marked with *MN*.

MN, 5, 6, The 2. bunches of the ſecond racke which fall into the cavities of the firſt.

O, 7, The appendix or tooth of the ſecond racke. *P*, 5, A knub of this appendix cruſted over with a griſtle. *Q*, 6, The backſide of the tooth. *R*, 6, the *Sinus* or cavity of the ſame, about which a tranſverſe Ligament is rowled containing the ſaid tooth in the cavity of the firſt racke. *ST* 6. Certaine cavities at the ſides of the tooth whence the roots iſſue of the fore-branch of the ſecond paire of ſinews. *V*, 5, the point of the tooth. *X*, 3, An aſperity or roughneſſe where is a hole but not thrilled through. *Y*, 6, A cavity of the ſecond racke which together with the cavity marked with *Z*, maketh a hole, through which the nerves doe iſſue. *Z*, 4, the **Sinus** of the firſt racke. *a*, 5, 6, 7, the double ſpine of the ſecond racke. *b*, 5, 6, 7, the tranſverſe proceſſe of the ſecond rack. *c*, 7, the hole of the ſaid tranſverſe proceſſe. *d*, 6, 7, the deſcending proceſſe of the ſecond rack whoſe cavity is marked with *d*, in the 6. figure. *e*, 6, 7, the place where the body of the ſecond rack deſcendeth downward. *f. gg*, 8, the lower ſide of the body of the third rack at *f*, the two eminent parts of the ſame at *gg*. *hi*, 8, the aſcending proceſſes. *lm*, 8, the two deſcending proceſſes *nopq*, 8, the tranſverſe proceſſes. *r*, 8, 9, the ſpine or backward proceſſe. *ſt*, 8, the two toppes of the ſpine. *u*, 9, the deſcending proceſſe of the third rack. *x*, 9, the aſcending proceſſe. *y*, the tranſverſe proceſſe of the third rack. α, 8, 9, the hole of this tranſverſe proceſſe. β, 9, the upper hollowed part of the body of the third rack. δ, 9, the *Sinus* or cavity which maketh the lower part of a hole through which the conjugations of the nerves are led. ε, 7, the upper part of the ſame hole.

By what articulation the head is bended backwards and forewards

And by this articulation the head is bended forewards and backewards, as it is moved to the ſides by the articulation of the firſt Racke-bone with the ſecond. That proceſſe is bound by two Ligaments, the firſt of which being the greater and broader is externall, comprehending in the compaſſe thereof all the upper articulation, aſcending from the Racke-bones to the head, or rather deſcending from the head to them, as any other Ligament going from one bone to another; The other is the ſtronger and alſo encompaſſes the articulation mixing its ſelfe with the griſtle, which by its interpoſition binds together all the Racke-bones, the firſt excepted, as you may ſee in pulling aſunder the Racke-bones of a Swine; and the whole Spine or Backe-bone is tyed together and compoſed throughout with ſuch Ligaments.

The *Vertebra* of the Holy bone.

The Holy bone is compoſed of 4. *Vertebræ* [or rather of five, or ſixe, as in the figure following] Beſides the Rumpe-bone, it receives, and holds faſt the *Oſſa Ilium*, or Hanch-bones, and is as a *Baſis* to all the Racke-bones placed above it, whereby it comes to paſſe that the Racke-bones from the head to the Holy-bone grow ſtill thicker, becauſe that which ſupports ought to be bigger than that which is ſupported. There is a certaine moyſture, tough and fatty, put between the Rack-bones, as alſo in other joints, to make them glib and ſlippery that ſo they may the better move: Whileſt this motion is made, the Racke-bones part one from another.

The manifold uſes of the backebone.

The commodities or uſes of the Spine are ſaid to be foure. The firſt is, that it is, as it were the ſeat and foundation of the compoſure and conſtruction of the whole body, as the Carkaſſe is in a ſhip. The ſecond, that it is a way or paſſage for the marrow. The third is, becauſe it containes and preſerves the ſame. The fourth is, that it ſerves for a wall or bulwarke to the entrailes which lye and reſt upon it on the inſide. And becauſe we have fallen into mention of Ligaments, it will not be amiſſe to inſert in this place, that which ought to be knowne of them. Firſt therefore we will declare what a Ligament is, then explaine the divers acceptions thereof, and laſtly proſecute their differences.

What a Ligament is.

Therefore a Ligament is nothing elſe than a ſimple part of mans body, next to a bone and Griſtle the moſt terreſtriall, and which moſt uſually ariſes from the one or other of them either mediatly or immediatly, and in the like manner ends in the one of them, or in a Muſcle, or in ſome other part; whereby it comes to paſſe that a Ligament is without blood, dry, hard, and cold and without ſenſe, like the parts from whence it ariſes, although it reſemble a Nerve in whiteneſſe and conſiſtence, but that it is ſomewhat harder.

Why it is without ſenſe.

What parts may be called Ligaments in a generall ſignification.

A Ligament is taken either generally, or more particularly; in generall, for every part of the body, which tyes one part to another, in which ſenſe the skin may be called a Ligament, becauſe in containes all the inner parts in one union. So the *Peritonæum* comprehending all the naturall parts, and binding them to the backe-bone: ſo the membrane inveſting the Ribbs, (that is the *Pleura*) containing all the vitall parts; thus the membranes of the braine, the nerves, veines, arteryes, muſcles, membranes, and laſtly all ſuch parts of the body, which bind together and conteine other, may be called Ligaments, becauſe they binde one part to another; as the nerves annexe the whole body to the braine, the Arteries faſten it to the heart: and the veines to the liver. But to conclude, the name of a Ligament more particularly taken, ſignifies that part of the body, which we have deſcribed a little before.

The differences of Ligaments are many, for ſome are membranous and thin; others broad, otherſome thicke and round, ſome hard, ſome ſoft, ſome great, ſome little; ſome wholy griſtlely, others of a middle conſiſtence betweene a bone and a griſtle, according to the nature of the motion of the parts, which they binde together in quickneſſe, vehemency and ſlowneſſe. We will ſhew the other differences of Ligaments, as they ſhall preſent themſelves in diſſection.

The differences of Ligaments properly ſo called.

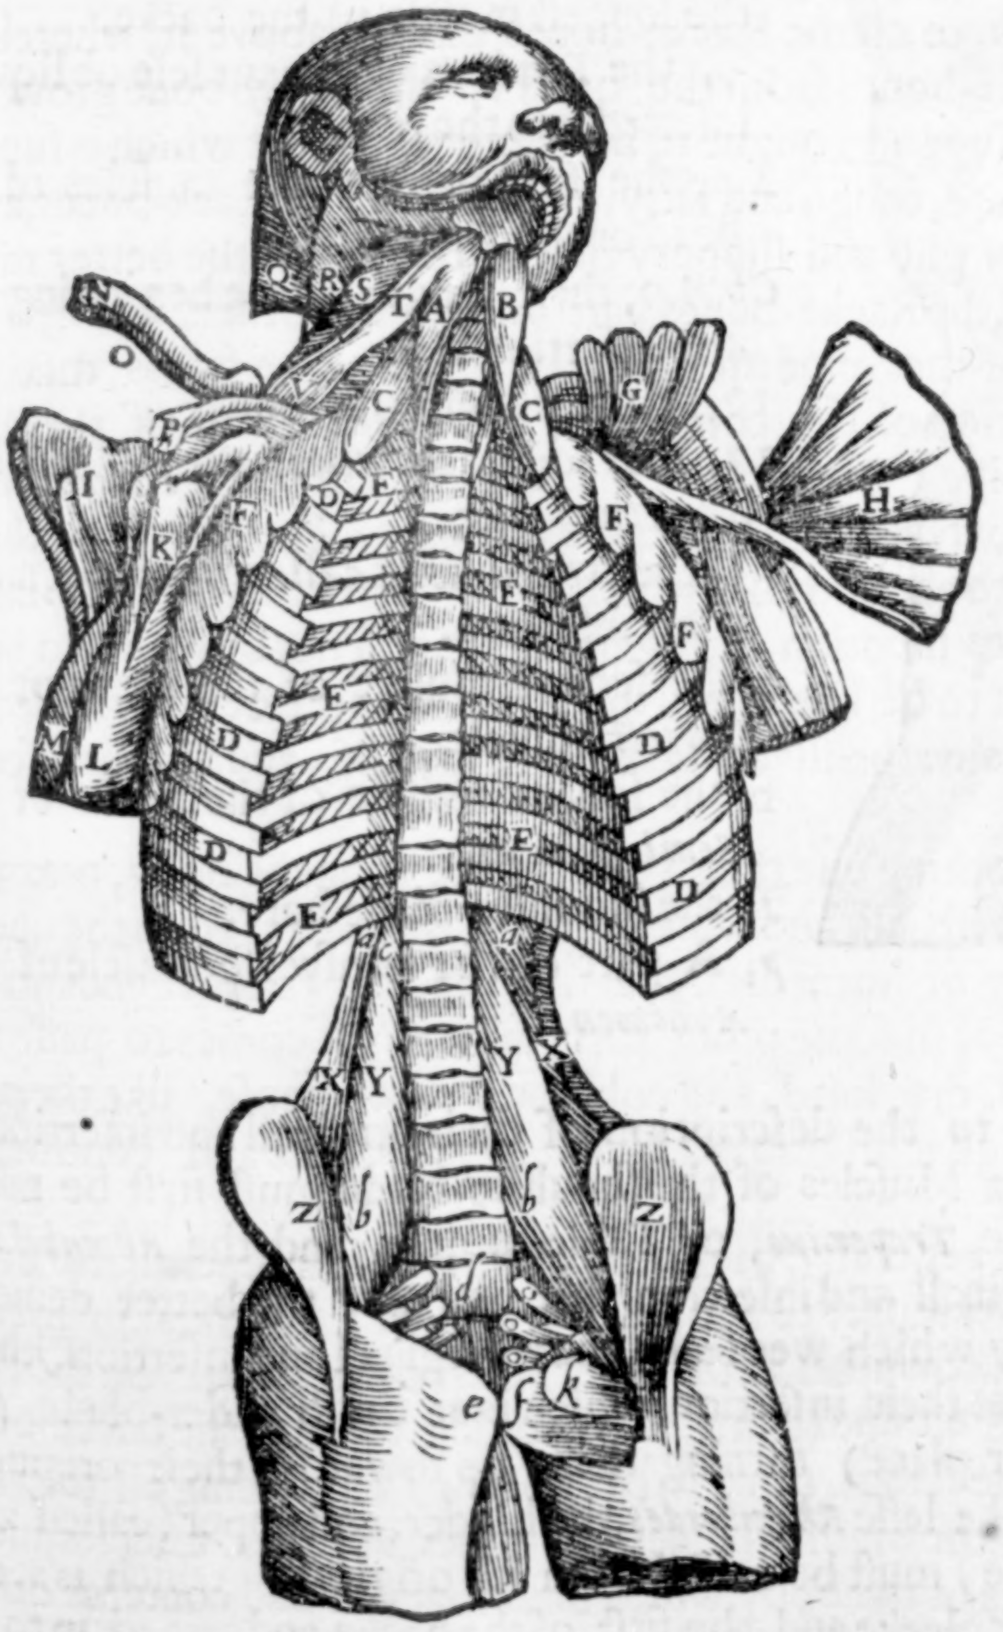
Chap. XVII.

Of the Muſcles of the Necke.

The Muſcles of the necke as well proper as common, are in number twenty, or elſe twenty two, that is, ten, or eleven on each ſide; of which ſeven only move the head, or the firſt *vertebra* with the head; the other 3 or 4, the necke it ſelf. Of the 7 which move the head, & with the head the firſt *Vertebra*, ſome extend & erect it, others bend and decline it, others move it obliquely, but all of them together in a ſucceſſive motion move it circularly; and the like judgement may be of the Muſcles of the Necke.

Their number

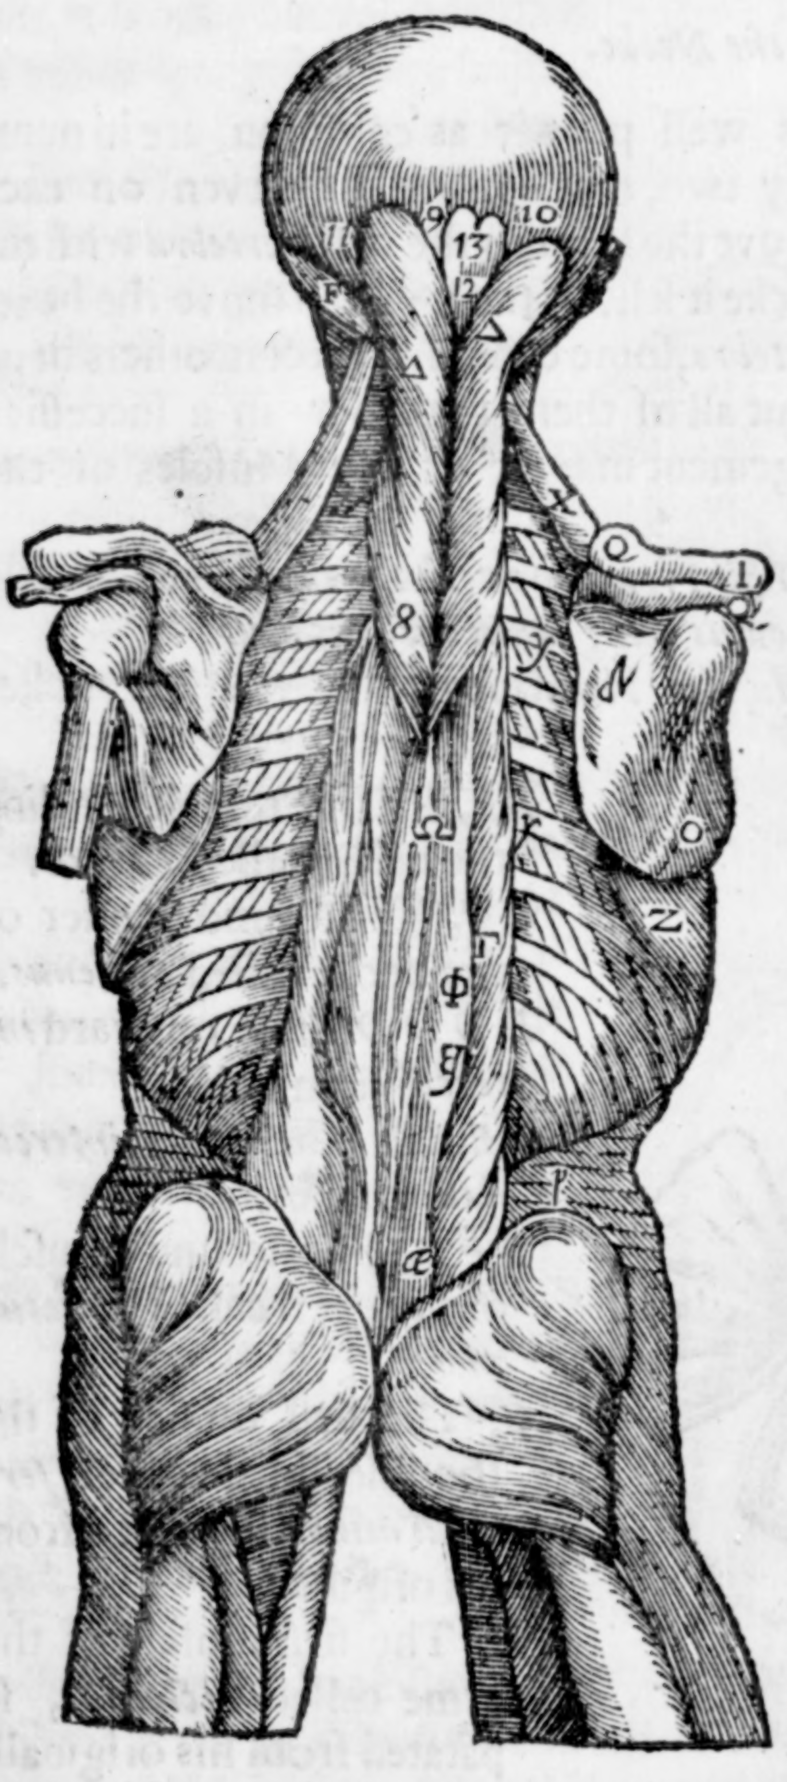
The fourth Figure of the Muſcles. This Figure ſheweth the cavities of the middle and lower bellies, the bowels being taken out, but moſt part of the bones and muſcles remaining.



AB, The firſt muſcle bending the necke called *Longus*.
C C, The ſecond bender of the necke called *Scalenus*.
D D D D, The outward *intercoſtall* muſcles.
E E E E, The inner *intercoſtall* muſcles.
F F F, The ſecond muſcle of the cheſt called *ſerratus maior*.
G, The firſt muſcle of the ſhoulder-blade called *ſerratus minor*, ſeparated from his originall.
H, The firſt muſcle of the arme called *Pectoralis*, ſeparated from his originall.
I, The ſecond muſcle of the arme called *Deltoides*.
K, The bone of the arme without fleſh.
L, The firſt muſcle of the cubite called *Biceps*.
M, The ſecond muſcle of the cubit called *Brachiæus*.
N, The clavicle or coller-bone bent backward.
O, The firſt muſcle of the cheſt called *ſubclavius*.
P, The upper proceſſe of the ſhoulder-blade. *Q*, The firſt muſcle of the head called *obliquus*

obliquus inferior. R, The ſecond muſcle of the head called *Complexus.* S, The fourth muſcle of the ſhoulder blade called *Levator.* T V, The two bellies of the fourth muſcle of the bone *Hyois.* X X, *a a*, The fiſt muſcle of the backe whoſe originall is at *a a.* Y Y, *b b*, *c c*, The ſixt muſcle of the thigh called *Psoa*, whoſe originall is at *c c*, and tendon at *b b.* Z Z, The ſeaventh muſcle of the thigh. *d*, the holy bone. *o o o*, the holes of the holy bone out of which the nerves doe iſſue. *e*, A portion of the fiſt muſcle of the thigh ariſing from the ſhare-bone. *f*, the ſhare-bone bared. *k*, the ninth muſcle of the thigh or the firſt *circumactor.*

The fifth Figure of the muſcles in which ſome muſcles of the head, Cheſt, arme, and ſhoulder-blade are deſcribed.



I, The proceſſe of the ſhoulder-blade, called the top of the ſhoulder.

O, The fourth muſcle of the arme or *the greater round muſcle*, to which *Fallopius* his right muſcle is adjoyned, which ſome call the *leſſer round muſcle.*

Q Q. The ſixt muſcle of the arme or the upper *blade rider.*

X, The ſecond muſcle of the ſhoulder-blade or the *Levator* or heaver.

Z· the ſecond muſcle of the cheſt or the *greater Saw* muſcle.

Υ, the fifth muſcle of the cheſt or muſcle called *Sacrolumbus.*

αβ, His place wherein he cleaveth faſt to the longeſt muſcle of the backe.

γγ, the Tendons of the muſcle obliquely inſerted into the ribs.

Δ Δ, the firſt paire of the muſcles of the head or the Splinters.

Ch. 8. 9, their length whoſe beginning at 8 and inſertion at 9.

10, 11. the ſides of this muſcle.

12, that diſtance where they depart one from the other.

13, the two muſcles called *Complexi*, neare their inſertion.

Φ, the ſecond muſcle of the backe or the *Longeſt* muſcle.

Ω, the fourth muſcle of the backe or the *Semi-ſpinatus.*

ſ, the ſhoulder-blade bare.

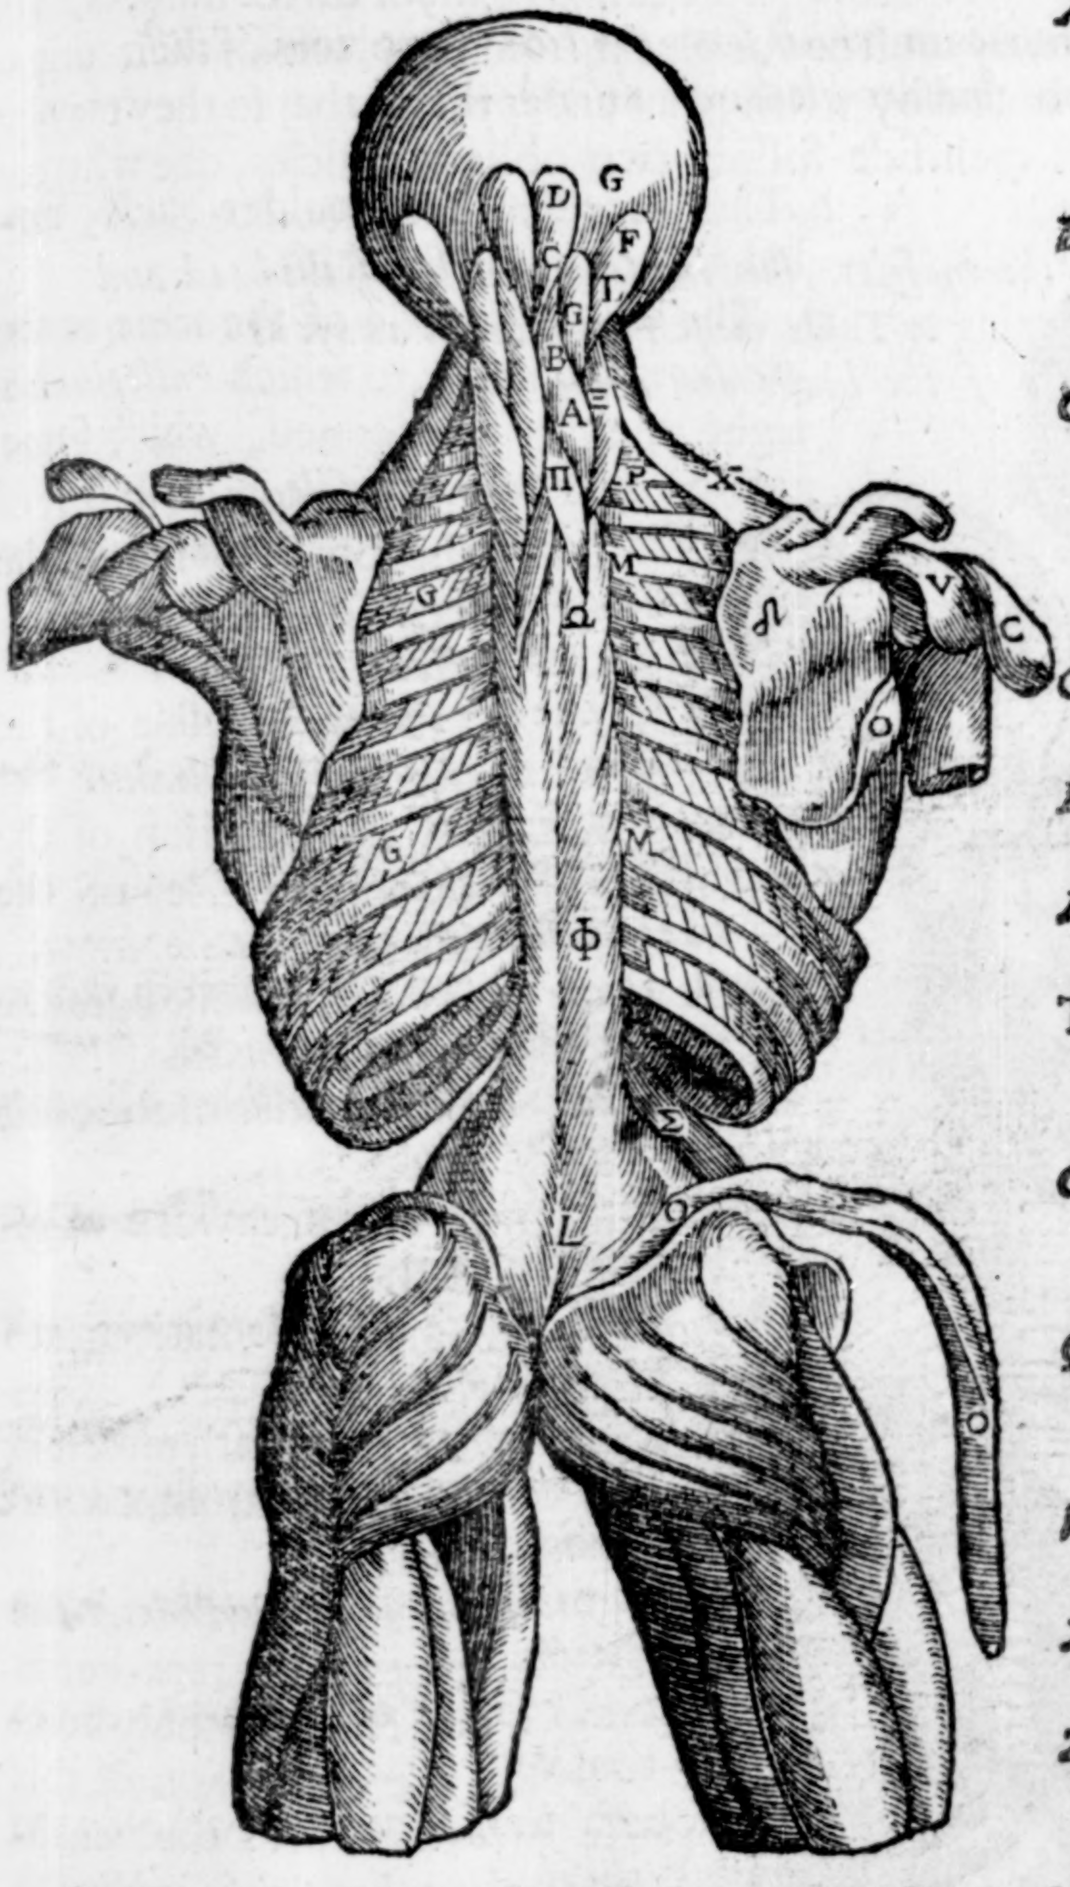
p, A part of the tranſverſe muſcle of the *Abdomen.*

But before I can come to the deſcription of their originall and inſertion, I muſt admoniſh thee, that the 2 Muſcles of the ſhoulder-blade muſt firſt be taken away by diſſection; that is, the *Trapezius*, or Table-muſcle, and the *Rhomboides*, or ſquare-muſcle; whoſe originall and inſertion that we may the better demonſtrate, (or rather the action by which wee ſeeke that originall and inſertion,) they muſt be pulled up, beginning at their inſertion, which is at the ſhoulder-blade (as ſhall be ſhewed in the proper place) turning them up towards their originall, that is, to the Spine. Beſides the leſſe *Rhomboides*, the hinder, and upper (called alſo the *Dentatus* or toothed-muſcle) muſt be raiſed from its originall, which is at the three lower Rack-bones of the Necke and the firſt of the backe, and turned up to its inſertion, which is at three ſpaces of the lower ribbs nigh to the hinde, and upper angle of the ſhoulder-blade, as ſhall be ſhewed in fit place hereafter. Theſe muſcles thus raiſed up, the 4 muſcles which erect and extend the head muſt be taken away, and then thoſe two which move it obliquely, and laſtly one which bends, or declines, for thus anatomicall order requires. Yet if you thinke good, you may, not hurting the other, firſt of all cut away that which is called the *Maſtoides*, which declines or bends the head. For theſe 4, which lift up and extend the head, the firſt from the figure of the Spleene is called the *Splenius*, it aſcends from the 5. upper ſpines of the backe and the 4 lower of the necke, and is obliquely inſerted at the backe part of the head and the mammillary proceſſe, whence you may raiſe it towards its originall. The ſecond by reaſon of its compoſure is called *Complexus*; this paſſing from the third, fourth and fift tranſverſe proceſſe of the Backe and often from the firſt of the Necke, aſcends directly to the backe part of the head

The Splenius.

The Complexus.

The ſixth Figure of the muſcles, ſhewing ſome of the muſcles of the Head, Backe, Cheſt, Shoulder-blade and Arme.



A D, the ſecond paire of the muſcles of the head, or the two *Complexi*, the firſt part is at *A D*.

B C. the ſecond part. *E F*, the third part riſing up under *G* and inſerted at *F*.

G, the fourth part of this muſcle or the right muſcle of the head according to *Fallopius*, which *Veſalius* made the 4. part of the 2.

G G, (Betwixt the ribs) the externall *Intercoſtall* muſcles.

L, the originall of the 2. muſcle of the backe.

M, His tendons at the racke-bone of the necke.

The upper *O* the fourth muſcle of the arme or the *greater round* muſcle.

O O, the lower, the 8 muſcle of the cheſt, or the *Sacrolumbus* hanging from his originall.

Q, the ſixt muſcle of the arme or the upper *Bladerider* inverted.

V, the third ligament of the joynt of the arme:

X, the fourth muſcle of the ſhoulder-blade or the *beaver*.

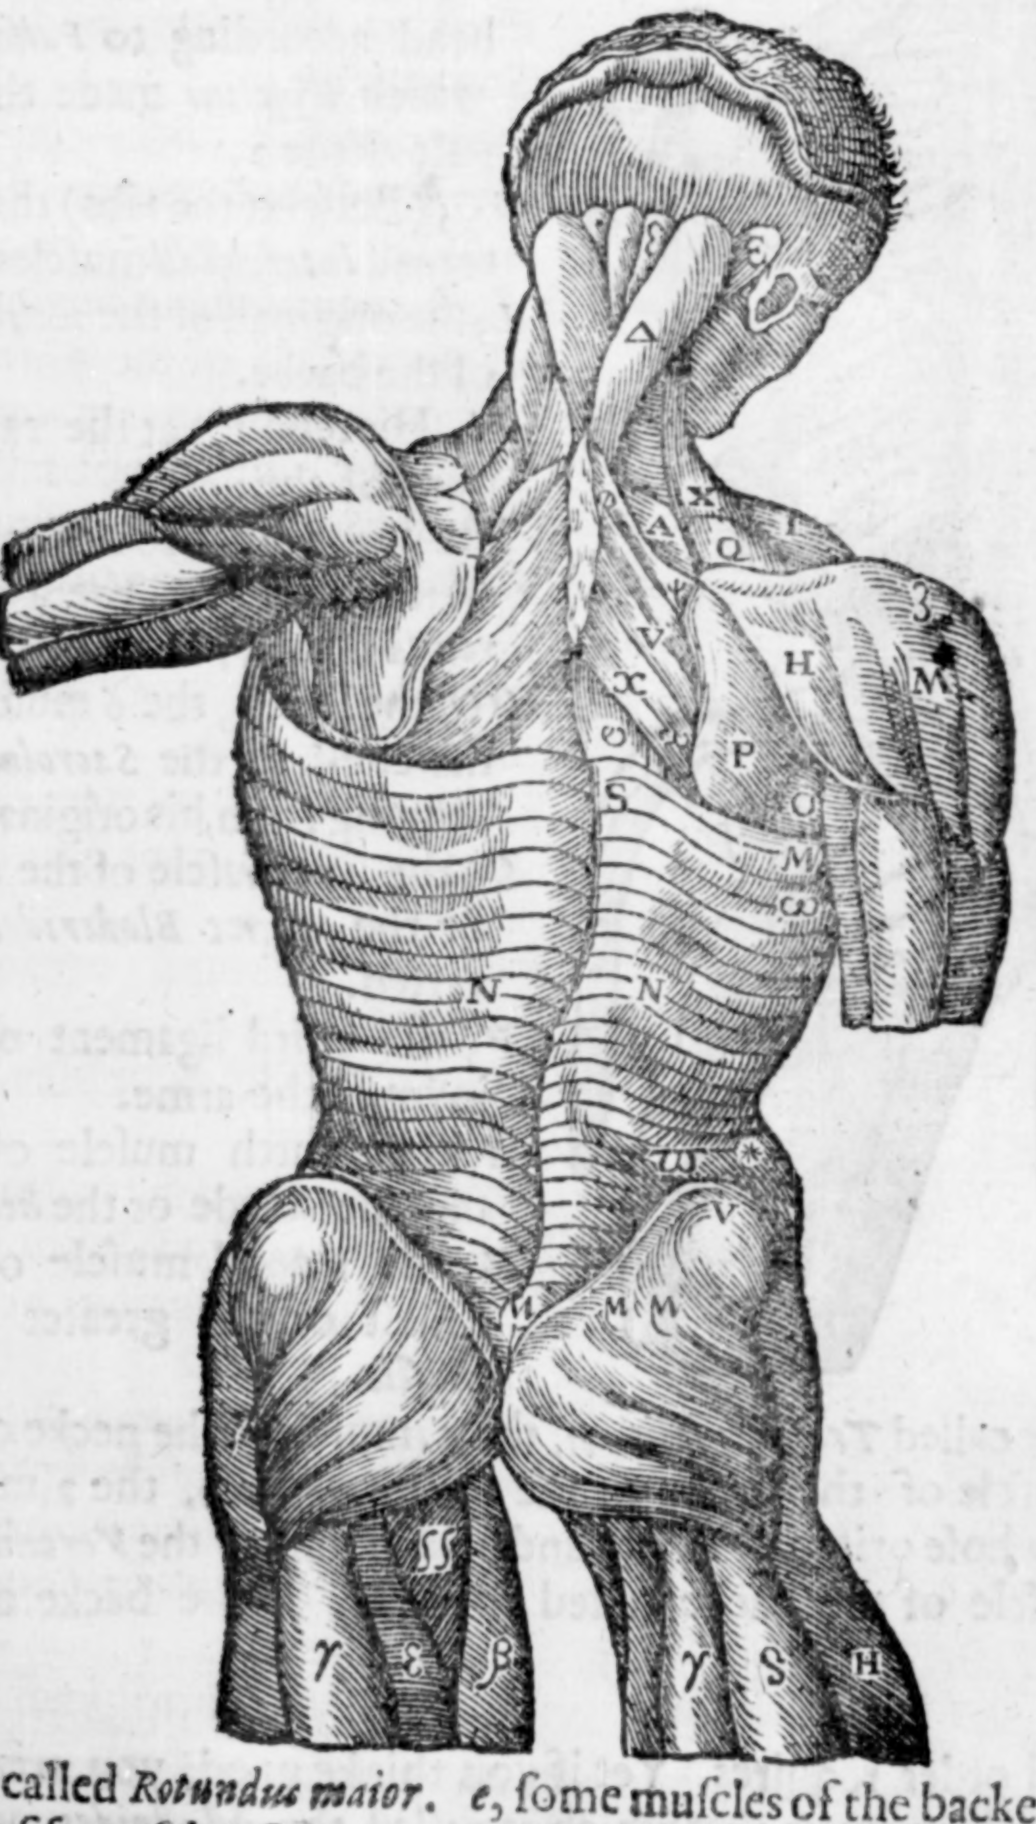
Z, the ſecond muſcle of the Cheſt or the greater *Saw-muſcle*.

Ξ, the 3. muſcle of the necke called *Tranſuerſalis*. Π, the 4. muſcle of the necke called *Spinatus*. Σ, the firſt muſcle of the backe or the *Square muſcle*. Φ, the 2. muſcle of the backe or the *Longeſt*, whoſe originall is at *L* and his tendons at the *Vertebræ* at *M M*. Ω, the fourth muſcle of the backe called *Spinatus*. ẟ, the backe of the ſhoulder-blade flaied.

head, incompaſſing the lower and ſide part of the necke, you may eaſily take it up; if you begin at the ſpine, and ſo goe forwards to the tranſverſe proceſſes and mammillary proceſſes of the nowle bone. This *Complexus* may be divided into two or three muſcles, but that with ſome difficulty, by reaſon of its folded texture. The third and fourth, which be two of the eight little muſcles, being foure on each ſide, doe aſcend ſomewhat obliquely, the firſt truely from the whole ſide of the ſecond *Vertebra.* The ſecond from the whole ſide of the proceſſe of the firſt *Vertebra,* which it hath in ſtead of a ſpine; they aſcend to the backe part of the head juſt againſt the ſpine; theſe two muſcles by the conſent of all Anatomiſts are called right, or direct muſcles, onely moveing the head: theſe truely muſt not be pluckt from the places of their originall, nor inſertion, but onely bound by a ſtring put under them, that ſo they may be the more eaſily ſhewed. On each ſide follow two oblique muſcles, one whereof

The Recti, or right muſcles.

The ſeventh Figure of the muſcles; ſhewing ſome muſcles of the head and Cheſt, the Trapezius *or Table-muſcle being taken away: as alſo of the blade and arme.*



A, The prominent part of the fourth muſcle of the cheſt called *Serratus poſticus ſuperior.*

Δ, the firſt muſcle of the head called *ſplenius.*

E E, the inſertion of the ſecond muſcle of the head called *Complexus.*

I, the coller bone bared.

M, the backpart of the ſecond muſcle of the arme called *Deltois.*

ζH, His backward originall.

θ, His implantation into the arme.

N N, the fourth muſcle of the arme called *Latiſſimus.*

ς μ, His originall from the ſpines of the rack-bones and from the holy bone

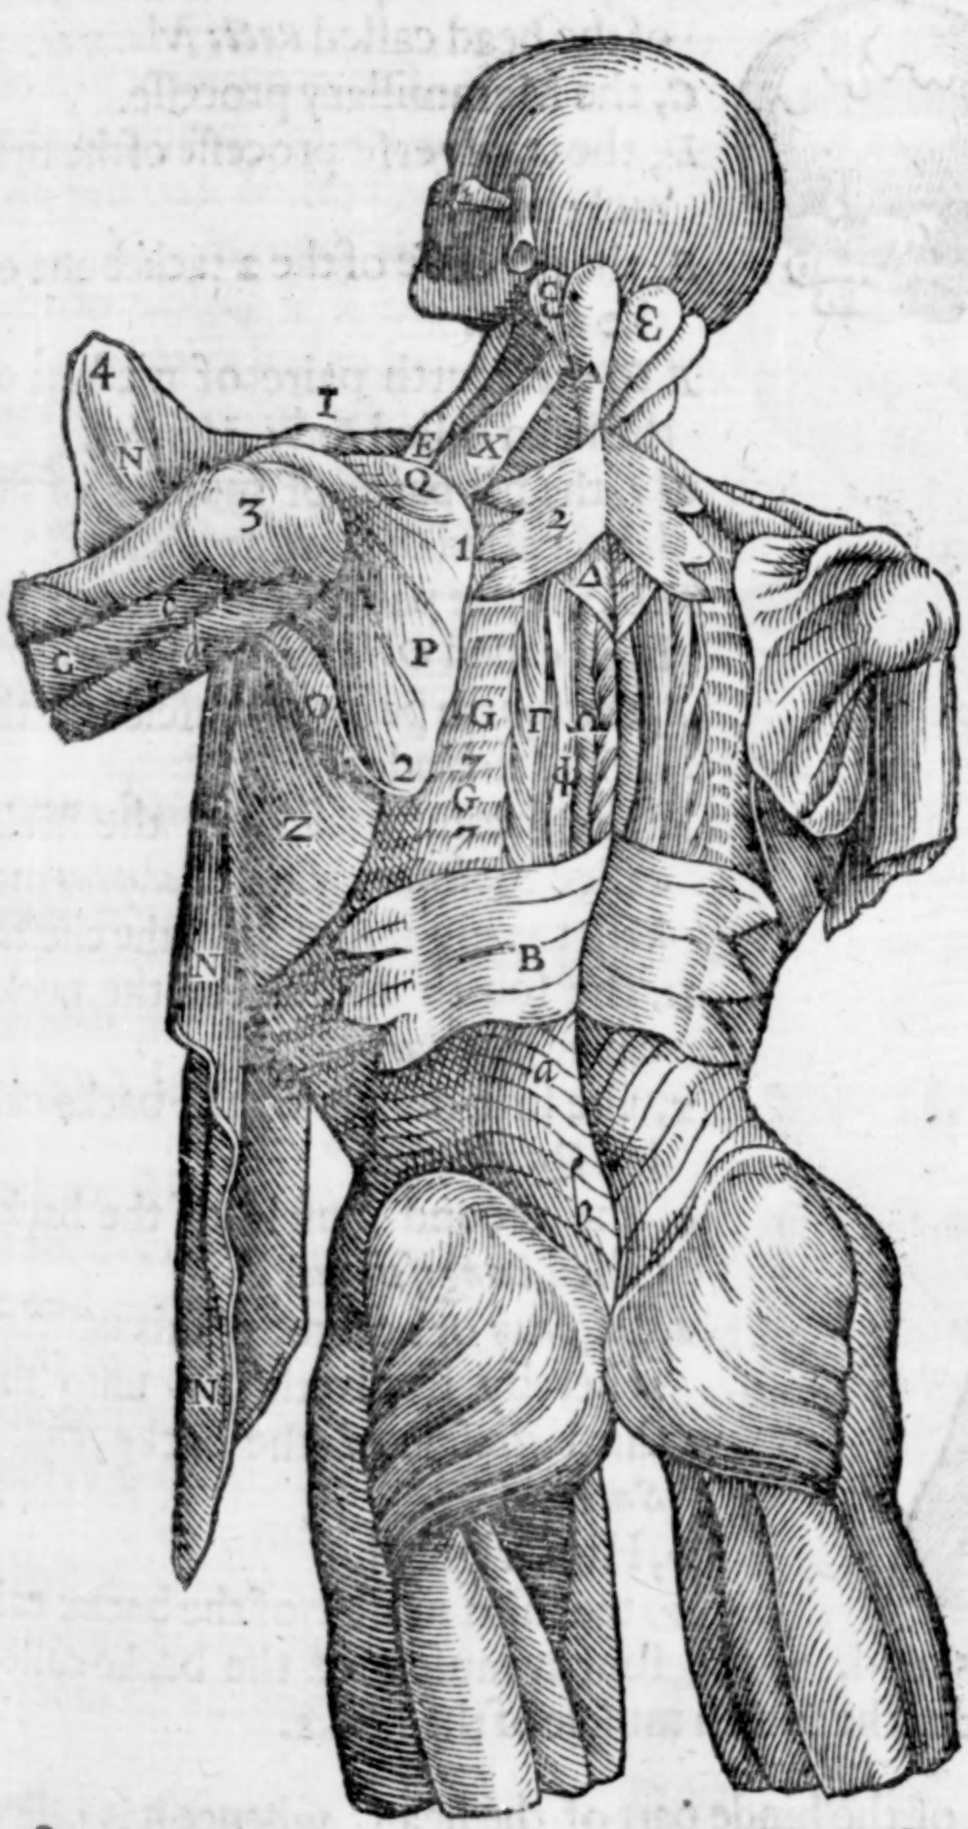
ϖ, the connexion of this muſcle with the hanch-bone, which is led in the inſide from μ to ϖ.

ω, the place where it lieth upon the lower angle of the Baſis of the ſhoulder-blade.

O, the 4. muſcle of the arme called *Rotundus maior.* *e*, ſome muſcles of the backe doe here offer themſelves. *P*, the fift muſcle of the arme called *ſuperſcapularis Inferior.* *Q*, the ſixt muſcle of the arme called *Superſcapularis Superior.* *S*, the beginning of the third muſcle of the arme called *Latisſimus.* *V*, the third muſcle of the blade called *Rhomboides.* φ *X*, His originall from the ſpines of the rackebones. ψ ω, His inſertion into the baſis of the ſhoulder-blade. χ, the fourth muſcle of the blade called *Levator.* * A part of the oblique deſcendent muſcle of the *Abdomen.*

onely moves the head; the other primarily the firſt *Vertebra*, but ſecondarily, and by accident the head it ſelfe. For the firſt, contrary to the opinion of ſome, it ariſes from the tranſverſe proceſſe of the firſt rack-bone, and then is inſerted, above the inſertion of the firſt right muſcle, the which in like manner you muſt lift up, by ſome thing put underneath it, but not ſeparate it. The other entring forth of the ſpine of the ſecond *Vertebra*, is inſerted at the proceſſe of the firſt, contrary to the originall of the precedent, although ſome thinke otherwiſe. It will be convenient in like manner onely, to lift up this with a ſtring, and not plucke him from his place, that ſo you may ſee how all theſe make a perfect triangle. The action of this muſcle is contrary to the action of the precedent, as the contrariety of its originall and inſertion ſhew.

The eight Figure of the muſcles; eſpecially of thoſe of the Cheſt, Head, and Shoulder-blade, the Trapezius, Latiſſimus, and Rhomboides, *being taken away.*



A, The fourth muſcle of the cheſt, or the upper and hinder Saw-muſcle.

B, the 5 muſcle of the cheſt, or the lower and hinder Saw-muſcle.

a, *b*, A membranous beginning of the muſcle of the *Abdomen*, deſcending obliquely downe from the ſpine of the backe.

C, the firſt muſcle extending the Cubit at *c*, his originall is from the necke of the arme, and from the lower baſis of the blade at *d*.

E, the originall of the fourth muſcle of the bone *hyois* from the blade.

GG, the outward intercoſtall muſcles.

I, the Clavicle or coller-bone bared.

N, the upper, the ſecond muſcle of the arme called *Deltois*, char. 4, 5, the beginning of this muſcle.

N, the third muſcle of the arme or the broad muſcle ſeparated.

O, the fourth muſcle of the arme or the lower *Super-Scapularis* or bladerider.

1, 2, 3. Char. His originall at the baſis of the ſhoulder-blade at 1 2, and his inſertion into the joynt of the arme at 3. *Q*, the ſixt muſcle of the arme or the upper *Super-Scapularis*. *X*, the fourth muſcle of the blade called *Levator* or the heaver. *Z*, the ſecond muſcle of the Cheſt or the greater Saw-muſcle. 7, 7, Char. the ribs. Γ, the ſixt muſcle of the cheſt, or the muſcle called *Sacrolumbus*. Λ, the firſt muſcle of the head or the ſplinter. E E, the ſecond muſcle of the head or the inſertion of the muſcles called *complexei*. Φ, the ſecond muſcle of the backe or the longeſt muſcle. Ω, the fourth muſcle of the backe called *Semiſpinatus*.

Wherefore

Which may be truly called the proper muſcle of the necke.

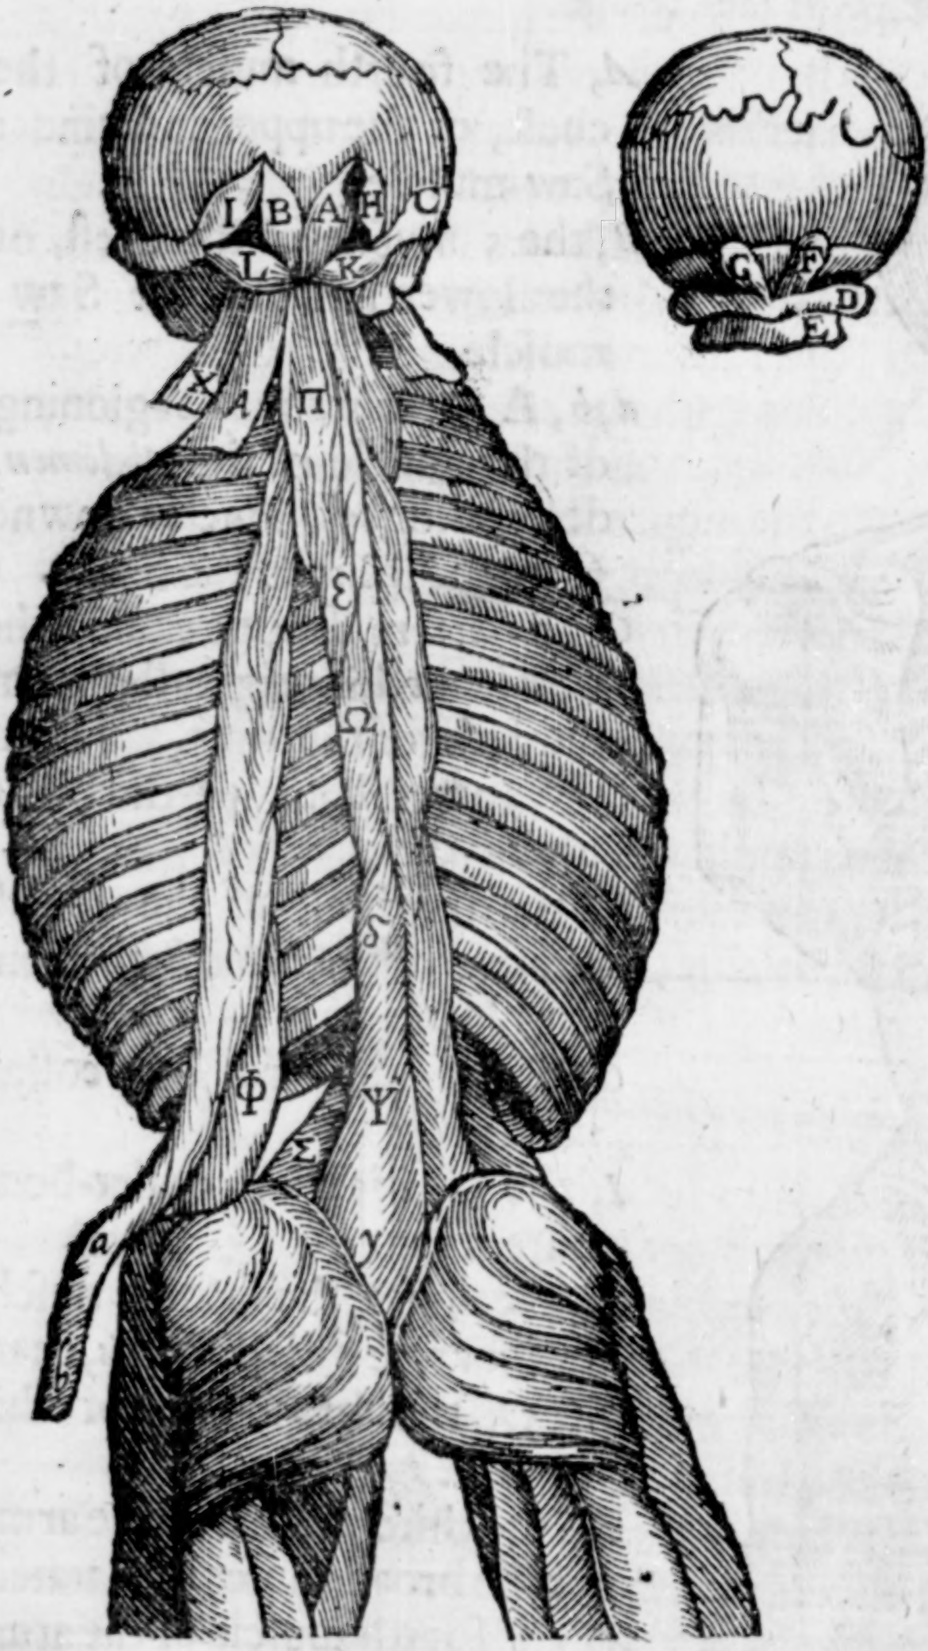
Wherefore when the firſt oblique moves the head obliquely forwards, the ſecond puls it packe by the firſt *Vertebra*, this with his aſſociate of the other ſide, may be truly termed the proper muſcles of the neck, becauſe they belong to no other part; whereas it is contrary in other muſcles. But we muſt note, that the head (according to *Galens* opinion) hath two motions, one directly forwards and backwards, as appeares in beckning it forwards, and caſting it backwards; the other circular.

The two motions of the head.

The firſt in *Galens* opinion is performed by the firſt *Vertebra* moved upon the ſecond; the ſecond by the head moved upon the firſt *Vertebra*; for which he is reproved by the latter Anatomiſts, who teach that the head cannot be turned round or circularly upon the firſt *Vertebra* without putting it out of joynt.

For the laſt, which bends the head, it aſcends from the upper and ſide part of the *Sternon*, and the next part of the clavicle, obliquely to the *Apophyſis*

The ninth Figure of the muſcles, ſhewing the muſcles of the Head and Necke.



A B, the third paire of the Muſcles of the head called *Recti Maiores*.

C, the Mammillary proceſſe.

D, the tranſverſe proceſſe of the firſt rackebone.

E, the proceſſe of the 2 rackebone of the necke.

F G, the fourth paire of muſcles of the head called *Recti Minores*.

H I, the fiſt paire of muſcles of the head called *Obliqui Superiores*.

K L, the ſixt paire of muſcles of the head called *Obliqui Inferiores*.

X, the fourth paire of muſcles of the ſhoulder-blade.

Λ, the ſecond muſcle of the necke called *Scalenus*, which *Falopius* maketh the eight muſcle of the cheſt.

Π, the fourth muſcle of the necke called *ſpinatus*.

Σ, the firſt muſcle of the backe called *Quadratus*.

Φ, the ſecond muſcle of the backe called *Longiſsimus*.

a, the *ſinus* or boſome of this muſcle, whereby it giveth way unto the third muſcle of the backe, called *Sacer*.

b, His Originall.

Ψ, the third muſcle of the backe called *Sacer*. γ, His Originall. δ, His end. Ω, the fourth muſcle of the backe called *Semiſpinatus*. ε, His upper end under the fourth muſcle of the necke.

The Maſtoideus.

Maſtoides or mammillary proceſſe of the hinde part of the head, whence it is called the *Maſtoideus*. You may divide this by reaſon of its manifold originall rather into two, than into three muſcles. But it had beene better that the head might have beene moved every way, equally backwards and to the right and left ſides; but thus it would often have beene ſtrained to our great dammage and danger of life; neither could there have beene ſuch facility of motion without a looſeneſſe of the joynt. Therefore nature had rather beſtow upon the head an harmeleſſe facultie of fewer motions, than one furniſhed with more variety, but with a great deale more uncertainty and danger, Wherefore it hath made this juncture not laxe or looſe, but ſtiffe and ſtrong.

After the ſhewing of theſe muſcles, we muſt come to three or foure of the necke, of which number two (which ſome reduce to one) extends, another bends, and the laſt moves ſide wayes, and all of them with a motion ſucceeding each other turne it about, as we ſaid of the muſcles of the head. The firſt of theſe which extend, taking its originall from the ſixe tranſverſe proceſſes of the ſixe upper racke-bones of the backe, or rather from the root of the oblique, aſcends directly to the ſpine of the ſecond *Vertebra* of the necke, and the oblique proceſſe thereof; ſome call it the *Tranſverſarius*; that is, the tranſverſe-muſcle. This, if you deſire to take it away, it is beſt firſt to ſeparate it from the ſpine, then to turne it upwards to the tranſverſe proceſſes; unleſſe you had rather draw it a little from its partner and companion in that place where their originals are diſtinct, ſeeing it is the laſt and next to the bones.

The *Tranſverſarius*.

Marvell not, if you finde not this diſtinction of their originall, ſo plaine and maniſeſt, for it is commonly obſcure. For the muſcle *Spinatus*, as it moſt commonly comes to paſſe, ariſing from the roots of the ſeven upper ſpines of the backe, and the laſt of the necke, is inſerted into other ſpines of the necke, ſo that it might eaſily be confounded with the former by *Galen*. The third bends the necke, and ariſing within from the body of the five upper *Vertebræ* of the back (though with a very obſcure originall, ſpecially in leane bodies) it aſcends under the gullet alongſt the necke, even to the nowle-bone, into whoſe inner part it is obſcurely inſerted. Wherefore it is likely that it helpes not onely to bend the necke, but alſo the head. This muſcle is made of oblique fibers proceeding from the body of the *vertebra*, all the way it paſſes to the tranſverſe proceſſes of the other *Vertebra*. But it ſeemes with its copartner which is oppoſite to it, to make a certaine hollow path upon the bodies of the *Vertebræ*, to the gullet, and it is called the long muſcle. The fourth and laſt, which we ſaid moves the necke to one ſide, is called *Scalenus* from the figure thereof; it aſcends from the hinder and upper part of the firſt rib of the Cheſt, inſerting its ſelfe into all the tranſverſe proceſſes of the necke by its fibers, which as it were for the ſame purpoſe, it hath ſufficiently long, that it may faſten it ſelfe from the furtheſt or loweſt proceſſe of the necke into the firſt or higheſt thereof. The paſſage of the nerves through this to the arme makes this muſcle ſeeme double or divided into two. For the veines and arteries pertaining to the necke, they have beene declared in the proper Chapters of the diſtributions of the veſſels; it remaines that you note, all theſe muſcles receive nerves from the *Vertebræ* whence they ariſe.

The *Spinatus*.

The *Longus*.

The *Scalenus*.

CHAP. XVIII.

Of the Muſcles of the Cheſt and Loynes.

WE muſt now ſpeake of the Muſcles both of the Cheſt which ſerve for reſpiration, as alſo of the Loines. But firſt we muſt know that the hinde part of the Cheſt called the *Metaphrenum*, or backe, conſiſts of twelve *Vertebræ*, the loines of five, all which differ not from the *Vertebræ* of the necke, but that they are thicker in their bodies than theſe of the necke; neither are they leſſer in holes, neither they have their tranſverſe proceſſes perforated, or parted in two, as the racke-bones of the necke have. Beſides each of theſe racke bones alone by it ſelf, on each ſide in the lower part thereof makes a hole, through which a nerve hath paſſage from the ſpinall marrow to the adjacent parts, when on the contrary in the *Vertrebræ* of the necke, ſuch holes or paſſages are not made, but by meeting together of two of them.

In what the *Vertebræ* of the necke and loines agree and diſagree.

Concerning the proceſſes of the Rackbones of the Cheſt, whether tranſverſe, right or oblique, they differ nothing from theſe of the necke (I meane even to the tenth) but that the tranſverſe ſeeing they are not perforated, as we ſaid before, do as it were ſuſtaine the ribbes, being ſtraitly bound to them with ſtrong ligaments both proper and common; but after the tenth *Vertebra* of the backe, the two other of the backe, and all thoſe of the loines are different, not onely from thoſe of the necke, but alſo from the tenne firſt of the backe, by reaſon of their oblique proceſſes, becauſe from the eleaventh (which is received, as well by that which is above it, as by that under it, for the ſtrength of the whole backe, and the eaſier bending thereof without feare of fracture or diſlocation) the above mentioned proceſſes of the lower rack-bones which were wont to receive, are received; as on the contrary they receive which were wont to be received. They differ beſides from all the forementioned, by reaſon of their ſpines, becauſe from the eleaventh they beginne by little and little to looke upwards, contrary to the former.

How the tenth *Vertebra* of the backe, may be ſaid to be the middle of the ſpine.

But if any aſke, how the tenth *Vertebra* of the backe may be termed the midſt of the ſpine, being the whole ſpine conſiſts of twentie foure *Vertebræ*? He may know that this may be true, as thus; if the ſixe bones of the holy-bone, and the fourth of the Rumpe (being more griſtlely than bony) be numbred amongſt the bones of the Spine; for then from the ſetting on of the head to the eleaventh racke bone of the backe, are ſeaventeene in number, and ſo many from thence downewards.

The number of the muſcles of the Cheſt.

The muſcles dilating the Cheſt.

The muſcles contracting the Cheſt.

The *Subclavius* is the firſt of the muſcles dilating the cheſt.

Serratus major.

Serratus poſterior and ſuperior.

The oblique aſcendent of the lower belly.

The eleaven *Intercoſtales externi.*

6. *Intercartilaginei.*

But let us returne to the muſcles of the Cheſt ſerving for reſpiration. Firſt, you muſt know that theſe Muſcles are fourescore and nine, that is, on each ſide fortie foure, alike in ſtrength, thickneſſe, ſite, and action; and one beſides in the midſt which they call the *Diaphragma* or Midriffe. Of theſe fortie foure, there are 22, which dilate the cheſt in drawing in the breath; that is, the *Subclavius*, the *Dentatus*, or *Serratus major* in the opinion of ſome, both the *Rhomboides*, or *Serrati poſtici*; the oblique aſcendent of the lower belly, the eleaven *Intercoſtales*, and the ſixe *Intercartilaginei externi*. On the contrary, as many contract the breaſt in expiration; to wit, the *Sacrolumbus*, the oblique deſcendent, the Right and tranſverſe of the lower belly, the inner Trangular, the ſixe *Intercartilaginei*, and the eleaven inner *Intercoſtales*. Of theſe twentie two dilating the Cheſt, the firſt, from the ſite is called the *Subclavius*, for it deſcends obliquely from the inner and forepart of the *Clavicula* or Coller-bone, into the griſtle of the firſt ribbe, even to the *Sternon*, and dilates it. The ſecond is the *Serratus major*, the greater Saw-muſcle ariſing according to the opinion of ſome from the whole *baſis* of the ſhoulder-blade on the inſide, and it is tranſverſely inſerted into the nine upper ribbes, producing certaine toothed or ſaw-like proceſſes running further to the bones of the rib, than to the ſpaces betweene them, or Intercoſtall muſcles, whereupon it hath the name of the ſaw-muſcle; yet ſome have referred this muſcle to them of the ſhoulder-blade. The third deſcends from the three lower ſpines of the neck, and the firſt of the backe, by means of a membranous and moſt thinne ligament, into the three or foure upper ribbs, running further into their ſpaces or Intercoſtall muſcles, than into the ribbs themſelves, wherupon it is called *Serratus poſterior, & ſuperior*, that is, the hinder and upper ſaw-muſcle. The fourth in like manner aſcends by means of a membranous and thin ligament from the three upper ſpines of the loines, and the two laſt of the cheſt, or backe, into three or foure of the lower, or laſt of the baſtard ribbs, ſent forth further into them or their bones, than into the Intercoſtall muſcles poſſeſſing the ſpaces betweene them, wherefore it is called *Serratus poſterior & inferior*, the hinder and lower ſaw-muſcle. Moreover theſe two laſt muſcles have beene called by a common name from their figure the *Rhomboides*, that is, the ſquare muſcles. The fiſt which we ſaid was the aſcendent of the *Epigaſtrium*, hath already beene ſufficiently deſcribed in his place. The eleaven *Intercoſtales externi*, or externall Intercoſtall muſcles deſcend obliquely from the backe part of the lower ſide of the upper ribbe, into the forepart of the upper ſide of the ribbe lying next under it, after a quite contrary manner to the ſixe *Intercartilaginei*, who having like originall and inſertion amongſt the griſtles, as the Intercoſtall amongſt the ribbes, deſcend obliquely from the forepart backwads. And thus much of the muſcles dilating the Cheſt in inſpiration.

The *Sacrolumbus*, the firſt of thoſe which contract the cheſt.

But the firſt, of the other muſcles, being as many in number, which contract the Cheſt in expiration, ariſing from the holy-bone, and the oblique proceſſes of the loines, aſcends (firmely and confuſedly adhering with the *Muſculus ſacer*, or holy-muſcle, which we ſhall deſcribe hereafter) to the roots of the twelve ribbes, imparting in the aſcent a ſmall tendon to each of them, by which it drawes theſe ribbs towards the tranſverſe proceſſes; and by reaſon of its Originall it is called *Sacrolumbus*, that is, the Holy-loine-muſcle.

The oblique deſcendent, the right and tranſverſe of the *Epigaſtrium*.

The ſecond, third, and fourth, which we ſaid were the oblique deſcendent, right, and tranſverſe of the *Epigaſtium*, have beene formerly deſcribed in their place.

But by the way you muſt note that theſe three muſcles of the *Epigaſtrium* helpe expiration rather by accident, than of themſelves, to wit, by driving backe the midriffe towards the lungs by the entrailes, which alſo they force upwards, by drawing the parts into which they are inſerted towards their Originall. The fifth which we called the *Triangulus*, or Triangular, may be called the *Compreſſor* of the griſtles, which proceeding from the inner ſides of the *Sternon*, goes to all the griſtles of the true ribbes; this is more apparent under the *Sternon* in beaſts, than in men, though it be not very obſcure in them neither. For the internall Intercoſtall muſcles, in my judgement, they ariſe from the lower ſides of the upper ribbe, and deſcending obliquely from the fore part backwards, are inſerted into the upper ſide of the ribbe next under it; ſo that they may follow the production of the fibers of the externall *Intercartilaginei*; as the ſixe internall *Intercartilaginei* follow the ſite of the externall Intercoſtall proceeding from behinde forwards; wherefore as well the Intercoſtall, as the *Intercartilaginei*, every where interſect each other, after the ſimilitude of the letter X. I know ſome have written that the internall muſcles (whether intercoſtall or *Intercartalaginei*) aſcend from the upper ſides of the lower ribbe forwards, or backwards.

Triangulus muſculus.

Intercoſtales interni.

Intercartilaginei interni.

But if this were true, it would follow that theſe muſcles admitted their nerves in their taile and not in their head, ſeeing the nerve alwayes goes under the ribbe, and not above it.

Muſcles alwayes receive their nerves in their heads.

The laſt muſcle of the Cheſt, that is, the *Diaphragma* or Midriffe, is ſufficiently deſcribed before; wherefore it remaines wee deſcribe the muſcles of the Loines. Theſe are ſixe in number, on each ſide three, equall in thickneſſe, ſtrength and ſituation; one of theſe bends, and the other two extend the Loines; it is called by reaſon of the figure the *Triangulus*, or Triangular which bends the Loines, it aſcends from a great part of the hinde ſide of the Hanch-bone into the tranſverſe proceſſes of the Loines, and the laſt of the Cheſt on the inſide, for which cauſe it is made of fibers ſhort, long, and indifferent, anſwering to the neareneſſe or diſtance of the ſaid proceſſes. The firſt of the extenders is called the *Semiſpinatus*, becauſe even to the middle of its body it takes the originall from the ſpines of the holy-bones and Loines; this with its oblique fibers aſcends from all the ſaid ſpines to the tranſverſe proceſſes as well of the Loines as Cheſt. The other is called *Sacer*, the Holy-muſcle, becauſe it takes its originall from the Holy-bone, or the ſides thereof; it aſcends with its oblique fibers to the ſpines of the Loines, and of the eleaven lower Rack-bones of the Cheſt.

The midriffe.

The muſcles of the loines. They are three paires *Triangulus*.

Semiſpinatus.

Sacer.

CHAP. XIX.

Of the Muſcles of the Shoulder-blade.

Now we muſt deſcribe the muſcles of the extreme parts, and firſt of the Arme, taking our beginning from theſe of the Shoulder-blade. But firſt, that we may the better underſtand their deſcription, we muſt obſerve the nature and condition of the ſhoulder-blade. Therefore the blade bone on that part, which lies next unto the ribbs, is ſomewhat hollowed; wherefore on the other ſide it ſomewhat buncles out. It hath two ribbs, one above, another below: by the upper is ment nothing elſe than a border or right line, which looking towards the temples is extended from the exterior angle thereof under the collar-bone, even to the Proceſſe *Coracoides* which this ribbe produces in the end thereof: By the lower, the underſide which lies towards the lower belly and the ſhort ribbs.

The deſcription of the blade-bone, or ſhoulder-blade.

Beſides in this ſhoulder-blade we obſerve the *baſis*, head and ſpine. By the *baſis* we underſtand the broader part of the ſhoulder-blade, which lookes towards the

The baſis of the blade.

The head of the ſhoulder-blade.

backe-bone. By the head we underſtand the narrower part thereof, in which it receives the head of the Arme in a cavity, indifferently hollow, which it produces both by it ſelfe, as alſo by certaine griſtles, which there faſtened encompaſſe that cavity. This kinde of cavity is called Glene.

The ſpine of the blade.
The proceſſes *Acromion* and *Coracoides.*
The muſcles of the ſhoulder-blade.

This receives and containes the bone of the arme, by a certaine ſtrong ligament encompaſſing & ſtrengthening the joynt, which kind of ligament is common to all other joints; this ligament ariſes from the bottome of the cavity of the ſhoulder-blade, and circularly encompaſſes the whole joynt, faſtening it ſelfe to the head of the arme; there are alſo other ligaments beſides this, which encompaſſe & ſtrengthen this articulation. By the ſpine is ment a proceſſe, which riſing by little and little upon the gibbous part of the blade, from the *baſis* thereof where it was low and depreſt, becomes higher untill it ends in the *Acromion*, or upper part thereof. Nature hath made two productions in this bone (that is to ſay, the *Acromion* from the ſpine, and the *Coracoides* from the upper ſide) for the ſtrengthening of the articulation of the arme and ſhoulder-blade, that is, leſt the arme ſhould be eaſily ſtrained upward or forwards; beſides, it is faſtened to the clavicle, by the proceſſe *Acromion.*

Serratus minor.
Rhomboides.
Levator.
Trapezius.

The muſcles which move the ſhoulder-blade are ſixe in number, of which foure are proper, and two common. The firſt of the foure proper ſeated in the forepart, aſcends from the bones of five or ſixe of the upper ribbs, to the *Coracoides*, which it drawes forwards, and is called *Serratus minor*, that is, the Leſſer ſaw-muſcle; which that you may plainely ſhew, it is fit you pull the pectorall muſcle from the collar-bone, almoſt to the middle of the *Sternon*. The other firſt oppoſite againſt it, is placed on the fore ſide, and drawes its originall from the three lower ſpines of the necke, and the three upper of the Cheſt, from whence it extends it ſelfe, and ends into all the griſtly *baſis* of the ſhoulder-blade, drawing it backwards; it is called the *Rhomboides*. The third from its action, is called the *Levator*, or the heaver, or lifter up, ſeated in the upper part, it deſcends from the tranſverſe proceſſes of the foure firſt *Vertebræ* of the necke into the upper angle and ſpine of the blade. The fourth called *Trapezius*, or the Table-muſcle, is ſeated in the backe part, and is membranous at the originall, but preſently becoms fleſhy: it ariſes from almoſt all the backe-part of the head, from all the ſpines of the necke, and the eight upper *Vertebræ* of the cheſt, and then is inſerted by his nervous part, almoſt into the whole *baſis* of the blade, extending it ſelfe above the muſcles thereof, even to the midſt of its ſpine, where being fleſhy it is inſerted even to the *Acromion*, the upper part of the clavicle, and in ſome ſort to the upper ribbe. This muſcle hath a threefold action, by reaſon of its triple originall. The firſt is to draw the ſhoulder-blade towards its originall, that is, to the nowle, and ſpine of the necke; the other is to draw it towards the backe, becauſe of the contraction of the middle or tranſverſe fibers which leade it directly thither; and the other is to draw it downewards by reaſon of the originall it hath from the fifth, ſixth, ſeventh, and eight ſpine of the *Vertebræ* of the Cheſt.

Latiſsimus.
Pectoralis.

But we muſt note that theſe diverſe actions are not performed by this muſcle, by the aſſiſtance of one onely nerve, but by more, which come into it by the ſpinall marrow, by the holes of the *Vertebræ*, as well of the necke as the cheſt, from whence it takes the originall. For the two other which are the common muſcles of the blade, and arme, or ſhoulder; we will deſcribe them with the muſcles of the ſhoulder or arme: for one of theſe which is called the *Latiſsimus*, that is, the broadeſt, aſcends from the holy-bone to the ſhoulder-blade and arme.

The other named the *Pectoralis* coms from the *Sternon* and collar-bone to the ſhoulder-blade and arme.

CHAP. XX.

The Deſcription of the Hand taken in Generall.

NOW it beſits us to to deſcribe in order the muſckes of the arme; but firſt we muſt know, what it is that we call the arme. But ſeeing that cannot fitly be underſtood, unleſſe 1. we know what the hand is, ſeeing that the arme is a part of the hand; therefore firſt we muſt define what a hand is, and then devide it into its parts. Therefore the hand is taken two manner of wayes, that is, generally and ſpecially.

The hand generally taken, ſignifies all that which is contained from the joyning of the arme to the ſhoulder-blade, even to the ends of the fingers. But in particular it ſignifies onely that which is comprehended from the furtheſt bones of the cubit, or the beginning of the wreſt, to the very fingers ends.

What is meant by the hand in generall.

Therefore the hand in generall is an inſtrument of inſtruments made for to take up and hold any thing. It is compoſed of three great parts, that is, of the Arme, Cubite, and Hand, vulgarly, and properly ſo called; but the hand taken thus in particular is againe devided in three other parts, the *Carpus* or *Brachiale*, the Wreſt, the *Metacarpium*, or *Poſtbrachiale*, the afterwreſt, and the fingers; all theſe parts (ſeeing each of them are not only organicall parts, but alſo parts of organicall parts) are compoſed of all, or certainely of the moſt of the ſimular parts; that is, of both the skinnes, the fleſhy pannicle, the fat vaines, arteries, nerves, muſcles or fleſh, coats both common aud proper, bones, griſtles and ligaments, all which we will diſcribe in their order.

But firſt I thinke good to admoniſh you of the differences of the hand taken from the ſite thereof; and theſe differences are ſixe in number, the fore, the hinde, the internall, the externall, the upper and lower ſide or part thereof.

The differences of the hand from the ſite thereof.

By the fore we meane that part which lookes directly from the thumbe to the ſhoulder: by the hinde, we underſtand the part oppoſite to it, which from the little finger lookes towards the baſis of the ſhoulder-blade. By the inſide we ſignifie that part which lies next to the ſides of the body, when the hand retaines its naturall ſite; by the outſide, the part oppoſite to it. The upper and lower ſide you may know by the very naming thereof.

The hand properly ſo called is devided into five fingers, that ſo it may hold and take up bodies of all figures, as round, triangular, ſquare and the like, and gather up the leaſts bodies with the fingers ends, as needles, pins, and ſuch like.

Why the hand is devided into ſo many fingers.

Nature hath beſtowed two hands upon us, that ſo they may helpe each other, each moving to each ſide. But for the taking up and holding of ſmall bodies it was fit, that the fingers of their owne nature ſoft, ſhould be armed with nailes, that conſiſting of ſoft fleſh and an hard naile, they might ſerve for all actions; for the naile is a ſtay to the ſoft fleſh, which otherwiſe would turne away in meeting with an hard body; the uſe of the nailes is to ſcratch, ſhave, and pull off the skinne, to rend, pinch, and plucke aſunder ſmall bodies. They have not bony hardneſſe, that ſo they might not breake, but bend.

Why the nailes are added to the ſoft fleſh of the fingers.

Yet other creatures have hard nailes, to ſerve them in ſtead of weapons. Their figure is round, becauſe ſuch a figure is leſſe obnoxious to externall injuries; and by reaſon they are ſubject to wearing, they grow continually.

Why the nailes grow continually.

Nature hath placed fleſh on the inner and ſide part of the fingers, ſo to preſſe more ſtraitly, the things they once take hold of, ſo that by holding them cloſe together, we can hold water that it may not runne out. The length of the fingers is unequall, that when they are opened and ſtretched forth, they make as it were a circular figure; for ſo it comes to paſſe, that the hand can hold all bodies, but eſpecially round.

It remaines that we proſecute the diſtribution of the veines, arteries, and ſinewes, which runne over all the parts of the hand taken in generall and particular, whereby wee may more commodiouſly hereafter handle all the proper parts thereof.

Chap. XXI.

The Diſtribution of the Subclavian veine, and firſt of the Cephalica, or Humeraria.

The Cephalicke vaine.

TWo large veines deſcend from the Subclavian, the one from the lower ſide, the other from the higher. Yet ſometimes, and moſt uſually, both theſe proceede from the ſame common orifice, as in men of a low ſtatnre in the arme. The one of theſe is called the *Axillaris*, the other the *Humeraria*, or *Cephalicke*; therefore this Cephalicke paſſing forth of the Subclavian runnes ſuperficially along the foreſide betweene the muſcle *Deltoides*, and the Tendon of the pectorall muſcle, and deſcends in the midſt betweene the common coate of the muſcles and the fleſhy pannicle, even to the bending of the cubite, where in leane bodies it is plainely to be ſeene, whereas in fat bodies it is hardly to be perceived, being as it were buried in abundance of fat. This veine having in its deſcent, ſent forth ſome ſmall branches, both to the skinne, as alſo to certaine muſcles over which it runs, is devided into two, a little above the outward protuberation of the arme. One of the branches into which it is devided deſcending obliquely to the fore part of the cubite, a little below the bending of the cubite, it meets, and is united with the like branch in the ſame place, as ſhall be ſhowne hereafter.

The median veine.

How by opening the median veine, you may draw more or leſſe bloud from the head or liver.

That which ariſes from this concourſe, is called the median veine, becauſe it ariſes from two branches, and is ſeated betweene them. They uſually open this median veine in the diſeaſes of the head and liver, which require Phlebotomy; but if it ſhall not be ſufficiently manifeſt, when you judge it muſt be opened, for a generall evacuation of the whole body; you may cut one of theſe branches, by whoſe concourſe it is made, which you ſhall think the fitter; and becauſe each branch drawes from the next parts, according to the ſtraightneſſe of the fibers, rather than from the oppoſite ſide; if you would evacuate the head, and liver equally, by opening either of theſe branches; it is convenient that opening that branch (for example) which comes from the Cephalicke, you preſently lay your thumbe upon it, untill you ſuppoſe, you have drawne a juſt quantity of bloud from the liver, by the *Baſilica*, or liver veine; which done, you may take off your thumbe, and ſuffer the bloud to follow freely, by the open branch of the Cephalicke, untill you have drawne as much bloud as you ſhall judge requiſite; otherwiſe you will draw it but from one part, to wit, the head. So you ſhall evacuate it onely from the liver, if you open the branch which comes from the *Baſilica*, and concurs to the generation of the median.

Moreover, when there is neede to open the *Baſilica*, and it ſhall be no where conſpicuous, the Cephalicke or median being eaſie to be diſcerned at the ſame time, you may in ſtead thereof open the median, or if it be not to be found, the Cephalicke, preſſing but the trunke thereof with your thumbe, as we ſaid before, leſt the head ſhould be evacuated in ſtead of the liver. You may doe the ſame in the *Baſilica*, if when there ſhall be neceſſitie to open the Cephalicke, it ſhall not appeare. Moſt of thoſe which at this day open a veine, in ſtead of the median, open that branch of the *Baſilica* which aſcends, together with the Cephalicke to make the median. But you muſt underſtand that the median deſcends betweene the two bones of the cubit, even to the end thereof, and then devided into many branches, it is at length ſpent on the backe of the hand behinde the thumbe, the fore and middle fingers, or the afterwreſt. Sometimes it runs backe into the following branch, and then at the wreſt it departs from it, to be beſtowed upon the forementioned parts. The other branch of the Cephalicke, which we may call the fore and outward Cephalicke, deſcending directly downe to the midſt of the wand, thence wanders overthwart into the hinde part of the arme, where encreaſed with a branch from the *Baſilica*, it is diſtributed over all the backe of the hand, which with the median it nouriſhes. But the branches of theſe veines doe ſo run through the forenamed parts, that by the way, they yeeld them neceſſary proviſion.

Chap. XXII.

The Deſcription of the Axillary veine.

The axillary is devided into

The deepe axillary, and outward axillary.

THe Axillary ariſing at the inſertion of the pectorall muſcle, or a little higher, after it hath produced the two *Thoracicæ* it is devided under the tendon of that muſcle into two faire branches, that is to ſay, into the inner deepe Axillary, and the ſkinne or outward axillary. The deepe or inner having ſtill for his companion in his deſcent, the axillary artery, and the nerves of the third conjugation, after it hath produced the ſmall externall muſculous of the arme, it goes into the bending of the elbow, where running ſomewhat deepe with the artery and nerve into the muſcles of the cubite, it is devided into three other branches, of which one deſcending with the wand, ſlides under the ring, into the inner ſide of the hand, and hath beſtowed two ſmall branches on the thumbe, two others on the fore, and one upon the middle finger, ſo that all of them aſcend by the ſides of theſe fingers, the other deſcending with the artery, as the former alongſt the cubite, ſends branches to the reſt of the fingers, like as the former. The third goes on the foreſide betweene the two bones even to the wreſt, and the ſquare muſcle.

But you muſt note that the veines of which we now treate, doe not onely make theſe deviſions mentioned by us, but infinite others beſides, as well in the parts which they goe to, as alſo in the inner muſcles of the hand which they nouriſh.

And thus much of the internall and deepe axillary veine. For the externall or skin Axillary (which firſt appeares under the ſkinne, eſpecially in leane bodies, a little above the inward production of the arme) it is devided in that place into two branches, the one whereof deſcending to the bending of the arme meets, and is united with the Cephalike branch, ſooner or later, that ſo it may produce the median, as we formerly mentioned.

The other branch [having ſent forth many ſhoots of a different length and thickneſſe, as well into the ſkinne, as into the other neighbouring parts, deſcending alongſt the lower ſide of the bone of the cubite, properly ſo called, is at length ſpent upon the fore and outward Cephalicke branch, which we ſaid deſcended alongſt the wand; and thus united, they runne over all the hand, where in the right hand, betweene the middle and fore finger, they make the *Salvatella*; but in the left, in the ſame place, they produce the *Splenitica*.

The *Salvatella* and *Splenitica*

But alwayes remember, (if in diſſection you finde any thing otherwiſe than wee have delivered it) that the diſtribution of the veſſels is ſo various (eſpecially in the hands) that there can no certaine rule be delivered thereof.

Chap. XXIII.

The Diſtribution of the Axillary Artery.

THe Axillary artery from the firſt originall, which is preſently after the two *Thoracicæ*, deſcending betweene the muſcle called *Biceps*, or the two headed muſcle, and the *Brachiæus*, with the deepe axillary veine, diſtributes a large branch amongſt the outward muſcles of the arme, which extend the cubite, and is ſpent in the externall muſcles of the ſame, which ariſe without, from the productions of the arme.

And this is called the *Ramus Muſculus*, or Muſculous branch, as alſo the veine that accompanyes this Arterye. Then this Arterye when it comes to the bending of the cubite, thruſting it ſelfe into the muſcles bending the fingers, communicates certaine branches to the parts pertaining to the dearticulation of the cubit with the ſhoulder, and other parts there ſituate, as it did in the upper parts, by which it deſcended hither. Verily it may it may be a generall rule; that every veſſell ſends or beſtowes certaine portions thereof by the way to all the parts by which it paſſes. But if you ſhould aske, why I have not proſecuted theſe productions; I would anſwer; I never intended, to handle other than large and faire branches of veſſels, by raſh inciſion of which, there may happen danger of death or a diſeaſe. For it would be both an infinit and needles buſines to handle all the ſmall divarications of the veines, arteryes and nerves. Therfore this Artery ſunke into theſe muſcles, when it comes almoſt to the midſt of the Cubit, preſently or a little after it is divided into two large branches, the one of which alongſt the wand, & the other alongſt the Cubite is carryed into the hand on the inſide under the Ring. For both theſe branches are diſtributed and ſpent upon the hand after the ſame manner as the branches of the internall Axillary veine, that is, having ſent by the way ſome little ſhoots into the parts by which they paſſe, at the length the branch which deſcends by the Wand of the remainder therof, beſtowes two ſprigs upon the Thumbe, on each ſide one, & two in like manner on the fore finger, and one on the midle; the other which runs alongſt the Ell, performes the like office to the litle and the midle or ring finger, as you may ſee by diſſection.

An Aontomicall Axiome.

Chap. XXIIII.

Of the Nerves of the Necke, Backe, and Arme.

The 7 paire of nerves of the necke.

NOw we ſhould handle the ſinewes of the Arme, but becauſe theſe proceed from the Nerves of the Necke and Backe, I thinke it fit therefore to ſpeake ſomething of them in the firſt place.

The firſt paire.

Therefore from the Necke there proceed ſeven paire of Nerves, the firſt of which proceeds from the nowle bone, and the firſt *Vertebra* of the necke; as alſo the firſt paire of the Backe from the laſt *Vertebra* of the Necke and the firſt of the Cheſt. But all theſe Nerves are divided into two or more branches of the firſt paire (that is to ſay, on each ſide) goe, the one to the ſmall right muſcle, aſcending from the firſt racke-bone of the necke to the nowle bone, the other to the long muſcle on the foreſide of the necke.

The ſecond paire.

The branches of the ſecond paire are diſtributed, ſome with a portion which they receive from the third paire over all the skin of the head; the two others go as well to the muſcles, which are from the ſecond *Vertebra* to the backe part of the head, and from the ſame to the firſt *Vertebra*, as alſo to the long muſcle before mentioned.

The third paire.

One of the third paire of Sinewes is communicated to the head, as we ſaid before, but others to the Muſcles which extend, or erect the head and the Necke; there is alſo one of theſe diſtributed into the neighbouring ſide muſcle and part of the long.

The fourth paire.

The fift paire.

The nerves of the fourth paire go, one to the muſcles aſwel of the neck as the head, & to the broad muſcle; the other after it hath ſent ſome portiõ therof into the long muſcle & the ſide muſcles of the necke, it deſcends with a portion of the fift and ſixt paire to the Midriffe. One of the branches of the fift paire is beſtowed on the hinde muſcles of the necke and head, the other upon the longe muſcle and Midriffe; the third is communicated to the *Levatores*, or Heaving muſcles of the Arme and ſhoulder.

The ſixt paire

One of the Nerves of the ſixt paire goes to the hinde muſcles of the Necke and head, another to the Midriffe, the third with a portion of the ſeventh paire of the necke, and of the firſt and ſecond of the Cheſt goe to the Armes and heaving muſcles of the ſhoulder-blade.

The ſeventh paire.

One of the branches of the ſeventh paire runs to the broad muſcle and to the neighbouring muſcles both of the necke and head; another encreaſed with a portion of the fift and ſixt paire of the necke, and a third joyned to the ſecond and third paire of the Cheſt deſcending into the Arme goe to the hand.

But you muſt note that the Muſcles which take their originall from many *Vertebræ*, whether from above downwards, or from below upwards, admit Nerves not onely from the *Vertebræ*, from whence they take their originall, but alſo from them which they come neere in their deſcent, or aſcent.

The 12. pairs of Nerves of the Cheſt.

There paſſe twelue conjugations of Nerves from the Rack-bones of the Cheſt.

The firſt paire

The firſt entring forth from betweene the laſt Racke-bone of the necke and the firſt of the Cheſt, is divided (that is, on each ſide, each Nerve from his ſide) into two or more portions, as alſo all the reſt. Therefore the branches of this firſt conjugation goe ſome of them to the Armes, as we ſaid before, others to the muſcles as well theſe of the Cheſt, as others ariſing there, or running that way.

The ſecond paire.

The branches of the ſecond conjugation are diſtributed to the ſame parts, that theſe of the firſt were.

The other paires.

But the branches of all the other conjugations even to the twelfth, are communicated, ſome to the intercoſtall muſcles running within under the true ribs even to the *Sternon*, and under the baſtard ribs even to the right and long muſcles; and the Coſtall Nerves of the ſixt conjugation are augmented by meeting theſe intercoſtall branches by the way as they deſcend by the roots of the Ribs. Other particles of the ſaid Nerves are communicated to the muſcles as well of the Cheſt, as ſpine, as the ſame Muſcles paſſe forth, or runne alongſt by the *Vertebræ*, from whence theſe nerves have either their originall, or paſſage forth.

The Nerves which are carryed to the Armes.

Having thus therefore ſhewed the originall of the Sinewes of the Arme, it remaines that we ſhew their number and diſtribution.

Their number is five or ſixe; proceeding from the fifth, ſixth, and ſeventh *Vertebra* of the necke, and the firſt and ſecond of the Cheſt. The firſt of which not mixed with any other from the fifth *Vertebra* of the necke, goes to the Muſcle *Deltoides* and the skin which covers it.

The other 4 or 5 when they have mutually embraced each other, not onely from their firſt originall but even to the ſhoulder, where they free themſelves from this convolution, are diſtributed after the following manner.

The firſt and ſecond deſcending to the Muſcle mentioned a litle before, and thence ſometimes even to the hand, is by the way communicated to the Muſcle *Biceps*, and then under the ſaid Muſcle it meets and is joyned with the third Nerve. Thirdly it is communicated with the Longeſt muſcle of the Cubite, in the bending whereof it is divided into two branches deſcending alongſt the two bones of the Cubit, untill at laſt borne up by the fleſhy pannicle it is ſpent upon the skin and inner ſide of the hand.

The third lower than this, is firſt united with the ſecond, under the Muſcle *Biceps*, then ſtraight way ſeparated from it, it ſends a portion thereof to the Arme which lyes under it, and to the skin thereof; laſtly at the bending of the Cubit on the fore ſide, it is mingled with the fift paire.

The fourth, the largeſt of all the reſt, comming downe below the third branch under the *Biceps* with the internall Axillary veine and Artery, is turned towards the outward and backe part of the Arme, there to communicate it ſelfe to the Muſcles extending the Cubit, and alſo to the inner skin of the Arme and the exteriour of the Cubit; the remainder of this branch when in its deſcent it hath arrived at the joynt of the Cubit, below the bending thereof it is divided into two branches, the one wherof deſcending alongſt the Cubit is ſpent on the outſide of the Wreſt; the other aſſociating the Wand is on the outſide in like manner in two branches beſtowed upon the Thumbe, and in as many upon the fore finger, and by a fift upon the middle finger though more obſcurely.

The fift branch being alſo lower than the reſt, ſliding between the muſcles bending and extending the Cubite, when it comes behinde the inner protuberation of the Cubite (in which place we ſaid before the third branch meets with this) it is communicated to the internall muſcles of the ſame, and then divided into three portions one of which on the outſide alongſt the middle of the Cubite goes in two ſprigs to the litle finger, & ſo many to the middle finger, and one to the Ring finger; the other two, the one without and the other within the Ring, goe to the hand, where after each of them hath beſtowed what was requiſite on the muſcles of the hand, they are waſted into other five ſmall portions, of which theſe which are from that portion which deſcends without the Ring, ſend two ſprigs to the litle, two to the fore and one to the middle finger; but theſe which come from that which paſſes under the Ring, by ſuch a diſtribution communicates it ſelfe to other fingers, as two ſprigs to the thumbe, two to the fore and one to the middle finger. The ſixt the loweſt and laſt runs betweene the skin and fleſhy Pannicle, by the inner protuberation of the Arme, and then is ſpent upon the skin of the Cubit.

CHAP. XXV.

The deſcription of the bone of the Arme, and the Muſcles which move it.

The greatneſſe and figure.
The Appendix of the Arme.
The proceſſes of the Arme.

BEcauſe we cannot perfectly demonſtrate the originall of the muſcles of the Arme, (eſpecially of the two Arme muſcles) not knowing the deſcription of this bone; firſt therefore we will deſcribe it, then returne to the originall of the muſcles ariſing from thence. The bone of the arme is the greateſt of all the bones in the body, except the Thigh-bone; it is round, hollow and filled with marrow, with a great Appendix or head on the top thereof, having an indifferent necke, to which it is knit by *Symphyſis*, for appendices are no otherwiſe united to their bones. In the lower part thereof it hath two proceſſes, or protuberations, one on the fore ſide, another on the hinde, betweene which ſwellings there is a cavity like to halfe the compaſſe of a wheele, about which the Cubit is moved. The extremityes of this cavity ends in two holes, of which one is the more externall, the other more internall: theſe cavityes receive the heads of the Cubite, that is, the fore, or internall receives the fore proceſſe when the arme is bended inwards, but the externall or hinder the exteriour, as it is extended.

For the head of the arme it hath a double connexion, the one with its owne necke by *Symphyſis*, that is, a naturall union of the bones without any motion; the other with the lightly ingraven cavity of the ſhoulder-blade, which we call *Glene*, by that kinde of Dearticulation which is called *Arthrodia*; this connexion is made firme and ſtable by the muſcles deſcending into the arme from the ſhoulder-blade, as alſo by the proper Ligaments deſcending from the circle and brow of the cavity of the *Acromion* and *Coracoides* to this head of the arme; this ſame head of the arme is, as it were more cleft and open on the inner ſide, than on the fore ſide, that ſo it may give way to one of the Ligaments comming from the ſhoulder-blade to the muſcle *Biceps*. For aſmuch as belongs to the lower end of the bone of the arme (which we ſaid hath two proceſſes) we may ſay that it is faſtened to the bones of the Cubit by two ſorts of articulation, that is, by *Ginglymos* with the Ell or proper bone of the Cubit, and by *Arthrodia* with the *Radius* or Wand, which in a lightly engraven cavity receives the fore proceſſe of the arme, and is turned about it for the motion of the hand. The hinder proceſſe is chiefly added for the ſafety and preſervation of the veines, arteries and nerves.

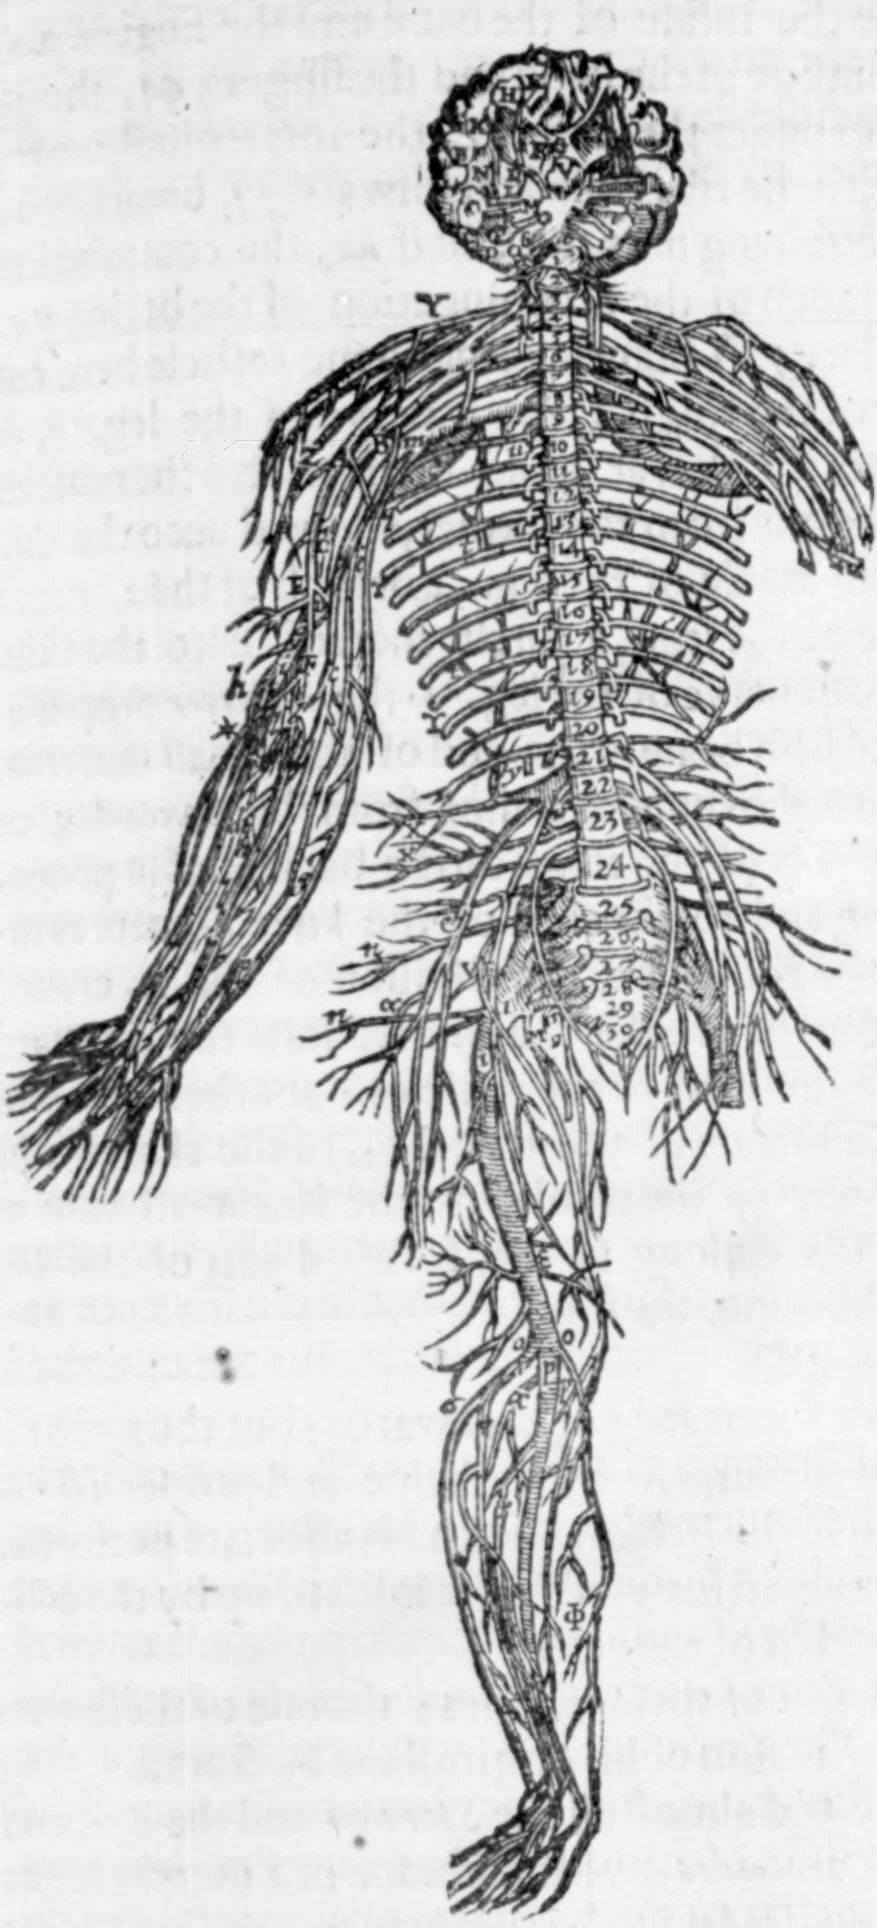
The figure of the Arme.

Theſe things thus ſhowne, it is worth our labour to know the figure of the arme it ſelfe, as it lyes betweene the forementioned appendices and proceſſes, that in the caſe of a fracture, we may know how conveniently to reſtore it; therfore firſt we muſt underſtand, that this bone is ſomwhat bended and hollowed on the inſide under the cleft of the head thereof, but bunching out on the out and fore ſide.

The 8 muſcles thereof.

Wherefore ſeeing it muſt be moveable forwards and backewards, upwards and downewards, nature for the performance of ſo many motions hath furniſhed it with eight muſcles, which are ſixe proper and two common with the ſhoulder-blade. Of which number two move it forwards, two backwards, two upwards and downewards Which muſt not be underſtood ſo, as that theſe two Muſcles ſhould move it directly forwards inclining either upwards, nor downewards; and the other two ſhould move

Table 24. ſheweth the Braine together with the After-braine, the ſpinall marrow and the Nerves of the whole body.



A, That part of the braine that is at the noſethrils.
B, That part which is at the ſide of the ventricles.
C, The back part of the braine.
D, The *Cerebellum* or After-braine.
E, The Mamillary proceſſe in the right ſide.
F, The originall of the opticke nerve.
G, Their conjunctions.
H, The coate into which the opticke nerve is extended.
I, The ſecond paire of the ſinewes of the braine.
K, The leſſer roote of the third conjugation.
L, The thicke roote of the ſame conjugation according to the common opinion.
M, The fourth conjugatiõ of the ſinews
N, The leſſer roote of the fift paire.
O, The bigger roote of the ſame paire.
P, The ſmall membrane of the eare which they call the *Tympany*.
Q, The lower branch of the bigger roote of the fift conjugation.
S, The ſixt paire of ſinewes.
T, The ſeventh paire.
V, The beginning of the ſpinall marrow out of the middle of the baſis of the braine.
X, The right ſinew of the midriffe cut off.
Y, A branch from the fift paire creeping to the top of the ſhoulder.
Z, The firſt nerve of the arme from whence there goeth a branch to the skin.
A, The ſecond nerve of the arme, and a branch there from into the firſt muſcle of the Cubite.
B, The third nerve of the arme and a branch going to the skin on the outſide.
C, A branch from the 3. nerve to the 2. muſcle of the Cubite.
D, The congreſſe or meeting of the ſecond nerve with the third.
E, A ſmall branch from the 3. nerve to the 2. muſcle of the *Radius*.
F, The diſtribution of the ſecond nerve into two branches.
* The leſſer branch of this diviſion lengthened out to the skin as far as the thumbe.
a, The place of the ſpinall marrow where it iſſueth out of the braine. 1, 2, 3, &c. Thirty paires of nerves ariſing from the ſpinall marrow are here noted by their Char. that is to ſay, 7. of the necke, 12, of the Cheſt, 5. of the loynes and 6, of the holy-bone.
b, The thicker branch of the 2, nerve divided into 2, parts.
c, Branches of the 3, nerve ſprinkled here and there.
d, Nerves from the third paire to the thumb, the forefinger and the middle finger.
ee, The 4, nerve of the arme. *f*, The paſſage hereof through the inſide of the ſhoulder.
g, A tripartition of this branch where it toucheth the Cubit. *bb*, A branch diſtributed from

from the 4. nerve to the outward skin of the Cubite. *i*, the upper branch of the diviſion of the 4. nerve. **kk**, A branch of *i*, reaching to the outſide of the hand. *ll*, the lower branch of the diviſion of the 4. nerve paſſing through the backſide of the Cubite. *m*, the 5. nerve of the arme. *n*, Branches of this nerve diſperſed here and there, *oo*, A branch of the 5. nerve reaching to the inſide of the hand and the fingers. *p*. A ſurcle of the branch *o*, derived to the outſide of the hand and the fingers. *qq*, the 6, nerve of the arme and the courſe thereof under the skin. *rr*, the intercoſtall nerves there cut off where they are together with the ribs reflected forward. *ſſ*, branches on each ſide running backward. *tt*, Nerves attaining unto the Cheſt. *uu*, the commixtion of the nerves *rr*, with the deſcending branch of the 6. conjugation of the braine. *xx*, Nerves from the loynes led unto this place. *y*, A branch going to the teſticle here cut off. *z*, A nerve reaching to the 1. muſcle of the thigh. ϛ, the 1. nerve of the leg. αβ, A ſurcle of the former nerve derived to the skin at α, and inſerted into the muſcles at β. γ, the 2. nerve of the leg. δδδ, A nerve from the former, allowed unto the skin as low as to the foot, and paſſing along the inſide of the leg. ε, a branch of the 2. nerve running unto the muſcles. ζ, the 3 nerve of the leg. η, a ſurcle thereof unto the skin. θ, another ſurcle unto the muſcles. ιι, the 4. nerve of the leg. κκ, the *anterior* propagations of the nerves proceeding from the holybone. λ, the end of the ſpinall marrow. μ, a branch from the 4 nerve inſerted into the muſcles ariſing from the *Coxendix* or hip bone. ν, another branch going to the skin of the thigh on the backſide. ξ, a propagation derived to the 4. muſcle of the leg and to the skin of the knee. οο, nerves attaining to the heads of the muſcles of the foote. ϖ, the diviſion of the 4: crurall nerve into two trunks. σ, a branch from the trunke π, diſperſed into the outward skin of the leg. τ, a ſurcle of the trunke π, derived to the muſcles. υ, another ſurcle to the skin of the leg on the foreſide. , a branch of the truncke ρ, to the skin of the inſide of the leg and of the foot. χ, a ſurcle of the trunke ρ, to the hindmoſt skin of the leg. ψ, a branch of the whole trunke ρ, led along to the forward part of the leg and the foot: ω, the deſcent of the trunke ρ, into the foot.

it ſo upwards, as it ſhould incline neither foreward, nor backwards; but thus, that it cannot be moved neither to this nor that part unleſſe by the helpe and proper action of this, or that muſcle. Thus therefore if the Pectorall with his aſſociate performe their duty or action, the arme is alwayes moved forwards, as it is lifted up by the action of the *Deltoides* and his companion, and ſo of the reſt.

The originall and inſertion of the pectorall muſcle.

But to come to the originall and inſertion of theſe muſcles; the one of theſe two which move the arme forwards called by reaſon of his originall, the Pectorall, ariſing from more than halfe of the Collar bone, and almoſt all the *Sternon* and the 6, 7. and 8, Rib, goes up and faſtens it ſelfe to the *Coracoides*, by a membrane or a membranous tendon ſufficiently ſtrong (for which cauſe it is ſaid to be common to the ſhoulder & arme) and it goes into the arme betweene the muſcles *Deltoides* and *Biceps* with a ſtrong tendon compoſed of fibers croſſing each other, of which ſome deſcend from the Collar-bone and the upper part of the *Sternon*, others aſcend from the lower originall hereof, that is, from the 6, 7, and 8, Ribs: and although the action of this muſcle be diverſe, by reaſon of the diverſity of its fibers ariſing from divers places, yet alwayes it drawes the arme forwards, whether it be moved upwards, downwards, or to the Breſt; the other which is his companion deſcends from the whole lip or brow of the ſimous or hollow part of the Blade, which it fils in the forepart of the arme neere the head thereof. For the two *Levatores*, or the Lifters up of the arme, the firſt named

The *Deltoides*

Deltoides deſcends from almoſt halfe the Clavicle, the proceſſe *Acromion* and all the ſpine of the ſhoulder-blade into the foreſide of the arme the bredth of foure fingers below the joynt. It hath divers actions according to the diverſity of the fibers, as alſo every muſcle hath; yet howſoever it is contracted, whether by the fibers from the clavicle alone, or by the ſpinall alone, or by both at once, it alwayes lifts and heaves the arme upwards. The other which is his aſſociate deſcends from the gibbous part of the Shoulder-blade conteined betweene the upper rib therof & the ſpine between

The *Epomis*, or *Scapularis*.

the proceſſes *Acromion* and *Coracoides*, to the neck of the arme; and this we will call the *Epomis* or *Scapularis*, that is, the ſhoulder Muſcle. But the firſt and larger of the two muſcles, which draw the arme backwards, ariſes from the greateſt part of the utter lip of the gibbous part of the ſhoulder-blade, which is under the ſpine therof, & lying upon the blade it ſelf, it goes into the hind part of the arme above the neck thereof. The other which is cōtiguous to it & his partner in working, but leſſer, paſſes from the upper and exteriour part of the lower rib of the ſhoulder-blade, and thence as it were in ſome ſort extending it ſelf upon the gibbous part therof neere unto that rib, it goes into the arme. This muſcle ſeemes to be the ſame with the former, being fleſhy without even above the top of the ſhoulder. One & the leſſer of theſe two which draw downwards, enters out from the ſtreight line of the lower Rib of the blade, & goes into the lower part of the arme about the neck therof. The other called the *Latiſsimus* or broadeſt, aſcends from the ſpines of the holy-bone, of the Loynes, & often alſo from the nine lower of the Cheſt, by the lower corner of the ſhoulder-blade into which it is inſerted by a membranous tendon, as alſo it is into the inner part of the arme neere unto the necke by another ſtrong tendon; wherupon this muſcle is called a common muſcle of the ſhoulder and arme. But when this muſcle happens to be wounded, the arme cannot eaſily be ſtretched forth, or lifted up.

CHAP. XXVI.

The Deſcription of the bones of the Cubit and the muſcles moving them.

AFter theſe muſcles, follow thoſe which bend & extend the cubit, but becauſe their inſertion cannot be fitly demonſtrated, unleſſe the bones of the cubit be firſt deſcribed; therefore firſt of all we will deliniate the bones themſelves. But verily leſt this doubtful word cubit ſhould cauſe obſcurity, firſt we muſt note, that it hath a threefold ſignificatiō, for ofttimes it is uſed for al that part of the hand which lies between the arme & wreſt, oft times for the lower bone of this part, ſomtimes for the upper part of this bone which is turned within the Orbe or Cavity of the arme (no otherwiſe than a cord in the wheele of a Pulley) and this is called the *Olecranon*. Here truly we uſe this word Cubit in the firſt ſignification. Wherfore we ſay the cubite is compoſed of two bones, the one of which we call the *Radius* or Wand, or the leſſer *Focile* of the Arme; the other we properly call the Cubit or Ell. Theſe two bones ſticke together at their ends being firmely bound together by ſtrong Ligaments; but the middle parts of them are a prety way diſtant from each other, & chiefly towards their lower ends, for the better ſcituation and paſſage of the muſcles and veſſells from the inner ſide, to the exteriour, as ſhall be ſhewed in fit place. The wand hath two *Epiphyſes* or Appendices, the one at the upper end, the other at the lower. The upper is round & hollowed on the ſurface like a baſon, it receives the fore proceſſe of the bone of the arme, bound to the ſame by ſtrong ligaments, deſcending as wel from that proceſſe of the arme, as the *Olecranon* into the circumjacent parts of this appendix of the VVand. This connexion is made for this uſe, that we may turne our hand upwards and downwards by the Cubit turned and twined about this proceſſe. But the lower appendix of this wand is hollowed on the inſide that ſo it might more commodiouſly receive the bones of the wreſt, but gibbous without, that it might be ſafer; now this wand is ſofter and thicker at the lower end, but leſſer and harder above, where on the inſide it hath a ſwelling out, wherby to receive the muſcle *Biceps*, beſides on the outſide of the middle therof it is ſomewhat gibbous and round, ſo to become more ſafe from the injuries of externall bodies; but it is hollowed, or bended on the inſide for the better taking or holding any thing in the hand. But that ſide which lyes next to the Ell is flatted for the fitter originall and ſeat of the muſcles; laſtly it is ſeated upon the bone of the Cubit, or Ell, juſt againſt the thumb. But the Ell, or bone of the cubit properly & particularly ſo called, hath in like maner two appendices, the one above, the other beneath. The upper which alſo is the greater, is fitted to the Orbe of the arme, in which it goes to & again for the extenſiō & bending of the arme, no otherwiſe than a rope runs in a pulley but that it turnes not abſolutly & perfectly round, which is cauſed by the two proceſſes of unequal bigneſſe, the which are therfore ſtaied in the holes or cavities of the bone of

What is ment by the Cubit.

What the *Olecranum* is.

The 2 bones of the Cubit.

The two Appendices of the wande,

The figure and ſite of the wande.

The 2 Appendices of the bone of the Cubit.

the arme, the greater proceſſe which we called *Olecranon* is letted by the exterior hole that ſo the extenſion of the arme can be no further, but the leſſer proceſſe by the inner hole makes the bending ther of the leſſe perfect. The Compoſure of theſe bones is by *Ginglymos*, & it is ſtrengthened not onely by common Ligaments comming from the muſcles, which move the bones themſelves, but alſo by proper Ligaments deſcending from the proceſſes of the arme & the lips of the holes and cavities ſtanding about the Appendix of the Cubit. The other lower and leſſer appendix is in ſome ſort hollow on the inſide for the fitter receiving the bones of the wreſt, but the outſide is round & ends in a point, whence it is called by the Greeks *Styloides*. But now this Ell (contrary in this to the wand) is thicker towards the arme, but ſlenderer towards the wreſt. And beſides in the thicker part therof it is hollowed or bended towards the inſide, & in the ſame place is gibbous or bunching forth on the out ſide; but it is round & ſtraight, unleſſe on that ſide which lyes next the wand, for the reſt, it is hollow & full of marrow like the wand. The ſite of the *Radius* or wand is oblique, but that of the Cubit or Ell is right, that the arme might be the better & more eaſily moved; becauſe the motion by which the arme is extēded & bēded is according to a right line, but that by which the inſide of the hand is turned upwards & downwards, is performed obliquely & circularly. Wherfore it was expedient that the wand ſhould be oblique, & the cubit ſtreight for the cubit-bone is appointed for to extend & bend the arme; but the wand to performe the wheeling & turning about therof, & this is the cauſe that it was fitting ther ſhould be a different connexion of theſe bones with the arme. Theſe things were fitting to be ſpoken concerning the nature of theſe bones, that in the cure of fractures we may worke the more ſafely & happily, taking indication from that which is agreeable to nature: wherfore now it remaines that we come to the deſcription of the muſcles which are ſeated in the arme, the cubit-bone, or Ell. Theſe are 4, in number, two extending it, & two bending it. The firſt of the Benders is called *Biceps*, by reaſon of its two heads; the one wherof deſcends from the *Coracoides*, that other from the lip of the cavity of the ſhoulder-blade by the fiſſure or clift of the head of the bone of the arme. Theſe two heads under the necke of this arme becoming fleſhy, are firmely united at the belly & midſt of the arme, & thus united are at length implanted by a ſtrong tendon to the inner protuberation of the wand. The other is called the *Brachiæus*, by reaſon of the ſtraite coherence therof with the bone of the arme; this faſtened under the *Biceps* deſcends obliquely on the backe and upper part of the bone of the arme into the top of the wand and the inner ſide of the Ell. But the firſt of the extenders is called the *longus* or Long muſcle, this deſcends from the lower Rib of the ſhoulder, and cleaving to the bone of the Arme goes thither (faſtened and as it were alwayes moſt ſtraitly joyned with his fellow muſcle, ſpecially nere the Cubite) where you ſhall preſently heare. The other termed the *Brevis* or ſhort Muſcle, being the companion of the long, deſcends on the hinde part of the necke of the bone of the Arme, as it were growing to and lying under the former long muſcle, ſo that making one common broad Tendon outwardly fleſhy, inwardly nervous, they are inſerted into the *Olecranum*, ſo by mutuall aſſiſtance to extend the Cubite.

The figure of the Cubit bone or Ell.

Chap. XXVII.

The Deſcription of the Bones of the Wreſt, Afterwreſt and fingers.

WE ſaid before that the Hand taken more particularly and properly, is divided into the Wreſt, afterwreſt & fingers, & that the hand in this ſignification is bounded by the ends of the bones of the cubit and fingers. All the parts of the wreſt, which it hath cōmon with the afterwreſt, have bin already alſo plentifully explaned, this only remaines to be noted, that the skin aſwell of the hands as of the feete, is of a middle nature betweene pure fleſh and pure skin, no otherwiſe than that which covers the forehead, but that this which covers the palmes of the hands & ſoles of the feet is unmoveable; But it is moſt thicke, eſpecially on the feete, leſt it ſhould be eaſily offended by continuall going. Beſides the common parts, the wreſt is compoſed of eight ſmall bones mutually knit together in a

What the Hand properly ſo called is.

a certaine order, and by *Diarthroſis* with the two bones of the Cubite, but mutually and amongſt themſelves by *Synarthroſis*, by interpoſition of Griſtles and Ligaments aſwell common, that is, comming from the muſcles, as proper, deſcending alwayes from the upper to the lower. But theſe ſame bones are ſome leſſe than otherſome, beſides they are hard and without marrow, gibbous on the outſide for the ſecurity and comlineſſe of the hand, but hollow on the inſide for to give way to the tendons going into the fingers. Theſe bones are diſpoſed in two rankes. The firſt Ranke containes onely three, but the ſecond five. The three of the firſt Ranke ar thus arayed, or placed, that one of them may receive the Appendix *Styloïdes* of the Cubite; the other the Ell and the Wand together, and the third may be received by the Wand. But three of the five bones of the ſecond order ſuſteine the foure bones of the afterwreſt & are knit to the ſame by *Synarthroſis*, after which manner of connexion they are joyned to the bones of the firſt ranke; the fourth ſuſtaines the firſt bone of the Thumbe to which alſo it is coarticulate by *Synarthroſis*; the fift and laſt is ſeated on the inſide againſt the Ell, cheifly above that bone of the firſt order, which receives the Appendix *Styloïdes* of the Cubite, this is the leaſt and weakeſt of them all by reaſon of its griſtlely ſubſtance, which makes the Ring with certaine Ligaments running from one of the inner ſides of the wreſt to the other.

What the *Annulus* or Ring is.

This Ring is placed there as well for the preſervation of the ſinewes, veines & Arteries paſſing under it (leaſt when we leane upon our hand, or wreſt, theſe parts ſhould be hurt by compreſſion) as alſo for the commodity of the Action of the muſcles bending the finger, which in the performance of their action & the cōtracting thēſelves might deform the hand by their paſſing forth of the Cavity of the wreſt. For what attraction ſoever is made by ſtrings, if it be free and not hindered, is according to a ſtreight line.

The bones of the Afterwreſt.

Now follow the bones of the ſecond part of the hand, or of the afterwreſt. Theſe are foure in number, gibbous without, but arched within, or hollow in the middle; for hence is the palme of the hand, or certainly the greater part thereof; their ends next the fingers are ſomewhat remote from each other, that in theſe clifts the Muſcles *Interoſſes* might finde a place and ſeate. But theſe ends have each an Appendix, as you may perceive in the Sceleton of a childe. But you muſt note that by the firſt bone of the wreſt or Afterwreſt, we meane that which is in the foreſide of the hand, that is to ſay, that in the wreſt which lies under the Thumbe, and that in the Afterwreſt, which it ſeated under the forefinger, as theſe which keepe in order the fingers which exceed the reſt in neceſſity and dignity.

The bones of the fingers.

After theſe follow the fifteene bones of the fingers, that is, three in each, which are hollow and fiſtulous full of a thin and liquid marrow, and not of groſſe and thicke as in the arme and thigh. They are outwardly gibbous, but inwardly hollow and flat for the fitter ſeate of the Tendons aſcending alongſt the fingers on the inſide even to the upper joynt. The which that nature might the better ſtrengthen and preſerve, it hath produced from the lips of the inner Cavities of theſe bones a membranous & ſtrong Ligament, which running overtwhart from one ſide to the other doth ſo ſtraitly cloſe the Tendons to their bones, that they cannot goe forth of their places, or incline to either ſide. They are connexed on the outſide, that they might be more fit to hold any thing. But for the firſt bones of the 4 fingers and Thumbe, foure are joyned together with ſo many bones of the afterwreſt by *Synarthroſis*, for the bones of the afterwreſt are moved by no manifeſt motion; the fift is knit to the ſecond ranke of the bones of the wreſt, therefore that bone cannot be attributed to the afterwreſt, as ſome have written, ſeeing it hath manifeſt motion and is knit by *Diarthroſis*, but the bones of the afterwreſt are onely faſtened by *Synarthroſis*. For the ſecond and third ranke of bones of the fingers, they are knit the ſecond to the firſt, and the third to the ſecond by *diarthroſis* and *Arthrodia*, becauſe beſides the manifeſt motion they have, they receive each other by a ſuperficary cavity, as thoſe of the firſt ranke, the bones of the afterwreſt, and thoſe of the ſecond ranke, them of the firſt; thoſe of the third them of the ſecond. And all the bones of the fingers are larger and thicker at their baſis, but ſmaller towards the ends; and they are bound by Ligaments eſpecially proper, which (as we ſaid formerly) deſcend from the firſt to the ſecond; ſo that the laſt bones ſeeing they have not to whom to communicate their nerve, make & produce nailes thereof:

Whence the nailes are generated. Wherefore the nailes are generated by the fibers of the Ligaments, and the excrement of the tendons which are terminated at the bottome of the nailes. The *Oſſa Seſamoidea*, or Seed-bones. Now remaine the *Oſſa Seſamoidea*, or ſeed-bones: theſe are 19. in number in the inner joynts of each of the hands, and as many in each foote, *viz.* two in the firſt joynt of the foure fingers and in the ſecond of the thumbe, and one in each of the reſt. For the inner ſide of the joynts, you may for the moſt part obſerve one in each of them; yet in the ſecond joynt of the thumbe there be two, above the two tendons, which are ſomewhat griſtlely.

Their uſe. They are made for this uſe, that they firme and ſtrengthen the joynts, ſo that the bones of the fingers may not be turned awry, or thruſt forth of their places by ſtrong and violent motions, as it ſometimes happens in the whirle-bone of the knee. They are called *Seſamoidea* from the reſemblance they have to the ſeed of *Seſamum*, which is ſomewhat long and flat.

The Figure of the bones of the Hand. The 1. ſhewes the inſide of the right hand, and the 2. ſhewes the backe ſide of the ſame.

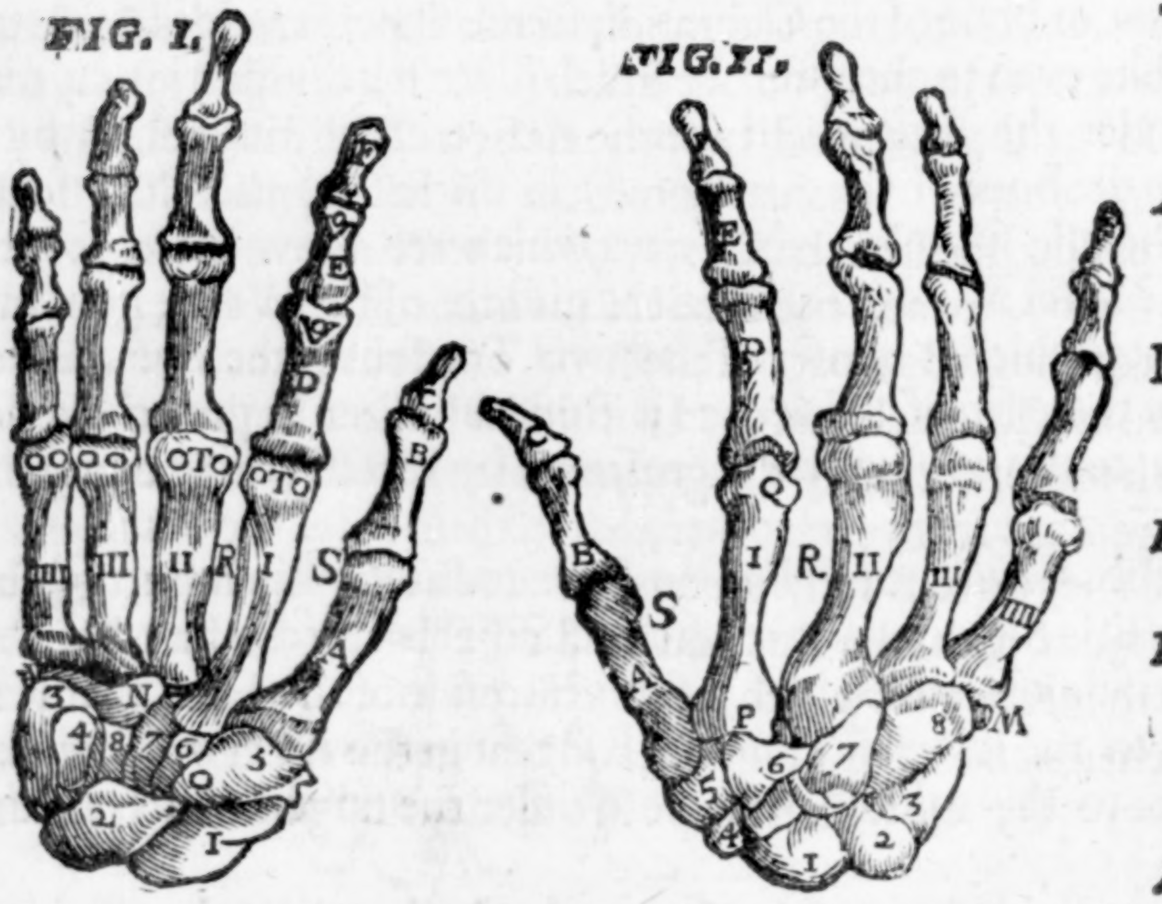

FIG. I.
FIG. II.

The Charact. 1, 2, 3, 4, 5, 6, 7, 8. ſhew the eight bones of the wreſt.

A, 1, 2, The firſt bone of the Afterwreſt lying under the thumbe.

I. II. III. IIII. The 4. other bones of the Afterwreſt annexed to the fingers.

B, *C*. The two bones of the thumbe.

D, *E*, *F*. 1, 2. The 3 bones of the forefinger, which are the ſame in the other fingers.

M, 1, 2. A litle bone ſometimes faſtened outwardly at the joynt of the eight bone of the wreſt.

N, 1. A proceſſe of the eight bone of the wreſt, ſwelling out into the ball of the hand.

O, 1. A proceſſe of the fift bone of the wreſt, from which a Ligament proceeds.

P, 2. An Appendix of the bones of the wreſt, by which they are articulated to the afterwreſt.

Q, 2. Another appendix which with its head entreth into the Cavity of the finger.

R, 1, 2. The ſpace betweene the bones of the afterwreſt.

S, 1, 2. Two litle ſeed-bones ſet on the inſide and outſide of the firſt joynt:

T, 1. Two ſeed-bones in the firſt of the 4 fingers.

V. *V*. 1. One ſeed-bone in the ſecond and third joynt of the fingers.

Chap. XXVIII.

Of the muſcles which ſeated in the Cubite move the Wand and with it the Hand.

The muſcles of the Cubite, NOw muſt we deſcribe the muſcles of the formerly deſcribed parts, that is, thoſe which are ſeated in the Cubit, which are carryed to the inſide of the hand, and thoſe which are called the *Interoſſes*: Now the muſcles of the Cubit are 14, 7 externall, and 7 Internall; two of the ſeven externall doe primarily twine or turne up the Wand, and ſecondarily or by accident turne the Palme of the hand upwards, wherupon they have called them *ſupinatores*, or turners up of the hand; two extend the wreſt, wherupon they are named *Carpitenſores* or the Wreſt-extenders; two the fingers, whence they are ſtiled *Digitumtenſores* or finger-ſtretchers; to cõclude, the ſeventh & laſt is termed *Abductor* or *Obliquator externus*. The firſt of the two *ſupinatores* is called the Long, or Longeſt, becauſe it deſcends from the outſide of the Arme above the proceſſes therof, and is inſerted by a round and ſtrong tendon into the lower Appendix. The other deſcends obliquely from the outward and upper proceſſe of the arme, and is inſerted at the third part of the Wand by a membranous & fleſhy tendon before and on the inſide thereof. The upper of the two Extenders of the Wreſt, deſcending above the wand from the externall and upper proceſſe of the arme is inſerted by two Tendons into the firſt and ſecond bone of the After-wreſt, which ſuſteine the fore and middle fingers.

The *Supinatores*.
The *Carpitenſores*.
The *Digitumtenſores*.
The *Obliquator externus*.
The firſt of the *Supinatores*.
The ſecond.
The upper of the *Carpitenſores*.

The other & lower, deſcending from the ſame place as the former, above the Cubit is inſerted into the fourth bone of the Afterwreſt which beares up the litle finger. Theſe muſcles whileſt they move alone, that is, each with his Antagoniſt, to wit the wreſt-benders, they move obliquely upwards or downwards the whole hand properly ſo called. The firſt and greater of the Extenders of the fingers, or finger-ſtretchers ariſing from the *Olecranum*, or bone of the Cubit, deſcends ſuperficiarilie betweene the two bones of the Cubite even to the wreſt, in which place it is divided into 4 tendons, which paſſing under the Ring ſeated there, end (each diſtinguiſhed by a common ligament above the bone of the Afterwreſt) in the laſt joynts of the foure fingers, adhering neverthelesſe firmely to the bones, which are above theſe joynts.

The lower.
The greater of the *Digitumtenſores*.

The other which is the leſſer ariſing almoſt in the middle of the Wand, goes obliquely to the Thumbe into which it is inſerted by two Tendons; the one thicker which is inſerted into the root therof, and drawes it from the other fingers; the other ſlenderer continued even to the upper joynt therof, and by its action extending the Thumbe.

The leſſer.

The ſeventh which is the *Abductor* or *Obliquator*, is ſeated at the hinde part of the hand, that is, towards the litle finger; we have often found this divided in two, yea verily we have found it trifide, or divided into 3. this yeare in three or 4 dead bodyes. one portion therof went to the lower ſide of the Ring-finger with two Tendons, the other in like manner to the middle and fore-fingers, and the third to the Thumbe.

The *Obliquator*, or *Abductor externus*.

And for all that it is thus divided, yet ſome have taken and accounted it for one Muſcle, becauſe it hath one originall and action, which is to draw the fingers backwards; ſome have added to this the extender of the Thumbe by reaſon of their common originall; and thus of 4. muſcles they have made one divided into 7. tendons, diſtributed, as is formerly ſhewed. But when the *Obliquator* of the Ring-finger is wanting, as it often happens, the extender of the finger ſupplyes that defect by certaine productions of tendinous ſtrings. But ſome alſo have written, that this muſcle which we ſaid hath 7. tendons, is onely a production of the deepe fore muſcle, which ſhould be ſent through the ſpace betweene the bones of the Cubit; yet I had rather make it a muſcle of it ſelfe, by reaſon of its ſtrait adheſion with the bones of the Arme and Wand. And let thus much ſuffice for the externall muſcles of the Cubit, which you may comprehend in the number of ſeaven, as we have done; or in ſixe, if you take away one of the 4. or in nine, if you had rather reſolve it into 4. with *Galen*; or in eight, if you divide this muſcle onely into three. For in very deed the *Abductor* or *Obliquator* of the Ring-finger is not often found in men.

Now muſt wee come to the inner muſcles of the Cubit, the firſt of which compaſſes the skin of the palme of the hand, whence it is called the *Palmaris*. The ſecond and third joyned by the communion of their action turne downe or prone the Wand, and conſequently the hand, ſo that the palme lookes towards the feet, whereupon they are called *Pronatores*.

The muſcles of the inner part of the Cubit.

The 4. and 5. joyned alſo in affinity of action bend the Wreſt, wherefore they are named *Carpiflexores*, Wreſt benders. The ſixth and ſeaventh are appointed to bend the firſt, ſecond, and third joynts of the fingers, wherefore they are tearmed

The *Palmaris*

The *Pronatores.*

The *Carpiflexores.*

Digitumflexores, Fingerbenders. For their originall; the ***Palmaris*** the leaſt & uppermoſt of them all, deſcends fleſhy from the hinde proceſſe of the inner arme, & a litle after ending in a long and ſlender Tendon, it is ſpent in the skin of the Palme of the hand even to the roots of the fingers. For it was neceſſary that this skin ſhould ſtraitly cohere with the ſubjacent parts, not onely for the fitter taking or comprehenſion of any thing, leſt that skin in holding ſhould be wrinckled & drawne away from the palme and fingers, and ſo be an impediment; but beſides that the hand might have a more exact ſenſe to diſtinguiſh of hot, cold, moiſt, dry, ſmoth, æquall, rough, ſoft, hard, great, litle, and ſuch other qualityes. Then follow the two *Pronatores*, of which one called the round, comes obliquely from the inner ſide of the hinde proceſſe of the arme almoſt to the middle of the Wand, to which it adheres by a mēbranous & fleſhly tendon, even to the place appointed for inſertion. The other ſquare three or foure fingers broad, yet ſomwhat ſlender, ſeated within under all the muſckes which deſcend on the inſide to the wreſt or fingers, upon the ends of the bones of the Cubit, aſcends tranſverſe from below the Ell, unto the top of the VVande where it ends in a membranous tendon. Both the *Carpiflexores*, or VVreſt-benders ariſe from the hinde, but inner proceſſe, and deſcende obliquely (the one more, or leſſe than the other) the one alongſt the Ell, but the other alongſt the wande; and that which deſcends alongſt the Ell, is inſerted into the eight bone of the wreſt, which we ſaid made part of the Ring; the other which followes the VVande is inſerted with his greater part into the bone of the wreſt, and with the reſt into the firſt bone of the After-wreſt which ſuſteines the fore-finger.

The *Digitum flexores.*

The *Sublimis Digitumflexor.*

Now remaine the *Digitumflexores*, or Fingerbenders, which becauſe they lye upon one another, the upper is called the *ſublimis*, but the lower the *Profundus*. The *Sublimis* or upper, ariſing from the inner part of the hinde proceſſe of the arme, and from the upper parts of the Ell and VVand deſcends betweene theſe two bones of the Cubit even to the wreſt and Ring; divided into 4. tendons it is inſerted into the ſecond dearticulation of the foure fingers, which it bends by the force of this his proper inſertion; as alſo the firſt, as well by the power of the common ligament, as by certaine fibers cōming from it, which it ſends thither by the way in its paſſage. But theſe 4 tendons nere unto this their inſertion are divided into two, ſo to give paſſage and ad ſtrength to the tendons of the Deep muſcles deſcending into the third and laſt joint of the fingers.

The *profundus Digitumflexor.*

But this ſame *Profundus* or Deepe muſcle ariſing from the upper and inner parts of the Ell and Wand, deſcends betweene theſe two bones under the *Sublimis*, alſo undivided even to the wreſt, where it is divided into 5. Tendons which it brings forth under the common Ligament, and the diviſions of the Tendons of the *Sublimis* even to the laſt joynt of the fingers, which they bend, by this their proper inſertion, as alſo the bones of the firſt and ſecond joynts of the fingers by the meanes of the common Ligament and fibrous productions which they beſtow upon them by the way. Beſides theſe forementioned there is ſeene alſo a certaine membranous Ligament which engirts the tendons in the compaſſe of the fingers.

Chap. XXIX.

Of the Muſcles of the inſide of the hand.

The number of the muſcles of the inſide of the hand.

The *Thenar.*

THe muſcles of the inſide of the hand are 7 in number; the firſt is called *Thenar* becauſe it makes the greater part of the Palme; the ſecond from the ſite is called the *Hypothenar*; the third the externall *Abductor* of the Thumbe. The 4. other are called by reaſon of their figure the *Lumbrici* or wormy muſcles, or the *Adductores*, or Drawers of the foure fingers to the thumbe. Now the firſt called *Thenar*, thicker than the reſt, ariſes from all the bones of the Afterwreſt, taking its beginning from that bone which beares up the Ring finger, whence aſcending alongſt the Vitall line even to the end therof at the firſt bone of the After-wreſt ſuſteining the fore finger, & it is at length inſerted into the laſt joynt of the Thumbe by the longſt fibers, but by the middle and ſhorteſt fibers almoſt into all the inner part of the firſt bones of two joynts, and by reaſon of this, the thumbe is drawne to the other fingers, and from them againe by his lower originall.

Some devide this muſcle into three, by reaſon of his diverſe actions, making the firſt to ariſe from the roote of the bone of the afterwreſt which beares up the ring finger; but the other from that middle bone of the afterwreſt which ſuſtaines the middle finger; but of the third, from the upper end of that bone which underprops the fore finger, and that the inſertion of them all, is, as we formerly mentioned. But the former opinion likes me better, both for ſhunning confuſion, and abbreviating the doctrine of the number of muſcles.

The *Hypothenar*.

The *Hypothenar* ariſes from the fourth bone of the afterwreſt, and that bone of the wreſt which ſuſtaines it, and then with its longeſt fibers, it is inſerted into the ſecond joynt of the ring-finger, and by the ſhorteſt into the firſt, through which occaſion, as alſo in reſpect of its twofold action, ſome have devided it into two, that the one of them might leade it from the reſt, and the other might draw it to the thumbe.

The externall *Abductor* of the thumbe.

The *Lumbrici*.

The third the externall *Abductor* of the thumbe, deſcends from the firſt bone of the afterwreſt, into the firſt and ſecond joynt of the thumbe; wherefore ſome have devided it into two. The *Lumbrici*, or foure externall *Abductores* of the foure fingers ariſe from a membrane, inveſting and binding together the tendons of the *Digitum flexores*, or fingerbenders, and at length on the ſides towards the thumbe even by a ſmall tendon, running even to the ſecond joynt of the foure fingers.

The *Interoſſes*.

Now the *Interoſſes* of the afterwreſt, remaine to be ſpoken of; theſe are ſixe, two in each of the ſpaces betweene the fingers, one Internall, the other Externall, of which the Internall deſcending with oblique fibers from the ſide of the firſt bone of the afterwreſt, goes alſo into the ſides of the fingers, that ſo it may the more cloſely binde together the bones of the afterwreſt, whoſe action is manifeſted when wee thruſt our fingers into a ſtrait glove, or when we bend our hand. Some thinke that it helpes alſo the drawing of the fingers towards the thumbe. The Externall aſcends alſo by oblique fibers from the ſides of the ſecond bone of the afterwreſt, to the firſt joynts of the fingers, interſecting the internall which we now deſcribed after the manner of the letter X, for to extend the palme of the hand, and helpe the drawing away of the fingers from the thumbe.

The number of the muſcles of the whole taken in generall.

Here concluding the deſcription of the muſcles of the whole hand taken in generall, you ſhall note that they are 39. in number, that is, eight appointed to move the arme; foure ſet to move the cubit in generall; ſeven ſeated on the outſide of the cubit, aud as many on the inſide in the ſame cubite, moving the wand, and with it the hand; ſeven on the inſide of the hand: and laſtly, the ſixe *Interoſſes*. Some encreaſe this number, ſaying, there are nine on the externall part of the cubite, and eleven on the inſide of the hand.

Chap. XXX.

A Deſcription of the Legge taken in generall.

AFter the hand followes the deſcription of the legge. Wherefore to take away all doubtfulneſſe, we will firſt define the legge; then devide it into the parts more and leſſe compound; thirdly we will proſecute all things common to all theſe parts; fourthly, thoſe which are peculiar to each, and then, God willing, we will give an end to our Anatomy.

The diverſe acception of the legge.

Now this word *Crus*, or Legge, is uſed two manner of wayes, that is, either generally and ſpecially, and ſpecially againe after two ſorts, that is, either abſolutely and ſimply ſo, or with an adjunct. It is ſimply taken for all that which is betweene the knee and the foote. But with an adjunct for the greater bone thereof. But the legge taken in generall, is the inſtrument of going, containing all whatſoever is from the hipps, to the very ends of the toes. It is devided into three great parts, that is to

ſay,

The thigh. The legge or ſhanke. The foote.

ſay, the Thigh, the Legge, or Shanke, and the Foote. By the thigh we meane that which lies betweene the hippe and the knee. By the legge, properly ſo called, or ſhanke, that which is contained betweene the knee and the foote. By the foote all from thence to the ends of the toes.

The diviſion of the foote. The Inſtep.

The top of the foote. The toes.

Againe, they devide the foote into three parts, that is, the *Tarſus* or Inſtep, the *Pedion* or top of the foote, and the *Digiti pedum*, or toes. We underſtand by the inſtep, that which is contained in the firſt ſeven bones, which anſwers in proportion to the wreſt of the hand. By the top of the foot, that which is comprehended in the five following bones, which is anſwerable to the afterwreſt That which remaines, we call the toes. But becauſe all theſe parts have other common and proper parts, we will onely follow the diſtribution of the veines, arteries, and nerves; ſeeing we have ſufficiently explained the reſt, when we deſcribed the containing parts of the body in generall.

Chap. XXXI.

A Deſcription of the Crurall veine.

The beginning of the Crurall veine. The two branches thereof.

THe Crurall veine begins then, when the hollow veine paſſing forth of the *Peritonæum*, and ſtretched to the hanch bone, and the ſides of the *Pubis* in the groine, is firſt divided into two large branches; the one of which deſcends on the inſide alongſt the bones of the whole legge, together with the artery and nerve; the other runnes downe outwardly and ſuperficially alongſt the legge, betweene the fat lying under the ſkinne, and the muſcles even to the foote, and is ſpent in the ſkinne thereof. This becauſe it is alwayes apparent and manifeſt, is called properly by the Greekes *Sapheia*, but commonly *Saphæna*.

By what veines, the matter cauſing thoſe tumors called *Bubones* flows downe.

This veine by the way preſently at its originall is devided into two branches, the one internall, the other externall; of which the internall is ſpent upon the *Bubones*, and other glandules of that place and the ſkinne, and by this branch come the defluxions called *Bubones*; the other branch is waiſted in the fore and utter ſkinne of the upper part of the thigh; then a little lower, that is, about the bredth of three or foure fingers, it is gathered againe into one branch made of many little ones, which is ſpent in the fore and hinde ſkinne of this thigh. Thirdly, a little below the middle of the thigh it is againe devided into two other branches, of which the one goes into the ſkinne on the fore ſide, and the other on the hinde ſide. Fourthly, it is diſtributed by two other ſmall ſpriggs into the ſkinne, on the fore and hinde part of the knee; which oftentimes are not found, eſpecially when the *Poplitea* or ham veine, is ſomewhat larger than ordinary. Fiftly, a little below the knee, it produces two other branches, lying upon each other in their paſſage out into the fore and hinde ſkinne of that place. You muſt note, that branch which runnes into the ſkinne of the hinde part, is carried by a certaine other ſprigge, which it produces, into a branch of the *Poplitea* paſſing forth of the two twin muſcles. Sixthly, in the bigger part of the calfe of the legge, it is divided into two other branches, which in like manner are diſtributed into the ſkinne, as well in the fore ſide as the backe ſide of the legge.

Where and in what diſeaſes, the *Sapheia* muſt be opened.

At length after many other diviſions, which for brevitie ſake, I omit, when it arrives at the fore and inner ſide of the ankle (where it is commonly opened in the diſeaſes of the parts below the midriffe which require bloud-letting) it is parted into two other branches, the leſſer of which deſcends to the heele; the other in many ſprigs is ſpent upon the ſkinne of all the upper and lower part of the foote and toes.

To what places, and by how manifold deviſions the internall branch of the crurall veine goes. *Iſchiadica vena.*

The ſecond branch of this Crurall veine, which wee ſaid deſcends within together with the artery and nerve, even into the foote, is devided; firſt peircing ſomewhat deepe in, it produces foure divarications; one internall deſcending below the originall of the *Sapheia* into the muſcle called *Obturator externus*, and into certaine other externall muſcles. The three other runne outwardly, the firſt towards the huckle bone, by which the *Iſchias* is made, the two other into the fore muſcles of the thigh, neither are theſe ſprigs far remote from one another. Secondly, all that branch is devided into two other branches, the one above, the other below, an artery alwayes accompanying it; the lower of which is ſpent upon many of the hinder muſcles of the thigh, ending nigh the ham. The upper, beſides, that it beſtowes many branches uppon the fore and inner muſcles of the thigh, deſcending to the ham, it produces the *Poplitea* or ham veine, made ſometimes of two branches, the one proceeding from above, and the other from below. This *Poplitea* deſcending by the bending of the ham, is ſpent one while upon the skinne of the calfe of the legge, another while upon the knee, otherwhiles encreaſed with branches of the *Sapheia*, it goes on the outſide of the anckle to the skinne, on the upper ſide of the foote, and ſometimes on the lower.

Muſcula Vena.

Poplitea Vena.

Thirdly, a little below the originall of the ham veine, and under the bending of the knee, it brings forth the *Suralis*, which is beſtowed upon the muſcle of the *Sura*, or calfe of the legge, and upon the skinne of the inner ſide thereof, and of the foote continued ſometimes even to the inner part of the great toe.

Suralis vena.

Fourthly, under the head of the hinder appendix of the bones of the legge, it produces betweene theſe two bones, another veine, which nouriſhing the fore muſcle of the legge, is conſumed upon the foote.

Fiftly, and laſtly, it brings forth the *Iſchiadica maior* or greater *Iſchias*, which is devided into two branches of an unequall bigneſſe; the larger whereof, from his originall deſcending alongſt the inner part of the legge bone, inſinuates it ſelfe under the muſcles of the calfe, betweene this and the heele, into the ſole of the foote, upon which it is waſted, devided into ten ſmall ſprigs, two for each toe; the other being the leſſer deſcending alongſt the *Perone*, or ſhin-bone, is conſumed betweene it and the heele, yet ſometimes it is produced, not onely even to the muſcle the *Abductor* of the toes, but alſo by five ſurcles, even to the fourth toe, and the ſides of the middle toe.

Iſchiadica maior.

CHAP. XXXII.

The Diſtribution of the Crurall Artery.

THe crurall artery ariſing from the ſame place whence the crurall veine proceeded, and deſcending with the internall crurall veine is diſtributed as followeth.

First, into the muſcle of the thigh, which ſpreading it ſelfe through the muſcles thereof meets with the utmoſt *hypogaſtrica*, deſcending with the veine through the common hole of the huckle and ſhare bone, and is joyned with it.

Arteria muſcula.

Secondly, when it arrives at the ham, betweene the *Condylos* or proceſſes of the legge, it ſends two branches into the knee.

Thirdly, a little after it produces another branch, which it ſends to the exteriour muſcles of the legge, and when it arrives at the middle of the legge, it is devided into two branches, betweene the twin muſcles and *Solæus*, the one internall, the other externall; the internall, ſome ſurcles communicated by the way to the parts by which it paſſes, but ſpecially to the joynt of the anckle, ſtretches it ſelfe over the ſole of the foote, betweene the lower extremity thereof and heele, whither, when it arrives it is divaricated into five ſurcles, of which it beſtowes two on the great toe, two on the next, and one on the middle toe. The externall deſcending in like manner to the ſole of the foote, betweene the *fibula* and the heele, beſides other ſprigs, which it may ſpread by the way, it produces one without on the joynt of the anckle, another in the muſcle, the *Abductor* of the toes, to the wreſt and backe of the foote. But the remainder is devided into five portions, of which two are ſent to the fourth, and two to the little toe, and one to the middle.

Chap. XXXIII.

Of the Nerves of the Loynes, Holy-bone and Thigh.

The five conjugations of the nerves of the loines.

THere ariſe five conjugations of nerves from the loines, devided into externall & internal branches; the externall are diſſeminated into the *Rachitæ* or chin muſcles, the muſcles *Semiſpinatus* and *Sacer* and the skinne lying over them. The internall are ſent into the oblique aſcendent and tranſverſe muſcle of the lower belly, into the *Peritonæum*, into the loine and cheſt muſcles ariſing there, but after a different manner; for ſome are abſolutely carried thither, as the nerves of the firſt conjugation of the loines, and oftentimes alſo of the ſecond, but that ſometimes they ſend a ſmall ſprigge to the teſticles, when the Coſtall have ſent none thither; but ſome lower are partly diſtributed there, and partly ſent ſome other way; for the greater portions firſt united amongſt themſelves, then preſently with the portions of theſe of the holy-bone, goe into the thigh, as we ſhall ſhew in the diſtribution of the nerves of the holy-bone.

Where the teſticles have their nerves.

The conjugations of the nerves proceeding through the holybone.

Now from the holy bone, proceede ſixe conjugations of nerves, reckoning that for the firſt which proceeds from the laſt *Vertebra* of the loines, and firſt of the holy-bone; and that the ſixte which proceeds from the loweſt part of the holy-bone, and the firſt of the rumpe; theſe conjugations of nerves are devided into externall and internall branches.

An Anatomicall axiome.

The leſſer externall paſſing forth by the externall and hinder holes of the holy-bone, are diſtributed into the parts properly belonging thereto, to wit, the muſcles and skinne thereof; for every nerve by the law of nature firſt and alwayes yeelds to the neighbouring parts, that which is needefull, then preſently to others as much as it can.

Wherefore if thou wouldſt know whence each part hath his veſſels at the next hand, that is, the veines, arteries and nerves, thou muſt remember the ſite of each part and the courſe of the veſſels, and to conſider this, that the veines and arteries as ſpeedily and conveniently as they can, inſinuate themſelves into the parts, ſometimes at the head or beginning, ſomewhiles by the middle, or extremes thereof, as there is occaſion.

But a nerve principally enters a muſcle at the head thereof, or at leaſt not farre from thence, but never by the taile, whereby it may eaſily be underſtood by what branch of each veine, artery, and nerve, each part may have nouriſhment, lift, and ſenſe. The other internall branches of the foreſaid conjugations goe, eſpecially the foure uppermoſt united from their originall with the three lowermoſt of the loines, into all the legge, as you ſhall preſently heare. But the two lower are conſumed upon the muſcles called *Levateres Ani*, the *Sphincter* muſcle of the ſame place; beſides, upon the muſcles of the yard, and necke of the bladder in men, but in women upon the necke of the wombe and bladder.

For theſe parts admit another in their bottome from the coſtall nerve, being of the ſixth conjugation of the braine; theſe thus conſidered, let us come to the nerves of the thigh, which (as we ſaid) from their firſt original, as it were copacted and compoſed of the greater portion of the three inner and lower branches of the loines, and the foure upper of the holy-bone, are devided in the thigh into foure branches, of which the firſt and higher deſcending from above the *Peritonæum*, to the little *Trochanter*, is waſted upon the inward and ſuperficiary muſcles of the thigh, and the skin which covers them a little above the thigh.

The ſecond, deſcending with the crurall veine and artery by the groine, is devided into two branches like as the veine, the one internall, the other external, of which the internall deſcending with the veine and artery is ſent into the inner and deepe muſcles of the thigh ending above the knee. But the externall deſcending ſuperficially with the *Saphæna*, even into the foote, gives branches by the way to the skinne which covers it.

The third ſeated under theſe former, paſſing by the hole common to the ſhare and hanch-bone, ſends certaine branches to the groines, to the muſcles called *Obturatores*, to the *Tricipites*, and ſometimes to the muſcles of the yard, and it ends at the midſt of the thigh.

The fourth, which is the thickeſt, ſolideſt, and hardeſt of all the nerves in the body, deſcending wholely from the productions of the holy-bone, and deſcending outwardly betweene the lower part of the ſame bone, and the *Os Ilium*, or Hanch-bone to the thigh, beſtowes certaine ſprigges to the hinde muſcles thereof proceeding from the proturberation of the *Iſchium* or huckle-bone, and in like ſort it gives otherſome to the skinne of the buttocks, and alſo to the skinne covering the forementioned muſcles.

A little after, it is parted into two branches deſcending undevided even to the bending of the knee, they both are communicated by diverſe ſurcles of the muſcles of the legge; yet ſo as the leſſer produces another branch from the reſt of the portion thereof deſcending on the fore part of the legge, alongſt the ſhin-bone unto the top of the foote, where it is devided into tenne ſurcles ſcarſe apparent to the ſight, two running to each of the toes. The other greater deſcending in like manner in the remainder of its portion by the hinde part of the legge into the ſole of the foote, caſts its ſelfe with the veines and arteries betweene the heele and legge bone; where firſt devided into two branches, each of which preſently parted into five, ſend two ſprigs to the ſides of the toes. And theſe are the moſt notable and neceſſary diſtributions of the veſſels and nerves; we purpoſely omit others which are infinite, and of which the knowledge is impertinent.

CHAP. XXXIIII.

Of the proper parts of the Thigh.

HAving explaned the common parts of the legge in generall; now wee muſt come to the proper, beginning at the Thigh. The proper parts of the Thigh, are muſcles, bones, and ligaments But becauſe the demonſtration of the muſcles is ſomewhat difficult, if we bee ignorant of the deſcription of the bones from whence they ariſe, and into which they are inſerted; therefore we judge it worth our labour, firſt to ſhew the bones, and the dearticulation of theſe of the Thigh; beginning with theſe bones which are knit with the upper part of the holy-bone. And they are two in number, on each ſide one, commonly called the *Oſſa Ilium*; each of theſe is compoſed of three bones, of which one is the upper, another the lower and anteriour, and the third the middle, and after a manner the poſteriour. The upper by a particular name is called the *Os Ilium*, the hanch bone, and it is the largeſt and biggeſt, having a griſtlely appendix in the compaſſe thereof, even to the connexion it hath with the other neighbouring bones, whoſe upper part we terme the right line thereof; but the *baſis*, which is adjoyned to it by *Simphyſis*, we call the lippe or brow therof, becauſe it ſtands both ſomewhat out and in, after the manner of the brow. But that which lies betweene the *baſis* and ſtraight line we name the ribbe; this ſame upper bone hath two hollow ſuperficies, the one internall, the other externall. The connexion thereof by *Symphyſis*, is twofold, the one with the upper part of the holy-bone; the other with that bone wee called the middle, and after ſome ſort the poſteriour; which taking its beginning from the narrower part of the *Os Ilium*, makes that cavity in which the head of the thigh is received; this cavity the Greekes call *Cotyle*, the Latines *Acetabulum*, and it is ended by the ſide of the hole common to it, and the ſhare-bone; this middle, and in ſome ſort poſteriour bone is called properly and particularly the *Os Iſchij*, or huckle-bone, and containes nothing elſe but the forementioned cavitie, but that on the hinde and lower part thereof, it brings forth a proceſſe, which adjoynes it ſelfe to the ſhare bone at the lower part of the common hole, in which place it appeares very rough and unequall, and it is called the tuberoſitie of the huckle-bone, at whoſe extremity alſo it brings forth a little head ſomewhat reſembling the proceſſe

Of how many bones the *Oſſa Ilium* conſiſt.
What the *Os Ilium* ſtrictly taken is.

What the line, lippe, brow, and rib, of the *Os Ilium* are.

The *Os Iſchium*, or huckle-bone.

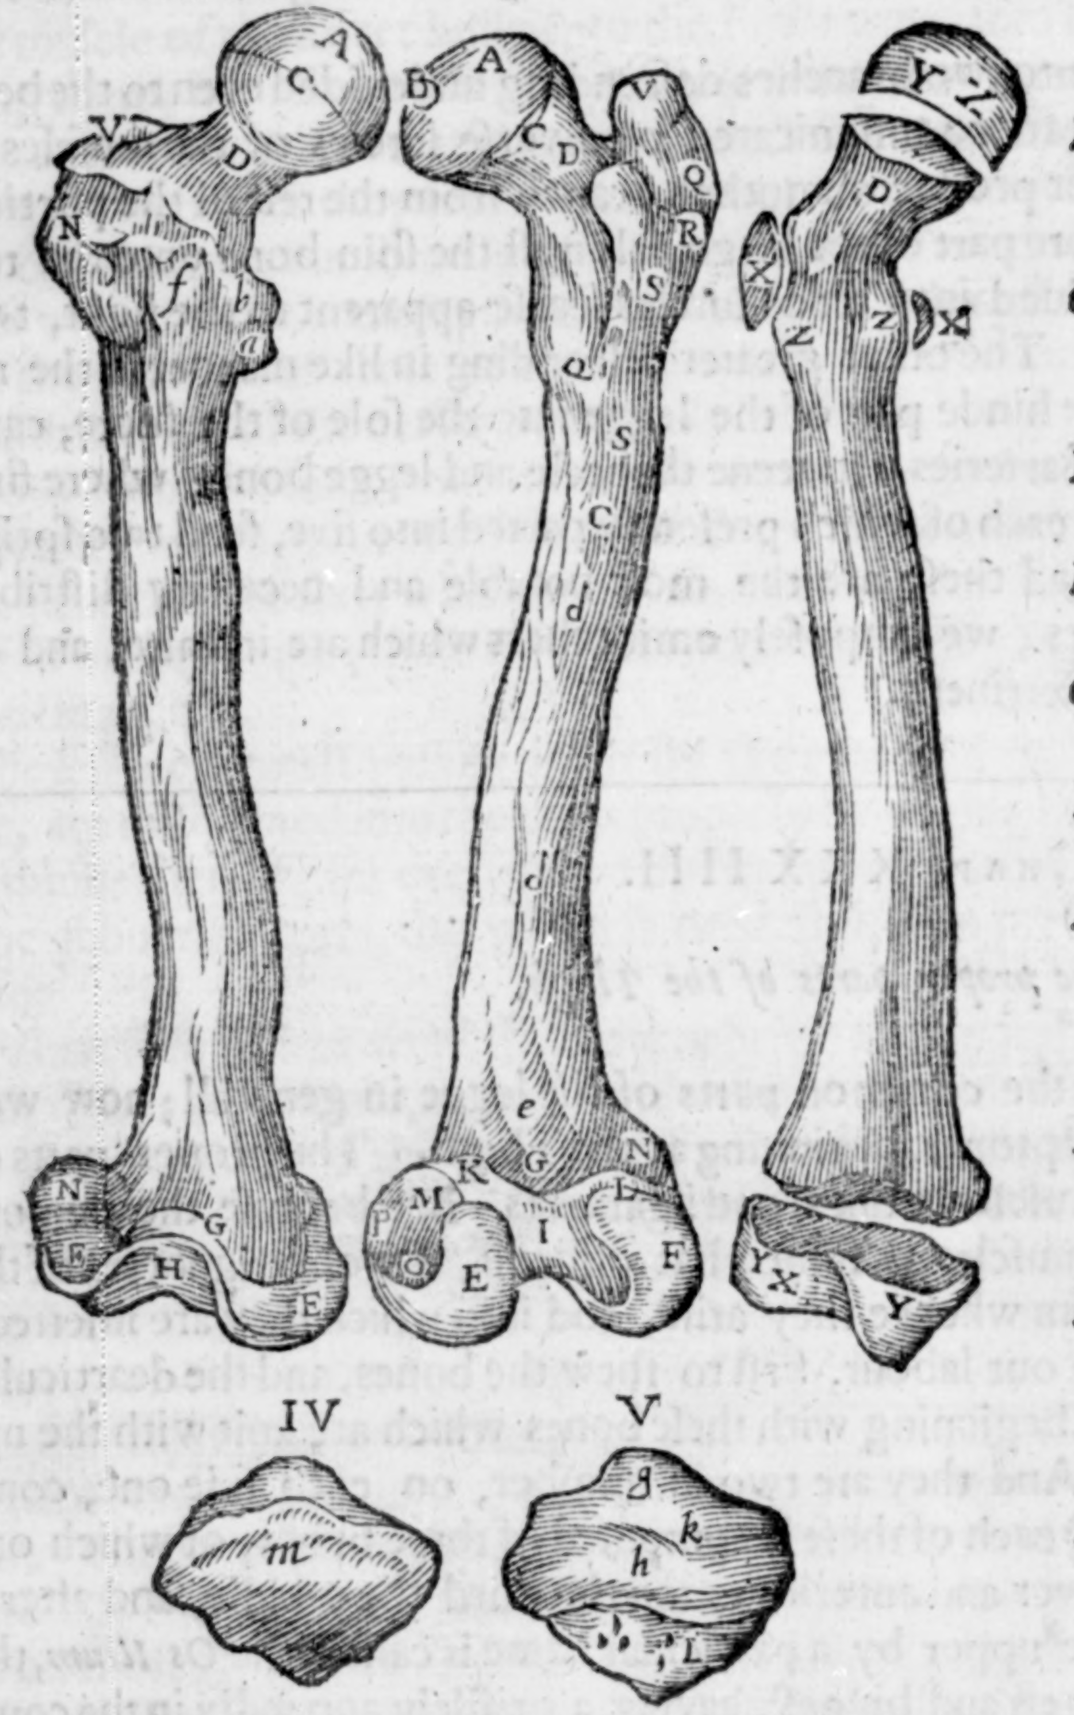
of

The *Os pubis*, or ſhare-bone.

of the lower jaw called *Corone*. The third bone named *Os pubis* or the ſhare-bone, ſtretches it ſelfe even to the higheſt part of the *pecten*, where meeting with the like bone of the other ſide, it is united to it by *Symphyſis*, after which manner alſo, all theſe three bones are united ; it is reported, that this bone opens in women in their travell, yet hitherto I can finde no certainety thereof.

The Figure of the Thigh-bone.

FIG. I 2 III.



IV V

A 1, 2. The head of the thigh going into the cup of the hip-bone.

B, 2, A ſinus in the head of the thigh, into which is inſerted a round Ligament.

C 1, 2, The conjunction of the appendix of the thigh with the bone it ſelfe.

D 1, 2, 3, the necke of the thigh.

E, *F*, the two lower heads of the thigh.

G, 1, 2, The conjunction of the lower appendix.

H, 1, 1 2, A ſinus betwixt the two heads of the thigh.

K 2, A part of the lower head of the thigh, from whence the firſt muſcle of the foote doth proceede.

L 2, Another part from whence the ſecond and firſt muſcles ariſe.

M 2, Another part to which the Tendon of the fift muſcle of the thigh is infixed.

N 1, 2, A ſinus of the outward ſide of the head for the fourth muſcle of the legge.

O 2, A ſinus of the inſide through which the tendons doe paſſe. *P* 2, A protuberation at which the ſaid tendons are reflected. *Q* 2. the upper proceſſe of the thigh, and betwixt *Q* and *D* is the ſinus. *R* 1, 2, the union of the proceſſe with the thigh. *S S* 2, a rough line from the impreſſion of the externall proceſſes. *T* 1, the anterior impreſſion of the internall proceſſes. β, betwixt *T* and *V* another impreſſion higher than the former. *V* 1, 2, the fourth impreſſion in the toppe of the proceſſe. *X* 3. Foure *X*, ſhew the foure *appendices* of the thigh. *Y* 3, Three *Y*, ſhew the three heads of the thigh. *Z Z* 3, Two proceſſes of the thigh. *a* 1, the interior proceſſe of the thigh. *b* 1, the conjunction of the proceſſe with the thigh. *c c* 2, a line deſcending obliquely from the inner proceſſe. *d d* 2, a line running through the length of the thigh. *e* 2, the largeneſſe of the thigh in this part. *f* 1, a roughneſſe from which the eight muſcle iſſueth. *g*, *h* 5, a knub of the Whirle-bone going into the ſinus marked with *I*, which is betwixt the heads of the thigh. *i* 5, a ſinus fitted for the inner head of the thigh. *k* 5, a ſinus agreeing with the externall head of the thigh. *l* 5, the lower aſperity or roughneſſe. *m* 4, the foreſide of the pattell or whirle-bone rough and unequall.

You may perceive a manifeſt ſeparation of theſe three bones in the *Sceleton* of a child; for in thoſe who are of more yeares, the griſtles which runne betweene theſe connexions turne into bones.

The deſcrip of the thigh bone.

Now followes the thigh-bone, the biggeſt of all the bones of the body; it is round, and ſo bended, that it is gibbous on the exteriour and fore part thereof, that ſo it might be the ſafer from externall injuries; but on the hinde and inner part, it is hollow or ſimous, like to the backe of an Aſſe, whereby the muſcles might have a more commodious originall and inſertion.

That ſimous part a little below the midſt thereof, is devided into two lines, the one whereof goes to the internall tuberoſitie, the other to the externall of the lower appendix of the ſame thigh. Theſe are chiefely to be obſerved, becauſe the oblique fibers of the vaſte muſcles thence take their originall.

The two appendices of the thigh-bone.

Beſides, this bone hath two appendices in the ends thereof, as eaſily appeares in a childs thigh; the upper appendix, makes the round head of the thigh it ſelfe, which (as every other appendix) ſeated upon a long necke, is received in the cavitie of the hanch-bone by *Enarthroſis*; it is ſtaied and faſtened there by two ſorts of ligaments, of which the one is common, proceeding from the muſcles, which deſcend from above, about the necke thereof; the other is proper, which is twofold, that is, one membranous and broad, proceeding from the whole cavity of the orbe, or cuppe, deſcending about all the head of the thigh, above the necke thereof; the other thicke and round, deſcending from the ſecond cavity of the *Cotyle* it ſelfe, which is extended, even to the common hole at the top of the head thereof.

The two proceſſes of the thigh-bone make the two *Trochanters*.

Beſides, under this head, that bone hath two proceſſes, the one great and thicke, the other little and ſhort.

The greater ſeated in the hinde part, is called the great *Trochanter*; the leſſer ſituate in the inner part, is named the little *Trochanter*.

But you muſt note, that the great *Trochanter*, on the higher and hinde part thereof, which lookes towards the head of this bone, makes a certaine ſmall *ſinus* or boſome, into which the twin muſcles and others, whereof we ſhall hereafter ſpeake, are implanted; we muſt alſo conſider the multitude of holes encompaſſing this necke, betweene the head and the two *Trochanters*, which yeeld a paſſage to the veſſels, that is, the veines, arteries, and nerves, into the marrow of the bone it ſelfe, whence the marrow it ſelfe becomes partaker of ſenſe, eſpecially on that part which is covered with a coate, and the bone lives and is nouriſhed.

Whence the marrow becomes partaker of ſenſe.

The other Appendix of the thigh, that is, the lower, is the greateſt and thickeſt, riſing, as it were with two heads, which are devided by two cavities, the one ſuperficiarie and on the fore ſide, whereby it receives the whirle-bone of the knee; the other deepe, and on the backe part, by which it receives the griſtlely and as it were bony ligaments, proceeding from the eminencie which is ſeene betweene the two cavities of the upper appendix of the bone of the legge, which *Hippocrates, lib. de fracturis*, calls in his tongue *Diaphyſis*.

CHAP. XXXV.

Of the muſcles moving the thigh.

Their number.

THe muſcles of the thigh are juſt foureteene in number, that is, two bend it, whereupon they are called the *Flexores*, or benders; three extend it, whereupon they are called *Tenſores*, extenders; three move it inwards, driving the knee outwards, and drawing the heele inwards, as when wee croſſe our legges; yet ſome make theſe three one, and call it the *Triceps*, or threeheaded muſcle. Sixe ſpread it abroad, and dilate it, as happens in the act of venery.

Foure of theſe are called ***Gemini*** or Twins, by reaſon of the ſimilitude of their thickneſſe, originall inſerrion and action; the two other are called *Obturatores*, becauſe they ſtop the hole which is common to the ſhare and backe-bones.

The two flexores.

Now one of the two *Flexores*, being round, deſcends on the inſide with fibers of an unequall length from all the tranſverſe proceſſes of the loines, above the hinde commiſſure of the hanch and ſhare-bones, and is inſerted into the little *Trochanter*; the other broader and larger from the originall paſſes forth of the whole lippe, and inner brow of the hanch-bone, and filling the inner cavity thereof, is inſerted above the fore part of the head of the thigh, into the little *Trochanter* by a thicke tendon, which it with the fellow muſcle lately deſcribed, produces, even from the fleſhy part thereof, wherefore you neede to take no great paines in drawing, or plucking them away.

The three Tenſores.

The three *Tenſores* or extenders, make the buttocks, of which the firſt being the thicker, larger, and externall, ariſing from the rumpe, the holy-bone, and more than halfe of the exteriour and hinder lippe of the hanch-bone, is inſerted by oblique fibers, ſome foure fingers breadth from the great *Trochanter* at the right line, which we ſaid, reſembled an Aſſes backe.

The ſecond, which is the middle in bigneſſe and ſite, deſcends from the reſt of the lippe, and from the fore and outward ribbe of the hanch-bone, and above the midſt of the bone, is inſerted into the upper part of the great *Trochanter* by a triangular inſertion above the upper and exteriour part thereof.

The third being leſſer, ſhorter and thinner, lying hidde under theſe former, proceeds from the middle of the externall ſurface of the hanch-bone, and then is inſerted into the greater part of the right line of the great *Trochanter*.

Theſe three muſcles have a great andlarge originall, but a narrow inſertion, as it were by oblique fibers.

Three *Intromoventes*.

Then follow thoſe three muſcles which move the thighes inwards, ſtraiten and croſſe then, ſo that the knee ſtands forwards or outwards, but the heele is drawne inwards, as you may underſtand by their inſertion, although ſome thinke otherwiſe. But theſe three muſcles by their originall, partly fleſhy, and partly membranous, ariſe from the upper and fore part of the circumference of the ſhare-bone, and thence are inſerted into the hinde line of the huckle-bone, ſome higher than otherſome; for the leſſer and ſhorter ſtayes at the roots of the little *Trochanter*, the middle deſcends a little deeper; the 3. with the longeſt of his fibers, deſcends even to the midſt of the line.

This if it be ſo, that is, theſe muſcles proceeding from the fore and upper part, to be inſerted into the hinder line of the huckle-bone, whileſt they alone performe their action, and draw the thighs together, they will turne them outwards, juſt ſo as when we put them acroſſe, but they will not draw one heele to another, and put the heele outwards, for ſuch like motion is performed by the inner Vaſte muſcle of the thigh, moving the legge. Now follow the ſixe which move the buttocks.

The movers of the buttocks.

The firſt, and higher of the *Quadrigemini*, or the foure twin muſcles, paſſes forth of the commiſſure of the holy-bone, with the bone of the rumpe, or rather from the loweſt extreme of the holy-bone, and thence it is inſerted into the cavity of the great *Trochanter* by a tendon of a ſufficient largeneſſe.

The ſecond proceeding from the hollow part or fiſſure, which is betweene the extremity of the huckle-bone, and the tuberoſitie, or ſwelling out of the ſame, is inſerted in like manner into the cavity of the great *Trochanter*.

The third, aſcends from the inner part of the ſwelling out of the huckle-bone, a little above, betweene the two *Trochanters*, into the cavity of the greater of them.

The fourth, and laſt, the loweſt and broadeſt of them all proceeds from all the exteriour protuberancie of the huckle-bone, and thence is inſerted into the great *Trochanter*, and theſe foure muſcles lie hid under the thicke and more eminent part of the buttocks; wherefore that you may the better ſhew them, they muſt be turned up towards their originall.

The two *Obturatores*.

The two ***Obturatores*** remaine to be ſpoken of, that is, the internall and externall, both which ariſe from the circuite and circumference of the hole which they ſtoppe, which as wee ſaid is common to the ſhare and huckle-bone, but the internall aſcends to the exteriour roote of the great *Trochanter* by the middle fiſſure betweene the upper part of the protuberancy of the hucklebone, and the ſpine which ſtands up in the hinder baſis of the hanch-bone.

But the externall proceedes from the exteriour cavity, and the middle ſpace betweene the tuberoſity of the huckle-bone and cavity thereof, and is inſerted in the lower part into the cavity of the great *Trochanter*, together with the *Quadrigemini.*

If you would plainely ſee the exteriour *Obturator*, you muſt either cut off the beginning of the three-headed muſcle, or handſomely pluck it away, and then extend it, and turne it up; The internall is eaſily diſcerned when the bladder is taken away.

CHAP. XXXVI.

Of the bones of the Legge, or Shanke.

What the *Patella*, or whirle bone of the knee is.

THoſe which would deſcribe the muſcles of the legge, ought firſt to deſcribe the bones thereof, beginning at the *Rotula*, or whirle-bone of the knee.

This bone is griſtlely on the outſide, and round in compaſſe, but on the inner and middle part after ſome ſort gibbous, but ſomewhat flatted at the ſides, that ſo it may be fitlier applied to the joynt of the knee, and fitted within the anteriour cavity of the two *appendices* of the thigh, and the upper and foremoſt of the legge.

The uſe thereof.

The uſe thereof is to ſtrengthen the joynt of the knee, and to hold the legge at his due extent, ſo that it may not be bended ſo farre forwards, as it is backewards.

What, and how many bones the legge hath.

The bones of the legge are two, the one thicker, called by the particular and proper name, the *Os Tibiæ* or legge-bone; the other which is leſſer, is termed *Perone*, or *Fibula*, but commonly the leſſer *focile*, (and in Engliſh it may be termed the ſhin-bone.) The thicker being hollow and marrowie, is ſeated in the inner part of the leg, having two proceſſes, the one bigger, the other leſſe.

The legge-bone.

The bigger ſeated on the upper part of the bone, and conjoyned to it by *Symphyſis*, makes two ſuperficiall and ſide cavities diſioyned by an indifferent riſing; wherefore this bone is connext to the bone of the thigh by *Ginglymos.* For in the cavities thereof it receives the lower and hinder protuberances of the Appendix of the thigh-bone, but the middle eminencie thereof, is received by it betweene the two protuberances thereof.

What *Diaphyſis* is.

This joynt is ſtrengthened, not onely by the force of the tendons, or muſcles ending there, but alſo of three ſtrong ligaments, of which one proceeds from all the externall, another from all the internall part of that connxeion; the third which we, out of *Hippocrates*, called *Diaphyſis*, from the diſtance or ſpace betweene them. The other proceſſe of the legge-bone, which we called the leſſe, ſeated in the lower part thereof, makes as it were a double cavitie, whereby it receives the *Aſtragalus* or Paſterne bone; but on the inſide it makes the anckle, as the *Perone* makes it without: betweene theſe ancles the *Aſtragalus* is received on the ſides, and turned as the nut in a Croſſe-bow, as often as there is neede to bend or extend the foote. Beſides, this ſame leg-bone, being triangular hath three eminencies made in the ſhape of an Aſſes back; the ſharper deſcends alongſt the fore part, called by the Greekes *Anticnemion*; the ſecond reſides on the inner part, and the third on the outer; all theſe muſt be diligently obſerved, and chiefely, that on the fore part; becauſe it is as a guide and rule to a Chirurgion in the well ſetting of a broken legge. The *Perone*, or ſhinne-bone, is ſeated, as it were, on the outſide, and as behinde the legge-bone; it hath alſo two *appendixes* hollow on the inſide, but gibbous on the out. This bone by the upper of theſe is faſtened and inſerted under the inner, and in ſome ſort the hinder *appendix* of the legge-bone, ſo that it is in no ſort articulated with the thigh, but

The *Perone fibula*, or ſhin-bone.

ſerves onely in ſtead of a leaning ſtocke. But by the lower, this ſame bone is not onely received in the loweſt part of the legge, or anckle, or paſterne bone, but alſo receives part thereof, which is joined on the ſame ſide with the heele, eſpecially then when we bend our foote outwards.

This bone is faſtened to the forementioned bones by *Synarthroſis*, but bound by ſtrong ligaments proceeding from the ſame bones, and mutually ſent from one to another, or if you had rather, from the upper into the lower, as we ſaid in the arme. But this ſame *fibula* or ſhin-bone is alſo ttiangular, having three lines, of which one ſtands outwards, another on the foreſide, and the third behinde.

Chap. XXXVII.

Of the Muſcles of the Legges.

Their number. ALL the motions of the legge are performed by eleven muſcles, of which there be ſixe on the foreſide, and five on the hinde. But of theſe, ſome move the legge onely, as thoſe which take their originall from the bone of the thigh; others truly move the legge, but with the thigh, as thoſe which ariſe above the thigh, that is, from the hanch, huckle, and ſhare-bones.

The *Longus*. The firſt of theſe on the foreſide, called the Long, but commonly the *Sutorius* (or Tailor-muſcle by reaſon of its action) it ariſes from the lower and fore extremity of the ſpine or appendix of the hanch-bone, and deſcending obliquely above the other muſcles, is inſerted by a large and membranous tendon, into the fore and inner part of the legge under the knee; the action thereof is to croſſe the legges, but being firſt bended by the muſcles preſently to be treated of, it helpes alſo the three headed muſcle in the performance of the forementioned action.

The *Membranoſus*. The ſecond of theſe fore muſcles is termed the *membranoſus*, or membranous, becauſe it is wholy ſuch, unleſſe at the originall where it deſcends fleſhy from the roote and baſis of the above mentioned ſpine of the hanch-bone, and that obliquely with its membranous and broad tendon (mixed with the common coat of the muſcles) into the outward part of the legge, which it moves outwards, as alſo the thigh with the foure twin muſcles; for as we have in another place obſerved, of two oblique motions, concurring in one, is made a right motion; and beſides, almoſt all the motions of the body, are thus performed; the muſcles which performe ſuch motions are placed and oppoſed in an oblique ſite, as may be perceived by the motions and ſite of the muſcles of the hand taken in generall.

The *Rectus*. The third, called the *Rectus*, or right (becauſe it deſcends above the *Crureus*, alongſt the right fore-line of the thigh, betweene the two Vaſte muſcles) comes forth betweene the extremity of the appendix of the hanch-bone and cavity thereof, with a very ſtrong ligament, and then is inſerted into the fore part of the legge, paſſing over the midſt of the whirle-bone of the knee; it extends the legge, with the three following, but by accident it may helpe the bending of the thigh.

The two *Vaſti*. The fourth and fifth are called *Vaſti*, Vaſte or huge muſcles, by reaſon of their largeneſſe; the one of theſe is internall, the other externall: they both ariſe with right fibers, from their originall, but with oblique at their inſertion, by reaſon whereof they both ſeeme to have a compound action from a right and oblique motion; the right helping for the extenſion of the legge, but the oblique to draw one knee to another, or to deſioyne both the knees; the internall comes by its right fibers from the root of the little *Trochanter*, but by its oblique from the inner deſcendent line of the thigh. The externall paſſes forth by its right fibers from the root of the great *Trochanter*, but by the oblique from the externall deſcendent line of the ſame bone. But all theſe fibers are in certaine places ſo mixed with the *Crureus* that they cannot be ſeparated unleſſe you violate the one of them; they goe into the legge (each on his ſide) above the whirle-bone of the knee alongſt the ſides of the right muſcle, with which it makes an unſeparable tendon, as you ſhall preſently

The *Crureus*. heare. The ſixt and laſt of theſe fore muſcles called the *Crureus*, or Thigh-muſcle, (by reaſon of the ſtraite and firme adheſion, which it hath with the thigh-bone, which is by ſome called *Crus*) from the ſpace betweene the two Trochanters deſcends under the right muſcle,and two vaſte muſcles into the fore part of the thigh, even to the whirle-bone of the knee. But we muſt note that theſe foure laſt muſcles make a common thicke and broad tendon with which they couer the *Patella*, or whirle-bone, and all the fore dearticulation of the knee, that they cannot be ſeparated without tearing; wherefore we muſt thinke that this tendon, ſerves the knee for a ligament; now all theſe muſcles performing their action together, extend the legge. The five hinde muſcles follow to be ſpoken of; of which three ariſe from the tuberoſitie of the huckle-bone,going into the inner part; the fourth from the middle of the *Pubis*,called *Biceps*, that is, thetwo headed muſcle into the outſide of the legge. Of the internall,one paſſing frõ the forementioned tuberoſitie,deſcends ligamentous even into the midſt of the thigh, and then becomming fleſhy, is inſerted by its tendon, after the manner we formerly mentioned.

The three Internall.

The other being ſlender, paſſing forth alſo from the ſame place, with its tendon, is inſerted with the tendon of the long muſcle,and ends in the inner part of the legge, which with its companion, it drawes inwardly, and brings to the other, which ſame thing it performes in the thigh, by the helpe of the three headed muſcle.

The third, being the inner, or hinder, deſcends from the middle part of the ſhare-bone, with a broad and ſlender ligament, and is inſerted with a round tendon, into the inner part of the legge after the manner of the fore-mentioned.

The fourth called *Biceps* takes one of the two heads, of which it conſiſts,from the laſt mentioned tuberoſitie; the other from the outer line of the thigh, but is inſerted into the externall part of the legge, as we formerly ſaid.

The *Biceps*, or two-headed muſcle.

The fifth and laſt called the *Popliteus* deſcends obliquely fleſhy from the externall condyle or knot of the thigh, into the inner and hinder part of the legge, at the joyning thereof to the ſhinne-bone; the action thereof is, to draw the legge, after a manner inwards.

The Popliteus or ham muſcle.

Chap. XXXVIII.

Of the Bones of the Foote.

THe Order of Anatomy requires, that we now proſecute the muſcles moving the foote; but becauſe we ſhould in vaine deliver their inſertion, the diſpoſition and condition of the bones of the foote, not being firſt known, wherefore it firſt behoves us, to ſet forth their deſcription. Therefore the bones of the foote are ſixe and twenty in number,diſtinguiſhed into three ranks, that is, the bones of the *Tarſus* or Inſtep, are ſeven; theſe of the *Pedium*, the afterwreſt, or backe of the foote, five, and thoſe of the toes foureteene. Of the ſeven bones of the inſtep, there are 4. named, and 3. unnamed. The firſt of the named immediately following the bones of the legge, is called *Aſtragalus*, the paſterne, or ankle-bone. This hath three connexions, one, as we ſaid before, in the upper and broader part with the bones of the legge, of which it is received; the other in the lower and hinde part, by which it receives the upper and inner proceſſe of the bone of the heele; the third on the foreſide by which it is received in the cavitie of the *Os naviculare* or *Scaphoides*, that is, the boate-like-bone. By the firſt connexion the foote is extended and bended; by the ſecond it is moved with the heele to the ſides: the two firſt connexions are by *Diarthroſis*, the laſt by *Synarthroſis*. But it is ſtrengthened by ſtrong and broade ligments, deſcending, and aſcending from one bone into another; alſo they are ſtrengthened by membranes, muſcles and tendons, deſcending to the foote, above and under theſe joints. But this bone hath 3. proceſſes, as 3. feete faſtened to the bone of the heele; of which the firſt and leaſt is under the outer ankle; the bigger (which *Galen* ſaith, makes a round head, faſtened on a long necke) lookes towards the fore part of the foote, over againſt the great toe, and the next toe to it; the middlemoſt is at the heele, behinde the legge-bone.

Their number.
The bones of the Inſtep.

The *Aſtragalus*, its three connexions, and their uſe.

Its three proceſſes.

I paſſe over in ſilence many other things, as the ſmoothneſſe and aſperity or roughneſſe of the bone, which I had rather you ſhould learne by ocular inſpection, than by booke. The ſecond bone lying under this is called the *Calcaneum*, or heele-bone, being the biggeſt of all the bones of the foote, upon which all the body relies when we go. It hath two upper proceſſes, the one great, the other little. The great is received in the hinde and outer proceſſe of the *Aſtragalus*; the leſſer is received on the inſide in the 3. proceſſe of the ſame bone, which we ſaid had a round head faſtened to a long neck. Beſides, it is round on the hinde part, and much diſioyned from the legge-bone, but on the fore and longer part, it is knit by *Synarthroſis* to the Die-bone, whoſe lower and inner part, it ſeemes to receive; the ſuperficies thereof is wholy unequall, and riſing up with many ſwellings. On the inner ſide it makes as it were a channell, ſo to give way, as well to the veſſels as tendons going to the ſole of the foote and toes. Laſtly, we muſt conſider the holes by which the veſſels paſſe into that bone to give it nouriſhment; by reaſon of which veſſels the fracture of this heele-bone, is very dangerous, becauſe of the preſſing and contuſion of the veſſels, as *Hippocrates* ſhewes. For the ligaments of this heele, or heele-bone they are ſuch, as theſe of the *Aſtragalus*, to wit, tendons, membranes and ligaments properly ſo called, comming from one bone to another. The third bone of the foote is named *Scaphoides* or boate-like, from the reſemblance it hath to a boate, for on that part which lookes towards the poſterne bone, it is hollow; but on that part which is next the three *Innominata*, or nameleſſe bones (which it ſuſtaines, and of which it is received, as it in the cavity thereof receives the head of the *Aſtragalus*) it is gibbous like the bottome of a boate. The connexions thereof are by *Synarthroſis*, and they are ſtrengthened by the forementioned ligaments; this ſame bone is arched on the upper part, but ſomewhat hollowed or flatted below: the inner part ends in a point, like the prow of a ſhip, but the outer obtuſe like the ſterne of a ſhippe. The fourth bone of theſe which have names, is called the *Cuboides*, from the reſemblance of a Die; although that ſimilitude be very obſcure. On the fore part it ſuſtaines the toes; which by a certaine proportion to the fingers of the hand, may be called the Ring and little toes, but it is ſuſtained on the hinde part, with the backe part of the heele; on the inner ſide it is joyned with the boat-like-bone, and that nameleſſe bone which ſuſtaines the middle toe; on the outſide, it produces a riſing like the backe of an Aſſe, which on the lower part is extended tranſverſly all the length thereof; at the two ſides of this eminency or riſing, there are two ſmall cavities, in the forme of a channell. The firſt and the greater of the *Oſſa innominata*, or nameleſſe bones, ſuſtaines the great toe; the leſſer and ſecond, the next toe thereto; the third and middle in bigneſſe, the middle toe. Theſe three bones are arched on their upper part, but ſomewhat hollowed below. They are knit to the three forementioned bones by *Synarthroſis*, of which they are received, but on the hinde part with the boate-like bone which they receive. Now we muſt come to the bones of the ſecond ranke, that is, of the *Pedium*, or backe of the foote; theſe are five in number, bearing up the five bone of the toes. They are ſomewhat gibbous on their upper part, but hollow below; each of them hath two proceſſes at the end thereof, by the lower and firſt of which they receive the three nameleſſe and Die-bone, but by the upper made into a round head, they are received of the firſt bones of the toes. Their connexions, whether with the toes, or bones of the inſtep, are by *Synarthroſis*. The ligaments as well proper as common are ſuch, as we ſaid of the former. The bones of the third order now remaine to be ſpoken of, which wee ſaid, make the toes, and they are foureteene, two of the great toe, but three of each of the other toes. The firſt is ſomewhat longiſh, but the reſt are very ſhort, except that of the great toe, all of them on the upper ſide are round and convexe, but on the lower ſomewhat hollow, and plaine long wiſe, that the tendons which bend them, may paſſe more ſtraightly and ſafely without inclining to either ſide, even to their furtheſt joynts; although ſuch paſſages are much helped by the membranous and common ligament, which riſing from the ſides of theſe bones, involves theſe tendons, as we mentioned in the fingers. To conclude, each of theſe bones the laſt excepted, have a double connexion by *Diarthroſis*, they are all unequall in their bignes, that is, thicke at their beginning (where they receive the heads of the precedent bones,

The bones of the toes.

bones,upon which they move,as a doore upon the hinges) and ſo they grow ſmaller towards the ends, but by their ends, they are received of the following bones: at their ends they riſe into two eminencies on their ſides;diſtinguiſhed by a cavity betweene them,through which occaſion they are farre thicker at their ends,than in their midle.

B 13, a proceſſe of the third bone of the wreſt whereinto the fift muſcle of the foot is inſerted. ι 12. the place of the inner bone of the wreſt to which that bone of the Afterwreſt which ſuſtaineth the great Toe is coupled. κ 12, the place of the ſecond bone of the wreſt whereto the bone of the Afterwreſt that ſupporteth the fore Toe is articulated. λ 12 the place of the third bone of the wreſt whereto that bone of the Afterwreſt which ſupporteth the middle toe is articulated. μ 1,2, a ſmall bone whereby that bone of the Afterwreſt which ſuſtaineth the little toe is joyned unto the Cubebone. νν 1,2 the diſtances betwixt the bones of the Afterwreſt. ξξ,1,2, the heads of the bones of the Afterwreſt which enter into the boſomes of the toes. π 2, a proceſſe of the bone of the afterwreſt wherein the tendon of the ſeventh muſcle of the foote is implanted. ρ 2, a proceſſe of the Bone of the Afterwreſt, which ſuſtaineth the litle toe, which proceſſe receiveth the tendon of the eight muſcle of the foote. ς,τ,υ,1,2, the three bones of the foretoe. φ,ω,2, two ſeede bones placed under that bone of the afterwreſt which ſuſtaineth the great toe,* 2 under X. a ſeede bone ſet to the ſecond joynt of the great Toe. Γ, 1, 2, the *Talus* or paſterne. Δ,1,2, the Heele. Θ,1, 2, the Boat-bone. Λ, Ξ,1,2, the bones of the toes. Φ, Χ, 1,2, two bones of the great toe I,II,III,IV,V, 1. the five bones of the afterwreſt.

The Ligaments by which their connexions are faſtened, are ſuch as the former. The *Oſſa ſeſamoidea* or Seed-bones of the feet are like in number and ſite to theſe of the hands. But this is to be noted, that thoſe Seed-bones which are in the firſt articulation are ſomewhat bigger than the reſt, and they are round and longiſh on the out ſide, but ſmooth and hollow on the inſide, ſeated betweene two cavities, encompaſſed by three riſings, of which two are on the ſides, and the third in the midſt of the extremity of the firſt bone of the *Pedium*, which chiefly beares up the great toe. To conclude, before we come to ſpeake of the muſcles, we muſt obſerve that the foote was made for two commodities. The firſt is to ſtay and beare the whole body when we ſtand, for which cauſe nature ſet not the great toe contrary to the other, as it placed the Thumbe on the hand. The other is for apprehenſion, or taking hold of, wherefore nature framed and made the foote and theſe moveable and joynted in the toes, as in the fingers of the hand. Beſides alſo for that we muſt goe upon our feet, Nature hath made them in ſome places hollow on the lower ſide, & in other ſome plaine in a triangular figure, that ſo our feet may carry us over every ſoile, plaine mountanous, equall and unequall, through all parts of the world.

The Seed-bones of the foote.

The twofold uſe of the feete.

CHAP. XXXIX.

Of the Muſcles moving the foote.

Their number.

THe muſcles of the Legge moving the foote are abſolutely nine, three in the fore part and ſixe in the hinde. Two of the three fore muſcles bend the foote, when they joyntly performe their action, but when ſeverally, each drawes it to his ſide; the third chiefly extends the Toes, for other whiles it ſeemes by its ſlenderer and longer Tendon (which exceeds not that bone of the *Pedium* which ſuſteines the litle Toe) to helpe alſo to bend the foote.

Muſculus Peronæus.

The firſt is called *Peronæus*, becauſe it deſcends alongſt the bone *Perone*; the other the *Tibiæus anticus*, for that it deſcends along the *Os Tibiæ*, or bone of the Legge. The third from its action is called the *Digitumtenſor*, or Toe-ſtretcher. For their originall the *Peronæus* which ſeemes to have two heads, deſcends from the upper appendix of the *Perone* or ſhin-bone by its firſt head, but by the other from the middle of the ſame bone from the fore ſide into the hinde, as the ſuperficies ſhewes which paſſes betweene the fore and outward line of the ſaid bone; but after it arives at the lower and hinder appendix of the ſame bone, behind the outer Anckle it produces two tendons, which by the guidance of the Ligaments as well proper, as common, goe, the thicker under the ſole of the foote, ending in the Die-bone and that bone of the *Pedium* which ſuſteines the great Toe; the leſſer goes on the outſide to the Die-bone, & the laſt & leaſt bone of the *Pedium* which beares up the litle Toe, ſometimes a ſlender portion thereof is produced even to the ſide of the litle Toe, extending it and drawing it from the reſt. The *Tibiæus anticus* or Fore legge muſcle proceeding from the upper and outer appendix of the Leg-bone deſcends above the ſurface of the ſame bone, which is betweene the fore and outer line to which it adheres, as alſo to that ſurface even to the midſt, from which place it produces one tendon, which deſcending on the fore and loweſt part, ends on the outſide into two of the nameles bones, that is, into the firſt which is the thicker, and into the middlemoſt, but beſides by a ſlender portion thereof it is extended into the firſt and greater bone of the *Pedium*, ſo to extend the great Toe, drawing it inwards to the other foote. And this muſcle with the precedent bends the foote, if they both performe their parts at once; but if ſeverally, each drawes the foote towards his ſide. The third which is the *Digitumtenſor*, or Toe-ſtretcher, is two fold; the one takes its originall from the top of the Legge, and running alongſt the ſhin-bone and paſſing under the ring, carries it ſelfe into the foote, in which it ends by five tendons going to all the joynts of the Toes, and by a ſixth at that bone of the *Pedium* which ſuſteines the litle Toe, whereby (as wee formerly ſaid) it helpes the bending of the foote. The other deſcends into the midſt of the ſhin-bone, and ſomewhat faſtened thereto by one tendon paſſing under the Ring it goes to the great Toe. But you muſt note that all theſe. Tendons have nervous, ligamentous and fleſhy fibers ſo ſeparated from each other, that they can equally alone performe their function, as if they were more diſtinct muſcles. And wee muſt thinke the ſame of the reſt which have diſtinct Tendons preſently from their fleſhy part.

Tibiæus anticus,

The Toeſtretcher is two-fold.

The 6 hinde muſcles.

The ſixe hinde muſcles follow, of which the two firſt are called the *Gemelli* or Twins by reaſon of the ſimilitude of their thickneſſe, originall, inſertion and action. The third is called the *Plantaris*, becauſe it is ſpent upon the ſole of the foot, as the *Palmaris* upon the palme of the hand. The fourth is termed the *Soleus* or ſole muſcle by reaſon of the reſemblance it hath to the fiſh of that name. The fift the *Tibiæus poſticus* or hindlegge Muſcle which deſcends alongſt the backe part of the leg-bone. The ſixth and laſt the *Digitumflexor* or Toe-bender, equivalent to the Deepe muſcle of the hand, ſome make but one muſcle of this and the *Tibiæus poſticus*, which produces three tendous; others had rather make three, as thus, that one ſhould be the *Tibiæus*, the other the bender of foure Toes, the third the bender of the great Toe.

The 2 *Gemelli* or Twins muſcles.

Now for the two *Gemelli* or Twins, the one is internall, the other externall; the internall paſſes forth from the roote of the inner Condyle of the Thigh; but the externall from the externall Condyle;and from this their originall preſently becomming fleſhy,eſpecially on the out ſide,they meet together a litle after in their fleſhy parts,and with the *ſoleus* they make the thicke and great Tendon at the midſt of the legge, which from thence is inſerted into the backe part of the heele; in this very Tendon breed painfull kibes. The action thereof is, to helpe our going by putting forth the foote, whileſt it drawes the Heele towards its originall.

In what place the kibes breed

The Plantaris

The *Plantaris* the leaſt and ſlendereſt of them all,paſſes forth fleſhy from the outward head of the legge-bone, and from thence the ſpace of ſome foure fingers bredth it ends in a ſtrong and ſlender Tendon, which it ſends betweene the Twin and ſole muſcles to the ſole of the foot,there to produce a membrane which covers the ſole of the foote,and a muſcle equivalent to the upper bender of the Hand.

The *Soleus.*

The *Soleus*, or ſole muſcle the thickeſt of them all, and ſeated under the Twin muſcles,deſcends from the commiſſure of the legge and ſhin-bones, and about the midſt of the legge, after it hath mixed his tendon with that of the Twin muſcles, it runs into the foreſaid place that it may extend the foote for the foreſaid uſe,

The *Tibiaus poſticus.*

The *Tibiaus poſticus* deſcends from the hinder appendix of the legge and ſhinbones, and adhering to them almoſt as fare as they goe,by a ſtrong Tendon,being as it were bony at the end thereof,it is inſerted into the Boat-like bone and the two firſt nameles bones ſo to helpe the oblique extenſion of the foote.

The *Digitumflexor* twofold.

The laſt being the *Digitumflexor* or Toe-bender is twofold, for one ariſes from the legge-bone,in that place where the *Poplitaus* ends,and inſerted into that ſame bone it goes even to the backſide of the inner ankle & from thence into the joynts of foure of the toes. The other drawes his originall from almoſt the middle of the ſhin-bone, and ſomewhat inſerted into it,it goes by the heele and paſterne bone to the great toe, mixed with the precedent; their action is to bend the firſt joynt of the Toes, rather by the force of the common Ligament, than by the ſmall portion of the Tendon which ends there. But it is their action to bend the laſt dearticulation of the Toes by their proper inſertion.

Chap. XL.

Of the Muſcles moving the Toes of the feete.

Their number.

Now follow the muſcles moving the Toes; theſe are eight in number, one on the upper,and ſeven on the lower ſide. The firſt proceeds from the Paſterne,heele and Die bones below the externall Anckle, or the Ligament of theſe bones with the Legge-bone, and obliquely ſtretched to the top of the foote is parted into five ſmall tendons to the ſides of the five toes,ſo to draw them outwards towards its originall, whereupon it is called the *Abductor* of the Toes, and alſo *Pedioſus*, becauſe it is ſtretched over the *Pedium*,or backe of the foote.

The *Abductor* of the Toes,or *Pedioſus.*

The *Flexor ſuperior.*

The firſt of the ſeven of the lower ſide called the *flexor ſuperior* or upper bender, ariſes from the heele and ſtretched alongſt the foote under the ſtrong membrane, (which from the heele is ſtraitly faſtened to the extremity of the bones of the *Pedium* to ſtrengthen the parts conteined under it) is inſerted by foure Tendons,at the ſecond joints of the foure Toes which it bendes. Here you muſt note that neer the inſertion thereof, this muſcle divides it ſelfe, like that muſcle of the hand which is called *ſublimis*,that ſo it may give way to the Deepe,which (as we ſaid) deſcends alongſt the fingers, to which a certaine common membranous Ligament adjoynes it ſelfe,which involues and faſtens it to the bone all alongſt the lower part of the fingers, even to the laſt dearticulation.

The muſcle equivalent to the *Thenar.*

The ſecond equivalent to that muſcle of the hand which is called *Thenar*, ſeated on the inner ſide of the foote,ariſes from the inner and hollow part of the heele and paſterne bones and ends in the ſide,and inner part of the great Toe, which it drawes from the reſt,inwards. This may be divided into two or three muſcles,as the *Thenar* of the hand,to draw the great Toe to the reſt,as much as need requires,juſt as we ſaid of the Hand. The third anſwerable to that of the hand which is named the *Hypothenar*,paſſes from the outer part of the heele and aſcending by the ſides of the foote it is in like manner inſerted into the ſide of the litle Toe, ſo to draw it from the reſt;

to which ſame action a certaine fleſh contained under the ſole of the feete may ſerve, which is ſtretched even to theſe Toes, that alſo it may ſerve to hollow the foote. The foure *Lumbrici* or wormy muſcles follow next, which from the membrane of the Deep Toe-bender are inſerted into the inner & ſide part of the foure Toes, ſo to draw them inwards, by a motion contrary to that which is performed by the *Pedioſus*. The *Interoſſes* or bone-bound muſcles of the *Pedium* or back of the foot, remaine to be ſpoken of: Theſe are eight in number, foure above, and as many below, different in their originall, inſertion and action; for the upper becauſe they draw the foote outwards with the *pedioſus*, ariſe from the fore and inner part of that bone of the *pedium*, which beares up the litle Toe (and ſo alſo the reſt each in its order) and are inſerted into the outward & forepart of the following bone. The lower on the contrary paſſe from the fore and outer part of that bone of the *pedium*, which beares up the Great Toe (and ſo each of the reſt in its order,) but are inſerted into the inner and upper part of the following bone, ſo with the wormy muſcles to draw it inwards, or to hollow the foote as the outwards, or to flat the foote, as we ſaid of the *Interoſſes* of the hand.

The 4 *Lumbrici*.

The deſcription of the upper and lower *Interoſſes*.

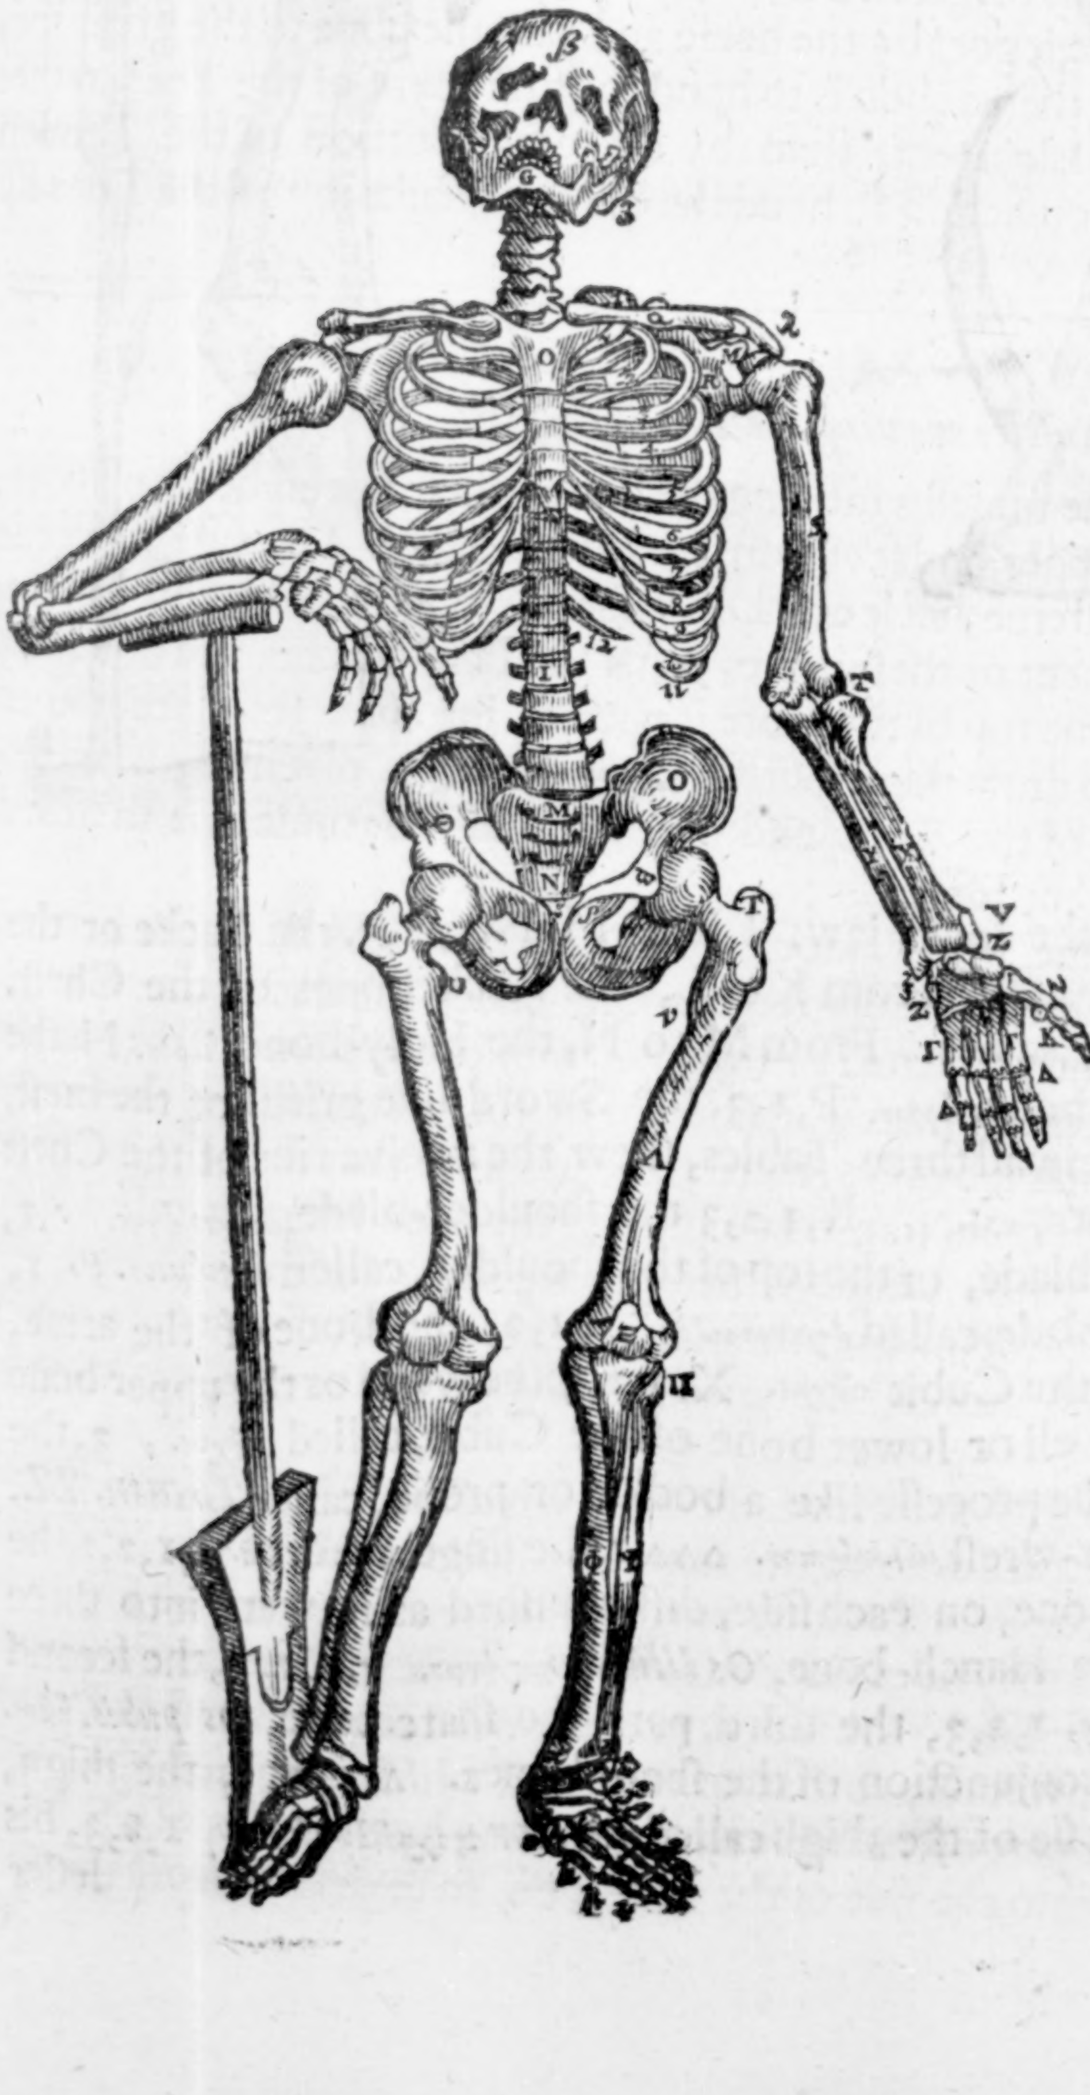
CHAP. XLI.

An Epitome or brieſe recitall of the bones in a mans body.

THe whole head which hath the leaſt conſiſts of 60. bones; but that which hath moſt of 63. that is, 14 of the *Cranium* or ſcull, 14 or 17. of the face, and 32 teeth; Of the bones of the ſcull there be 8 conteining and ſixe conteined; the

The bones of the Scull, 14.

This firſt ſheweth the forepart of the Sceleton of a man, &c.



The Declaration of theſe three figures put into one.

A 3. The Coronall Suture called in Greeke στεφανιαία.

B 2 3. The ſuture like the letter Λ, called λαμβδοειδῆ.

C 2, The ſagittall Suture called ὀβελιαῖα.

D 2,3. The ſcale-like *Conjunction* called λεπιδοειδεῖς.

α 2,3, *Os verticis*, or *ſyncipitis*, the bone of the *Syncipꝰt*, called *Os* βρέγματος.

β, 1,3. The forehead-bone, that is, μετώπου.

γ, 2, 3. The bone of the Nowle or ἰνίου.

δ, 2,3. The bones of the temples or κροτάφων.

ε, 3. An appendix in the temple-bone like a Bodkin, στυλοειδής.

ζ 1,2,3. A proceſſe in the temple-bone like the teate of a dugge, called therefore *Mamillaris* & μαστοειδής

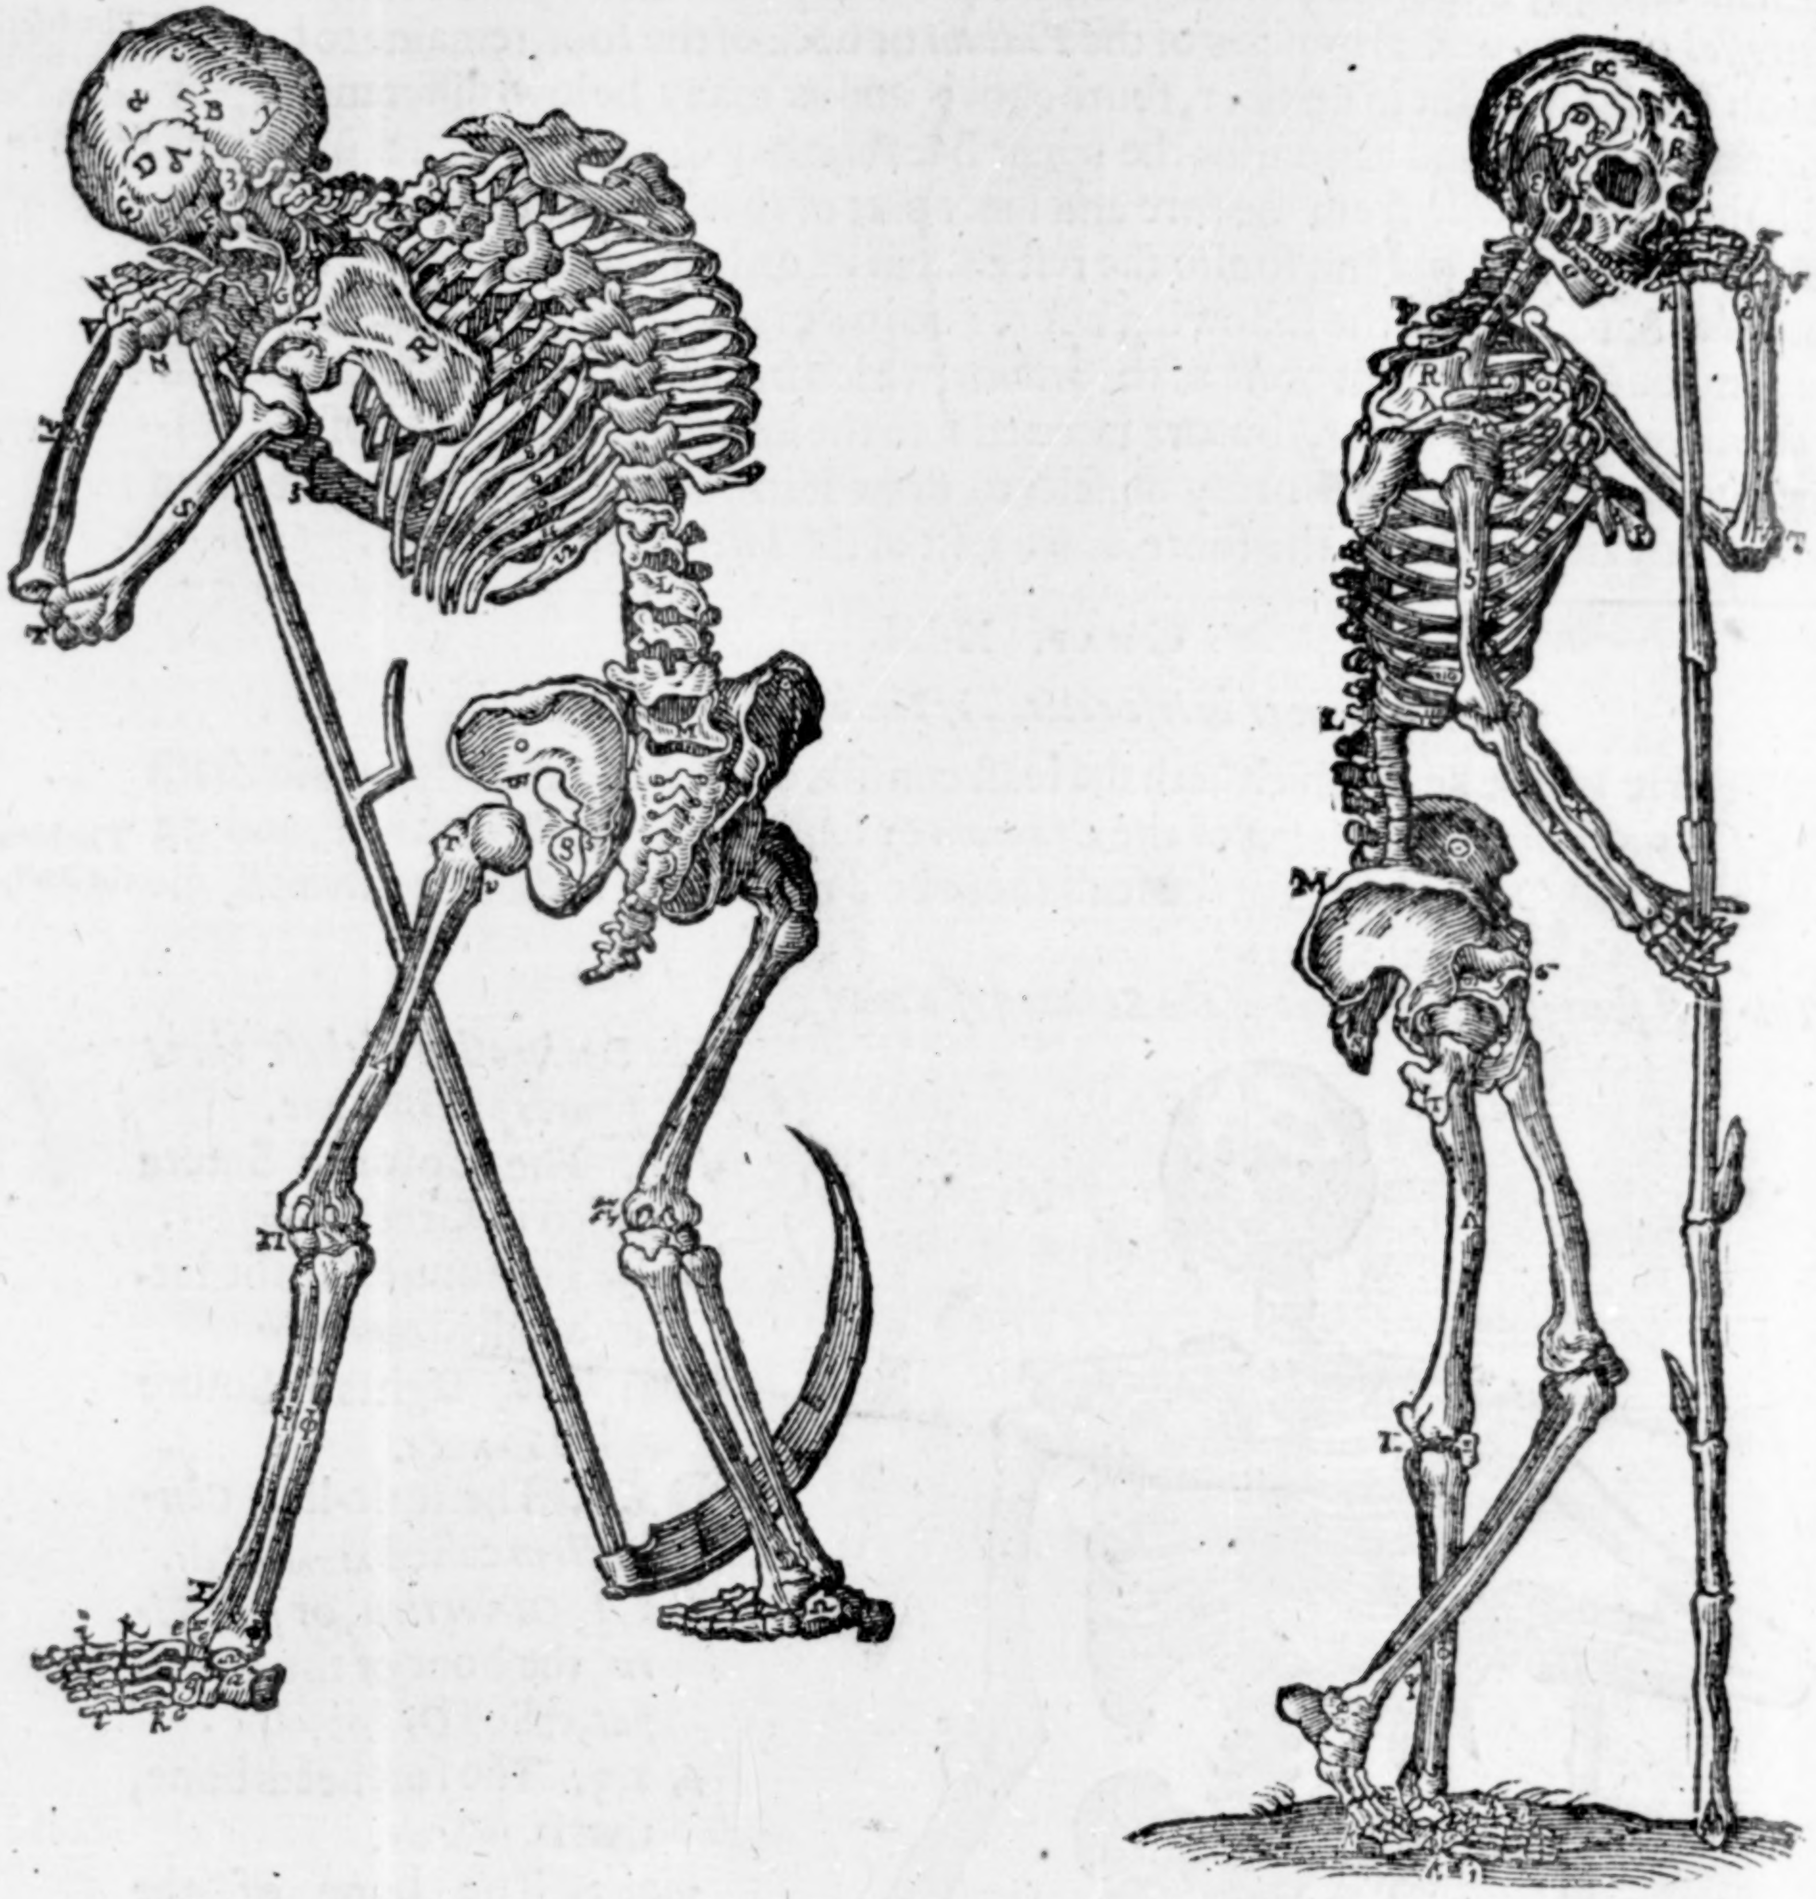
E, 2, 3. the wedge-bone, σφηνοειδές.

η, 3, the ſtony part of the Scull.

θ, 3, a proceſſe of the wedge-bone much like the wing of a Bat, and therefore called πτερυγοειδεῖς

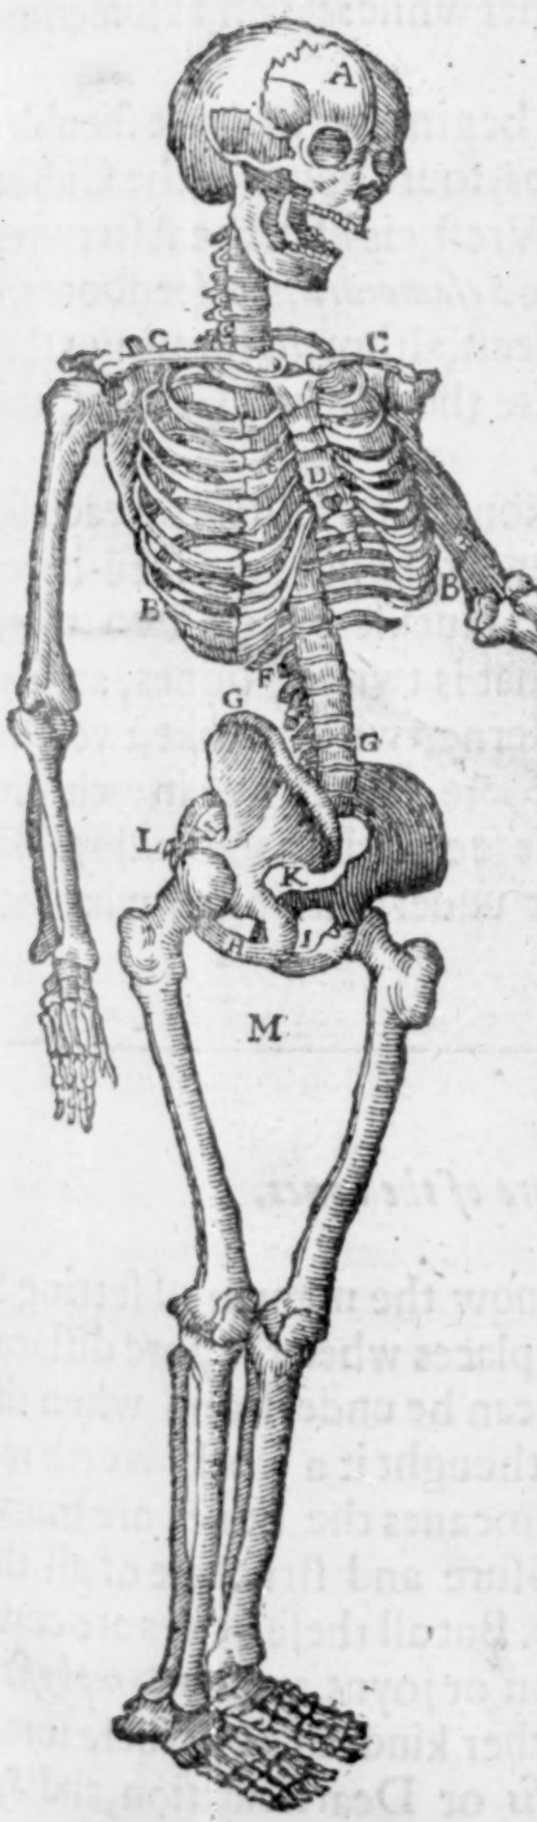
F, 1,

The 2 and 3 Figures ſheweth the backſide of the Sceleton, and the laterall part of the Sceleton.



F, 1, 2, 3. the yoke-bone ζύγωμα. G 1, 3. the lower jaw. I, K, L, M, N, 1, 2, 3. the backe or the ſpine, ῥαχίς. From I to K, the Necke, τράχηλος. From K to L, the Rackebones of the Cheſt. From L to M, the rackebones of the Loynes. From M to N, the Holy-bone, ἱερὸν. N, the Rumpe bone, κόκκυξ. O, 1, 3. the breſt-bone, στέρνον. P, 1, 3. the Sword-like griſtle of the breſt, ξιφοειδὴς Char. 1, 2, 3, as farre as to 12. in all three Tables, ſhew the twelve ribs of the Cheſt πλευραί. Q 1, the clavicles or coller bones, κλεῖδες. R, 1, 2, 3 the ſhoulder-blade, ὠμοπλάτες. λ, 1, 2, 3, the upper proceſſe of the ſhoulder-blade, or the top of the ſhoulder, called ἀκρώμιον. μ, 1, 3, The lower proceſſe of the ſhoulder-blade: called ἀγκυροειδὴς. S, 1, 2, the bone of the arme, called *Humerus* and βραχίων. T, V, 1, 2, 3, the Cubit πῆχυς. X, 1, 2, 3: the wand or the upper bone of the Cubit, called κερκίς. Y, 1, 2, 3, the ell or lower bone of the Cubit, called πῆχυς. ν 3, the proceſſe of the Cubit, ὠλέκρανον. ξ, 13, the proceſſe like a bodkin or probe, called στυλοειδὴς. ZZ: 1, 2, 3, the wreſt καρπὸς. ΓΓ, 1, 3, the after-wreſt μετακάρπιον. ΔΔΔ. 1, the fingers δάκτυλοι. Θ, 1, 2, 3, the bones joyned to the ſides of the Holy bone, on each ſide, diſtinguiſhed as it were into three parts. ο, 1, 2, 3, the firſt part called the Hanch-bone, *Os Ilium*, λαγόνων. π, 1, 2, 3, the ſecond part the bone of the *Coxendix* ἰσχίον. ϛ, 1, 2, 3, the third part the ſhare-bone, *Os pubis*, ἥβης. σ, 1, 2, 3, a griſtle going betweene the conjunction of the ſhare-bones. Λ, 1, 2, 3, the thigh, μηρὸν. τ, 1, 2, 3, the greater outward proceſſe of the thigh called *Rotator* τροχαντὴρ μέγας. υ, 1, 2, 3, his leſſer and inner proceſſe. Ξ, 1, 2, 3, the whirlebone of the knee, *Patella Rotutula*, ἐπιμυλίς. Π, Σ, 1, 2, 3, the leg, κνήμη, Φ, 1, 2, 3, the inner & greater bone of the leg προκνήμιον. Ψ, 1, 2, 3, the utter and ſmaller bone of the leg, called the *Brace-bone*, *Fibula*, περόνη. φ, 1, 2, 3, the proceſſe of the Leg or the inner anckle called *Malleolus internus*. X, 1, 2, the proceſſe of the brace of the out-ward ankle, both of them are called in greeke, σφυρὸν. Ω, 1, 2, 3, the bone called the cockal, *Talus*, *baliſta*, *Os* ἀστράγαλος. *a*, 2, the Heele *Calx*, πτέρνα. *b*, 1, 3, the bone called *Os Naviculare*, σκαφοειδὲς. *cc*, 1, 2, 3, the wreſt of the foot called *Tarſus*, conſiſting of foure bones, ταρσὸς. *d*, *e*, *f*, 1, 2, 3, three inner bones of the wreſt of the foot, called by ſome χαλκοειδῆ. *g*, 1, 2, 3, the utter bone of the wreſt of the foot like a Dye, κυβοειδὲς. *hh*, 1, 2, 3, the afterwreſt of the foote called *Pedium*, by ſome μετάταρσος. *ii*, 1, 2, 3, the toes of the foote. *k*, 1, 2, 3, the ſeed bones of the foote, called *oſcicula ſeſamina*, σησαμοειδῆ.

This figure ſheweth the Sceleton of the bones & griſtles of a woman, that it may appeare all her bones are in proportion leſſer than the bones of a man. But in this figure onely thoſe parts are marked with letters wherein a woman differeth from a man in her bones and griſtles.



A, The ſagittall ſuture deſcending into the noſe, & dividing the fore head bone, which is ſometimes found in women, very rarely in men, but alwayes in Infants.

BB, the Cheſt ſomewhat depreſſed before, becauſe of the Paps.

CC, the coller bones not ſo much crooked as in men, nor intorted ſo much upward.

D, the breſt-bone perforated ſometimes with a hole much like the forme of a heart, through which veines do run outward, from the mammary veines unto the paps.

E, the griſtles of the ribs, which in women are ſomewhat bony, becauſe of the weight of the Dugs.

F, a part of the backe reflected, or bent backward above the loynes.

GG, the compaſſe of the hanchbones running more outward, for the wombe to reſt upon, when a woman is with child.

HH, the lower proceſſes of the ſhare-bones, bearing outward that the cavity marked with K, might be the larger.

I, the anterior commiſſure or conjunction of the ſhare-bones filled up with a thicke griſtle, that in the birth they might better yeeld ſomewhat for Natures neceſſity.

K, A great and large cavity circumſcribed by the bones of the coxendix and the Holy-bone. L, The Rumpe or Coccyx, curved backeward to give way in the time of the birth. M, the thigh bones by reaſon of the largeneſſe of the foreſaid cavity, have a greater diſtance betwixt them above, whence alſo it is that womens thighes are thicker than mens.

conteining are, the *Os frontis*, or Forehead bone, the Nowle-bone, the two bones of the *Synciput*, the two ſtony bones, the Wedgebone, and the Sive-like or ſpongy-bone. But the conteined are ſixe ſhut up in the cavity of the Eares, the Anvile, Hammer and ſtirrop.

The bones of the face 15.

For the bones of the face, there are ſix within or about the Orbe of the Eye, that is, on each ſide three; two bones of the Noſe, two leſſer Iaw bones, and two bigger, which are alwayes in beaſts ſeene diſtinguiſhed by a manifeſt difference, but it is ſo rare in men, that I have not found it as yet; therefore theſe onely are diſtinguiſhed by manifeſt difference, two which conteine all the upper teeth, the two inner of the palate, the two of the lower Iaw in children; And laſt of all the *Os Criſtæ*, whence the middle griſtle or partition of the noſe ariſe.

The teeth 32.

The two and thirty teeth are equally diſtributed in the upper and lower Iawes; and of theſe there be eight ſhearers, foure fanges, or Dog-teeth, and twenty Grinders.

The bone *Hyoides*

And there is another bone at the roote of the tongue called *Os Hyoides*, alwayes compoſed of three bones, ſometimes of foure.

The bones of the ſpine 34.

Now follow the bones of the Spine, or Back-bone, which are juſt foure and thirty, that is, ſeven of the necke, twelve of the Cheſt, five of the loines, ſix of the holy-bone; and foure of the rumpe. Beſides there are two bones of the throate, or Collar bones.

2 Coller-bones.
The Ribs 24.
The bones of the *Sternon* 3.

The Ribbes are twenty foure, that is, fourteene true and ten baſtard ribs. The bones of the *Sternon* or Breaſt-bone moſt frequently three, other whiles ſeven, as ſometimes in young bodyes.

The bones of the whole arme 62.

Hence comming to the Armes there are reckoned *62*, beginning with the ſhoulder-blade; as there are two ſhoulder-blades; two Arme bones; foure bones of the Cubite; that is, two Ell-bones and two Wands; ſixteene of the Wreſt, eight of the Afterwreſt, and thirty of the fingers: into this number alſo come the *Seſamoidea*, or ſeedbones, of which ſome are internall, & theſe alwayes twelve at the leaſt, although ſomtimes there may be more found, a great part of which rather merite the name of Griſtles, than bones; there are others externall if we beleeve *Sylvius*.

The bones of the whole leg. *66*.

Now remaine the bones of the Leg, which (if we reckon the *Oſſa Ilium* on each ſide three, as in yong bodies, it is fit they ſhould) they are ſixty ſix, beſides the ſeed-bones, that is to ſay, two Haunch-bones, two ſhare bones, two Huckle-bones, two thigh-bones, two Whirlbones of the knees, foure of the leg, that is two leg-bones, and two ſhin-bones. Fourteen of the Inſtep, as two ſheele, two paſterne, two boat-like, two Die, & ſix nameleſſe bones. Ten of the *Pedium* or back of the foote, that is, five in each foot; & twenty eight of the Toes: & as many ſeed-bones in the feet, as the hands enjoy. But I have thought good to adde theſe figures for the better underſtanding of what hath beene ſpoken hereof.

Chap. XLII.

An Epitome of the names and kinds of compoſure of the bones:

What the *Sceletos* is.

The bones are compoſed two manner of wayes.

2 Sorts of Articulation.
What *Diarthoſis* and *Synarthroſis* are.

3. Sorts of *Diarthroſis*.
What *Enarthroſis* is.

BEcauſe it is as nececeſſary for a Chirurgion to know the manner of ſetting & repairing broken bones, as to put them in their places when they are diſlocated, or out of joynt; but ſeeing neither of them can be underſtood when the naturall connexion of the bones is not knowne, I have thought it a worke worth my labour, breifly to ſet downe, by what and how many meanes the bones are mutually knit and faſtened together. The univerſall compoſure and ſtructure of all the bones in a mans body is called, by the Greekes; *Sceletos*. But all theſe bones are compoſed after two ſorts, that is, by *Arthron*, an Articulation or joynt, and by *Symphyſis* a naturall uniting or joyning together. There are many other kinds of both theſe ſorts. For there are two kinds of Articulation, that is *Diarthroſis* or Dearticulation, and *Synarthroſis*, or Coarticulation; which differ as thus, Dearticulation is a compoſition of the bones with a manifeſt and viſible motion; Coarticulation hath a motion of the bones, yet not ſo manifeſt, but more obſcure. But theſe two do againe admit a ſubdiviſion into other kinds. For *Diarthroſis* conteines under it *Enarthroſis*, *Arthrodia* & *Ginglymos*. Now *Enarthroſis* or Inarticulation is a kind of Dearticulation, in which a deep

Cavity receives a thicke and long head, ſuch a compoſition hath the Thigh-bone with the Huckle-bone.

Arthrodia is when a lightly engraven civity admits a ſmall and ſhort head, ſuch a connexion is that of the Arme-bone with the ſhoulder-blade; of the firſt *Vertebra* with the ſecond. The Greekes have diſtinguiſhed by proper names theſe two kinds of Cavities and heads; For they call the thicke and long head *Cephale*, that is, a Head abſolutely; but the leſſer they terme *Corone*, or *Coronon* which the Latines call *Capitulum*, a Litle-head. But they call a deepe Cavity *Cotyle*, and a ſuperficiary one *Glene*. The third ſort called *Ginglymos*, is when the bones mutually receive and are received one of another; as when there is a cavity in one bone, which receives the head of the oppoſite bone, and alſo the ſame bone hath a head which may be received in the Cavity of the oppoſite bone; ſuch a compoſure is in the Cubite and knee, that is in the connexion of the Thigh-bone.

What *Arthrodia.*

What *Cephale* is.

What *Corone* is.

What *Cotyle* is

What *Glene* is

What *Ginglymos.*

And thus much of Dearticulation and the three kinds thereof. *Synarthroſis* or Coarticulation, another kinde of juncture, hath alſo three kinds thereof * (*Gal. lib. de Oſſibus*) to wit, *Sutura*, *Gomphoſis* and *Harmonia*.

3 Kinds of *Synarthroſis.*

Suture is a compoſition of the bones after the manner of ſowing things together, example whereof appeares in the bones of the Scull. *Gomphoſis* is when one bone is faſtened in another as a pin is faſtened in a hole, after which manner the teeth are faſtened in their ſockets in both the Iawes. *Harmony* is when the bones are compoſed by the interpoſition of a ſimple line, after which manner many bones of the noſe and face are joyned together.

What a Suture is.

What *Gomphoſis* is.

What *Harmonia* is.

Hitherto we have ſpoken of the firſt conſtruction of the bones by articulation and the kinds thereof; now it followes we treat of *Symphyſis*.

Symphyſis, or Growing together as we formerly ſaid, is nothing elſe, than naturall union of the bones; ſuch union is made two manner of wayes, that is, either by interpoſition of no other thing; after which ſort in ſucceſſe of time the bones of the lower Iaw grow together, which formerly in children were maniſeſtly diſtinguiſhed; or by the mediation of ſome *Medium*; but that happens three manner of wayes, by interpoſition of three ſeverall *Media*, as firſt of a Griſtle, which kinde of union the Greeks call *Synchondroſis*, after which manner the Share-bones grow together and alſo ſome *Appendices* in young bodyes; ſecondly of a Ligament, and it is named by the Grecians *Syneuroſis*, the name of a Nerve being taken in the largeſt ſenſe, for ſometimes it is uſed for a tendon, otherwhiles for a Ligament, otherwhiles for a Nerve properly ſo called and which is the author of ſenſe and motion. But this *Symphyſis* or union hath place by *Syneuroſis*, or interpoſition of a Nerve in certaine bones of the *Sternon* and Haunch.

What *Symphyaſis* is.

Synchondroſis.

Syneuroſis.

The things ſignified by word Nerve.

Thirdly, the bones grow into one by interpoſition of fleſh, called in Greeke *Synſarcoſis*; thus the fleſh of the Gums faſtens the teeth and makes them immoveable. But if ſome be leſſe pleaſed with this diviſion, by reaſon of the obſcurities, in which it ſeemes to be involved, this following expreſſion comes into my minde, which I was firſt admoniſhed of by *German Cortin* Doctor of Phyſicke, which if you well obſerve it, is both blameleſſe and more eaſie for your underſtanding.

Synſarcoſis.

The bones, which as pillars ſuſteine the fabricke of the whole body, are either,

- Vnited mutually by *Symphyſis* or union; by which they are ſo conjoyned that there is no diſſimular, nor heterogeneous body, at leaſt which may be diſcerned, interpoſed between them. Such union appeares in the two bones of the lower Iaw at the Chin, in the bones of the *Sternon*, the Hanch with the Huckle-bones, and the Share-bones betweene themſelves; of this union there are no more kinds, for by this it cometh to paſſe, that the bones, which were more and diſtinct meet together by interpoſition of one *Medium*, to wit, a Griſtle, which now indeed is no Griſtle, but is turned into a Bone.
- or Conjoyned by that which they call *Arthrodia*, or Articulation, as when they ſo concur & are bound together, that ſome Heterogeneous ſubſtance may be noted betwixt them, but the bones thus cōpoſed are knit two manner of wayes, that is,
  - either more looſly as by *Diarthroſis*, that is a kind of Articulation not very ſtraite, as by which it might have opportunity to preforme diverſe motions: of this compoſure or Articulation of bones there are three kinds, as
    - *Enarthroſis*, when the head of a bone is wholy received in the cavity of another, & hid therein, as the Thigh-bone is joyned with the Huckle-bone.
    - *Arthrodia*, when in a lightly engraven & not much depreſſed cavity, the head of another bone is not wholy hid, but only received in part thereof; ſo that unleſſe nature had otherwiſe provided a ſufficient receptacle for the head of this bone (as by the ligamēts of the neighbouring Muſcles) it would otherwiſe have bin in perpetuall danger of diſlocation. Thus the Arme-bone is faſtened to the ſhoulder-blade.
    - *Gynglymos*, when the bones mutually receive each other, ſuch like compoſition hath the Cubit and Arme-bone.
  - or more ſtraitly, as by *ſynarthroſis*, whē the bones are more ſtraitly knit ſo that they can performe no motions in the body. Of this Articulation there are alſo 3, kinds, that is
    - *Gomphyſis*, as when one bone ſo receives another as a Pin is faſtened in the hole made by a peircer, thus the teeth are faſtened in the Iawes.
    - *Sutura*, like a Saw, or teeth of a combe, as the bones of the ſcul are mutually knit together, or as ſcales, or tiles are laid, after which manner the ſtony bones are faſtened to theſe of the *Syncipnt*. *Harmonia*, which is by interpoſition of a ſimple line, which parts bones abutting one upon another, as the bones of the Noſe.

An Epitome or briefe recitall of all the Muſcles of mans body.

As I have formerly reckoned up the bones, ſo here I have decreed to recite the muſcles of mans body. Wherefore in the face we firſt meet with the broad or skin muſcle, ariſing from the fleſhy pannicle, & covering the whole necke & almoſt all the face. Then follow 4, perteining to the upper eye-lids. In the Orbs of the eyes lye 14, that is 7, in each Orbe, of which 4 are called right, two oblique and one pyramidall. Then ſucceed 4 of the noſe, two externall on each ſide one, and two internall, theſe draw it together and the other open it. After theſe come the ten muſcles of the lower Iaw, of which two are called the *Crotaphitæ* or Temporall; two *Maſſeteres* or Grinders; two round (which ſeeme to me rather to perteine to the lips, than to this Iaw;) two litle ones hid in the mouth, ariſing from the winged proceſſe of the wedge-bone; two openers of the mouth being nervous or tendinous in their midſt. Then follow the 8 muſcles of the lips, that is, 4 of the upper and as many of the lower, ſhutting and opening the mouth. The tongue with his ten muſcles is hid as it were in the den of the mouth. Wherfore the muſcles of the whole face are 51. In the fore part of the necke are found the muſcles of the bone *Hyoides* & throtle; now 8 muſcles hold the bone *Hyoides* as equally ballanced; of which there are 2 upper ariſing from the Chin; 2 on the ſides from the proceſſe *Styloides* perforated in their midſt, through which the 2 openers of the mouth in that part nervous do paſſe; 2 ariſe from the *Sternō*, & laſtly 2 from the upper rib of the ſhoulder-blade to the *Coracoides*, which alſo in their midſt are nervous, in which place the two *Maſtoidei* lye upon them.

The 18. of the *Larinx.*

The Throtle compoſed of three griſtles hath eighteene or twenty muſcles, of which ſixe or eight are common, and twelue proper; Of the common there are two above, two below, and two at the ſides of the firſt griſtle, to which wee may adde theſe two which ſerve for the opening of the *Epiglottis*, which are alwayes found in great foure footed beaſts for to preſſe downe the *Epiglottis*.

The proper are twelue which almoſt all of them come from the ſecond griſtle, ſo to be inſerted into the firſt and third, of which ſome are before, others behinde the *Thyroides*. Beſides theſe, there are the *Maſtoidei* which bend the head.

The head is mooved by 14. Muſcles.

But in the backe part of the Necke there are twelue muſcles alſo appointed for to move the head, ſo that in all there are fourteene muſcles ſerving for the motion of the head, the two fore *Maſtoidei*, and the twelue hinde Muſcles, that is to ſay, the two *Spleny*, two *Complexi*, foure Right, and ſo many oblique which are very ſhort, ſo that they paſſe not beyond the firſt and ſecond *Vertebra*.

The 8. Muſcles of the necke.

The Necke hath eight Muſcles, of which two are called the long, lying before upon the bodyes of the *Vertebræ*; the two *Scaleni* which are at the ſides; the two *Spinati* which runne alongſt the Spine; the two tranſverſe which goe to the tranſverſe proceſſes of the Cheſt.

The Muſcles of the cheſt 18.

The Cheſt hath 81 Muſcles, of which ſome are on the fore part, ſome on the hinde, others on the ſides; they are all combined or coupled together except the Midriffe. Now of theſe there are the two *Subclavÿ*; the two great Saw-muſcles which proceed from the baſis of the ſhoulder-blade; the foure litle *Rhomboides* or ſquare muſcles, that is, two above and two below; the two *Sacrolumbi*; the two binders of the Griſtles within the Cheſt.

Beſides there are twenty and two externall and as many internall Intercoſtall muſcles, twenty foure *Intercartilaginei*, that is, twelue externall and as many internall; ſo that the Intercoſtall, and *Intercartilaginei* are 68, which with the twelue before mentioned make the number of 80 Muſcles. Adde to theſe the Midriffe being without an aſſociate, and you ſhall have the number formerly mentioned, to wit, 81. But alſo if you will adde to theſe the Muſcles of the lower belly, I will not much gainſay it, becauſe by accident they helpe inſpiration and exſpiration.

The 8. muſcles of the lower belly.

Wherefore of the eight muſcles of the *Epigaſtrium*, there are foure Oblique, of which two are deſcendent and ſo many aſcendent; two right, to which you may adde the two Aſſiſting or Pyramidall muſcles which come from the ſhare-bone, if it pleaſe you to ſeparate them from the head of the right muſcles.

The 6. or 8. of the loines.

There are ſixe or eight Muſcles of the Loynes, of which two bend the loines which are the triangular; the two *Semiſpinati*; two *Sacri*; two are in the midſt of the backe, which for that cauſe we may call the *Rachitæ* or Chine-muſcles. Now, that hereafter we may ſeverally and diſtinctly ſet downe the muſcles of the extreme parts, will we come to the privities.

The two Cremaſters of the Teſticles.

Where for the uſe of the Teſticles there are two Muſcles called the *Cremaſteres*, or Hanging Muſcles. At the roote of the yard, or *Perinæum*, there are foure others, partly for the commodious paſſing of the urine and ſeed, and partly for erecting the yarde. The *Sphincter* Muſcle is ſeated at the Necke of the Bladder.

The three of the fundament.

At the end of the right Gut are three Muſcles, two *Levatores Ani*, or Lifters up of the fundament, and one *Sphincter* or ſhutting Muſcle. Now let us proſequute the Muſcles of the Extremities, or Limbs. But it will be ſufficient to mention onely the Muſcles of one ſide, becauſe ſeeing theſe parts of the body are double, thoſe things which are ſaid of the one may be applyed to the other.

The muſcles of the Arme in generall 32.

Wherefore the muſcles of the Arme, beginning with theſe of the ſhoulder-blade, at the leaſt, are 42. for there are 4 of the ſhoulder-blade: of the Arme properly or particularly ſo called, ſeven or eight; and there are three, foure, or five proper muſcles of the Cubite, that is, appointed for the performance of the motions thereof; in the inner part of the Cubite are ſeven, and as many in the outer; but thoſe of the hand are reckoned thirteene at the leaſt.

The fourth of the ſhoulder-blade are the *TrapeZius* reſembling a Monkes Cowle, which moves it upwards and downewards, and drawes it backwards; the ſecond is the *Levator*, or Liſter-up; the third the great *Rhomboides* lying under the *Trapezius*. The fourth, the leſſer ſaw muſcle which is inſerted into the *Coracoides*. The arme is moved forwards, backwards, upwards, downewards and circularly.

The Pectorall muſcle ariſing from the Clavicle, Breaſt-bone and neighbouring ribs, drawes it forwards; the *Humilis* or low-muſcle comming from the lower rib of the ſhoulder-blade drawes it backwards; the *Deltoides* upwards; and the *Latiſſimus* downewards, and ſomewhat backe-wards. But the three ſeated about the ſhoulder-blade move it about, or circularly.

The *Epomis* or *Scapularis* upwards; the *Superſcapularis*, which may ſeeme two, backwards and downewards; the *Subſcapularis* which is in the Cavitie of the ſhoulder blade, forewards, ſo that by a certaine viciſſitude and ſucceſſion of action they move it circularly. Two muſcles bend the Cubite, the one named *Biceps* or Two-headed, and the other *Brachiæus* or the Arme-muſcle; but one, two, or three muſcles extend it; for if you have reſpect to the originall, this muſcle hath two or three heads, but one onely inſertion.

In the inſide of the Cubite are ſeven muſcles, one *Palmaris*, two wreſt-benders; two *pronatores*, one ſquare, another in ſome ſort round; two finger-benders, and one *Abductor* or Drawer aſide. Theſe fourteene internall and externall muſcles of the Cubite, doe not indeed move the Cubite, but onely ſeated there move the wande and with it the hand. Theſe are the thirteene Muſcles of the hand; the *Thenar* which may not only be divided into two, but into ſixe, not only by the diverſe actions it performes, but alſo by the branches divided by a manifeſt ſpace betweene them; the ſecond is called the *Hypothenar*, which lyes under the litle finger, as the *Thenar* doth under the Thumbe; the third is the *Abductor of* the Thumbe; then follow the foure *Lumbrici* and ſixe *Interoſſes*, although eight may be obſerved.

The muſcles of the legge in generall 50.

The whole Legge hath at the leaſt 50. Muſcles, for wee reckon there are fourteene muſcles in the thigh; there are eleven made for the uſe of the Legge; there are nine ſeated in the Legge, three before and ſixe behinde which ſerve for the uſe of the foot and toes; in the foote are ſeated ſixteene. Therefore of the foureteene muſcles ſerving the thigh two bend it, one called the *Lumbaris*, the other ariſing from the cavity of the Hanch-bone; but the three which make the Buttocks and the *Triceps* or Three-headed muſcle, (which if you pleaſe, you may divide into three) extend it. Beſides theſe the 4. twin muſcles, and two *Obturators*, of which the one is internall, the other externall, turne the Thigh about. The Legge hath eleven, that is, the Long, the Membranous, the foure *Poſtici* or Hinde muſcles (three of which come from the Huckle-bone, but the other from the commiſſure of the Share-bone) the Right, the two Vaſte, the *Crureus* or Legge-muſcle, and the *Poplitæus*, or Ham-muſcle. Theſe ſeated in the leg for the uſe of the foote and toes are three fore and ſixe hinde muſcles: two of the fore bend the foote, one of which is called the *Tibiæus anticus*, the other *Peronæus*, which you may divide into two. The third the bender of the toes, although it alſo partly bend the foote, to which alſo the bender of the Thumbe may be revoked. One of the hinde is the Toe-bender, others extend the foote, and are in this order; Two twins, one *Plantaris*, one *Soleus*, one *Tibiæus poſticus* and the great bender of the Toes, to which may be revoked the bender of the Thumbe. Of the ſixteene ſeated in the foote, one is above, ſeated on the backe of the foote, which wee call the *Abductor* of the Toes; another in the ſole of the foote, to wit, the litle bender of the Toes, which goes to the ſecond joynte of the Toes alongſt the inſide of the foote; the other lends his helpe to the great Toe, which you may call the *Abductor* of the Thumbe; another is ſeated on the outſide for the uſe of the litle Toe. To theſe are added the foure *Lumbrici*, beſides the eight *Interoſſes*; or if you had rather, ten. And thus much may ſuffice for the enumeration of the muſcles.

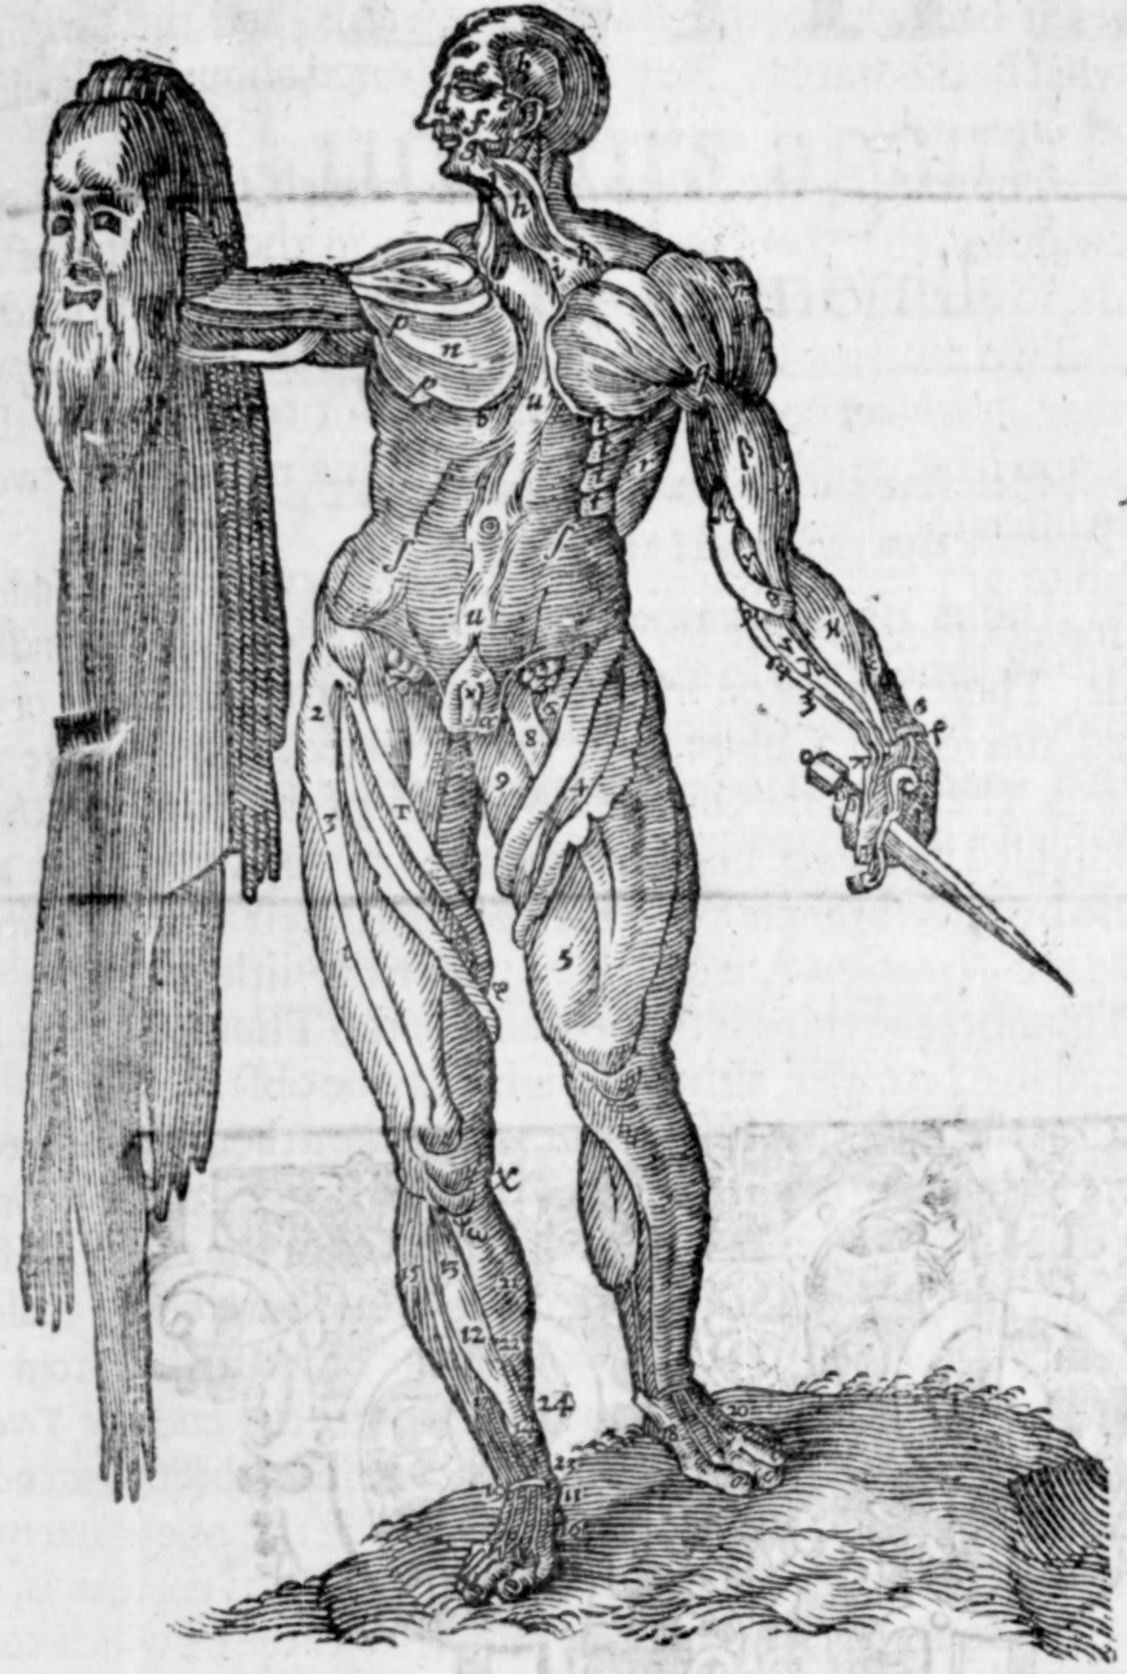
The Figure of the Muſcles when the skin with its veines, the fat, and all the fleſhy membrane are taken away, that part of the fleſhy membrane excepted, which takes upon it the nature of a muſcle, as being conjoyned with the muſcles.



a, the muſcle of the fore-head.
b, the temporall muſcle.
c, the muſcle ſhutting the eye-lid.
d, the muſcle opening the wings of the noſe.
e, the fore part of the yoake-bone.
f, the muſcle of the upper lip tending to the noſe.
g, the beginning of the maſſeter or grinding muſcle.
h, the broad muſcle conſiſting of a fleſhy membrane.
i, *k*, the beginning therof which riſes immediatly from the coller-bone & the top of the ſhoulder.
l, that part therof which bends forwards to *l*.
m, the muſcle which lifts up the arme.
n, the pectorall muſcle.
o, the membranous part of this muſcle which is joyned to the nervous part of the firſt muſcle of the *Abdomen* or belly. *q*, *q*, the fleſhy portion thereof, from the 6. and 7. ribs, and the inſertion thereof. *r* the muſcle drawing down the arme. *ſ*, the oblique deſcending muſcle of the lower belly. *t*, *t*, *t*, the inſertion of the greater ſaw muſcle. u u. the *linea alba* or white line, at which the two oblique deſcendent muſcles meet, covering the whole belly. *x*, the yard, the skinne being taken away. *y*, the veſſels of ſeed. α, the teſticles wrapped in the fleſhy membrane. β, the fore muſcle bending the cubite. γ, γ, the hinde muſcle bending the cubite. δ, the muſcle extending the cubite. ε, the two-headed muſcle extending the wreſt. ε, the muſcle producing the broad tendon on the backe of the hand. ζ, his tendon. η, the muſcle turning up the Wand. θ, the upper muſcle flatting the Wand. ι, the ſecond of the arme-benders, whoſe beginning is κ, and tendon λ. ο, a portion of the muſcle, whereof one part yeelds tendons to the wreſt, the other to the thumbe. π, the fleſhleſſe articulation of the thumbe. ρ, a muſcle inſerted into the wreſt, lying neere to the following muſcle. σ, a muſcle devided into two tendons, the one whereof is inſerted into the firſt joint of the thumbe, the other into the following. τ, the firſt muſcle of the thigh, whoſe head is at υ, and tendon at φ, and inſertion at χ. ψ, the end of the ſecond muſcle of the thigh. ω the end of the third muſcle of the thigh. 1, the ſixt muſcle of the legge; his beginning at 2. almoſt wholy membranous at 3. 4, the ninth muſcle of the legge. 5, the eight of the legge. 6, a portion of the ſixth and ſeventh of the thigh. 7, the Glandules of the groines. 8, the eight of the thigh.

9, the ſecond of the legge. 11, the innermoſt of the anckle. 12, the ſixth muſcle of the foote, his originall 13. end 14. 15, the ſeventh of the foote. 16, the tendon of the muſcle lifting up the great toe. 17, the muſcles extending the foure other toes. 18, the abductor of the great toe. 19, a tranſverſe ligament. 20, a tendon of the ninth muſcle of the foote. 21, the firſt muſcle. 22, the fourth muſcle of the foote. 23, the tendon of the third muſcle. 24. a muſcle bending the third bone of the foure leſſer toes.

THE SEVENTH BOOK Of Tumours againſt Nature in Generall.

Chap. I.

What a Tumour againſt Nature, vulgarly called an Impoſtume, is, and what be the differences thereof.

AN Impoſtume, commonly ſo called, is an affect againſt nature, compoſed and made of three kinds of diſeaſes, Diſtemperature, ill Conformation, and Solution of Continuitie, concurring to the hindering or hurting of the Action. An humor, or any other matter, anſwering in proportion to a humor, aboliſhing, weakening, or depraving of the office or function of that part or body in which it reſides, cauſeth it.

What an Impoſtume vulgarly ſo called is.

The materiall cauſes of Impoſtumes, or unnaturall tumors.

The differences of Impoſtumes are commonly drawne from five things; quantitie, matter, accidents, the nature of the part, which they affect or poſſeſſe; and laſtly, their efficient cauſes. I have thought good for the better underſtanding of them, to deſcribe them in this following Scheme.

A Table of the differences of Tumors.

The differences of *Impoſtumes* are drawne principally from five things, that is,	from their quantity, by reaſon whereof *Impoſtumos* are called --	Great, which are comprehended under the generall name of Phlegmons, which happen in the fleſhy parts, by *Galen, Lib de tumor. contra naauram, & lib. 2, ad Glauconem.*		
		Indifferent, or of the middle ſort, as Fellons.		
		Small, as thoſe which *Avicen* calls *Bothores*, i. Puſhes and Puſtules, all kinde of Scabs and Leproſies, and laſtly, all ſmall breakings out.		
	from their accidents, as	Colour, from whence Impoſtumes are named white, red, pale, yellow, blew, or blacke, and ſo of any other colour.		
		Paine, hardneſſe, ſoftneſſe, and ſuch like, from whence they are ſaid to be painefull, not painefull, hard, ſoft, and ſo of the reſt.		
	from the matter, of which they are cauſed and made, which is either	Naturall or	Hot, and that either,	Sanguine, from whence a true *Phlegmon*.
				Cholerick, from whence a true *Eryſipelas*.
			Cold & that either	Phlegmatiek, frō whence a true *Oëdema*.
				Melācolick frō whēce a perfect *Scyrrhus*.
		Not naturall, which hath, exceeded the limits of its naturall goodneſſe, from whence illegitimate tumors, therefore	of a ſanguine humor,	Carbunckles, Gangrenes, eating ulcers, Sphaceles are cauſed.
			of a cholerick humor,	Of the groſſer, the eating *Herpes*, of the ſubtiler the *Herpes miliaris* is made.
			of a phlegmatick humor,	Watery and flatulent Impoſtumes, the Kings-evill, knots & all phlegmatick ſwellings, & excreſcenſes.
			of a melācholick humor,	The exquiſite or perfect *Scyrrhus*, hardneſſes and all ſorts of cancerous Tumors.
	From the condition and nature of the parts which they poſſeſſe, from whence the *Ophthalmia*, is a Phlegmon of the eyes. *Parotis* a tumor neere the eares. *Paronychia* or a whitlow at the roots of the nailes; and ſo of the reſt.			
	From the efficient cauſes, or rather the manner of doing. For ſome impoſtumes are ſaid to be made by defluxions, others by congeſtion, thoſe are commonly hot, & the other cōmonly cold, as it ſhal more manifeſtly appeare by the following chapter.			

Chap.

CHAP. II.

Of the generall cauſes of Tumors.

After what manner tumours againſt nature are chiefely made.

THere are two generall cauſes of Impoſtumes, Fluxion, and Congeſtion. Defluxions are occaſioned, either by the part ſending, or receiving; the part ſending diſcharges it ſelfe of the humors, becauſe the expulſive facultie reſident in that part is provoked to expell them, moved thereto, either by the troubleſomeneſſe of their quantity or quality. The part receiving drawes, and receives occaſion of heat, paine, weakeneſſe (whether naturall, or accidentall) openneſſe of the paſſages, and lower ſituation.

Three cauſes of heat.

The cauſes of heat, in what part ſoever it be, are commonly three, as all immoderate motion (under which frictions are alſo contained,) externall heat, either from fire, or ſun, and the uſe of acride meates and medicines.

Foure cauſes of paine.

The cauſes of paine are foure, the firſt, is a ſodaine and violent invaſion of ſome untemperate thing, by meanes of the foure firſt qualities; the ſecond is ſolution of continuitie, by a wound, luxation, fracture, contuſion or diſtention; the third, is the exquiſit ſenſe of the part, for you feele no paine in cutting a bone, or expoſing it to cold or heate; the fourth is, the attention, as it were of the animall faculty, for the minde diverted from the actuall cauſe of paine, is leſſe troubled, or ſenſible of it.

Two cauſes of weakneſſe.

A part is weake, either by its nature, or by ſome accident; by its nature as the Glandules and the Emunctories of the principall parts; by accident, as if ſome diſtemper, bitter paine, or great defluxion have ſeazed upon it, and wearied it, for ſo the ſtrength is weakened, and the paſſages dilated. And the lowneſſe of ſite yeelds opportunity for the falling downe of humors.

Two cauſes of congeſtion.

The cauſes of congeſtion are two principally, as the weakeneſſe of the concoctive facultie, which reſides in the part, (by which the aſſimulation into the ſubſtance of the part of the nouriſhment flowing to it is fruſtrated) and the weakeneſſe of the expulſive faculty; for whileſt the part cannot expell ſuperfluities, their quantity continually encreaſes.

And thus oftentimes cold impoſtumes have their originall from a groſſe and tough humor, and ſo are more difficult to cure.

Laſtly, all the cauſes of Impoſtumes may be reduced to three, that is, the primitive, or externall; the antecedent, or internall; and the conjuncte, or containing, as we will hereafter treat more at large.

CHAP. III.

The ſignes of Impoſtumes or Tumors in generall.

The principall ſignes of tumors are drawne from the eſſence of the part.

BEfore wee undertake the cure of Tumors, it is expedient to know their kindes and differences, which knowledge muſt be drawne from their proper ſignes, the ſame way, as in other diſeaſes. But becauſe the proper and principall ſignes of tumors are drawne from the eſſence of the part they poſſeſſe, we muſt firſt know the parts, and then conſider what their eſſence and compoſition are.

We are taught both, by skill in Anatomy, and the obſervation of the deprived function, eſpecially when the affected part is one of thoſe which lie hid in the body; for we know whether or no, the externall parts are affected with a tumor againſt nature, by comparing that with his naturall which is contrary. For comparing the ſound part with the diſeaſed, wee ſhall eaſily judge whether it be ſwollen, or no.

But becauſe it is not ſufficient for a Chirurgion onely to know theſe generall ſignes (which are knowne even to the vulgar) he muſt attentively obſerve ſuch as are more proper and nere. And theſe are drawne from the difference of the matter and humors of which the tumors conſiſt.

Lib. 2. ad Glauc. & 13. method.

For this *Galen* teaches, that all differences of tumors ariſe from the nature and condition of the matter which flowes downe and generates the tumor; alſo they are knowne by ſuch accidents as happen to them, as colour, heat, hardneſſe, ſoftneſſe, paine, tenſion, reſiſtance.

The proper ſignes of a ſanguine tumor, of a plegmaticke, of a melancholick, of a cholerick.

Wherefore paine, heate, redneſſe, and tenſion indicate a ſanguine humor; coldneſſe, ſoftneſſe, and no great paine, phlegme; tenſion, hardneſſe, the livide colour of the part, and a pricking paine by fits, melancholy; and yellowiſh and pale colour, biting paine without hardneſſe of the part, choler.

The knowledge of tumors by their motion and exacerbation.

And beſides, Impoſtumes have their periods and exacerbations following the nature and motion of the humors of which they are generated. Wherefore by the motion and fits it will be no difficult matter to know the kinde of the humor; for as in the Spring, ſo in the morning the bloud is in motion; as in the Summer, ſo in the middeſt of the day, choler; as in Autumne, ſo in the evening, melancholy; as in Winter, ſo on the night the exacerbations of phlegme are moſt predominante. For *Hippocrates* and *Galen* teach, that the yeare hath circuits of diſeaſes, ſo that the ſame proportion of the exceſſe and motion of humors which is in the foure ſeaſons of the yeare, is alſo in the foure quarters of each day.

Lib. 2. Epidem.

Impoſtumes which are curable have foure times, their beginning, increaſe, ſtate, and declination, and we muſt alter our medicines, according to the varietie of theſe times. We know the beginning by the firſt ſwelling, of the part; The increaſe when the ſwelling, paine, and other accidents do manifeſtly encreaſe, and enlarge themſelves; the ſtate, when the foreſaid ſymptoms increaſe no more, but each of them, becauſe at their height, remaine in their ſtate immoveable, unleſſe the very matter of the tumor degenerate, and change it ſelfe into another kinde of humor; The declination, when the ſwelling, paine, feaver, reſtleſneſſe are leſſened. And from hence the Chirurgion may preſage what the end of the tumor may be; for tumors are commonly terminated foure manner of wayes, if ſo be that the motion of the humors cauſing them be not intercepted, or they without ſome manifeſt cauſe, doe flow backe into the body.

The beginning of an impoſtume. The encreaſe. The State.

Therefore firſt they are terminated by inſenſible tranſpiration, or reſolution; ſecondly, by ſuppuration when the matter is digeſted and ripened; thirdly, by induration when it degenerates into a Scyrrhus, the thinner part of the humor being diſſolved; the fourth, which is the worſt of all, by a corruption and Gangrene of the part, which is, when overcome with the violence, or the abundance or quality of the humor, or both, it comes to that diſtemper, that it looſes its proper action.

It is beſt to terminate a tumor by reſolution; and the worſt by corruption; ſuppuration and induration are betweene both, although that is far better than this. The ſignes by which the Chirurgions may preſage that an Impoſtume may be terminated by reſolving, are the remiſſion, or ſlacking of the ſwelling, paine, pulſation, tenſion, heat, and all other accidents, and the unaccuſtomed livelineſſe and itching of the part; and hot Impoſtumes are commonly thus terminated, becauſe the hot humor is eaſily reſolved, by reaſon of its ſubtilty.

The ſignes of a tumor to be terminated by reſolution.

Signes of ſuppuration are the intenſion or encreaſe of paine, heat, ſwelling, pulſation, and the feaver; for according to *Hippocrates*, paine and the feaver are greater when the matter is ſuppurating, then whan it is ſuppurated.

The ſignes of ſuppuration.

The Chirurgion muſt be very attentive to know and obſerve when ſuppuration is made; for the purulent matter oft times lies hid (as *Hippocrates* ſaith) by reaſon of the thickneſſe of the part lying above, or over it.

The ſignes and cauſes of a tumor terminated in a *Scyrrhus*.

The ſignes of an Impoſtume degenerating into a Scyrrhus hardneſſe, are the diminution of the tumor, and hardneſſe remaining in the part. The cauſes of the hardneſſe not going away with the ſwelling, are the weakeneſſe of nature, the groſneſſe and toughneſſe of the humor, and unskilfulneſſe of the Chirurgion, who by too long uſing reſolving things hath occaſioned, that the more ſubtile part of the humor being diſſolved, the reſt of the groſſer nature like earthy dreggs remaines concrete in the part. For ſo potters veſſels dried in the Sunne grow hard. But the unskilfull Chirurgion may occaſion a Scyrrhous hardneſſe by another meanes, as by condenſating the skinne, and incraſſating the humors by too much uſe of repercuſſives. But you may perceive an Impoſtume to degenerate into a Gangrene thus, if the accidents of heat, redneſſe, pulſation and tenſion ſhall be more intenſe, than they are wont to be in ſuppuration; if the paine preſently ceaſe without any manifeſt cauſe, if the part waxe livide or blacke; and laſtly, if it ſtinke.

The ſignes of a Gangrene at hand.

But we ſhall treate of this more at large when we come to treate of the Gangrene and *Sphacelus*. A ſodaine diminution of the tumor, and that without manifeſt cauſe, is a ſigne of the matter fallen backe, and turned into the body againe, which may be occaſioned by the immoderate uſe of refrigerating thinge. And ſometimes much flatulencie mixed with the matter, although there be no fault in thoſe things which were applied.

Of diſappearance of a tumor, and the ſignes thereof.

Feavers and many other maligne Symptomes, as ſwoundings and convulſion, by tranſlation of the matter to the noble parts, follow this flowing backe of the humor into the body.

Chap. IIII.

Of the Prognoſticks in Impoſtumes.

TVmors ariſing from a melancholy, phlegmaticke, groſſe, tough, or viſcous humor, aske a longer time for their cure, than thoſe which are of bloud or choler. And they are more difficultly cured which are of humors not naturall, than thoſe which are of humors yet contained in the bounds of nature.

Cold tumors require a longer cure.

For thoſe humors which are rebellious, offend rather in qualitie, than in quantitie, and undergoe the divers formes of things diſſenting from nature, which are joyned by no ſimilitude or affinitie with things naturall, as ſuet, poultis, hony, the dregs of oile, and wine; yea, and of ſolid bodies, as ſtone, ſand, coale, ſtrawes, and ſometimes of living things, as Wormes, Serpents, and the like monſters.

Tumors made of matter not naturall, are more difficultly cured.

The tumors which poſſeſſe the inner parts, and noble entrailes, are more dangerous and deadly, as alſo thoſe which are in the joints, or neere to them. And theſe tumors which ſeaze upon great veſſels, as veines, arteries, and nerves, for feare of great effuſion of bloud, waſting of the ſpirits and convulſion. So impoſtumes of a monſtrous bigneſſe are often deadly, by reaſon of the great reſolution of the ſpirits cauſed by their opening. Thoſe which degenerate into a *Scyrrhus* are of long continuance and hard to cure, as alſo thoſe which are in hydropicke, leprous, ſcabby and corrupt bodies, for they often turne into maligne and ill conditioned vulcers.

Hippo. Aph. 8. ſect. 6.

Chap. V.

Of the generall cure of Tumors againſt Nature.

THere be three things to be obſerved in cure of impoſtumes. The firſt is the eſſence thereof; the ſecond the quality of the humor cauſing the impoſtume; the third the temper of the part affected. The firſt indication drawne from the eſſence, that is, from the greatneſſe, or ſmallneſſe of the tumor, varies the manner of curing, for the medicines muſt be increaſed or diminiſhed according to the greatneſſe of the tumor. The ſecond, taken from the nature of the humor alſo changes our counſell, for a *Phlegmon* muſt be otherwiſe cured than an *Eryſypelas* and an *Oedema* than a *Scyrrhus*, and a ſimple tumor, otherwiſe than a compound. And alſo you muſt cure after another manner a tumor comming of an humor not naturall, than that which is of a naturall humor, and otherwiſe that which is made by congeſtion,

What muſt be conſidered in undertaking the cure of tumors.

geſtion, than that which is made by defluxion. The third Indication is taken from the part in which the tumor reſides; by the nature of the part wee underſtand its temperature, conformation, ſite, faculty, and function.

What we muſt underſtand by the nature of the part.

The temperature indicates that ſome medicines are convenient for the fleſhy parts, as thoſe which are more moiſt; others for the nervous, as more drie; for you muſt apply ſome things to the eye, and others to the throate; one ſort of things to theſe parts which by reaſon of their raritie are eaſily ſubject to defluxion, another to thoſe parts which by their denſity are not obnoxious to it.

But we muſt have good regard to the ſite of the part, as if it have any connexion with the great veſſels, and if it be fit to powre forth the matter and humor when it is ſuppurated.

Galen by the name of faculty underſtands the uſe and ſenſe of the part. This hath a manifold indication in curing, for ſome parts are principall, as the Braine, Heart, and Liuer; for their vertue is communicated to the whole body, by the nerves, arteries, and veines.

What we muſt underſtand by the faculty of the part.

Others truly are not principall, but yet ſo neceſſary that none can live without them, as the Stomacke. Some are endued with a moſt quicke ſence, as the eye, the membranes, nerves, and tendons; wherefore they cannot endure acrid and biting medicines. Having called to minde theſe indications, the indication will be perfected by theſe three following intentions, as if we conſider the humor flowing downe, or which is ready to flow; the conjunct matter, that is, the humor impact in the part; the correction of accidents; yet ſo that we alwayes have care of that which is moſt urgent and of the cauſe. Therefore firſt repercuſſives muſt be applied for the antecedent matter, ſtrong or weake, having regard to the tumor as it is then, onely excepting ſixe conditions of Tumors; the firſt is, if the matter of the Tumor be venenate: the ſecond, if it be a criticall abſceſſe: the third, if the defluxion be neare the noble parts: the fourth, if the matter be groſſe, tough, and viſcide: the fifth, when the matter lies farre in, that is, flowes by the veines which lies more deepe: the ſixth, when it lies in the Gandules. But if the whole body be plethoricke, a convenient diet, purging, and Phlebotomie muſt be appointed, frictions and bathes muſt be uſed. Ill humors are amended by diet and purging. If the weakeneſſe of the part receiving draw on a defluxion, it muſt be ſtrengthened.

What we muſt conſider in performing the cure.

What things diſſwade us from uſing repercuſſives.

If the part be inferiour in its ſite, let the patient be ſo ſeated, or layed, that the part receiving, as much as may be, may be the higher. If paine be the cauſe of defluxion, we muſt aſſwage it by things mitigating it. If the thinneſſe, or lightneſſe of the humor cauſe defluxion, it muſt be inſpiſſate by meats and medicines. But for the matter conteined in the part, becauſe it is againſt nature, it requires to be evacuate by reſolving things, as Cataplaſmes, ointments, fomentations, cupping glaſſes; or by evacuation, as by ſcarifying, or by ſuppurating things, as by ripening and opening the Impoſtume. Laſty, for the conjunct accidents, as the Feaver, paine and ſuch like, they muſt be mitigated by aſſwaging, mollifying and malaxing medicines, as I ſhall ſhew more at large hereafter.

CHAP. VI.

Of the foure principall and generall Tumors, and of other Impoſtumes which may be reduced to them.

THe principall and cheife Tumors which the abundance of humors generate are foure, A *Phlegmon*, *Eryſipelas*, *Oedema* and *Scyrrhus*: innumerable others may be reduced to theſe, diſtinguiſhed by divers names according to the various condition of the efficient cauſe and parts receiving. Wherfore a *Phygethlum*, *Phyma*, Fellon, Carbuncle, inflammation of the eyes, Squincy, *Bubo*, & laſtly all ſorts of hot and moiſt tumors may be reduced to a Phlegmon. *The Herpes miliaris*, the eating *Herpes*, Ringwormes and Tetters and all impoſtumes brought

What tumors may be reduced to a Phlegmon.

Which to an *Eryſipelas*.

Which to an Oëdema.

forth by choler, are contained under an *Eryſipelas*. *Atheromata*, *Steatomata*, *Melicerides*, the *Teſtudo*, or *Talpa*, *Ganglion*, Knots, Kings-evill, Wens, watery Ruptures, the *Aſcites* and *Leucophlegmatia* may be reduced to an *Oëdema*, as alſo all flatulent tumors, which the abundance of corrupt Phlegme produces.

Which to a *Scyrhus.*

In the kindred of the *Scyrrhus* are reckoned a Cancer, Leproſie, Warts, Corns, a *Thymus*, a *Varix*, *Morphew*, black and white, and other Impoſtumes ariſing from a melancholy humor.

Now wee will treate of theſe Tumors in particular beginning with a Phlegmon.

Chap. VII.

Of a Phlegmon.

What a true Phlegmon is.

A Phlegmon is a generall name for all Impoſtumes, which the abundance of inflamed bloud produces. That is called a true Phlegmon, which is made of laudable bloud, offending onely in quantity. But a baſtard Phlegmon, or a Phlegmonous Impoſtume hath ſome other, and proper name; as a Carbuncle, Fellon, Gangrene, Sphacel, and the like maligne Puſtules. So when there is a confluxe of diverſe humors into one tumor, divers kinds of phlegmonous Impoſtumes called by diverſe names, according to the more abundant humor, ariſe; as if a ſmall portion of phlegme ſhall be mixed with a greater quantity of bloud, it ſhall be called an *Oëdematous Phlegmon*; but if on the contrary, the quantity of phlegme be the greater, it ſhall be named a phlegmonous *Oëdema*, and ſo of the reſt; alwayes naming the tumor, from that which is moſt predominant in it.

A Phlegmon one thing, and a Phlegmonous tumor another.

Therefore we muſt obſerve that all differences of ſuch tumors ariſe from that, either becauſe the bloud cauſing it offends onely in quantity; which if it doe, it cauſes that tumor which is properly called a Phlegmon; if in quality, it makes a phlegmonous tumor, becauſe the matter thereof is much departed from the goodneſſe of bloud.

But bloud is ſaid to offend in quantity, either by admixture of ſome other matter, as Phlegme, Choler, or melancholy, from whence proceedes *Oëdematous*, *Eryſipelous* and *Scyrrhous* Phlegmons; or by corruption of its proper ſubſtance from whence Carbuncles, and all kindes of Gangrens; or by concretion, and when nature is diſappointed of its attempted and hoped for ſuppuration, either by default of the aire, or patient, or by the error of the phyſition; and hence oft times happen *Atheroma's*, *Steatoma's*, and *Melicerides*. Although theſe things be ſet downe by the ancients, of the ſimple and ſimular matter of the true Phlegmon; yet you muſt know, that in truth there is no impoſtume, whoſe matter exquiſitely ſhewes the nature of one, and that ſimple humor without all admixture of any other matter; for all humors are mixed together with the bloud, yet from the plenty of bloud prodominating, they are called Sanguine, as if they were of bloud alone.

Wherefore if any Tumors reſemble the nature of one ſimple humor, truely they are not of any naturall humor, but from ſome humor which is corrupt, vitiated and offending in quality; for ſo bloud by aduſtion degenerates into choler and melancholy.

Gal. lib. de tumoribus, & 2. ad Glauc.

Therefore a true Phlegmon is defined by *Galen*; A tumor againſt nature, of laudable bloud flowing into any part in too great a quantity.

Hippoc. lib. de vuln: cap. Gal. lib. de tumor. præter naturam.

This tumor though moſt commonly it be in the fleſh, yet ſometimes it happens in the bones, as *Hippocrates* and *Galen* witneſſe.

A Phlegmon is made and generated thus, when bloud flowes into any part, in too great a quantity; firſt the greater veines and arteries of the affected part are filled, then the middle, & laſtly, the ſmalleſt and capillary; ſo from thoſe thus diſtended, the bloud ſweats out of the pores and ſmal paſſages like dew; and with this the void ſpaces which are between the ſimular parts are firſt filled, & then with the ſame bloud all the adjacent parts are filled, but eſpecially the fleſh, as that which is moſt fit to receive defluxions, by reaſon of the ſpongious rarity of its ſubſtance; but then the nerves, tendons, membranes, and ligaments, are likewiſe ſtuffed full; whereupon a Tumor muſt neceſſarily follow, by reaſon of the repletion which exceeds the bounds of nature; and from hence alſo are tenſion and reſiſtance; and paine alſo happens at the ſame time, both by reaſon of the tenſion and preternaturall heate.

The cauſe of a beating paine in a Phlegmon

And there is a manifeſt pulſation in the part, ſpecially whileſt it ſuppurates, becauſe the veines, arteries, and nerves, are much pained, being they are not onely heated within by the influxe of the fervide humor, but preſſed without by the adjacent parts. Therefore ſeeing the paine comes to all the foreſaid parts becauſe they are too immoderately heated and preſſed, the arteries which are in the perpetuall motion of their *Syſtole & diaſtole*, whileſt they are dilated, ſtrike upon the other inflamed parts, whereupon proceeds that beating paine.

Hereunto adde, the Arteries then filled with more copious and hot bloud, have greater neede to ſeeke refrigeration by drawing in the encompaſſing Aire; wherefore they muſt, as of neceſſitie, have a conflict with the neighbouring parts which are ſwollen and pained. Therefore from hence is that pulſation in a Phlegmon which is defined by *Galen*, an agitation of the arteries, painefull, and ſenſible to the Patient himſelfe; for otherwiſe as long as we are in health, we doe not perceive the pulſation of the arteries.

Comm. ad Aph. 21. ſect. 7.

Wherefore theſe two cauſes of pulſation, or a pulſificke paine in a phlegmon are worthy to be obſerved, that is, the heate and aboundance of bloud, contained in the veſſels and arteries (which more frequently than their wont incite the arteries to motion, that is, to their *Syſtole* and *Diaſtole*) and the compreſſion and ſtreightning of the ſaid arteries, by reaſon of the repletion and diſtention of the adjacent parts, by whoſe occaſion the parts afflicted and beaten by the trembling and frequent pulſation of arteries are in paine.

Another kinde of Pulſation in a phlegmon.

Hence they commonly ſay, that in the part affected with a Phlegmon, they feele as it were the ſenſe or ſtroke of a Mallet or Hammer ſmiting upon it. But alſo beſides this pulſation of the arteries, there is, as it were another pulſation with itching from the humors whilſt they putrefie and ſuppurate, by the permixtion, motion, and agitation of vapours thereupon ariſing.

The cauſe of heate in a Phlegmon is bloud, which whileſt it flowes more plentifully into the part, is as it were troden or thruſt downe, and cauſes obſtruction, from whence neceſſarily followes a prohibition of tranſpiration, and a putrifaction of the bloud, by reaſon of the preternaturall heate. But the Phlegmon lookes red by reaſon of the bloud contained in it, becauſe the humor predominant in the part ſhines through the skinne.

CHAP. VIII.

Of the cauſes and ſignes of a Phlegmon.

The primitive cauſes of a Plegmon.

THe cauſes of a Plegmon are of three kindes; for ſome are primitive, ſome antecedent, and ſome conjunct. Primitive are falls, contuſions, ſtraines, immoderate labour, frictions, application of acrid ointments, burnings, long ſtaying or labouring in the hot Sun, a diet unconſiderate, and which breeds much bloud. The antecedent cauſes are, the great abundance of bloud, too plentifully flowing in the veines. The conjunct, the collection or gathering together of bloud impact in any part.

The Antecedent and conjunct.

The ſignes of a Phlegmon.

The ſignes of a Plegmon are ſwelling, tenſion, reſiſtance, feaveriſh heate, paine, pulſation, (eſpecially while it ſuppurates) redneſſe, and others, by which the abundance of bloud is ſignified.

And a little Phlegmon is often terminated by reſolution; but a great one by ſuppuration; and ſometimes it ends in a Scyrrhus, or a Tumor like a Scyrrhus; but otherwhile otherwhiles in a Gangren, that is, when the facultie, and native ſtrength of the part affected, is overwhelmed by the greatneſſe of the deſlxion, as it is reported by Galen. The Chirurgion ought to conſider all theſe things, that he may apply and vary ſuch medicines as are convenient for the nature of the Patient, and for the time and condition of the part affected.

Gal. l. de Tum.

CHAP. IX.

Of the cure of a true Phlegmon.

What kinde of diet muſt be preſcribed in a Plegmon.

THe Chirurgion in the cure of a true Phlegmon muſt propoſe to himſelfe foure intentions. The firſt of Diet; This, becauſe the Plegmon is a hot affect and cauſes a feaver, muſt be ordained of refrigerative and humecting things, with the convenient uſe of the ſixe things not naturall, that is, aire, meat, and drinke, motion and reſt, ſleepe and waking, repletion, and inanition; and laſtly, the paſſions of the minde. Therefore let him make choiſe of that aire which is pure and cleere, not too moiſt, for feare of defluxion, but ſomewhat coole; let him command meates which are moderately coole and moiſt, ſhunning ſuch as generate bloud too plentifully; ſuch will be brothes not to fat, ſeaſoned with a little Borage, Lettuce, Sorrell, and Succory, let him be forbidden the uſe of all ſpices, and alſo of Garlicke, and Onions, and all things which heate the bloud, as are all fatty and ſweet things, as thoſe which eaſily take fire. Let the Patient drinke ſmall wine, and much alaied with water: or if the feaver be vehement, the water of the decoction of Licoris, Barly, and ſweet almonds, or water and ſugar; alwayes having regard to the ſtrength, age, and cuſtome of the Patient.

For if he be of that age, or have ſo led his life, that he cannot want the uſe of wine, let him uſe it, but altogether moderately. Reſt muſt be commanded; for all bodies waxe hot by motion, but let him chiefely have a care that hee doe not exerciſe the part poſſeſſed by the plegmon for feare of a new defluxion. Let his ſleepe be moderate, neither, if he have a full body, let him ſleepe by day, ſpecially preſently after meate. Let him have his belly ſoluble, if not by nature, then by art, as by the frequent uſe of gliſters and ſuppoſitories. Let him avoid all vehement perturbations of minde, as hate, anger, brawling; let him wholly abſtaine from venery.

How to divert the defluxion of humors.

This manner of diet thus preſcribed, wee muſt come to the ſecond ſcope, that is, the diverſion of the defluxion, which is performed by taking away its cauſe, that is, the fulneſſe and illneſſe of the humors. Both which we may amend by purging and bloud-letting, if the ſtrength and age of the patient permit.

The paine muſt be aſſwaged.

But if the part receiving be weake, it muſt be ſtrengthened with thoſe things which by their aſtriction amend the openneſſe of the paſſages, the violence of the humor being drawne away by cupping glaſſes, frictions, ligatures. But if paine trouble the part, which is often the occaſion of defluxion, it muſt be mitigated by medicines aſſwaging paine.

When we muſt uſe repercuſſives.

The third ſcope is to overcome the conjunct cauſe. That we may attaine to this, we muſt enter into the conſideration of the tumor, according to its times, that is, the beginning, encreaſe, ſtate, and declination. For from hence the indications of variety of medicines muſt be drawne. For in the beginning we uſe repercuſſives to drive away the matter of the Phlegmon flowing downe, as the white of an Egge, Oxicrate, the juices or waters of Houſeleeke, Plantaine, Roſes; Cataplaſmes of Henbane, Pomgranate, Pills, Balauſties, Bole armenicke, *Terra ſigillata*, oile of Roſes, Quinces, Mirtilles, Poppies.

Of theſe ſimples, variety of compound medicines ariſes. This may be the forme of a Cataplaſme. ℞, *far. hordei* ℥ij. *ſucci ſempervivi, plantag. an.* ℥iij. *pul. malicorij, balauſtiorum & roſar. an.* ʒij *ol. mirtill. & roſar. an.* ℥j, *fiat Cataplaſma.* Another, ℞, *Plantag. ſolani, hyoſcyam. an. m.* ij. *cauda equin. tapſi barb. cintinodiæ an. m.* j. *coquantur perfecte in oxicrato, piſtentur, trajiciantur, addendo pulveris mirtill. nuc. cupreſſi. & roſ. rub. an.* ʒiij. *farin. fab.* ℥ij, *olei roſar. & cydon. an.* ℥ß:

mixe them and make a cataplaſma to the forme of a liquid pultis. And you may uſe this liniment, by dipping linnen clothes in it, and applying to the part; ℞, *ol. nymph. & roſar. an.* ℥iij, *aq. roſ. ſolani & plantag. an.* ℥ij, *aceti* ℥iij, *albumin. ovor um n.* iij, *fiat linimentum.* Alſo *ung. roſatum & ung. Album, camphor. Raſis* are good to apply to it, as in like manner, *Emp. Diacalcitheos* diſſolved in vinegar, and oile of Roſes, and alſo *Populeon* may be uſed. In the increaſe you muſt have care of the humor flowing downe, and of that which already impacted in the part, did formerly fall down. Therefore repercuſſives muſt be tempered & mixed with diſcuſſing medicines, but ſo that they may carry the chiefe ſway, as ℞, *fol. malvæ, abſinth. plantag. an. m.* iij, *coquantur in oxicrato, contundantur, trajectis* adde *farinæ fabarum & hordei an.* ℥j, *pul. roſar. rub. & Abſinth. an.* ʒi, *ol. roſar. & chamæm. an.* ℥j, *fiat cataplaſma od formam pultis ſatis liquidæ.* Another. ℞, *farinæ hord.* ℥iij. *farinæ ſem. lini & fænugræci, an.* ℥j. *coquantur in aqua communi, addendo ſub finem pul. mirtillorum, roſarum & chamameli an.* ℥ß, *axungiæ anſeris & olei roſarum an.* ℥j, *miſce, fiat cataplaſma.*

What locall medicines we muſt uſe in the encreaſe.

What in the ſtate,

But in the ſtate the repercuſſives, & diſcuſſives ought to be alike with ſome anodine, or mitigating medicines, if it be painefull, as ℞, *rad. Altheæ* ℥iiij, *malvæ, parietar. an. m.* ij, *coquantur ſub cineribus, addendo farin. fabarum & lentium an* ℥ij, *pulveris chamæm. & metiloti an.* ℥ß. *olei chamæm. & roſar. an.* ℥j. *axungiæ gal.* ℥ij. *fiat cataplaſma.* Another ℞, *micæ panis triticei aqua calida macerati* ℔ß, *pulveris roſar. rub. & abſinth. ana.* ℥vj. *olei aneth. & mellis com. an.* ℥ij. *miſce omnia ſimul & fiat cataplaſma ad formam pultis ſatis liquidæ*; which is of chiefe uſe when there is paine.

What in the declinations

But when the violence of paine and other ſymptomes are aſſwaged, it is likely that the plegmon is come to determination. Wherefore then we muſt uſe more powerfull and ſtrong diſcuſſives, and onely then beginning with the more gentle, leſt the ſubtiler part of the humor being diſſolved, the groſſer, remaining in the part, ſhould grow hard, as ℞, *mal. biſmal. an. m.* iij. *coquantur addendo farinæ hordei* ℥ij, *mellis com.* ℥j, *ol. chamæ. & melilot. an.* ℥ß, *fiat cataplaſma,* Or ℞, *radicum Brion. & Cucumer. agreſt. an.* ℥ij, *florum chamæm. & meliot. ana. m.* iij. *coquantur in hydromelite addendo farinæ, ſem. lini & fænugræc. an.* ℥ij. *ol. aneth. axungiæ Anſer. & anat. an.* ℥j. *fiat Cataplaſma.* And this plaiſter following may here finde place.

℞, *Diachyl. mag.* ℥ij, *Empl. de melilot.* ʒj, *olei aneth. & chamæmel. an.* ℥ß: diſſolve them all together and make a medicine for your uſe. Or ℞, *Empl. de mucag. & oxycro: an.* ℥ij. *Empl. Diachyl. Ireat.* ℥j. *olei liliorum & chamæmel. quantum ſatis eſt,* and make thereof a ſoft emplaiſter.

The correction of the accidents,

The fourth ſcope of curing a Phlegmon conſiſts in correction of the accidents which accompany it; of which paine is the principall.

Wherefore the Chirurgion muſt be diligent to aſſwage it, for beſides, that it weakens the ſtrength, and debilitates and depraves the function, it alſo cauſes defluxions by drawing the bloud and ſpirits to the part affected.

The diſcommodities of paine. Medicines aſwaging paine.

According to the varietie of paine there muſt be variety of medicines, as ℞, *micæ panis albi in lacte tepido macerati* ℔ß, *vitell. ovorum* iij. *ol. roſar.* ℥ij, *croci* ℈ß, *fiat cataplaſma.* Or ℞, *florum chamæm. & melil. an. p.* iij. *farinæ ſem. lini. & fenugræc. an.* ℥j. *fiat cataplaſma pultis, ſatis liquidæ.* Or ℞, *mucagin. rad. althea & fænugraci an.* ℥iij, *ol. roſar. & aneth. an.* ℥j. *farin. ſem. lini. quantum ſatis, ut inde formetur cataplaſma ſatis molle.*

Narcoticke medicines.

But if the paine remaine, and yeeld not to theſe remedies, we muſt flie to ſtronger, making uſe of narcoticks, or ſtupifactives, but with care leſt we benum, or dead the part; as ℞, *fol. hyoſcyani & papauer. ſub. cineribus coctorum an.* ℥iij, *adipis ſuillæ, & ol. roſ. an.* ℥j, *croci.* ℈ij, *fiat cataplaſma*: or, ℞, *fol. cicutæ & ſolani furioſi. an.* ℥iiij, *coquantur ſub cineribus, piſtentur, & traijciantur addendo unguent. popul. & ol. roſar. an* ℥j, *farin. fænugræc. quantum ſatis erit, ut inde formetur cataplaſma ad formam pultis liquidæ.*

CHAP. X.

The cure of an ulcerated Phlegmon.

The ſignes of a Phlegmon turning to an Abſceſſe.

BVt it often happens, that the humor is ſo impact in the part, that it cannot be repreſſed, and ſo groſſe, that it cannot be diſcuſſed; which we may know by the greatneſſe of the heat and ſwelling, by the bitterneſſe of the pricking paine, the feaver, and pulſation, and heavineſſe.

Lib. 2 ad Glauc. Cap. 7.

Wherefore laying aſide all hope of diſcuſſing, wee muſt come to ſuppuratives; For which purpoſe *Galen* foments the ſwollen part with water, or oile being warme, or with both of them; and then applies this following cataplaſme.

Suppurative medicines.

℞, *farinæ tric. vel micæ panis*, ℥iiij. *ol. com.* ℥iij, *aquæ com. quantum ſufficit, fiat cataplaſma*; or ℞, *rad. lilior. alb. & altheæ, an.* ℥iij, *fol. malvæ, parietar. & ſenecionis ana. m.* j. *coquantur in hydromelite, piſſentur, trajectis* adde *farin. ſem. lini* ℥ij, *axungiæ ſuillæ, ol. liliorum an.* ℥iß, *fiat cataplaſma*: Or ℞, *malvæ, biſmalv. violar. an. m.* j. *caricarum ping. n. x. paſſul.* ℥ij, *coquantur in aq. com. tuſis, & traiectis*, adde *mellis com.* ℥ij, *ung. baſilicon. & butyri recent. ana.* ℥j, *fiat cataplaſma.* You may profitably uſe for the ſame purpoſe *Empl. Diachylon magnum*, or *Baſilicon.* Or ℞, *Empl. Dyachil. mag.* ℥iij. *ung. baſilicon.* ℥j, *ol. liliorum* ℥ß. Of theſe mixed together make a a medicine for the foreſaid uſe.

The ſignes of *pus* or matter.

When the heat, paine, feaver, and other accidents ſhall remit, when the tumor hath a ſharpe head, when by the preſſing of your finger you finde the humor to flow as it were to and fro, then you may know that it is ripe.

Wherefore without any further delay the tumor muſt be opened, leſt the matter too long ſhut up, corrode the adjacent parts, and the ulcer become ſinuous and fiſtulous.

For this uſually happens, eſpecially then, when the matter is venenate or maligne, or when the ſwelling is neare a joint, or at the fundament, or ſuch like hot and moiſt places.

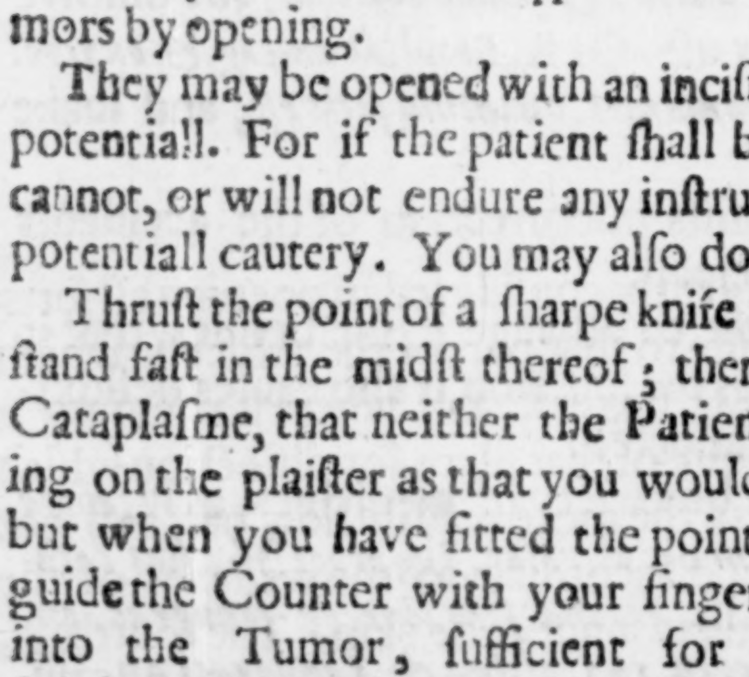
Hip. lib. de Fiſtula.

For by the decree of *Hippocrates* wee ſhould anticipate the maturation of ſuch tumors by opening.

They may be opened with an inciſion knife or cauſticke, and that, either actuall or potentiall. For if the patient ſhall be hartleſſe and leſſe confident, ſo that he either cannot, or will not endure any inſtrument, you muſt make way for the matter by a potentiall cautery. You may alſo doe the buſineſſe by another ſlight, as thus.

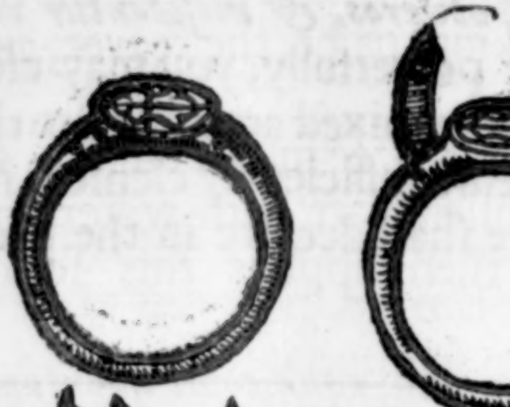
Thruſt the point of a ſharpe knife or lancet, through a braſſe counter that it may ſtand faſt in the midſt thereof; then cover it diligently with ſome Emplaiſter or Cataplaſme, that neither the Patient nor ſtanders by perceive the deceit: then laying on the plaiſter as that you would make a paſſage for the matter by that meanes, but when you have fitted the point to the part, where it is fit to open the tumor, ſo guide the Counter with your fingers, that you may preſently make an impreſſion into the Tumor, ſufficient for excluding the matter. I have here expreſſed three deliniations of ſuch Inſtruments, that you may uſe theſe, either bigger, leſſer or indifferent, as occaſion ſhall ſerve.

Counters with the points of Knives or Lances put through them.

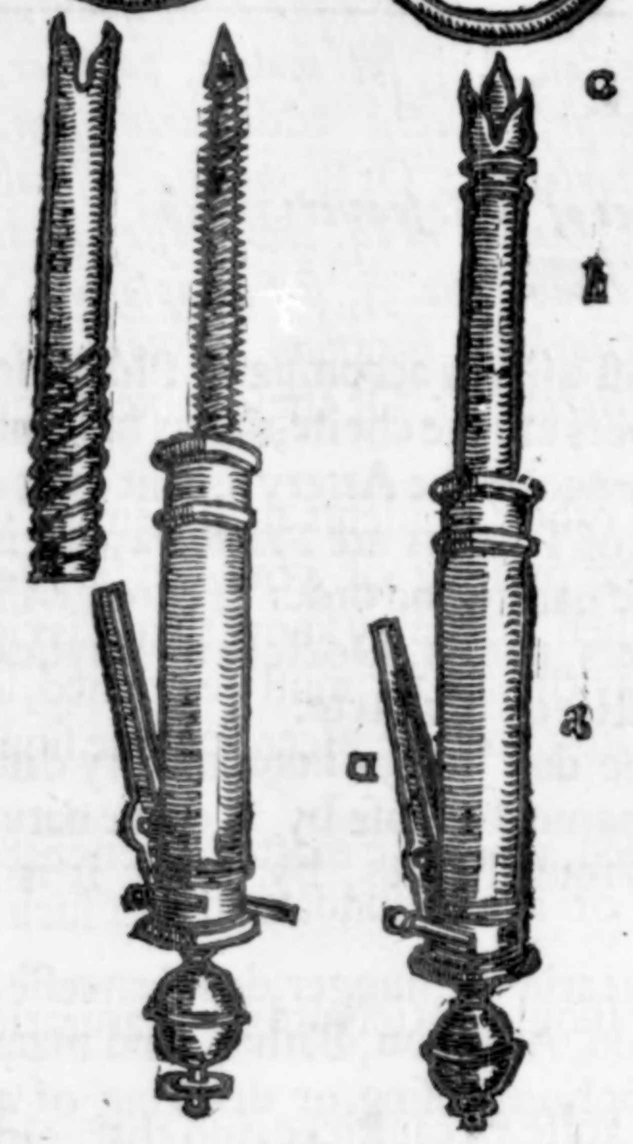


A. ſhewes the Counter or peece of Silver.
B. ſhewes the point of the Lancet.

Other Inſtruments for opening Abſceſſes.



Rings in which litle knives lye hid, fit for to open Abſceſſes.



The Deliniation of a Trunke or hollow Inſtrument going with a ſpring.

A. Shewes the thicker pipe.
B. Shewes another which enters and is faſtened in the other by a ſcrue.
C. The point of the Inſtrument, looking out.
D. The ſpring which forces the Inſtrument.

But there are ſeven things which muſt be diligently conſidered in opening all ſorts of Impoſtumes. The firſt is, that you put your knife to that part of the Abſceſſe which is the ſofter, and yeelds to the impreſſion of your fingers, and where it riſes into a head, or point. The ſecond is, that you make choiſe of that place for diſſection which is the loweſt, that ſo the conteined impurity may the more readily flow out, and not ſtay in the paſſage. The third is, that it be made according to the wrincles of the skin, and the right fibers of the Muſcles lying next under the skin. The fourth is, that you turne your knife from the larger veſſels and Nerves worth ſpeaking of. The fifth is, that the matter conteined in them be not evacuated too abundantly at once in great Abſceſſes, leſt thereby the ſtrength be dejected, the ſpirits being much waſted together with the unprofitable humor. The ſixth is, that the affected part be handled as gently as you can. The ſeventh is, that after the opening when the matter is evacuated, the Abſceſſe be clenſed, filled with fleſh, and laſtly conſolidated and cicatrized. But ſeeing that commonly after ſuch ſections ſome part of the Tumor remaines, all the conteined humor being not wholy ſuppurated, the Chirurgion may perceive that this is an implicite affect, that is a, Tumor and Vlcer. But the Cure thereof muſt be ſo, that you take away the Tumor before the ulcer; for the ulcer cannot be healed before the part be reſtored to its nature. Therefore the ſuppuratives formerly preſcribed muſt be uſed, and the ulcer muſt be dreſſed for two or three dayes with this following Medicine.

What the cure muſt be after the opening of the Abſceſſe

℞ *Vitellum vnius ovi, terebinth. Veneta, & ol. Roſar. an.* ℥ß, *fiat medicamentum.* Then you muſt ſeeke to clenſe it by this following Medicine.

Deterſive Medicines.

Vnguentum de Appio.

℞ *Mellis roſar.* ℥j, *Syrupi roſar. & tereb. Venet. an.* ℥jß, *far. hordei* ℥ij, *fiat medicamentum ad uſum.* For this very purpoſe there is a ſingular Deterſive made of *Appium* or Smallage of which this is the deſcription.

℞ *Succi appij, plantag. beton. an.* ℥j, *Mellis commun.* ℥v, *terebint. Venet.* ℥iiij, *farin. Hordei & Orobi, an.* ʒij, *pulveris Aloës, rad. Ireos florent. myrrhæ, an* ʒj. *coquatur mel cum ſuccis, quibus conſumptis addantur farinæ & pulveres, & miſceantur omnia ad formam unguenti.* But if you would clenſe it more powerfully, you may uſe *Vnguentum Apoſtolorum*; or *Vnguentum Aureum* and *Ægyptiacum* mixed according to the ſcope you conceive in your minds, when the ulcer ſhall ſeeme ſufficiently clenſed, it ſhall be filled with fleſh and cicatrized after the manner we ſhall declare in the proper treatiſe of the cure of Vlcers.

Chap. XI.

Of feavers, and the cures of theſe feavers which accompany Plegmons.

The Feaver of a Phlegmon. What a Feaver is.

Amongſt the *Symptoms* which moſt uſually accompany Phlegmons, & afflict all the body of the patient, Feavers are the cheiſe; that is hot, and dry diſtempers kindled in the heart, and thence by the Artery is ſent over all the body; yet theſe which uſually follow this kinde of Tumors are *Ephemeræ*, that is, Diary, unputrid *Synochi* or putrid *Synochi*; Of whoſe nature and order of cure I will here briefly relate what I have learnt from my Maſters, that is, Doctors of Phyſicke, as I have beene converſant with them in the practiſe of my Arte.

What an Ephemera, or Diarye is.

The *Ephemera*, or Diary [that is of one day] is, a hote and dry diſtemperature kindled in the vitall ſpirits. It hath that name, becauſe by its owne nature it tarryes not above the ſpace of one day or twenty foure houres, by reaſon it is kindled in a ſubtle eaſily diſſipable matter.

The cauſes thereof.

The efficient cauſes of this Feaver are wearineſſe, hunger, drunkenneſſe, anger, fury, ſorrow, watching, great and peircing cold, Aduſtion, Bathes, and manner of living inclining more to heat than ordinary, applying, uſing or drinking of acride medicines as Poyſons, or of hot meats, and drinkes; to conclude, all the efficient cauſes common to all Feavers, putrifaction onely excepted which properly appertaines to putride feavers.

Aphoriſm. 55. lib. 4.

For a *Bubo* alſo, which is a *Phlegmon* of the Glandules, cauſes a Diary, as *Hippocrates* ſhewes. All feavers proceeding from the Tumors of the Glandules are evill, the Diary excepted. Which *Aphoriſme* muſt be underſtood warily and with that diſtinction which *Galen* gives in his commentary, where he ſaith; It is only to be underſtood of Tumors riſen in the Glandules without occaſion, that is, without any evident and manifeſt cauſe; for otherwiſe Feavers that thence take their originall, though not Diary, yet are not all evill, as we learne by Buboes in Children, and the venereous Buboes, which happen without inflammation, or corruption of the liver, for ſuch commonly have no maligne Feaver accompanying them, which thing is worthy a Chirurgions obſervation.

The ſignes of a Diarie.

The common ſignes of a Diary are, a moderate and vaporous heate feeling gentle to the hand, a pulſe ſwift and frequent, ſometimes great and ſtrong, as when the Diary is cauſed by anger; ſometimes litle, if the Feaver proceede from ſorrow, hunger, cold, crudity; for other reſpects equall and ordinary.

The moſt certaine ſignes are, if the Feaver come upon one not by litle and litle but ſodainly and that from ſome externall and evident cauſe, no loathing of meat, no cauſeleſſe wearineſſe, no deepe ſleepe, yawning, great paine, reſtleſneſſe, ſhaking nor cold going before, and laſtly no other troubleſome ſymptome preceeding. Wee here make no mention of the urine, becauſe moſt frequently they reſemble the vrines of ſound bodyes; for in ſo ſhort a time as Diaryes endure, there cannot ſo great a perturbation be raiſed in the blood that there may be ſignes thereof found in the vrine.

Why in a Diarye the vrines like to theſe in health.

A Diary is ended in one fit, which by the proper nature of this Feaver laſts but one day, although ſometimes, otherwiſe it is extended to three, or, foure dayes ſpace; and then it eaſily degenerates into a Putride, eſpecially any error of the Patient, Phiſition, or thoſe which attend him concurring therewith, or if the externall things bee not rightly fitted.

This Feaver is terminated either by inſenſible tranſpiration, or by the moiſture of the skin, or by a ſweate naturall, gentle, and not ill ſmelling; to this Diary wee may referre the unputride *Synochus*, generated of blood not putrid, but onely heated beyond meaſure. For uſually there ariſes a great heate over all the body, by meanes of the blood immoderatly heated; whence the veines become more tumide, the face appeares fiery, the Eyes red and burning, the breath hot, and to conclude, the whole habite of the body more full, by reaſon of that Ebullition of the blood, and the diffuſion of the vapours thence ariſing over all the body: Whence it is, that this kinde of *Synochus* may be called, a vapourous Feaver. To this Children are incident as alſo all ſanguine bodyes, which have no ill humors. The cure of this and the *Ephemera* or Diary is the ſame; becauſe it may ſcarſe ſeeme different from the *Ephemera* in any other thing, than that it may be prolonged for three or foure dayes. Wherefore whatſoever we ſhall ſay for the cure of the *Ephemera*, may be all applyed to the *Synochus*, bloodletting excepted, which in an unputrid *Synochus* is very neceſſary.

The unputride *Synochus*.

Now the Cure of a Diary Feaver conſiſts in the decent uſe of things not naturall, contrary to the cauſe of the diſeaſe; wherefore bathes of warme and naturall water are very profitable; ſo that the Patient be not Plethoricke, nor ſtufft with excrements, nor obnoxious to catarrhes and defluxions, becauſe a catarrhe is eaſily cauſed and augmented by the humors diffuſed and diſſolved by the heate of a bath; therefore in this caſe we muſt eſchew frictions, and annointing with warme oile, which things notwithſtanding are thought very uſefull in theſe kind of Feavers, eſpecially when they have their originall from extreme labour, by aſtriction of the skin or a *Bubo*. Let this be a generall rule, that to every cauſe, whence this Feaver proceeded, you oppoſe the contrary for a remedy; as to labour, reſt; to watching, ſleep; to anger and ſorrow, the gratefull ſociety of friends, and all things repleniſhed with pleaſant good will; and to a *Bubo*, the proper cure thereof.

The cure of a Diary feaver.

Wine moderately tempered with water according to the cuſtome of the ſicke patient, is good and profitable in all cauſes of this Feaver, except he be pained in his head, or that the Feaver drew its originall from anger, or a *Bubo*; for in this laſt caſe eſpecially, the patient muſt abſtaine wholy from wine, untill the inflammation come to the ſtate, and begins to decline. This kinde of Feaver often troubles infants; and then you muſt preſcribe ſuch medicines to their Nurſes, as if they were ſicke, that ſo by this meanes their milke may become medicinable. Alſo it will be good to put the Infant himſelfe into a bath of naturall and warme water, and preſently after the bath to anoint the ridge of the backe and breſt with oile of Violets. But if a *Phlegmon* poſſeſſe any inward part, or otherwiſe by its nature be great, or ſeated neare any principall Bowell, ſo that it may continually ſend from it either a putrid matter or exhalation to the heart, and not onely affect it by a quality or preternaturall heate by the continuity of the parts, thence will ariſe the Putride *Synochus*, if the blood by contagion putrifying in the greater veſſells, conſiſts of an equall mixture of the foure humors. This Feaver is cheifly thus knowne, it hath no exacerbations, or remiſſions, but much leſſe intermiſſions; it is extended beyond the ſpace of twenty foure houres, neither doth it then end in vomite, ſweat, moiſture, or by litle and litle by inſenſible tranſpiration, after the manner of intermitting Feavers, or Agues; but remaines conſtant, untill it leaves the Patient for altogether; it commonly happens not unleſſe to theſe of a good temper and complexion, which abound with much blood, and that tempered by an equall mixture of the foure humors. It commonly endures not long, becauſe the blood by power of ſome peculiar putrifaction degenerating into choler or Melancholy, will preſently bring forth another kinde of feaver, to wit a Tertian or continued Quartaine.

The uſe of wine in a Diarye.

How a putride *Synochus* is cauſed.

The cure of this Feaver (as I have heard of moſt learned Phyſitions) cheifly conſiſtsin Bloodletting. For by letting of blood the fullneſſe is diminiſhed, & therfore the obſtruction is taken away, and laſtly the putrefaction. And ſeeing that in this kinde of

Phlebotomy neceſſary in a putride *Synochus*.

Feaver there is not onely a fault of the matter, by the putrefaction of the blood, but alſo of the Temper by exceſſe of heat; certainely Phlebotomy helps not only, as we ſaid, the putrefaction, but alſo the hote diſtemper. For the blood in which all the heate of the creature is conteined, whileſt it is taken way, the acrid and fuliginous excrements exhale and vaniſh away with it, which kept in, encreaſed the Feveriſh heate. Moreover, the veines, to ſhun emptineſſe, which nature abhors, are filled with much cold aire in ſtead of the hot blood which was drawne away, which followes a cooling of the habite of the whole body; yea and many by meanes of Phlebotomy have their bellyes looſed, and ſweate, both which are much to be deſired in this kinde of Feaver.

What benefit we may reape by drawing blood even to fainting.

This moved the ancient Phyſitions, to write, that we muſt draw blood in this diſeaſe, even to the fainting of the Patient.

Yet becauſe thus, not a few have poured out their lives together with their blood, it will be better and ſafer to divide the evacuations, and draw ſo much blood at ſeverall times, as the greatneſſe of the diſeaſe ſhall require, and the ſtrength of the Patient may beare.

Why we muſt give a clyſter preſently after bloodletting.

When you have drawne blood, forthwith inject an emollient and refrigerative clyſter; leſt that the veines emptied by Phlebotomy may draw into them the impurity of the Guts; but theſe clyſters which coole too much, rather binde the belly, than looſe it. The following day the Morbificke matter muſt be partly evacuated by a gentle purge, as a bole of *Caſsia*, or *Catholicon*; then muſt you appoint Syrupes which have not onely a refrigerative quality, but alſo to reſiſt putrefaction, ſuch as the Syrupe of Lemmons, Berberries, of the Iujce of Citrons, of Pomgranats, Sorrell and Vineger; let his diet be abſolutely cooling and humecting and alſo ſlender; for the native heate much debilitated by drawing of a great quantity of blood cannot equall a full diet. Therefore it ſhall ſuffice to feed the Patient with chicken and veale brothes made with cooling herbes, as Sorrell, Lettuce and Purſlaine. Let his drinke be Barly water, Syrup of Violets mixed with ſome pretty quantity of boiled water, *Iulepum Alexandrinum*, eſpecially if he be troubled with ſcouring, or laske. But the Phyſition muſt cheifly have regard to the fourth day, for if then there appeare any ſignes of concoction in the excrements, the *Criſis* muſt be expected on the ſeventh day and that either by a looſeneſſe of the belly, or an aboundance of urine, by vomits, ſweats, or bleeding. Therefore we muſt then doe nothing, but commit the whole buſineſſe to nature.

What Syrupes profitable in this caſe.

Why a ſlender Diet muſt be uſed after letting much blood.

When drinking of water is to be permitted in a putride *Synochus*.

But for drinking cold water, which is ſo much commended by *Galen* in this kinde of Feaver, it is not to be ſuffered before there appeare ſignes of concoction; moreover in the declining of the diſeaſe the uſe of wine will not be unprofitable to helpe forwards ſweats.

Chap. XII.

Of an Eryſipelas, *or Inflammation.*

HAving declared the cure of a Phlegmon, cauſed by laudable blood, wee muſt now treate of theſe tumors which acknowledge Choler the materiall cauſe of their generation, by reaſon of that affinity which interceeds betweene Choler and Blood. Therefore the tumors cauſſed by naturall Choler, are called *Eryſipelata*, or Inflammations; theſe conteine a great heate in them, which cheifly poſſeſſes the skin, as alſo oftentimes ſome portion of the fleſh lying under it. For they are made by moſt thin and ſubtle blood (which upon any occaſion of inflammation eaſily becomes cholericke) or by blood and choler, hotter than is requiſit, and ſometimes of choler mixed with an acride ſerous humor.

The definition of an *Eryſipelas*.

Gal. Cap. 2. lib. 14. Meth. med. & 2. ad Glau.

That which is made by ſincere and pure choler, is called by *Galen*, a true and perfect *Eryſipelas*. But there ariſe three differences of *Eryſipelaes* by the admixture of choler with the three other kinds of humors. For if it being predominant be mixed with blood, it ſhall be termed *Eryſipelas Phlegmonodes*; if with phlegme, *Eryſipelas œdematodes*; if with Melancholy, *Eryſipelas Scirrhodes*. So that the former and ſubſtantive word ſhewes the humor bearing dominion, but the latter or adjective that which is inferiour in mixture. But if they concurre in equall quantity, there will be thereupon made *Eryſipelas Phlegmone*; *Eryſipelas* œdema; *Eryſipelas ſcirrhus*.

Two kinds of *Eryſipelas*.

Galen acknowledges two kinds of *Eryſipelaes*, one ſimple and without an ulcer, the other ulcerated. For Choler drawne and ſevered from the warmneſſe of the blood, running by its ſubtlety and acrimony vnto the skin, ulcerates it; but reſtrained by the gentle heat of the blood, as a bridle, it is hindred from peircing to the top of the skin, and makes a tumor without an ulcer. But of unnaturall choler are cauſed many other kinds of cholericke tumors, as the *Herpes exedens*, and *Miliaris*, and laſtly all ſorts of tumors which come betweene the *Herpes* and *Cancer*. You may know *Eryſipelaes* cheifly by three ſignes, as by their colour, which is a yellowiſh red; by their quicke ſliding backe into the body at the leaſt compreſſion of the skin (the cauſe of which is the ſubtlety of the humor and the outward ſite of it under the skin, whereupon by ſome an *Eryſipelas* is called a Diſeaſe of the skin) Laſtly by the number of the Symptoms, as heat, pulſation, paine. The heat of an *Eryſipelas* is far greater than that of a Phlegmon, but the pulſation is much leſſe; for as the heat of the blood is not ſo great, as that of choler, ſo it farre exceeds choler in quantity and thickneſſe, which may cauſe compreſſion and obſtruction of the adjacent muſcle.

Gal. lib. 2. ad Glauc.

For Choler eaſily diſſipable by reaſon of its ſubtlety quickly vaniſhes, neither doth it ſuffer it ſelfe to be long conteined in the empty ſpaces betweene the muſcles; neither doth an *Eryſipelas* agree with a Phlegmon in the propriety of the paine. For that of an *Eryſipelas* is pricking and biting without tenſion, or heavineſſe, yet the primitive, antecedent and conjunct cauſes are alike of both the tumors. Although an *Eryſipelas* may be incident to all parts, yet principally it aſſailes the face, by reaſon of the rarity of the skin of that place, and the lightneſſe of the cholericke humor flying upwards. It is ill when an *Eryſipelas* comes upon a wound, or ulcer, and although it may come to ſuppuration, yet it is not good; for it ſhewes that there is obſtruction by the admixture of a groſſe humor, whence there is ſome danger of eroſion in the parts next under the skin.

Hip. Apho. 79 Sect. 7. Aph. 25 Sect: 6. Aph. 43. Sect. 3.

It is good when an *Eryſipelas* comes from within outwards; but ill when from without it retires inward. But if an *Eryſipelas* poſſeſſe the wombe it is deadly, and in like manner if it ſpread too far over the face, by reaſon of the ſympathy of the membranes of the braine.

CHAP. XIII.

Of the cure of an Eryſipelas.

FOr the cure of an *Eryſipelas* we muſt procure two things, to wit, evacuation and Refrigeration. But becauſe there is more need of cooling, than in a Phlegmon, the cheefe ſcope muſt be for refrigeration. Which being done, the conteined matter muſt be taken away and evacuated with moderatly reſolving medicines. We muſt doe foure things to attaine unto theſe forementioned ends. Firſt of all we muſt appoint a convenient manner of Diet, in the uſe of the ſixe things not naturall; that is, we muſt incraſſate, refrigerate and moiſten as much as the nature of the diſeaſe and patient will ſuffer, much more than in a Phlegmon; then we will evacuate the Antecedent matter, by opening a veine, and by medicines purging choler. And that by cutting the Cephalicke veine, if there be a portion of the blood mixed with Choler, if the *Eryſipelas* poſſeſſe the face, and if it be ſpread much over it.

Gal: 14. Method.

4 Things to be performed in curing an *Eryſipelas*.

In what *Eryſipelas* it is convenient to let blood, in what not.

But if it ſhall invade another part, although it ſhall proceed of pure choler, Phlebotomy will not be ſo neceſſary, becauſe the blood which is as a bridle to the choler being taken away, there may be danger, leſt it become more fierce; yet if the body be plethoricke, it will be expedient to let blood, becauſe this, as *Galen* teacheth, is oft times the cauſe of an *Eryſipelas*. It will be expedient to give a clyſter of refrigerating and humecting things before you open a veine; but it belongs to a learned and prudent Phyſition to preſcribe medicines, purging choler.

What topicke medicines are fit to be uſed it the beginning of an *Eryſipelas*

The third care muſt be taken for Topick, or locall medicines, which in the beginning and encreaſe muſt be cold and moiſt, without any either drynes or aſtriction, becauſe the more acride matter by uſe of aſtringent things being driven in, would ulcerate and fret the adjacent particle.

Galen and *Avicen* much commend this kinde of remedy; Take faire water ℥vj. of the ſharpeſt Vinegar ℥j, make an Oxycrate, in which you may wet linnen clothes and apply to the affected part and the circumjacent places, & renew them often. Or ℞, *Succi ſolani, plantag. & ſempervivi, an.* ℥ij, *aceti* ℥ß, *Mucaginis ſem. Pſylij* ℥ij, *ſucci hyoſcyami* ℥j, *Miſce.* But if the *Eryſipelas* be upon the face, you muſt uſe the medicine following.

℞. *Vnguent. Roſ.* ℥iiij, *ſucci plantagin. & ſempervivi, an.* ℥j. *trochiſc. de Camphora* ʒß, *aceti parum*; let them be mixed together and make a liniment. But if the heate and paine be intolerable, we muſt come to narcoticke medicines. As, ℞ *ſucci hyoſcyami, ſolani, cicutæ, an.* ℥j. *album. ovorum n. ij. aceti* ℥ß, *opij & Camphor. an. gra.* 4 *croci* ℈ß, *Mucaginis ſem. pſill. & fænigr. extractæ in aq. roſ. & plantag. an* ℥j, *ol. de papau.* ℥ij. *fiat linimentum, addendo ung. refrigerantis Gal. camphor q. ſatis ſit.* Yet we muſt not uſe ſuch like medicines too long, leſt they cauſe an extinction of the native heate and mortification of the part.

What caution muſt be had in the uſe of narcoticke medicines.

Wherefore ſuch Narcoticke medicines muſt be uſed with regard of place, time and ſuch other circumſtances. Therefore we may three manner of wayes underſtand when to deſiſt from uſing Narcoticke or ſtupefactive medicines. The firſt is when the Patient in the affected part feels not ſo much heat, pricking and paine, as before; The ſecond is when the part feeles more gentle to the touch than before; The third when the fiery and pallide colour begins by litle and litle to waxe livid and blacke; for then muſt we abſtaine from Narcoticke, and uſe reſolving and ſtrengthening things, whereby the part may be revived and ſtrengthened by recalling the Native heate; As ℞. *Farinæ hordei & Orobi, an.* ℥ij *farinæ ſem. lini* ℥jß. *coquantur in Hydromelite vel oxycrato, addendo pulv. roſarum & chamæmal. an.* ℥ß. *ol. anethi & chamæm. an.* ℥j, *fiat cataplaſma.* Or you may uſe this following fomentation ℞. *Rad. Altheæ* ℥ij, *fol. malvæ, biſmal. pariet. abſinthij, ſalviæ, an. m. j. flor. chamæm. meliloti, roſar. rub. an. m. ij. coquantur in æquis partibus vini & aquæ, & fiat fotus cum ſpongia.* After the fomentation you may apply an Emplaiſter of *Diachylon Ireatum*, or *Diapalma* diſſolved in oile of chamomille and Melilote, and ſuch other like.

Reſolving and ſtrengthening medicines.

The fourth Intention which is of the correction of accidents, we will performe by theſe meanes which we mentioned in curing a Phlegmon, by varying the medicaments, according to the judgement of him which undertakes the cure.

CHAP. XIIII.

Of the Herpes; *that is Teaters, or Ringwormes, or ſuch like.*

What a *Herpes* is, what be the kinds thereof.
Gal. 2. ad Glauconem.
What the *Herpes miliaris* is.
What the *exedens.*

HErpes is a tumor cauſed by pure choler ſeparated from the reſt of the humors, that is carryed by its naturall lightneſſe and tenuitye even to the outer or ſcarfe skin, and is diffuſed over the ſurface thereof. *Galen* makes three ſorts of this tumor. For if perfect choler of an indifferent ſubſtance, that is, not very thicke, cauſe this tumor, then the ſimple *Herpes* is generated, obteining the name of the *Genus*; but if the humor be not ſo thin, but compounded with ſome ſmall mixture of Phlegme, it will raiſe litle bliſters over the skin like to the ſeeds of Millet, whence it was that the Ancients called this Tumor the *Herpes Militaris*. But if it have any admixture of Melancholy, if will be an *Herpes exedens*, terrible by reaſon of the eroſion or eating into the skin and muſcles lying under it.

Three intentions in curing *Herpes*,

There are abſolutely three intentions of curing; The firſt is to appointe a Diet juſt like that we mentioned in the cure of an *Eryſipelas*; The ſecond is to evacuate the antecedent cauſe, by medicines purging the peccant humor, for which purpoſe oftimes

times clyſters will ſuffice, eſpecially if the patient be ſomewhat eaſie by nature, and if the urine flow according to your deſire; for by this a great part of the humor may be carryed into the bladder; The third ſhall be to take away the conjunct cauſe by locall medicines ordained for the ſwelling and ulcer: Therefore the Chirurgion ſhall have regard to two things, that is, the reſolving of the tumor, and the drying up of the ulcer, for every ulcer requires drying, which can never be attained unto, unleſſe the ſwelling be taken away. Therefore becauſe the chiefeſt care muſt be to take away the Tumor, which unleſſe it be performed there can be no hope to heale the ulcer, he ſhall lay this kinde of medicine to diſſolve and dry, as ℞. *Ceruſæ & tutbiæ præpar. an.* ℥j. *ol. roſ. & adipis capon. an.* ℥ij. *corticis pini uſti, & loci,* ʒß *ceræ quantum ſatis, fiat unguentum.* Or ℞. *Farin. hordei & lent. an.* ℥ij, *coquantur in decocto corticis mali granati, balauſt. plantag. addendo pulveris roſar. rub. abſinth. an.* ʒß. *olei Myrtillor. & mellis com. an.* ʒvj, *fiat ungentum, ut artis eſt.* But for an *Herpes Miliaris* theſe muſt chiefly be uſed, ℞. *pulv. gallarum, malicorũ, balauſt. boli armeni an.* ℥j. *aquæ roſ.* ℥iij, *aceti acerrimi* ℥j. *axungiæ anſer. & olei Myrtillor. an.* ℥jß, *terebinth.* ℥j *fiat unguentum ad uſum.* I have often found moſt certaine helpe in *unguentum enulatum cum Mercurio*, for it kills the puſtules, and partly waſts the humor conteined in them. Yet if the ulcer, not yet neither yeelds, but every day diffuſes it ſelfe further and further, you ſhall touch the edges and lipps thereof with ſome acride medicine, as *Aqua fortis*, oyle of Vitriole, or ſuch like, for by this kinde of remedy, I have oft times healed fretting ulcers, which ſeemed altogether incureable.

A rule for healing ulcers conjoined with tumors.

The force of *Vnguentum enulatum cum Mercurio.*

Medicines fit for reſtraining eating and ſpreading ulcers.

CHAP. XV.

Of Feavers, which happen upon Eryſipelous Tumors.

AS Feavers ſometimes happen upon Inflammations, and Eryſipelaes, which ſavour of the humor whereof they proceed, that is, Choler. Therefore ſeeing it is peculiar to Choler, to move every third day, it is no marvaile if great Inflammations bring with them Tertian Feavers, or Agues, which have their fit every third day; for it is called an Intermitting Tertian which comes every other day.

A vulgar deſcription of an intermitting Tertian feaver.

The Primitive cauſes in generall are ſtrong exerciſes, eſpecially in the hot Sunne, the uſe of heating, and drying either meats or medicines, great abſtinence joyned with great labour, care, ſorrow; the antecedent cauſes are the plenty of choler in the body, an hot and dry diſtemperature either of the whole body, or of the liver onely: the conjunct cauſe is the putrefaction of the Cholericke humor lying in ſome plenty without the greater veſſells, in the habit of the body.

The cauſes of Tertian feavers.

The ſignes, a ſhaking or ſhivering like as when we have made water in a cold winter morning, a great pricking, ſtretching, or ſtiffneſſe, as if there were pins thruſt into us over all our bodies, by reaſõ of the acrimony of the cholerick humor driven uncertainly & violently over all the body, & the ſenſible membranous & Nervous particles at the beginning of the fit; then preſently the heate becomes acride, the Feaver kindled, like a fire in dry ſtraw; the pulſe is great, quicke and equall; the tongue dry; the urine yellowiſh, red and thin. The Symptomes are watchings, thirſt, talking idlely, anger, diſquietneſſe & toſſing the body at the leaſt noiſe or whiſpering. Theſe Feavers are terminated by great ſweats. They are incident to cholericke young men, ſuch as are leane, & in Summer; after the fit oft times follow cholericke vomiting & yellowiſh ſtooles. After the fit there followes an abſolute intermiſſion reteining no reliques of the Feaver, untill the approach of the following fit, becauſe all the cholericke matter by the force of that fit & nature is eaſily caſt out of the body, by reaſon of its natural levity & facillity; wheras in Quotidians there is no ſuch thing, as which after the fit alwaies leave in the body a ſenſe & feeling of a certaine inequality by reaſon of the ſtubborneſſe of the Phlegmatick humor, & dulneſſe to motion. The fit commonly uſes to endure 4, 5, or 6 houres, although at ſometime it may be extended to 8 or 10. This Feaver is ended at 7 fits, and uſually is not dangerous, unleſſe there be ſome error committed by the Phyſition, Patient, or ſuch as attend him. Tertians in ſummer are ſhorter, in winter longer.

The ſignes of an intermitting Tertian.

The Symptomes.

Why Tertians have an abſolute ceſſation of the feaver at the end of each fit.

Wherefore the beginning of the fit is accompanied with ſtiffeneſſe, or ſtretching, the ſtate with ſweate, whereupon if the noſe, lips or mouth breake forth into pimples or ſcabbes, it is a ſigne of the end of the Feaver, and of the power of nature which is able to drive the conjunct cauſe of the diſeaſe from the center to the habite of the body; yet theſe pimples appeare not in the declining of all Tertians, but onely then, when the Cholericke humor cauſing the Feaver ſhall reſide in the ſtomacke, or is driven thither from ſome other part of the firſt region of the Liver. For hence the ſubtler portion therof carryed by the continuation of the inner coate to the mouth and noſe, by its acrimony eaſily cauſes pimples in theſe places. The cure is performed by Diet, and Pharmacy.

The Diet of ſuch as have a Tertian.

Therefore let the Diet be ſo ordered for the ſixe things not naturall, that it may incline to refrigeration and humection, as much as the digeſtive faculty will permit, as Lettuce, Sorrell, Gourds, Cowcumbers, Mallowes, Barly Creames, Wine much alaid with water, thinne, ſmall, and that ſparingly and not before ſignes of concoction ſhall appeare in the urine; for at the beginning he may not uſe wine, nor in the declining, but with theſe conditions, which we have preſcribed.

When ſuch as have a tertian may uſe wine.

The time of feeding the patient.

But for the time of feeding the patient, on that day the fit is expected, hee muſt eate nothing for three houres before the fit, leſt the aguiſh heate lighting on ſuch meats as yet crude, may corrupt and putrefie them; whence the matter of the Feaver may be increaſed (becauſe it is as proper to that heate to corrupt all things, as to the native to preſerve and vindicate from putrefaction), the fit lengthened, and nature called away from the concoction and excretion of the Morbificke humor; yet wee may temper the ſeverity of this law by having regard to the ſtrength of the patient; for it will be convenient to feed a weake patient not onely before the fit, but alſo in the fit it ſelfe, but that onely ſparingly, leſt the ſtrength ſhould be too much impaired.

When to purge the patient.

Now for Pharmacy; It muſt be conſidered, whether the ſtrength of the Patient be ſufficient, if the humors abound; for then you may preſcribe *Diaprunum ſimplex*, *Caſsia* newly extracted, the decoction of Violets, of Citrine Myrobalanes; Syrupes of Violets, Roſes, of Pomegranats and Vineger. But if the powers of the Patient languiſh, hee muſt not onely not be purged, but alſo muſt not draw blood too plenteouſly, becauſe Cholericke men ſoone faint, by reaſon of the facile and eaſie diſſipation of the ſubtle humors and ſpirits; beſides, ſuch as are ſubject to tertian Feavers doe not commonly abound with blood, unleſſe it be with Cholericke blood, which muſt rather be renued, or amended by cooling and humecting things, than evacuated. Yea verily, when it is both commodious and neceſſary to evacuate the body, it may be attempted with far more ſafety by ſuch things as worke by inſenſible tranſpiration, which provoke ſweats, vomite or urine by reaſon of the ſubtlety of the Cholericke humor, than by any other. Alſo the frequent uſe of emollient glyſters made with a decoction of Prunes, jujubes, Violets, branne and Barly, will profit much; If the patient fall into a *Delirium* or talke idlely by reaſon of the heate and drynes of the head, with a particular exceſſe of the Cholericke humor, the head muſt be cooled by applying to the Temples and forehead and putting into the noſe oyle of Violets, Roſes, or womans milke. Let the feete and legs be bathed in faire and warme water, and the ſoles of the feet be anoynted with oyle of Violes and ſuch like.

In the declining, a Bath made of the branches of Vines, the leaves of Willowes, Lettuce and other refrigerating things boyled in faire water, may be profitablely uſed three houres after meat eaten ſparingly.

When the time is fit to uſe a Bath,

But I would have you ſo to underſtand the Declination or declining not of one particular fit, but of the diſeaſe in generall, that the humors already concocted, allured to the skin by the warmneſſe of the bath, may more eaſily and readily breathe forth: he which otherwiſe ordaines a bath at the beginning of the diſeaſe, will cauſe a conſtipation in the skin and habit of the body, by drawing thither the humors peradventure tough and groſſe, no evacuation going before.

What kinds of evacuations are moſt fit in a Tertian.

Alſo it will be good after generall purgations to cauſe ſweate by drinking White wine thinne and well tempered with water; but urine by a decoction of Smallage and Dill; Certainely ſweate is very laudable in every putride

Feaver, becauſe it evacuates the conjunct matter of the diſeaſe, but chiefly in a Tertian, by reaſon that choler by its inbred levity eaſily takes that way, and by its ſubtilty is eaſily reſolved into ſweat. But that the ſweate may be laudable, it is fit it be upon a criticall day, and be foreſhewed by ſignes of concoction agreeable to the time and manner of the diſeaſe. Sweats when as they flow more ſlowly are forwarded by things taken inwardly and applyed outwardly; by things taken inwardly, as with white wine, with a decoction of Figgs, Raiſons ſtoned, graſſe roots and the like opening things; but by things outwardly applyed, as ſpunges dipped in a decoction of hot herbes (as Roſmary, Time, Lavander, Marjerome and the like) applyed to the Greines, Armeholes, and ridge of the backe.

Sudoriſicks.

You may for the ſame purpoſe, fill two Swines bladders with the ſame decoction, or elſe ſtone bottles, and put them to the feete, ſides, and betweene the thighes. Then let this be the bound of ſweating, when the patient begins to waxe cold, that is, when the ſweate feeles no more hote, but cold.

But by the conſent of all, blood muſt not be letten after the third fit, but preſently at the beginning of the Feaver, according to the opinion and preſcription of *Galen*; for ſeeing this Feaver for the moſt part is terminated at ſeven fits, if you ſtay untill the third fit be paſt, the Feaver will now be comne to its ſtate; but *Hippocrates* forbide us to move any thing in the ſtate, leaſt nature then buſied in concocting the diſeaſe, be called from its begun enterpriſe.

When blood muſt be let.

Aphor.29. Sect.2.

CHAP. XVI.

Of an Oedema *or cold Phlegmaticke Tumor.*

Hitherto wee have treated of hote Tumors, now wee muſt ſpeake of cold; Cold Tumors are onely two, an *Oedema*, and a *Scirrhus*; And for all that *Hippocrates* and the Ancients uſed the word *Oedema* for all ſorts of Tumors in generall; yet by *Galen* and theſe Phyſitions which ſucceeded him, it hath beene drawne from that large and generall ſignification, to a more ſtraite and ſpeciall, onely to deſigne a certaine *ſpecies*, or kinde of Tumor.

Gal. lib. de tumo. praeter naturā.

Wherefore an *Oedema* is a ſoft, laxe and painleſſe Tumor, cauſed by collection of a flegmaticke humor.

What an *Oedema* is.

The Ancients made eight differences of Tumors proceeding of Phlegme. The firſt they termed a true and lawfull *Oedema* proceeding from naturall Phlegme; from unnaturall Phlegme by admixtion of another humor they would have three ſorts of Tumors to ariſe, as that by mixture of blood, ſhould be made an *Oedema Phlegmonodes*, and ſo of the reſt.

The differences of *Oedemas*

Beſides, when they perceived unnaturall Phlegme either puffed up by flatulency, or to flow with a wateriſh moiſture, they called ſome *Oedemaes* flatulent, others wateriſh; but alſo when they ſaw this ſame Phlegme often to turne into a certaine Plaiſter-like ſubſtance, they thought that hence proceeded another kinde of *Oedema*, which they expreſſed one while by the name of *Atheroma*, another while by *Steatoma*, and ſometime by *Melicerides*, as laſtly they called that kind of *Oedema* which is cauſed by putride and corrupt flegme, *Scrophulæ*. For we muſt obſerve that Phlegme ſometimes is naturall, and offends onely in quantity, whence the true *Oedema* proceeds; otherwhiles it is not naturall; and it becomes not naturall, either by admixtion of a ſtrange ſubſtance, as blood, Choler or Melancholy, whence ariſe the three kinds of *Oedema's* noted formerly by the way; or by the putredneſſe and corruption of its proper ſubſtance, whence the *Struma* and *Scrophulæ* proceed; or by concretion, whence kernells and all kinds of Wens, *Ganglia* and knots; or by reſolution, whence all flatulent and wateriſh Tumors, as the *Hydrocele*, *Pneumatocele* and all kinds of Dropſies.

By how many waies Phlegme becomes not naturall.

The cauſes of all *Oedema's* are the defluxion of a Phlegmaticke or flatulent

The Cauſes.

humor into any part, or the congeſtion of the ſame made by litle & litle in any part, by reaſon of the imbecillity thereof in concocting the nouriſhment, and expelling the excrement.

The ſignes. The ſignes are a colour whitiſh and like unto the skinne, a ſoft Tumor, rare and laxe by reaſon of the plentifull moiſture with which it abounds, and without paine, by reaſon this humor inferres no ſenſe of heate nor manifeſt cold; when you preſſe it with your finger the print thereof remaines, becauſe of the groſſeneſſe of the humor and ſlowneſſe to motion. **The prognoſticks.** *Oedema's* breed rather in winter than in the ſummer, becauſe winter is fitter to heape up Phlegme; they chiefly poſſeſſe the Nervous and Glandulous parts, becauſe they are bloodleſſe, and ſo cold and more fit by reaſon of their looſeneſſe to receive a defluxion; for the ſame cauſe bodyes full of ill humors, ancient, and not exerciſed, are cheifly troubled with this kinde of Tumor.

How Oedema's are terminated. An *Oedema* is terminated ſometimes by reſolution, but oftner by concretion, ſeldomer by ſuppuration, by reaſon of the ſmall quantity of heate in that humor.

A Symptomaticall *Oedema*, as that which followes upon a Dropſie or Conſumption, admits no cure unleſſe the diſeaſe be firſt taken away.

The intentions of curing Oedema's. The generall cure is placed in two things, that is, in evacuation of the conjunct matter, prohibiting the generation of the antecedent. Wee attaine to both cheifly by foure meanes.

The diet. The firſt truely by ordaining a fit manner of living and preſcribing moderation in the uſe of the ſixe things not naturall. Wherefore we muſt make choyſe of ſuch aire as is hote, dry and ſubtle; wee muſt preſcribe wine of a middle nature for his drinke; let the bread be well baked; let meates be appointed which may generate good blood, and theſe rather roſted than boyled. Let all fruites be forbidden, as alſo brothes and milke-meates; let him eate ſuch fiſh as are taken in ſtony rivers; the Patient ſhall obſerve mediocrity in feeding, but principally ſobriety in drinking, for feare of crudities; After meat let him uſe digeſtive powders, or common drige pouder; if his belly be not naturally looſe let it be made ſo by arte.

Exerciſe. Let the Patient uſe exerciſe before meate, ſo by litle and litle to ſpend this humor, and reſtore the native heate. Let him ſleepe litle, becauſe much ſleepe breedeth cold humors; let him avoyde griefe and ſadneſſe. And if he be of a weake body, let him abſteine from venery, leſt by another weakening by the uſe of venery added to his preſent infirmity, he fall into an uncureable coldneſſe, from whence a greater meaſure of crudity will ariſe. **What to be obſerved in the uſe of venery.** Otherwiſe, if the body be ſtrong and luſty, by ſuch exerciſes and the moderate uſe of venery it will be the more dryed and heated.

6. Epid. ſect. 5. ſen. 23. For ſo that ſentence of *Hippocrates* is to be underſtood; That venery is a cure for Phlegmaticke diſeaſes, as *Galen* in his commentaryes tells us. The Phyſition may performe the ſecond intention by turning his counſell to that part, from whence the ſpring of this Phlegmaticke humour flowes. For if the infirmity ariſe from the ſtomacke, or from any other part, the part from whence it comes muſt be ſtrengthened; if from the whole habite of the body, let attenuating, penetrating and opening medicines be preſcribed. Wee performe the third intention by evacuating the humor impact in the part with locall medicines varyed according to the foure times of the Tumor.

Lib. 2. ad Glauc. cap. 3. For *Galen* in the beginning and encreaſe preſcribeth a fomentation of *Oxycratum* uſed with a ſpunge. **A rowler.** But if ſo be that the *Oedema* be upon the Arme or Leg, a repelling rowler is very good, that is, ſuch an one as is brought from below upwards. So theſe medicines following are very fit for the ſame purpoſe, ℞. *Lixivij ex cineribus ſarmentorum, & caulium, an.* ℥iiij. *Tartari & Aluminis an.* ʒß, *aceti* ℥ij. mixe all together and make a decoction, wherein wet ſpunges and foment the place. Alſo you may uſe the following Cataplaſme, ℞, *farinæ hordei* ℥iiij. *coquantur in Lixivio communi, addendo pulveris nucis cupreſsi, corticum granatorum, balauſti. an.* ℥j. *Myrrhæ, Aloes, alum. an.* ʒß, *olei Myrtill.* ℥ij, *fiat Cataplaſma.* In the ſtate and declination you muſt uſe drying and reſolving medicines, as ℞. *Nucum cupreſsi, granat. ſumach, balauſti, an.* ℥j. *Salviæ, origan. calament. Hyſſopi, meliſſæ an. m.* j. *abſinthij, plantag. caudæ. equ. tapſi. barb. centinod. an. m. ſſ. alumi. tartar. & ſalis com. an.* ʒj. *coquanter cum lixivio*; foment it with a ſpung, then preſently apply this following Cataplaſme. ℞, *Rad. Brioniæ* ℥ij. *abſinth. plantage. centin. chamæm. meliloti, puleg. an. m. ſſ. coquantur in hydromelite, piſtentur, traijciantur, addendo pulveris roſ. rub. chamæm. melil. an.* ℥j. *fiat Cataplaſma.*

Laſtly, you may here with good ſucceſſe uſe reſolving emplaiſters and ointments, firſt heating or chafing the part by friction or fomentations aſwell moiſt as dry; otherwiſe emplaiſters will ſcarſly doe their duty, by reaſon of the great coldneſſe of the part, being not ſufficient of it ſelfe to aſſimulate the nouriſhment, or to expell the ſuperfluous and unprofitable humor. Let a fomentation be made with white wine, in which Sage, Roſmary, Time, Lavander, Chamomile and Melilote flowers, red Roſes, Orris roots, *Stæchos* and ſuch like have beene boyled, with a litle Vineger added thereunto. Quench hot brickes in the ſame decoction, and apply them wrapped in linnen clothes to the affected part, for ſo a vapour will breathe forth which hath an attenuating, pearcing, reſolving and ſtrengthening faculty. But you may in ſtead of the bricks fitly apply Hoggs or Oxe bladders, filled halfe full with the foreſaid decoction, and that hot. The frictions muſt be made with hot linnen clothes, for ſo the native heate together with the blood and ſpirits is recalled to the part, and fuliginous humors conteined under the ſkinne are reſolved, whereby the ſtrength of the part is in ſome ſort recovered.

What caution to be had in application of Emplaiſters.

CHAP. XVII.

Of the cure of flatulent and wateriſh Tumors.

I Formerly declared that not onely flatulent and wateriſh Tumors were comprehended under this word *Oedema*, but alſo ſuch as are bred of congealed Phlegme, as *Atheromata, Steatomata* and *Melicerides*. Flatulent or windy Tumors are cauſed by vapour and winde kept in or conteined ſometimes under the ſkinne, ſomewhiles under the membranes, as the *Perioſtium* and *pericranium*, whereupon enſues cruell torment by reaſon of the diſtention of theſe parts which are endued with moſt exquiſite ſenſe. Sometimes the Entrailes, as the ſtomacke and Guts are ſwollen and ſtretched out with winde, as in a Tympany.

In what places flatulencies may be gathered.

They in this differ from a true and legitimate *Oedema*, that when you lay your finger upon them and take it off againe, there remaines no ſigne of the preſſure thereof, becauſe they are diſtent by vapour and not by humor, for the vapour being preſſed returnes ſpeedily againe, as you may perceive by balles or bladders filled with winde.

In what flatulent tumors differ from a true *Oedema*.

The cauſe of ſuch Tumors is the weakeneſſe of the native heate, not being able eaſily to reſolve and waſte the Phlegme by which the windy Tumors are raiſed, for ſo the morning Sunne (which in ſome ſort reſembles our native heate) cannot reſolve the miſts diperſed in the aire; which at noone it eaſily reſolves into pure aire. Almoſt after the ſame manner our weaker heate ſtirs up vapours from that flegme it could not diſſolue, which vapours are the matter of inflations, or ſwellings. But oft times although the native heate be ſufficiently powerfull, yet becauſe the humor lyeth deepe, or is kept in by the thickneſſe of ſome membrane, tendon or Ligament, the ſtirred up vapour cannot exhale, whereby it comes to paſſe, that encreaſed by litle and litle it cauſes a Tumor.

The cauſes of flatulent Tumors.

The ſignes of ſuch a Tumor are a certaine renitency or reſiſtance perceived by preſſing it with your finger, and ſome times a noiſe as if you ſmit upon a drum,

The ſignes of ſuch Tumors.

eſpecially if much winde be conteined therein, ſuch as is often gathered together in the hollowneſſe of the belly, and in the ſpaces betweene the larger muſcles. The Tumor is neither red nor hot, but rather cold and white as in an *Oedema*. It often poſſeſſeth the joints, and eſpecially the knees, and it is very difficult to be reſolved. If ſuch flatulency be gathered together in the Guts, it cauſeth the winde Collicke, in which ſometimes the diſtention is ſo great that death enſues by reaſon of the renting or tearing the coats of the Guts.

Chap. XVIII.

Of the cure of a flatulent and wateriſh Tumor.

Diet. Things ſtrengthning the parts.

Medicines evacuating the conjunct matter.

WE ſhall chiefly and principally cure flatulent and wateriſh tumors by three meanes. Firſt by the ſame diet which wee preſcribed in an *Oedema*; then by ſtrengthening the parts appointed for concoction, as the ſtomacke & Liver, chiefly by the temperate uſe of Aromaticke things as *Diacuminum, Diacalamentha, Aromaticum caryophyllatum, Aromaticum Roſatum*, and the like, to be preſcribed according to good liking of the Phyſition which overſees the cure; laſtly by taking away of the conjunct matter by hot, drying and attenuating medicines which they call Carminative, that ſo the part being rarified the humor and flatulency therein conteined may be diſcuſſed and diſſipated. But remedies of this nature muſt be varied according to the variety of the parts; for ſome things are fit to be applyed to the ſtomacke, others to the Guts, others to the joynts, and others to the fleſhy parts; for the Collicke you muſt inject carminative gliſters, let reſolving *Sacculi* or Baggs be applyed, and cupping Glaſſes faſtened to the Navel; if an outward part be affected, we uſe fomentations, liniments, cheifly if paine torment; as alſo Cataplaſmes and Emplaiſters, as ℞ *Florum chamæm. melil. roriſmarini, roſar. rub. an. p.* j: *abſinth. hyſſopi, an. m. ij.* let them be boiled in Lye, adding a litle vineger for a fomentation to be uſed with ſpunges.

Galens fomentation.

Galen foments the part with Roſe-vinegar and a litle ſalt put thereto, and would have a ſpunge dipped therein to lye ſomewhat long upon the part. ℞. *Olei chamæm. aneth. rut. & liliorum, an.* ℥ß, *ceræ albæ* ℥vj; *aq. vitæ* ℥j, let them all be mixed together and make a liniment, with which anoint the part after the fomentation. ℞. *Farinæ fabar. orobi, an.* ℥iij, *coquantur in decocto pulegij, origani, calamenth. ſalviæ, addita pulverum chamæm. & melilot. an. m. ß. furfur. farinæ fab. & orobi, an.* ℥ij, *coquantur cum lixivio communi, addendo terebinth.* ℥iij, *oleor. aneth. & rut. an.* ℥ij; make an emplaiſter for the foreſaid uſe.

The emplaiſter of *Vigo* with Mercury, and without is very good for the ſame purpoſe. But you muſt note, that ſuch medicines muſt be applied to the part actually hot, and the ſame heat muſt be conteined and renewed by putting about it linnen clothes, bricks, bottles and ſuch like hot things.

Corroborating medicines

The Humor and flatulency which were kept ſhut up in the part being reſolved, the part muſt be ſtrengthened, leſt now and then it receive or generate the like matter: That may be done by the following fomentation and cataplaſme. ℞. *Nucum cupreſſi, corticum granat. ſumach. berberis, balauſt. an.* ʒj, *caudæ equin. arnogloſs. tapſi barb. abſinth. ſalviæ, roriſm. lavendul. an. m.* ß. *flor. chamæm. melil. roſar. anthos, an. p.* j. *alum. ſalis com. an.* ℥j, *bulliant omnia in æquis partibus aquæ fabrorum & vini auſteri*, make bagges for a fomentation, or uſe the decoction for the ſame purpoſe with a ſpunge. ℞, *Farinæ fab. hordei & lupin. an.* ℥ij. *terebinth. com.* ℥iiij, *pulver. radicis ireos, maſtic. an.* ʒß, *mellis com.* ℥ijß, of the foreſaid decoction as much as ſhall ſuffice, ſo to make a cataplaſme to the forme of a poultice liquid enough, let it be applyed hot to the affected part having uſed the fomentation before.

The ſignes of a wateriſh Tumor.

The ſignes of a wateriſh tumor are the ſame as of a flatulent; but over and beſides it ſhines, and at the preſſing with your fingers, there is hard a noyſe or murmure as of a bladder halfe filled with water.

Therefore the wateriſh tumor if it ſhall not yeeld to the forementioned reſolving medicines, the way muſt be opened with an inciſion knife, after the ſame manner, as we mentioned in a Phlegmon. For often times this kind of remedy muſt be neceſſarily uſed, not onely by reaſon of the contumacie of the humor which gives no place to the reſolving medicines, but alſo becauſe it is ſhut up in its proper cyſt or bagge, the thickneſſe of which fruſtrates the force of the reſolving medicines, neither ſuffers it to penetrate into the humor. As I ſome yeares agoe found by experience in a maid of 7. yeares old; which troubled with a *Hydrocele* or wateriſh rupture, to whom when I had raſhly applyed to diſſolve it reſolving medicines of all ſorts, at length I was forct to open it with my knife; not onely to evacuate the contained matter, but alſo that I might plucke out the bagge, which unleſſe it were cut up by the roote, would be a meane to cauſe a relapſe. *Iohn Altine* doctor of Phyſicke called me to this buſineſſe. *Iames Guilemeau* the Kings Chirurgion overſaw the cure.

Why a wateeriſh tumor muſt be opened with an inſtrument;

A Hiſtory.

Chap. XIX.

Of an Atheroma, Steatoma, and Meliceris.

ALthough theſe Tumors may be thought comprehended under one *genus* with other *Oëdematous* tumors, yet they differ as thus; that is, their matter is ſhut up in its bladder or bagge, as it were in a peculiar cell. But their difference amongſt themſelves is thus; the matter of the *Steatoma* as the name ſignifieth, is like nnto Tallow [for Στέας in Greeke ſignifieth Tallow, or ſeame] yet it oft times is found ſtuffed with other divers hard bodies, ſtony, bony or callous like unto the clawes of an hen. For *Philoxenus* reports that he ſometimes ſaw flyes in a *Steatoma* at the opening thereof, and ſuch other like things wholy diſſenting from the common matter of Tumors. The matter contained in an *Atheroma* is like to pappe, with which they feede little Children. A *Meliceris* containes matter reſembling honey in colour and conſiſtence; theſe Tumors appeare and riſe without any Inflammation going before them. Thus you ſhall know theſe Tumors; a *Steatoma* is harder than the other two, neither yeelds it to the preſſure of your finger, but when it once yeelds, it doth not ſpeedily and eaſily returne to its former figure, becauſe the matter is more groſſe; It is of the ſame colour as the skin, without paine, and of a longiſh figure. The *Meliceris* yeeds to the touch, as being a looſe and ſoft body, and as it is eaſily diſpoſed and diffuſed, ſo it quickly returnes to its former place and Tumor. It differs from the *Atheroma* in figure and ſubſtance. For it is more globous and of a ſubtiler and more ſhining matter, beſides alſo it takes up a large ſpace, and is more obſequious to the touch, and for the reſt, without paine. As for the manuall operation of the Chirurgion in their cure, it ſeemes to bee of no great conſequence of what ſort the matter is, whether reſembling tallow, honey, or pappe, for there is one ſimple manner of operation, which is, that you plucke away the conteined humor, as alſo the receptacle in which it is conteined. Yet you muſt note ſuch Tumors, ſometimes as it were hanging in the ſurface of the skin, are eaſily to bee mooved this way and that way; but other ſome againe deeper faſtned firmely cohere with the adjacent bodies, and theſe require an exquiſite hand and alſo induſtry for feare of a great flux of blood and convulſion by cutting a veine. There are many other kinds of Tumors, as the *Teſtudo* or Mole, the *Nata*, the *Glandula*, *Nodus*, *Botium*, *Lupia*, which as in matter (for they are all of a thicke, clammy and viſcous Phlegmaticke humor) ſo alſo in kinde they agree with an *Atheroma*, *Steatoma* and *Meliceris*. But alſo in theſe for the moſt part, when they are opened, you may ſee bodies of all ſorts farre different from the common matter of Tumors, as ſtones, chalke, ſande, coales, ſnailes, ſtrawes, or awnes of Corne, hey, horne, haires, fleſh both hard and ſpongious, griſtles, bones, whole creatures as well living as dead.

In what an *Atheroma*, *Steatoma*, and *Meliceris* differ,

Of Chirurgery to be uſed to theſe Tumors.

What the cauſe may be, that wee ſometimes finde *inſecta* in theſe Tumors.

The generation of which things (by the corruption & alteration of humors) ſhal not make us much to admire it, if we conſider, that as nature of all the ſeedes & elements of the wholegreat world, hath made man the Microcoſme or litle world, that he might be, as it were, the lively Image of that greater world; ſo in him, it being never idle in us, would have all the kindes of all motions and actions to ſhew themſelves, as long as matter for generation is not wanting. But becauſe there is little, or rather no mention of theſe tumors amongſt the anicents, we will brieſely ſhew the opinions of the later Writers concerning them.

What the *Teſtudo*, or *Talparia* is.

Now they ſay, the *Teſtudo* is a tumor contrary to nature, ſoft, diffuſed, or vaulted, or arched like a Tortois, ſometimes it ariſes in the head in forme of a Mole, and then it is called a Mole.

What the *Nata* is.

The *Nata* is a great and fleſhly tumor, not in ſhape unlike a Melon, or rather the fleſh of a mans buttockes, whence it may ſeeme to have had the name, unleſſe wee had rather ſay it had it, becauſe it more uſually breeds upon the buttocks, than upon any other part of the body.

What a *Glandula*.

The *Glandula* takes its denomination from an Acorne, called *Glans* in Latine, the which it ſomewhat reſembles in the compaſſe and forme of the tumor; or elſe becauſe it moſt commonly breeds in the Glandules, or Emunctories of mans body.

What *Nodus*.

The *Nodus* or knot, is a round tumor, hard and immoveable, named from a rope tied on a knot.

Guido Cauliacenſis affirmes knots commonly to grow in nervous bodies; but at this time they more uſually ariſe on the bones of ſuch as have the French diſeaſe.

Chap. XX.

Of the cure of Lupiæ, *that is, Wens, or Ganglions.*

What a *Ganglion* is.

A Wen or *Ganglion* is a tumor ſometimes hard, ſometimes ſoft, yet alwayes round, uſing to breed in dry, hard, and nervous parts. And ſeeing that ſome of the tumors mentioned before in the former Chapter, ſticke immoveable to the part to which they grow, becauſe they are contained in no cyſte, or bag; otherſome are moved up and down by the touch of your fingers, becauſe they are contained in a bag or bladder, it commonly comes to paſſe that Wens have their bladder wherein to containe them, and therefore we thinke fit, the rather more freely, and particularly to treate of their cure, becauſe they are more difficultly cured, eſpecially where they are inveterate and of long ſtanding.

The cauſes.

The primitiue cauſes of theſe are dull blowes, fallings from high places, ſtraines, and other ſuch like occaſions. But the antecedent and conjunct cauſes are the ſame with thoſe of an *Atheroma*, *Meliceris* and *Steatoma*.

Signes.

The deſcription formerly ſet downe, will furniſh you with the ſignes by which you may know when they are preſent; certainely from very ſmall beginnings they grow by little and little to a great bigneſſe, in the ſpace of ſixe or ſeaven yeares, ſome of them yeeld much to the touch, and almoſt all of them are without paine.

Their cure at the beginning.

You may hinder ſuch as are beginning and firſt growing, from encreaſe by ſomewhat a ſtrong and frequent rubbing with your fingers. For ſo their bagge or bladder, together with the ſkinne waxe thin, and the contained humor growes hot, is attenuated and reſolved. But if ſo you nothing prevaile, you muſt lie upon them with your whole hand, or a flatted peece of wood as heavy as you can, untill ſuch time as the cyſte or bagge be broken by your impreſſion; Then apply and ſtrongly binde unto it a a plate of lead, rubbed over with Quick-ſilver; for I have many times found by experience, that it hath a wonderfull force to reſolve and waſte the ſubject humor.

Plates of lead rubbed with Quick-ſilver.

But if the Wen be in ſuch a place in which you can make no ſtrong impreſſion, as in the face, cheſt, belly, and throat, let there be applied an Emplaiſter which hath a reſolving force, ſuch as this following hath; ℞, *gummi ammon. bdelij. galban. an.* ℥iij, *liqueſiant in aceto, & traijciantur per ſetaceum, addendo olei liliorum & lauri, an.* ℥j, *aquæ vitæ parum, pulveri, ireos, ſalis ammon. ſurphur. vivi, vitrioli romani, an* ʒß; let them be all incorporated together, and make an Emplaiſter according to Art. But if the tumor

A reſolving plaiſter.

tumor cannot be thus reſolved, it muſt be opened with a knife or cautery. And after the Eſchar is removed, and the bagge waiſted by Ægyptiacum, Mercury, and the like, the ulcer muſt be cleanſed, repleniſhed with fleſh, and cicatrized.

Things to waſt or conſume the bag.

Sometimes Wens grow to ſo great a maſſe, that they cannot be cured by the deſcribed remedies, wherefore they muſt be taken away by the roote, by your hand and inſtrument, if ſo be that there be no danger by reaſon of their greatneſſe, and ſo that they adhere not too cloſely to the adjacent parts, and if they be not too nigh to the greater veines and arteries; for it will be better in ſuch a cauſe to let them alone. This ſhal be your way to cut thẽ off, or take them away. A ſmal inciſion muſt be made even to the bladder, or bag, by which thruſt in a probe of a fingers thicknes, hollowed in the midſt, round at the end, and as long as neede ſhall require; then draw it many times about betweene the skinne and the bagge, even to the roote of the Wen, that ſo the skinne may be devided long wayes, then it will be requiſite to make another inciſion overthwarte, ſo that they may interſect each other like a croſſe; then preſently draw the skinne from the bladder, from the corners of the Wen, towards the roote, and that with your finger covered with a fine linnen cloath, or elſe with a Razor if neede require.

The manner to take away Wens.

But you muſt obſerve that in a Wen there are alwayes certaine veſſels, which are ſmall in the beginning, but much encreaſed in proceſſe of time, according to the encreaſe of the Wen, whereof they are as it were the rootes; wherefore if any *Hæmorrhagie* or fluxe of bloud happen, let it be ſtopped by binding the veſſels at their heads and roots, or make a ſtrait ligature at the roots of the Wen, with a peece of whipcord, or with a manytimes doubled thred, and let the ends hang forth untill it fall away of its owne accord. Neither will it be ſufficient to have cut away all this tumor, but alſo it will be fit to cut away portion of the skinne, wherewith the tumor was covered, and onely to leave ſo much as ſhall ſuffice to cover the part, then with a needle and threed draw together the lips of the inciſion, but in the interim let tents be put into the bottome of the ulcer untill it be perfectly cleſed, and the reſt of the cure be workemanlike performed, even to the cicatrizing thereof.

The Chirurgion *Collo* and I uſing this method, in the preſence of Maſter Dr. *Violanius* the Kings Phyſition, tooke away a Wen from Martiall *Colard*, the Major of Burbon; it hanged at his necke, as bigge as a mans head, and it weighed eight pounds; which made it ſo troubleſome and burdenſome to him, that he was forced to carry it bound up in a towell, as in a ſcrip.

A Hiſtory.

Verily if theſe kinde of tumors have a ſlender roote and broade top, they muſt be ſtraitly tied and ſo cut off. But it is very difficult and full of dangerous chance to take away ſuch Wens as are ſeated in the necke, neare unto the Iugular veines, theſe under the armeholes, in the groines, and ſuch as are under the ham; by reaſon of the deadly force of ſuch ſymptomes, as may thence ariſe. We can onely conjecture, not certainely ſay what kind of matter may be contained in them. We can onely know of what ſort it is, when by inciſion it is preſented to our ſight. Yet in ſuch as are very hard and doe much reſiſt the touch, there are often found matters, which in conſiſtence may be reſembled to little ſtones, or pebles.

What Wens to be cured by ligature.
Which dangerous to cure.

I being on a time called to open the body of a great Lady, found in one of her breaſts a body which might equall the bigneſſe of an Hens egge, hard, and compact like a rough peble; it was held, whilſt ſhe lived, both by the Phyſitions and Chirurgions to be a *Cancer*, becauſe this hardneſſe was very painefull to her, when it was but gently preſſed downe.

A Hiſtory.

The matter of a Wen is ſometimes taken for a *Cancer.*

But alſo ſome few yeares agon, I being called to the cure of a very honeſt woman, which was troubled with the ſame diſeaſe, ſtrongly withſtood the Phyſitions and Chirurgions affirming it to be a *Cancer*, for the tumor had taken no deepe roote, the habite of the part was not changed from the native colour, the veines about it were not ſwollen, neither was there any other convincing ſigne of a *Cancer*. For this ſame woman had her courſes at their due and uſuall time, and was well liking, and had a good colour in her face and body, was free from all ſort of paine, unleſſe when you preſſed downe the part affected. Beſides thenceforward the tumor grew not at all; no other evill accident befell her, yea verily ſhe lives merrily, and well both in body and minde.

Another *Hiſtory.*

How you may know a Wen from a *Cancer.*

Chap.

CHAP. XXI.

Of a Ganglion *more particularly ſo called.*

What a *Ganglion* properly ſo called is.

The cauſes.

THere are alſo certaine ſmall tumors of the kinde of *Lupiæ* or Wens, which grow on diverſe parts of the body, but chiefely on the wreſts of the hands, and anckles of the feete, being called by a more particular name *Ganglia*; they appeare on the top of the skinne, neither doe they ever lie deepe. The cauſe of them is either the imbecilitie of a Nerve or Tendon got by wreſting, extenſion, a blow, labour, or other ſuch like cauſe. Through which occaſion the alimentary juyce which flowed to theſe parts, ſeeing it can neither be concocted, nor aſſimulated into the proper ſubſtance, is converted into an humor of the like nature cold, and groſſe; which in continuance of time heaping it ſelfe up by little and little about the fibers, and the very ſubſtance of the tendon, concretes into a tumor.

What *Ganglia* may not be cured with iron Inſtruments.

It is not fit to uſe any iron inſtrument to theſe *Ganglia* which poſſeſſe the tendons and joints, but onely apply *Ammoniacum* and *Galbanum* diſſolved in Vinegar and *Aqua vitæ*: as ℞ *gummi ammon. & ſagapeni in aqua vitæ diſſolutorum, ana.* ℥j. *coquantur ſuper cineres calidos ad formam emplaſtri, ſub finem adde ſulphuris vivi ſubtiliter pulveriſati*, ℥ß, *fiat empl. ad uſum.* Alſo the Emplaſter of *Vigo* with double *Mercury* would be good for the ſame purpoſe.

The tumor ſoftened by theſe remedies, muſt be wrought, rubbed, or preſſed, ſo long, untill the bladder or bagge be broken under your fingers, which I have divers times done; then it will be expedient preſently to apply and binde hard thereunto a plate of lead rubbed with Quickſilver, which may waſte and conſume the remainder of the tumor.

Sometimes there are *Ganglia* ſeene hanging by a ſmall roote, as it were a ſtring; wherefore they muſt be tied with a ſtring at the roote, and every day twitched harder and harder, till ſuch time as they fall off. The reſt of the cure may be eaſily performed by the common rules of Art.

CHAP. XXII.

Of the Strumæ *or* Scrophulæ, *that is, the Kings-Evill.*

What the *Scrophula* or Kings-Evill is.

THe *Scrophulæ* are œdematous tumors ariſing in the glandulous parts, as the breaſts, armeholes, groines, but chiefely in the glandules of the neck: They appeare either one or many, according to the quantity of that matter from whence they proceede, commonly contained in their proper cyſte, or bagge, as *Atheromaes*, *Steatomaes*, and *Melicerides* are.

Their materiall cauſe.

How they differ from other glandulous tumors.

They are made of a groſſe, cold, viſcide, and phlegmaticke matter with ſome admixture of malancholy. They differ from other glandulous tumors; firſt in number, for moſt uſually there appeare many of them united together, ſpringing from ſomewhat a deeper roote than glandulous tumors doe; ſome of them are moveable, otherſome woven with the neighbouring nerves, remaining unremoveable.

Gangliæ appeare fewer in number, and are without paine; but *Scrophulæ* oftentimes are painefull, eſpecially when they waxe hot by putrefaction; ſo that ſometimes they degenerate into cancerous ulcers, not to be touched by inſtruments, nor acride medicines.

Their cure by diet.

Phlegmaticke, Melancholike, and gluttonous perſons, and ſuch as are accuſtomed to feede on cold and moiſt nouriſhments, as fiſh and cold water, and leade a ſedentarie and idle life, are ſubject to the *Scrophulæ*. They are cured by a moſt ſlender diet, for ſo the native heate by want of nouriſhment turned upon the materiall cauſe of ſuch like tumors, waſts it.

And they are cured by purging of the ſuperfluous humors, and alſo by application of emollient reſolving, and ſuppuratine topicke medicines, after this following manner. ℞, *Mucaginis alth. fænugr. & ficuum ping. an.* ℥ij, *olei liliorum, & chamæm. an.* ℥j, *pinguedinis anſeris & axungiæ porci* ʒß, *Terebinth. Ven.* ʒiß, *ammoniaci, & galbani in aceto diſſolutorum an.* ℥j, *ceræ novæ quantum ſatis, fiat cerotum ſecundum artem ad modum diachyli magni.*

Emollient and reſolving medicines.

The ointment for the French diſeaſe, and the Emplaiſter of *Vigo* with *Mercury*, are excellent for this purpoſe, eſpecially if we continue ſo long, untill the Patient come to Salivation, for ſo Nature will disburden it ſelfe of the humor, generating the *Scrophulæ*, which I have ſometimes tried with happy ſucceſſe. ℞, *Emplaſtri diachyl. alb. & mag. ceroti æſopi deſcriptionis Philagrij, ana.* ℥ij. *Terebinth. claræ* ℥j, *olei liliorum parum, fiat emplaſtrum ſatis molle.* But if the *Scrophulæ* cannot by this meanes be reſolved, but as it oft times happens, tend to ſuppuration, you muſt uſe ſuppuratives, as ℞, *rad. alth. & liliorum, an.* ℥iij, *coquantur in aqua communi, piſtentur, trajectis adde capitum alliorum ſub cineribus coctorum* ℥iij, *olei liliorum, & ping. anſeris & anat. an.* ℥ß, *farinæ ſeminis lini quantum ſatis, formetur cataplaſma.*

Suppuratives.

Here we muſt admoniſh the Chirurgion, that he open not the *Scrophula* before that all the contained humor be fully and perfectly turned into *pus* or matter; otherwiſe the reſidue of the humor will remaine crude, and will ſcarſe in a long time be brought to maturation; which precept muſt be principally obſerved in the *Scrophulæ*, and alſo ſometimes in other abſceſſes, which come to ſuppuration. For we muſt not as ſoone as any portion of the contained humors appeares converted into *pus*, procure and haſten the apertion. For that portion of the ſuppurated humor, cauſes the reſt ſooner to turne into *pus*, which you may obſerve in inanimate bodies. For fruits which begin to periſh and rot, unleſſe we preſently cut away the putrifying part, the reſidue quickly becomes rotten; there is alſo another reaſon; The native heate is the efficient cauſe of ſuppuration; it therefore (the ſore being opened) diminiſhed and weakened by reaſon of the diſſipation of the ſpirits, evacuated together with the humor, will cauſe the remaining portion of the humor, not to ſuppurate, or that very hardly, and with much difficulty. Yet if the tumified part be ſubject, by its owne nature, to corruption and putrefaction, as the fundament; if the contained matter be maligne, or criticall, it will be farre better to haſten the apertion.

A note to be obſerved in opening *Scrophulous* tumors.

Naturall heate the cauſe of ſuppuration.

There is alſo another way of curing the *Scrophulæ*, which is performed by the hand. For ſuch as are in the necke, and have no deepe roots, by making inciſion through the skin, are pulled and cut away from theſe parts with which they were entangled. But in the performance of this worke, wee take ſpeciall care, that we doe not violate or hurt with our inſtrument, the jugular veines, the ſleepy arteries, or recurrent nerves. If at any time there be danger of any great effluxe of bloud, after they are plucked from the skin, they muſt be tied at their roots, by thruſting through a needle and thred, and then binding the thred ſtrait on both ſides, that ſo bound they fall off by themſelves by little and little without any danger. The remainder of the cure may be performed according to the common rules of Art.

The Chirurgicall manner of curing *Scrophulæ*.

Chap. XXIII.

Of the Feaver which happens upon an œdematous Tumor.

HAving ſhewed all the differences of œdematous tumors, it remaines that we briefely treate of the Symptomatical feaver, which is ſometimes ſeene to happen upon them. This therefore retaining the motion of the humor by which it is made, is commonly of their kinde, which they name Intermitting Quotidians. Now the fit of a Quotidian comes every day, and in that repetition continues the ſpace of eighteene houres; the reſidue of the day it hath manifeſt intermiſſion.

How an intermitting Quotidian happens upon œdematous tumors.

The cauſe of a Quotidian fea.

The primitive cauſes of this feaver are, the coldneſſe and humidity of the aire encompaſſing

compaſſing us, the long uſe of cold meates and drinkes, and of all ſuch things as are eaſily corrupted, as Summer fruites, crude fiſhes, and laſtly, the omiſſion of our accuſtomed exerciſe.

The antecedent cauſes are a great repletion of tumors, and theſe eſpecially phlegmaticke. The conjunct cauſe, is phlegme putrefying in the habite of the body, and firſt region thereof without the greater veines.

The Signes:

The ſignes of this feaver are drawne from three things; as firſt naturall; for this Feaver or Ague chiefely ſeazes upon theſe which which are of a cold and moiſt temper, as Old-men, Women, Children, Eunuches, becauſe they have abundance of phlegme; and it invades Old-men by its owne nature, becauſe their native heate being weake, they cannot convert their meates, then taken in a ſmall quantity, into laudable bloud, and the ſubſtance of the parts. But it takes children by accident, not of its ſelfe, and the owne nature, for children are hot and moiſt; but by reaſon of their voracitie, or greedineſſe, and their violent, inordinate, and continuall motion after their plentifull feeding, they heape up a great quantity of crude humors fit matter for this feaver; whereby it comes to paſſe, that fat children are chiefely troubled with this kinde of feaver, becauſe they have the paſſages of their bodies ſtraite and ſtopped; or becauſe they are ſubject to Wormes, they are troubled with paine, by corruption of their meate; whence ariſeth a hot diſtemper by putrefaction, and the elevation of putride vapours, by which the heart being moleſted, is eaſily taken by this kinde of feaver.

How children come to be ſubject to Quotidian feavers.

From things not naturall, the ſignes of this feaver are thus drawne. It chiefely takes one in Winter, and the Spring, in a cold and moiſt Region, in a ſedentary and idle life, by the uſe of meates, not onely cold and moiſt, but alſo hot and dry, if they be devoured in ſuch plenty, that they overwhelme the native heate.

How phlegmaticke humors happen to be generated by hot and dry meats.

For thus wine, although it be by faculty and nature, hot and dry, yet taken too immoderately, it accumulates phlegmaticke humors, and cauſes cold diſeaſes. Therefore drunkenneſſe, gluttony, crudity, bathes, and exerciſes preſently after meate, being they draw the meats as yet crude into the body and veines, and to conclude, all things cauſing much phlegme in us, may beget a Quotidian feaver. But by things contrary to nature, becauſe this feaver uſually followes cold diſeaſes, the Center, Circumference, and Habit of the body being refrigerated.

The Symptomes of quotidians.

The ſymptomes of this feaver are, the paine of the mouth of the ſtomacke, becauſe that phlegme is commonly heaped up in this place, whence followes a vomiting, or caſting up of phlegme; the face lookes pale, aud the mouth is moiſt without any thirſt, often times in the fit it ſelfe; becauſe the ſtomacke flowing with phlegme, the watery and thinner portion thereof continually flowes up into the mouth and tongue, by the continuitie of the inner coate of the ventricle common to the gullet and mouth.

The manner of the pulſe and heate in a Quotidian.

It takes one with coldneſſe of the extreame parts, a ſmall and deepe pulſe, which notwithſtanding in the vigour of the fit, becomes more ſtrong, great, full, and quicke. Iuſt after the ſame manner, as the heate of this feaver at the firſt touch appeares mild, gentle, moiſt, and vaporous; but at the length it is felt more acride, no otherwiſe than fire kindled in greene wood, which is ſmall, weake, and ſmokie at the firſt; but at the length when the moiſture being overcome, doth no more hinder its action, it burnes and flames freely.

Criticall ſweats.

The urine.

The Patients are freed from their fits with ſmall ſweats, which at the firſt fits breake forth very ſparingly, but more plentifully when the *Criſis* is at hand; the urine at the firſt is pale and thicke, and ſometimes thinne, that is, when there is obſtruction. But when the matter is concoct, as in the ſtate, it is red: if at the beginning of the fit they caſt up any quantity of phlegme by vomite, and that fit be terminated in a plentifull ſweate, it ſhewes the feaver will not long laſt; for it argues the ſtrength of nature, the yeelding and tenuitie of the matter flying up, and the excretion of the conjunct cauſe of the feaver.

Why Quotidians are oft times long.

In to what diſeaſes a quartaine uſually changes.

A Quotidian feaver is commonly long, becauſe the phlegmaticke humor being cold, and moiſt by nature, is heavie and unapt for motion; neither is it without feare of a greater diſeaſe, becauſe oft times it changes into a burning, or quartaine feaver, eſpecially if it be bred of ſalt Phlegme; for ſaltneſſe hath affinity with bitterneſſe, wherefore by aduſtion it eaſily degenerates into it, ſo that, it neede not ſeeme very ſtrange, if ſalt Phlegme by aduſtion turne into choler, or Melancholy. Thoſe who recover of a quotidian Feaver, have their digeſtive faculty very weake; wherefore they muſt not be nouriſhed with ſtore of meats, nor with ſuch as are hard to digeſt. In a quotidian the whole body is filled with crude humors, whereby it comes to paſſe that this Feaver oft times laſts ſixty dayes. But have a care, you be not deceived, and take a double tertian for a quotidian, becauſe it takes the patient every day as a quotidian doth. Verily it will be very eaſie to diſtinguiſh theſe Feavers by the kinde of the humor, and the propriety of the Symptomes and accidents; beſide, quotidians commonly take one in the evening, or the midſt of the night, as then when our bodies are refrigerated by the coldneſſe of the aire cauſed by the abſence of the Sunne. Wherefore then the cold humors are moved in us, which were bridled a litle before by the preſence and heate of the Sunne. But on the contrary, double tertians take one about noone. The ſhortneſſe and gentleneſſe of the fit, the plentifull ſweat breaking forth, the matter being concocted, cauſes us to thinke the quotidian ſhort and ſalutary.

How to diſtinguiſh a quotidian from a double tertian.

Diet.

The Cure is performed by two meanes; to wit Diet and Pharmacy. Let the Diet be ſlender and attenuating, let the patient breathe in a cleere aire moderately hot and dry; let his meats be bread well baked, cocke or chicken brothes in which have bin boiled the roots of Parſly, Sorrell and the like.

When the uſe of ſpiced and ſalted meats are fit.

Neither at ſome times will the uſe of hot meats, as thoſe which are ſpiced and ſalted, be unprofitable, eſpecially to ſuch as have their ſtomacke & liver much cooled. Let him eate Chickins, Mutton, Partridge and ſmall Birds, river fiſhes and ſuch as live in ſtony waters fryed or broiled, reare Egges and ſuch like. Theſe fruits are alſo good for him, Raiſons, ſtewed Prunes, Almonds and Dates. Let his drinke be ſmall white wine mixed with boyled water. Moderate exerciſes will be good, as alſo frictions of the whole body: ſleepe taken at a fitting time, and proportioned to waking, ſo that the time of ſleepe fall not upon the time of the fit; for then it hurts very much; for calling the heat to the inner parts, it doubles the raging of the feaveriſh heat inwardly in the bowells.

When ſleepe is hurtfull.

For the paſſions of the minde, the patient muſt be merry, and comforted with a hope ſhortly to recover his health. It ſeemes not amiſſe to ſome, at the comming of the fit to put the feet and Legs into hot water, in which Chamomill, Dill, Melilote, Marjerome, Sage, and Roſemary have beene boyled.

Medicines.

The Medicines ſhall be ſuch Syrupes as are called digeſtive and aperitive, as Syrupe of Wormewood, Mints, of the five opening rootes, *Oxymel* with a decoction of Chamomill, Calamint, Melilot, Dill and the like, or with common decoctions. The Purgatives ſhall be *Diaphænicon*, *Electuarium Diacarthami*, *Hiera picra*, Agaricke; Turbith; of which you ſhall make potions with the water of Mints, Balme, Hyſſope, Sage, Fennell, Endive or the like, *Pillulæ aureæ* are alſo good. Theſe purgatives ſhall ſometimes be given in forme of a bole with Sugar, as the Phyſition being preſent ſhall thinke moſt fit and agreeable to the nature of the Patient.

Care muſt be had of the ſtomacke.

Vomits.

About the ſtate of the diſeaſe, you muſt have a care of the ſtomake and principally of the mouth thereof, as being the chiefe ſeate of Phlegme; wherfore it will be good to anoynt it every other day with oyle of Chamomill mixed with a litle white wine, as alſo to unlade it by taking a vomit of the juice of Raddiſh, and much *Oxymel*, or with the decoction of the ſeeds and roots of *Aſarum* and Chamomill; and Syrupe of vineger will be very good, eſpecially at the beginning of the fit, when nature and the humors begin to move; for an inveterate quotidian, though you can cure it by no other remedy, nothing is thought to conduce ſo much as one dram of old Treacle taken with Sugar in forme of a Bole, or to drinke it diſſolved in *Aqua vitæ*.

The uſe of Treacle in an inveterate quotidian.

Chap. XXIIII.

Of a Scirrhus, *or an hard Tumor proceeding of Melancholy.*

What a true and legitimate *Scirrhus* is,

What an illegitimate *Scirrhus* is.

HAving ſhewed the nature of Tumors cauſed by blood, choler and Phlegme, it remaines we ſpeake of theſe, which are bred of a Melancholike humor; Of theſe there are ſaid to be foure differences. The firſt is of a true and legitimate *Scirrhus*, that is, of an hard Tumor endued with litle ſenſe, and ſo commonly without paine, generated of a naturall Melancholike humor. The ſecond is, of an illegitimate *Scirrhus*, that is, of an hard Tumor inſenſible, and without paine, of a Melancholike humor concrete by too much reſolving and refrigerating. The third is of a cancrous *Scirrhus* bred by the corruption and aduſtion of the Melancholike humor. The fourth of a Phlegmonous, *Eryſipelous* or *Oedematous Scirrhus*, cauſed by Melancholy mixed with ſome other humor. The cauſe of all theſe kinds of Tumors is a groſſe, tough and tenacious humor concrete, in any part. But the generation of ſuch an humor in the body happens either of an ill and irregular, diet, or of the unnaturall affects of the liver or ſpleene, as obſtruction; or by ſuppreſſion of the *Hæmorrhoides* or Courſes.

The ſignes.

Prognoſticks.

The ſignes are hardneſſe, renitency, a blackiſh colour, and a dilatation of the veines of the affected part with blackiſhneſſe, by reaſon of the aboundance of the groſſe humor. The illegitimate or baſtard *Scirrhus* which is wholy without paine and ſenſe, and alſo the cancerous, admit no cure, and the true legitimate ſcarſe yeeld to any. Thoſe which are brought to ſuppuration, eaſily turne into cancers and fiſtulaes; theſe tumors though in the beginning they appeare litle, yet in proceſſe of time they grow to a great bignes.

Chap. XXV.

Of the Cure of a Scirrhus.

Diet.

Lib. 2. Ad Glauconem.

THe Cure of a *Sirrhus* cheefly conſiſts of three heads. Firſt, the Phiſition ſhall preſcribe a convenient diet, that is, ſober and moderate in feeding, tending to humidity, and indifferent heate; for his manner of life, let it be quiet and free from all perturbation of anger, greiſe and ſadneſſe, as alſo abhorring the uſe of venery. The ſecond is placed in the evacuation of the antecedent matter, as by Phlebotomy, if need require, and by purging, by procuring the *hæmorrhoids* in men and the courſes in women; let purgations be preſcribed of *Diacatholicon*, *Hyera*, *diaſenna*, polipody, *Epythymum* according to the minde of the learned Phyſition. The third conſiſts in the convenient uſe of Topicke medicines, that is, emollient at the beginning, and then preſently reſolving, or rather ſuch as are mixed both of reſolving & emollient faculties, as *Galen* teaches; for by the uſe of only emollient things there is danger of putrefaction and a *Cancer*, and only of reſolving there is feare of concretion the ſubtiler part being reſolved, and the groſſer ſubſiding.

Emollients.

The emollient ſhall be thus: ℞. *Rad. alth. lib. ſ. rad. liliorum* ℥iij. *coquantur in aqua com. piſtentur, traijciantur per ſetaceum, addendo olei chamæm. & lilior. an.* ℥ij. *æſipi humidæ* ℥ß. *emplaſtri diachyl. alb. cum oleo liliorum diſſoluti* ℥iij, *ceræ albæ quantum ſit ſatis, fiat cerotum.* Or ℞. *gummi ammoniaci, galb. bdellij, ſtyracis liquidæ in aceto diſſolutorum, an.* ℥j. *diachyl. mag.* ℥jß, *olei liliorum, & axungiæ anſeris, an.* ℥j. *ceroti æſip. deſcriptione Philagr.* ℥ij. *liqueſcant omnia ſimul, ceræ quantum ſit ſatis, ut inde fiat cerotum ſatis molle.* When you have ſufficiently uſed emollient things, fume the Tumour with ſtrong Vinegar and *Aqua vitæ* poured vpon

a

a peice of a Milſtone, flint or bricke heated very hot; for ſo the mollified humor will be rarified, attenuated, and reſolved; then ſome while after renew your emollients, and then againe apply your reſolvers to waſte that which remaines, which could not be performed together and at once; for thus *Galen* healed a Scirrhus in *Cercilius* his ſonne. Goats dung is very good to diſcuſſe Scirrhous tumors; but the Emplaſter of *Vigo* with a double quantity of Mercury is effectuall above the reſt, as that which mollifies, reſolves and waſts all tumors of this kinde.

Lib. 2. ad Glau.

The efficacy of the Empl. of Vigo with Mercury.

CHAP. XXVI.

Of a Cancer *already generated.*

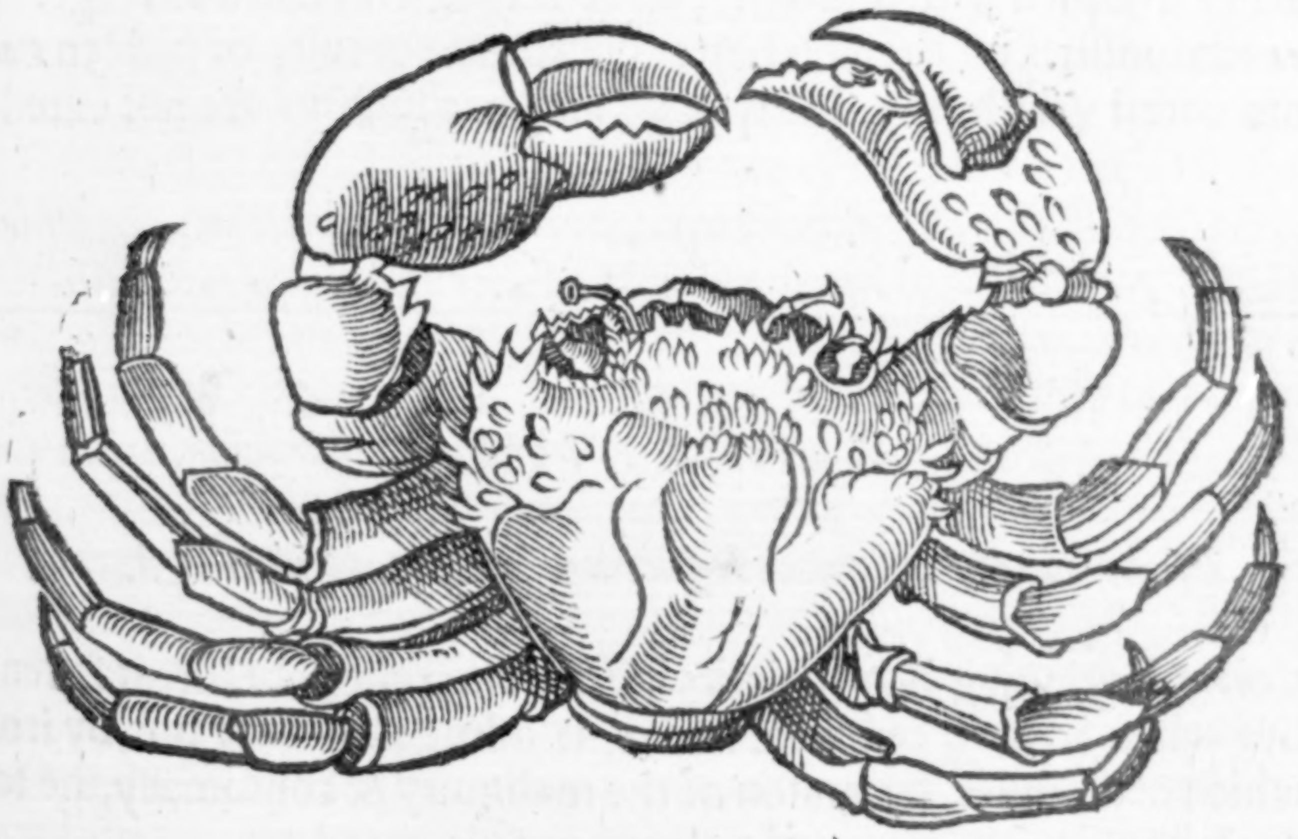
A *Cancer* is an hard Tumor, rough and unequall, round, immoveable, of an aſh, or livide colour, horrid by reaſon of the veines on every ſide, ſwollen with blacke blood, and ſpred abroad to the ſimilitude of the ſtretched out legs and clawes of a Crabb. It is a tumor hard to be knowne at the firſt, as that which ſcarſe equalls the bigneſſe of a Chicke, or *Cicer*, after a little time it will come to the greatneſſe of a Haſell Nut, unleſſe peradventure provoked by ſomewhat too acride medicines it ſodainly encreaſe; being growne bigger, according to the meaſure of the encreaſe it torments the patient with pricking paine, with acride heat, the groſſe blood reſiding in the veines growing hot, and inferring a ſenſe like the pricking of Needles, from which notwithſtanding the Patient hath oft times ſome reſt. But becauſe this kinde of Tumor by the veines extended & ſpred about it like clawes and feet, being of a livide and aſh colour, aſſociated with a roughneſſe of the skin and tenacity of the humor, repreſents, as it were, the toothed clawes of the Crab, therefore I thought it not amiſſe here to inſert the Figure of the Crabb, that ſo the reaſon both of the name and thing might be more perſpicuous.

What a *Cancer* is.

The nature of the paine.

The reaſon of the name.

The figure of the Crabb, called Cancer *in Latine.*



CHAP. XXVII.

Of the cauſes, kinds, and prognoſticks of a Cancer.

Here we acknowledge two cauſes of a *Cancer*, the antecedent, and conjunct. The antecedent cauſe depends upon the default of irregular diet, generating and heaping up groſſe and feculent blood; by the morbificke affection

The cauſes of a *Cancer*.

The cauſes of a not ulcerated Cancer.

of the Liver diſpoſed to the generation of that bloud; by the infirmity or weakeneſſe of the ſpleene in attracting and purging the bloud; by the ſuppreſſion of the Courſes or Hæmorrhoids, or any ſuch accuſtomed evacuation. The conjunct cauſe is that groſſe and melancholicke humor ſticking and ſhut up in the affected part, as in a ſtraite, That malancholicke bloud which is more milde, and leſſe maligne, onely encreaſed by a degree of more fervide heat, breeds a not ulcerated *Cancer*, but the more maligne and acride cauſes, an ulcerated. For ſo the humor which generated Carbuncles, when it hath acquired great heat, acrimony, and malignitie, corrodes, and ulcerates the part upon which it alights. A *Cancer* is made more fierce and raging by meates inflaming the bloud, by perturbations of the minde; anger, heate, and medicines too acride, oiely, and emplaiſticke, unfitly applied, both for time and place.

The ſorts and differences of Cancers.

Aetius lib. 16.

The parts moſt ſubject to Cancers.

What Cancers one muſt not undertake truely to cure.

Amongſt the ſorts or kindes of *Cancers*, there be two chiefely eminent, that is, the ulcerated or manifeſt *Cancer*, and the not ulcerated, or occult. But of *Cancers* ſome poſſeſſe the internall parts, as the Guts, Wombe, Fundement; others the externall, as the Breaſts; alſo there is a recent, or late bred *Cancer*, and alſo an inveterate one. There is one ſmall, another great; one raging and maligne, another more milde. Every *Cancer* is held almoſt incurable, or very difficult to be cured, for it is a diſeaſe altogether maligne, to wit, a particular Leproſie. Therefore ſaith *Aëtius*, a *Cancer* is not eaſily ſtaied untill it hath eaten even to the innermoſt of the part which it poſſeſſes. It invades women more frequently than men, and thoſe parts which are laxe, rare, fungous, and glandulous, and therefore opportune to receive a defluxion of a groſſe humor, ſuch are the Breaſts and all the emunctories of the noble parts. When it poſſeſſes the Breaſts, it often cauſes inflammation to the armeholes, and ſends the ſwelling ever to the glandules thereof; whereupon the Patients doe complaine that a pricking paine even peirces to their hearts. But this ſame paine alſo runs to the clavicles, and even to the inner ſide of the ſhoulderblades and ſhoulders. When it is encreaſed, and covers the noble parts, it admits no cure but by the hand; but in decaied bodies, whoſe ſtrength faile, eſpecially if the *Cancers* be inveterate, we muſt not attempt the cure, neither with inſtrument, nor with fire, neither by too acride medicines, as potentiall Cauteries; but we muſt onely ſeeke to keepe them from growing more violent, and from ſpreading further, by gentle medicines, and a palliative cure. For thus many troubled with a *Cancer*, have attained even to old age. Therefore *Hippocrates* admoniſhes us, that it is better not to cure occult, or hidden *Cancers*; for the Patients cured (ſaith he) doe quickly die, but ſuch as are not cured live longer.

Chap. XXVIII.

Of the Cure of a Cancer *beginning, and not yet ulcerated.*

Lib. 2. ad Glau.

A *Cancer* beginning is oft hindred from encreaſing, before it faſten its roots, but when it hath once encreaſed, it admits no cure but by iron, as that which contemnes, by reaſon of the malignity & contumacy, the force of all medicines. *Galen* affirmes, he cured a *Cancer* not ulcerated.

Now that cure is performed by medicines, purging melancholy, by Phlebotomy, when the ſtrength and age of the Patient may well endure it, by ſhunning all things, which may breed ill and fæculent bloud. The diſtemper of the Liver muſt firſt be corrected, the Spleene ſtrengthened, as alſo the part affected; in men the Hæmorrhoides, in women their Courſes muſt be procured.

Diet,

Threfore thicke and muddy wines, vinegar, browne bread, cold hearbes, old cheeſe, old and ſalted fleſh, Beefe, Veniſon, goate, hare, garlicke, onions and muſtard, and laſtly all acride, acide and other ſalt things, which may by any meanes incraſſate the blood, and inflame the humors, muſt be eſchewed. A cooling & humecting diet muſt be preſcribed; faſting eſchewed, as alſo watchings, immoderate labours, ſorrow, cares, and mournings; let him uſe priſans, and in his brothes boile Mallowes, Spinach, Lettuce, Sorrell, Purſlaine, Succory, Hops, Violets, Borradge, and the foure cold ſeeds. But let him feede on Mutton, Veale, Kid, Capon, Pullet, young Hares, Partridges, Fiſhes of ſtony rivers, reare Egges; and uſe white wine, but moderately for his drinke.

The part affected with the *Cancer* muſt be gently handled, and not overburdened by over hard, or heavy things, or by too ſolide, or fat emplaiſters; on the contrary gentle and mitigating medicines muſt be uſed; applying alſo at certaine times ſuch things as reſiſt venome or poyſon, as Treacle and Mithridate. Aſſes milke is exceeding fit to aſſwage the acrimony of the cancorous humor. Therefore it muſt not only be taken inwardly, but alſo applied outwardly to the cancrous ulcer, making thereof a fomentation.

How to handle the cancorous part.

Antidotes. Aſſes milke.

CHAP. XXIX.

Of the cure of an ulcerated Cancer.

AN Vlcerated *Cancer* hath many ſignes common with that which is not ulcerated, as the roundneſſe of the tumor, the inequality, roughneſſe, and paine; to the judgement of the eye, the tumour ſeemes ſoft, but it is hard to the touch; the Vlcer is filthy, with lips thicke, ſwolne, hard, knotty, turned out, and ſtanding up, having a horrid aſpect, and caſting forth ichorous, filthy, and carionlike filth, ſometimes blacke, ſometimes mixed with rotten filth, and otherwhiles with much bloud. This kinde of ulcer is maligne, rebellious, and untractable, as that which contemnes milde remedies, and becomes more fierce, by acride and ſtrong; the paine, feaver, and all the ſymptomes being encreaſed, from whence the powers are dejected, the waſting and conſumption of the body followes, and laſtly death. Yet if it be ſmall, and in a part which may ſuffer amputation, the body being firſt purged, and bloud drawne, the ſtrength of the Patient not diſſwading, it will be convenient to uſe the hand, and to take hold of, and cut away whatſoever is corrupt, even to the quicke, that no feare of contagion may remaine, or be left behind. The amputation finiſhed, the bloud muſt not be preſetly ſtopped, but permitted to flow out in ſome meaſure, yea verily preſſed forth all about it, that ſo the veines ſwollne with blacke and melancholicke bloud may be disburdened. When you have taken a ſufficient quantity of bloud, the place muſt be ſeared with an actuall cautery. For that will ſtrengthen the part affected, draw forth the venenate quality, and alſo ſtay the defluxion. Then muſt you apply mitigating medicines, & procure the falling away of the Eſchar. To conclude, that which remaines, muſt be performed according to the cure of other ulcers. Now we know and underſtand that all the *Cancer* is cut away, and all the malignity thereof extinct, when the ulcer caſts forth laudable matter, when that good fleſh begins to grow by little and little, like to the graines of a Pomeganate, the pricking paine, and all the ſymptomes being aſſwaged. Yet the cure of an ulcerated *Cancer*, which ſhall poſſeſſe the lips may be more happily and mildly performed, no cauſticke medicine being applied after ſection, ſo alſo that ſcarſe any deformity will be left, when it is cicatrized. Which new and never formerly tried, or written of way, as farre as I know, I found and performed in a man of fifty yeares old. Doctor *Iohn Altine*, a moſt learned Phyſition being called to Counſell, *Iames Guillemeau*, and Maſter *Euſtachius*, the Kings Chirurgions, and *Iohn Le Ieune* the Duke of Guiſe his moſt worthy Chirurgion being preſent.

The Signes.

How and where a *Cancer* may be cut away.

What to be obſerved in cutting away a *Cancer*.

The benefit of applying a cautery after amputation of the *Cancer*.

Signes that a *Cancer* is well taken away.

The way is this; The *Cancer* muſt be thruſt through the lips on both ſides, above and below with a needle and threed, that ſo you may rule and governe the *Cancer* with your left hand, by the benefit of the threed (leaſt any portion thereof ſhould ſcape the inſtrument in cutting) and then with your Sizers in the right hand, you may cut it off all at once, yet it muſt be ſo done, that ſome ſubſtance of the inner part of the lippe, which is next to the teeth, may remaine, (if ſo be that the *Cancer* be not

A new and obſerveable way of taking away a *Cancer* from the lippe.

not growne quite through) which may ſerve as it were for a foundation to generate fleſh to fill up the hollowneſſe againe. Then when it hath bled ſufficiently, the ſides & brinkes of the wound muſt be ſcarified on the right and lift ſides, within, and without, with ſomewhat a deepe ſcarification, that ſo (when we would draw together the ſides and lips of the wound, by that manner of ſtitching, which is uſed in an hare-lippe) we may have the fleſh more pliant and tractable to the needle and threed. The reſidue of the cure muſt be performed juſt after the ſame manner as we uſe in hare-lips; of which we ſhall treate hereafter.

Chap. XXX.

Of the Topicke medicines to be applied to an unlcerated, and not ulcerated Cancer.

Repelling medicines,

WE at the beginning uſe repercuſſive medicines, ſuch as are the juyces of Nightſhade, Plantaine, Henbane, Lettuce, Sorrell, Houſelecke, Water Lentill or Duckes-meate, Knotgraſſe, Pomegranates, and the like. Alſo *oleum roſarum omphacinum*, the powders of Sumach, Berberies, Litharge, Ceruſe, Burnt-lead, *Tutia*, Quickſilver, and the like. Of which you may compoſe Fomentations, Liniments, Ointments, Cataplaſmes, Emplaiſters. *Emplaſtrum Diacalcitheos* diſſolved with juice of Nightſhade, and oile of Roſes is very fit for not ulcerated *Cancers*. *Pompholix*, or *Tutia*, waſhed in juice of Nightſhade, or Plantaine, is very good for ulcerated *Cancers*. Beſides this following medicine is very cōmendable.

℞, *Lytharg. & ceruſ. an.* ℥j, *terantur in mortario plumb. cum oleo roſar. donec reducantur ad conſiſtentiam linimenti vel unguenti*; and there may be uſe of a reſolving and repercuſſive ointment, as ℞, *plumbi uſti loti, pomphol. thuris, an.* ʒijß, *abſinth. pontic.* ℥ß, *olei roſarum* ℥iij, *ceræ* ʒvj, *ſucci ſolani, quantum ſufficit ad unguenti craſsitudinem.* They very much commend *Theodorickes* Emplaiſter to aſſwage the paine of ulcerated *Cancers*.

Theodoricks Emplaiſter.

℞, *Olei roſ. ceræ alb. an* ℥ijß, *ſucci granat. & ſolani, an.* ℥ij, *ceruſæ lotæ* ℥j, *plumbi uſti, loti, & tuthiæ præpar. an.* ℥ß, *thuris, maſtich. an.* ʒij, *fiat empl. molle.* This following ointment I have often uſed with good ſucceſſe.

℞, *Therciac. veter.* ℥j, *ſucci cancrorum* ℥ß, *ſucci lactucæ & olei roſar. an.* ℥iß, *vitel. ovorum ſub cinerib. coct.* ij, *camphor.* ʒß, *piſtentur omnia in mortario plumb. & fiat unguentum.*

℞, *ſpum. argent. axungiæ porci recentis, ceræ alb. an lib.* ß, *olei boni* ℥viij, *vitel. ovorum aſſat.* iiij, *fiat ungnent. ſervetur uſui.* And when you will vſe it, mixe it with a little ointment of Roſes. I have alſo mitigated great paine by applying Leaches to an unulcerated *Cancer*, in that part where the torment was moſt vehement, by diſburdening the part of ſome portion of the maligne humor; which ſame thing I have done by application of young Whelpes, or Kitlings, or Pidgions, or Chickins cut long wayes, and preſently applied to the ulcer, and now and then changed, as ſoone as their heat ſeemes diſſolved; and others applied for the naturall heat in an anodyne or mitigating medicine. *John Baptiſta Theodoſius* in his Epiſtles, writes, that a cataplaſme of the herbe *Eryſimum*, or Cadlocke, being beaten, is very good to be applied to a *Cancer* not ulcerated; but if the *Cancer* be ulcerated, he boiles this ſame herbe in *Hydromel*, and ſo by injections and lotions clenſes the ulcer, and mitigates the paine. If the *Cancer* affect the wombe, the patient feeles the pricking of the paine in the groines above the *pecten*, and in the Kidneyes, & is often troubled with a difficulty of making water; but when it is ulcerated it poures forth filth or matter exceeding ſtinking & carion-like, and that in great plenty; the filthy vapour of which carryed up to the heart and braine, cauſes often ſwounding. Now to mitigate the paines of ſuch like places, the following medicines are of good uſe.

Leaches.

The application of whelps, chickins, &c.

Epiſt. 21. The eſtate of *Eryſimum*.

The ſignes of the *Cancer* in the wombe.

℞. *Mucag. ſemin. lini, fænugr. extract. in aqua roſar. & plantaginis quod ſatis eſt*; Of this being warme make a fomentation.

℞. *Rad. Athea,* ℔ß. *coquatur in hydromelite, piſtetur, & traijciatur, addendo olei roſar. parum, fiat Cataplaſma.* Alſo you ſhall make divers peſſaries according to the different kinds of paine; alſo make injections of the juice of Plantaine, Knotgraſſe, Lettuce, Purſlaine, mixed together, and agitated or laboured in a leaden mortar with a litle

oile

lation to generate
tiently, the ſides &
within, and with-

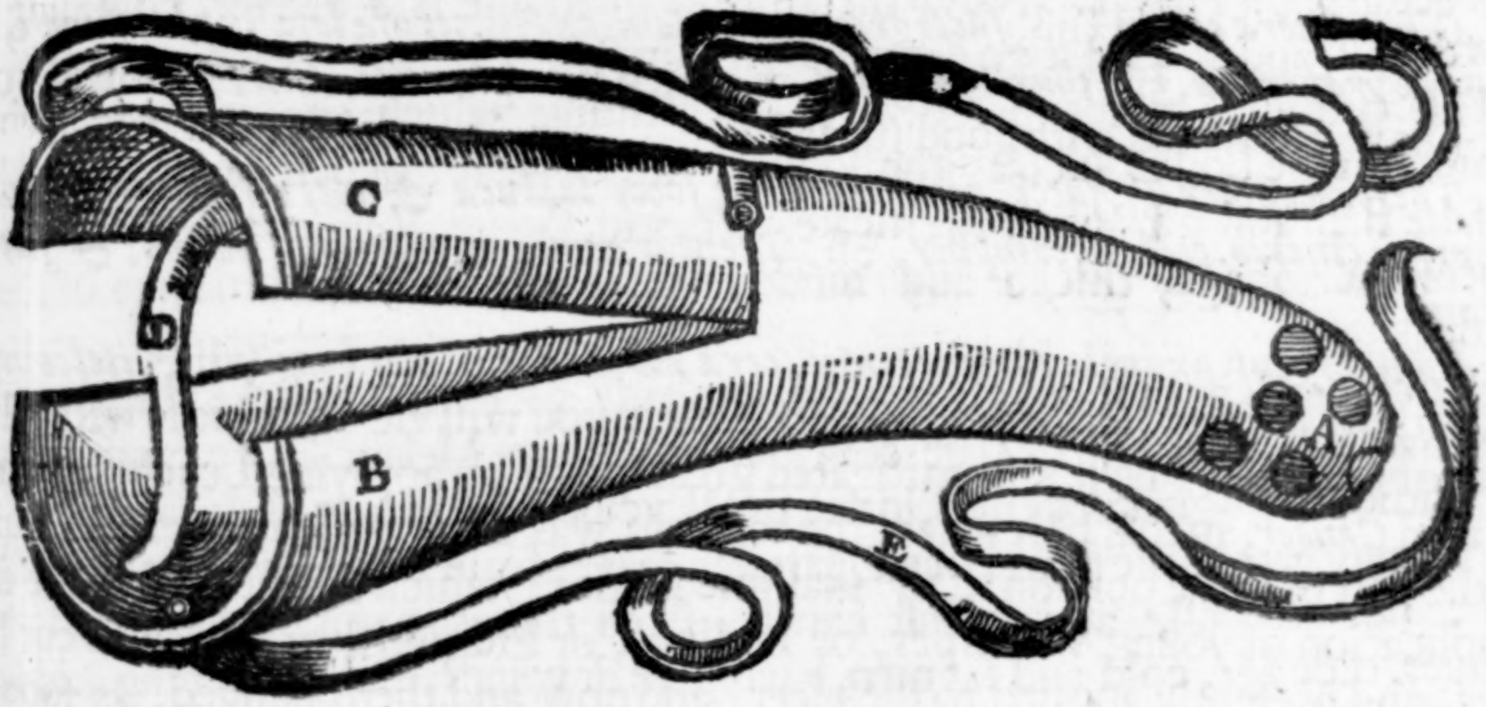
oyle of Roſes; for this kinde of medicine is commended by *Galen*, in every kinde of ulcerated *Cancer*. Alſo this following water is very profitable, and often approved by me. ℞. *Stercoris bubuli* ℔ .iiij. *herbæ Roberti*, *plantag*, *ſempervivi*, *hyoſcyami*, *portulac. lactuc. endiv. an. m.* j. *cancros fluviatiles*, *num. xij.* let them be all beaten together and diſtilled in a leaden Alembicke, keepe the liquor for uſe and with it make often injection into the part; or if the ſite of the part will permit, let the cancerous ulcers be waſhed therewith, and pledgets of lint ſteeped therein be applyed and renewed ever and anon; for ſo the acrimony and force of the inflammation is retunded, and the paine aſſwaged. *Galen* beats into powder river Crabs burnt; the powder mixed with oyntment of Roſes is moſt profitably applyed upon lint to cancerous ulcers.

Lib. 9. Simpl.

Lib. 4. de comp. med. ſecundum gen.

It will be very convenient to put into the necke of the wombe the following inſtrument made of Golde, or Silver, whereby the cancerous filth may have free and ſafe paſſage forth, and the filthy and putredinous vapours may more eaſily breathe forth. Therefore let it be hollow quite through; ſome five or ſixe fingers long, and about the bignes of ones Thumbes, at the upper end, perforated with many holes whereby the filth may have paſſage forth. Let the outer or lower end be ſome two fingers thicke in the circumference, make it with a neat ſpringe, that may hold that end open more, or leſſe according to the Phyſitions minde; let there be two ſtrings, or laces put unto it, by which being tyed before and behinde to the rowler, with which the woman ſhall girt her loynes, the Device may be kept from falling, as you may ſee in the following figure.

A Vent made like a Peſſary for the wombe affected with a Cancerous ulcer.



A. *Shewes the upper end perforated with five or ſixe holes.*
B. *The Lower end.*
C. *That part of the end which is opened by the ſpringe, which is marked with the letter* D.
E E. *The ſtrings, or laces.*

Neither is that remedy for not ulcerated cancers to be contemned, which conſiſts of a plate of lead beſmeared with quick-ſilver; for *Galen* him ſelfe teſtifies that lead is a good medicine for maligne and inveterate ulcers. But *Guido Cauliacenſis* is a witneſſe of ancient credit and learning, that ſuch plates of lead rubbed over with quick-ſilver, to ſuch maligne ulcers as contemne the force of other medicines, are as it were Antidotes, to waſte and overcome their malignity and euill nature. This kinde of remedy, when it was preſcribed by that moſt excellent Phyſition *Hollerius*, who commanded me to apply it to the Lady of *Montigni* maide of Honor to the Queene mother, troubled with a *Cancer* in her left breſt, which equalled the bignes of a Wallnut, did not truely throughly heale it, yet notwithſtanding kept it from further growth.

Lib. 9. ſimp.

Plates of Lead

A Hiſtory.

Wherefore at the length growing weary of it, when ſhee had committed her ſelfe to a certaine Phyſitian boldly promiſing her quicke helpe, ſhe tryed with loſſe of her life, how dangerous, and diſadvantagious that cure of a *Cancer* was, which is undertaken according to the manner of healing other ulcers; for this Phyſition, when he had caſt away this our medicine, and had begun the cure with mollifying, heating and attractive thing, the paine, inflammation and all the other Symptoms encreaſing, the Tumor grew to that bignes; that being the humor drawne thither could not be conteined in the part it ſelfe, it ſtretched the breſt forth ſo much, that it broke it in the middle, juſt as a Pomegranate cleaves when it comes to its full maturity; whereupon an immoderate fluxe of blood following, for ſtaying whereof hee was forcte to ſtrew cauſticke pouders thereon; but by this meanes the inflammation and paine becomming more raging, and ſwoundings comming upon her, ſhee poore Soule in ſteed of her promiſed health, yeelded up her ghoſt in the Phyſitions boſome.

Chap. XXXI.

Of the Feaver which happeneth in Scirrhous Tumors.

Why a quartaine happens upon ſcirrhous tumors.

SVch a Feaver is a Quartaine, or certainly comming neare unto the nature of a Quartaine, by reaſon of the nature of the Melancholike humor of which it is bred. For this ſhut up in a certaine ſeat in which it makes the tumor, by communication of putride vapours heats the heart above meaſure, and enflames the humors conteined therein, whence ariſes a Feaver. Now therefore a quartaine is a Feaver comming every fourth day, and having two dayes intermiſſion.

The primitive cauſes thereof are, theſe things which encreaſe Melancholicke humors in the body, ſuch as the long eating of pulſe, of courſe and burnt bread, of ſalte fleſh and fiſh, of groſſe meates as Beefe, Goate, Veniſon, olde Hares, olde Cheeſe, Cabbage, thicke and muddy wines and other ſuch things of the ſame kinde.

The antecedent cauſes are a heaped up plenty of Melancholicke humors abounding over all the body. But the conjunct cauſes are Melancholike humors putriſying without the greater veſſels, in the ſmall veines and habite of the body.

The ſignes.

We may gather the ſignes of a Quartaine feaver from things which they call naturall, not naturall, and againſt nature; from things naturall, for a cold and dry temper, olde age, cold and fat men, having their veines ſmall, and lying hidde, their ſpleene ſwolne and weak, are uſually troubled with quartaine Feavers.

Why they are frequent in Autumne.

Of things not naturall; this Feaver, or Ague is frequent in Autumne, not onely becauſe, for that it is cold and dry, it is fit to heape up Melancholike humors; but cheifly by reaſon that the humors by the heate of the preceding Summer are eaſily converted into aduſt Melancholy, whence far worſer and more dangerous quartaines ariſe, than of the ſimple Melancholike humor; to conclude, through any cold or dry ſeaſon in a region cold and dry, men that have the like Temper eaſily fall into quartaines; if to theſe a painefull kinde of life full of danger and ſorrow doth accrew.

Of things contrary to nature; becauſe the fitts take one with painefull ſhaking, inferring as it were the ſence of breaking or ſhaking the bones; further it taketh one every fourth day with an itching over the whole body, and oft times with a thinne skurfe and puſtles eſpecially on the legges; the pulſe at the beginning is litle, ſlow, and deepe, and the urine alſo is then white and wateriſh, inclining to ſomewhat a darke colour.

In the declination when the matter is concocted the urine becomes blacke, not occaſioned by any maligne Symptome or preternaturall exceſſe of heat, (for ſo it ſhould be deadly) but by excretion of the conjunct matter. The fit of the Quartaine continues 24 houres, but the intermiſſion is 48 houres. It often takes its originall from an obſtruction, paine, and *Scirrhus* of the Spleene, and the ſuppreſſion of the courſes and Hæmorroides.

Prognoſticks.

From what diſeaſes a quartain frees one.

Quartaines taken in the Summer are for the moſt part ſhort, but in the Autumne long, eſpecially ſuch as continue till Winter. Thoſe which come by ſucceſſion of any diſeaſe of the Liver, Spleene, or any other precedent diſeaſe, are worſe than ſuch as are bred of themſelves, and commonly end in a Dropſie. But thoſe which happen without the fault of any bowells, and to ſuch a patient, as will be governed by the Phyſition in his Diet, infer no greater harme, but free him from more grievous and long diſeaſes, as Melancholy, the Falling ſickneſſe, Convulſions, Madneſſe, becauſe the Melancholy humor, the author of ſuch diſeaſes, is expelled every fourth day by the force of the fit of the Quartaine.

Diet.

How much vomiting prevailes to cure a Quartaine

Medicine.

A Quartane Feaver, if there be no error committed, commonly exceeds not a yeare, for otherwiſe ſome Quartanes have beene found to laſt to the twelfth yeare according to the opinion of *Auicen*: the Quartane beginning in Autumne is oft times ended in the following ſpring; the Quartane which is cauſed by aduſt blood or choler or Salt flegme is more eaſily and ſooner cured, than that which proceeds from an aduſt Melancholy humor; becauſe the Melancholy humor, terreſtriall of its owne nature, and harder to be diſcuſſed than any other humor, is againe made by aduſtion (the ſubtiller parts being diſſolved and the groſſer ſubſiding) more ſtubborne, groſſe, maligne and acride. The cure is wholy abſolved by two meanes, that is, by Diet and medicines. The Diet ought to be preſcribed, contrary to the cauſe of the Feaver in the uſe of the ſixe things not naturall, as much as lyes in our power. Wherfore the Patient ſhall eſchew Swines fleſh, flatulent, viſcide and glutinous meats, fenny fowles, ſalt meats and Veniſon, and all things of hard digeſtion. The uſe of white wine indifferent hot and thin is convenient to attenuate and incide the groſſe humor, and to move urine and ſweat; yea verily at the beginning of the fit a draught of ſuch wine will cauſe vomiting, which is a thing of ſo great moment, that by this one remedy many have been cured. Yet if we may take occaſion and opportunity to provoke vomit, there is no time thought fitter for that purpoſe than preſently after meate; for then it is the ſooner provoked, the fibers of the Stomach being humected & relaxed, and the ſtomach is ſooner turned to vomiting, whereupon followes a more plentifull, happy and eaſie evacuation of the Flegmatique and Cholericke humor, and leſſe troubleſome to nature: and of all the crudities with which the mouth of the ventricle abounds in a Quartaine, by reaſon of the more copious afflux of the Melancholike humor, which by his qualities cold and dry, diſturbes all the actions and naturall faculties. Moreouer exerciſes and frictions are good before meat; ſuch paſſions of the minde as are contrary to the cauſe from which this Feaver takes his originall, are fit to be cheriſhed by the patient; as Laughter, Ieaſting, Muſique, and all ſuch like things full of pleaſure and mirth. At the beginning the patient muſt be gently handled and delt withall, and we muſt abſtaine from all very ſtrong medicines untill ſuch time, as the diſeaſe hath beene of ſome continuance. For this humor, contumacious at the beginning when as yet nature hath attempted nothing, is againe made more ſtubborne, terreſtriall and dry, by the almoſt fiery heat of acride medicines. If the body abound with bloud, ſome part thereof muſt be taken away by opening the Median or Baſilick veine of the left arme, with this caution, that if it appeare more groſſe and blacke, we ſuffer it to flow more plentifully; if more thin, and tinctured with a laudable red Colour, that we preſently ſtay it. The matter of this Feaver muſt be ripened, concocted and diminiſhed with the Syrrupes of *Epithymum*, of *Scolopendrium*, of Mayden hayre, Agrimony, with the waters of Hopps, Bugloſſe, Borage and the like. I ſincerely proteſt, next unto God, I have cured very many quartaines by giving a potion of a little Treakle diſſolved in about ſome two ounces of *Aqua vitæ*; alſo ſometimes by two or three graines of muske diſſolued in Muskadine, given at the beginning of a particular fitt towards the generall declination of the diſeaſe, after generall purgations the humor and body being prepared, and the powers ſtrong; And certainly an inveterate Quartaine can ſcarce ever be diſcuſſed unleſſe the body be much heated with meates and medicines. Therefore it is not altogether to be diſproved which many ſay, that they have driven away

way a quartaine by taking a draught of wine every day as ſoone as they came forth of their bed, in which ſome leaves of Sage had bin infuſed all the night. Alſo it is good a little before the fit to anoint all the ſpine of the backe with oyles heating all the nervous parts, ſuch as are the oyle of Rue, Wallnuts, of the Peppers, mixing therewith a little Aqua vitæ. but for this purpoſe the oyle of *Caſtoreum* which hath beene boyled in an apple of *Coloquintida*, the Kernells taken out, uppon hot coles to the conſumption of the halfe part, mixing therewith ſome little quantity of the powders of Pepper, Pelitory of Spaine and *Eupherbium*, is excellent. Certainly ſuch like Inunctions are good not onely to mitigate the vehemency of the terrible ſhaking, but alſo to provoke ſweats; for becauſe by their humid heat they diſcuſſe this humor being dull and rebellious to the expulſive facultie, for the Melancholy is as it were the droſſe and mudde of the bloud. Therefore if on the contrary the Quartaine feaver ſhall be cauſed by aduſt choler, we muſt hope for and expect a cure by refrigerating and humective medicines, ſuch as are Sorrell, Lettuce, Purſlane, brothes of the decoction of Cowcumbers, Gourds, Mellons and Pompions. For in this caſe if any uſe hot medicines, he ſhall make this humor moſt obſtinate by the reſolving of the ſubtiller parts. Thus *Trallianus* boaſts that hee hath cured theſe kinds of Quartane Feaver by the onely uſe of refrigerating *Epithemaes* being often repeated a little before the beginning of the fit. And this is the ſumme of the Cure of true and legitimate intermitting Feavers. That is, of thoſe which are cauſed by one ſimple humor, whereby the Cure of thoſe which they call baſtard intermitting Feavers, may be eaſily gathered and underſtood; as which are bred by a humor impure and not of one kinde, but mixt or compoſed by admixture of ſome other matter; for example, according to the mixture of diverſe humors Flegmatique and cholericke, the medicines muſt alſo be mixt, as if it were a confuſed kinde of Feaver of a *Quotidian* and *tertian*; it muſt be cured by a medicine compoſed of things evacuating flegme and choler.

What quartaines muſt be cured with refrigerating things.

What baſtard agues are and how they muſt be cured.

Chap. XXXII.

Of an Aneuriſma, *that is, the dilatation, or ſpringing of an Artery, veine, or Sinnew.*

What it is.

AN *Aneuriſma* is a ſoft tumor yeelding to the touch, made by the bloud and ſpirit powred forth under the fleſh and Muſcles, by the dilatation or relaxation of an Artery. Yet the author of the definitions ſeemes to call any dilatation of any venous veſſell by the name of an *Aneuriſma*. *Galen* calls an *Aneuriſma* an opening made of the *Anaſtomaſis* of an Artery. Alſo an *Aneuriſma* is made, when an Artery that is wounded cloſeth too ſlowly, the ſubſtance which is above it being in the meane time agglutinated, filled with fleſh and cicatrized, which doth not ſeldome happen in opening of Arteries unſkilfully performed and negligently cured; therefore *Aneuriſmaes* are abſolutely made by the *Anaſtomaſis*, ſpringing, breaking, *Eroſion*, and wounding of the Arteries. Theſe happen in all parts of the body, but more frequently in the throat, eſpecially in women after a painfull travaile. For when as they more ſtrongly ſtrive to hold their breath, for the more powerfull expulſion of the birth, it happens that the Artery is dilated and broken, whence followes an effuſion of bloud and ſpirits under the skin. The ſignes are, a ſwelling one while great, another ſmall, with a pulſation and a colour not varying from the native conſtitution of the skinne. It is a ſoft tumor, and ſo yeelding to the impreſſion of the fingers that if it peradventure be ſmall, it wholy vaniſheth, the Arterious bloud and ſpirits flying backe into the body of the Artery, but preſently aſſoone as you take your fingers away, they returne againe with like celerity. Some *Aneuriſmaes* doe not onely when they are preſſed, but alſo of themſelves make a ſenſible hiſſing, if you lay your eare neare to them, by reaſon of the motion of the vitall ſpirit ruſhing with great violence through the ſtraitnes of the paſſage.

In what parts they chiefly happen.

Prognoſticke.

A Hiſtory.

Aneuriſmaes muſt not raſhly be opened.

Wherefore in *Aneuriſmaes* in which there is a great rupture of the Artery, ſuch a noyſe is not heard, becauſe the ſpirit is carryed through a larger paſſage. Great *Aneuriſmaes* under the Arme pits, in the Groines and in other parts wherein there are large veſſells, admit no cure, becauſe ſo great an eruption of blood and ſpirit often followes uppon ſuch an inciſion, that death prevents both art and Cure. Which I obſerved a few yeares agoe in a certaine preiſt of Saint *Andrewes* of the Arches, M. *Iohn Maillet* dwelling with the chiefe Preſident *Chriſtopher de Thou*. Who having an *Aneuriſma* at the ſetting on of the ſhoulder about the bignes of a Wall-nut, I charged him, hee ſhould not let it be opened, for if it did, it would bring him into manifeſt danger of his life, and that it would be more ſafe for him, to breake the violence thereof with double clothes ſteeped in the juyce of Night-ſhade and Houſelike, with new and whayey cheeſe mixt therewith: Or with *Vnguentum de Bolo* or *Emplaſtrum contra rupturam* and ſuch other refrigerating and aſtringent medicines, if hee would lay upon it a thin plate of Lead, and would uſe ſhorter breeches that his doublet might ſerve to hold it too, to which hee might faſten his breeches inſtead of a ſwathe, and in the meane time he ſhould eſchew all things which attenuate and inflame the blood, but eſpecially he ſhould keepe himſelfe from all great ſtraining of his voyce. Although he had uſed this Diet for a yeare, yet he could not ſo handle the matter but that the tumor increaſed, which he obſerving goes to a Barber, who ſuppoſing the tumor to be of the kinde of vulgar inpoſtumes, applies to it in the Evening a Cauſticke cauſing an Eſchar ſo to open it. In the Morning ſuch an abundance of blood flowed forth from the tumor being opened, that he therewith aſtoniſhed, implores all poſſible ayde, and bidds that I ſhould be called to ſtay this his great bleeding, and he repented that he had not followed my directions. Wherefore I am called, but when I was ſcarce over the threſhould, he gave up his ghoſt with his blood.

How they muſt be cured.

Theſe of the inward parts incurable.

A Hiſtory.

Wherefore I diligently admoniſh the young Chirurgion that hee do not raſhly open *Aneuriſmas* unleſſe they be ſmall in an ignoble part, and not indued with large veſſells, but rather let him performe the cure after this manner. Cut the skinne which lyes over it untill the Artery appeare, and then ſeparate it with your knife from the particles about it, then thruſt a blunt and crooked needle with a thred in it under it, binde it, then cut it off and ſo expect the falling off, of the thred of it ſelfe whiles nature covers the orifices of the cut Artery with new fleſh, then the reſidue of the cure may be performed after the manner of ſimple wounds. The *Aneuriſmaes* which happen in the internall parts are uncurable. Such as frequently happen to thoſe who have often had the unction and ſweat for the cure of the French diſeaſe, becauſe the blood, being ſo attenuated and heated therewith that it cannot be contayned in the receptacles of the Artery, it diſtends it to that largeneſſe as to hold a mans fiſt; Which I have obſerved in the dead body of a certaine Taylor, who by an *Aneuriſma* of the Arterious veine ſuddenly whileſt hee was playing at Tennis fell downe dead, the veſſell being broken: his body being opened I found a great quantity of blood powred forth into the Capacity of the Cheſt, but the body of the Artery was dilated to that largeneſſe I formerly mentioned, and the inner Coate thereof was bony. For which cauſe within a while after I ſhewed it to the great admiration of the beholders in the Phyſitions Schole whileſt I publiquely diſſected a body there; the whilſt he lived ſaid he felt a beating and a great heate over all his body by the force of the pulſation of all the Arteryes, by occaſion whereof hee often ſwounded. Doctor *Sylvius* the Kings profeſſor of Phyſicke at that time forbad him the uſe of Wine, and wiſhed him to vſe boyled water for his drinke, and Crudds and new Cheeſes for his meate, and to apply them in forme of Cataplaſmes upon the grieved and ſwolne part. At night he uſed a ptiſan of Barley meale and Poppy-ſeedes, and was purged now and then with a Clyſter of refrigerating and emollient things, or with Caſſia alone, by which medicines hee ſaid hee found himſelfe much better. The cauſe of ſuch a bony conſtitution of the Arteries by *Aneuriſmaes* is, for that the hot and fervid blood firſt dilates the Coates of an Artery, then breakes them; which when it happens, it then borrowes from the neighbouring bodies a fit matter to reſtore the looſed continuity thereof.

This matter whileſt by litle and litle it is dried and hardened, it degenerats into a

Griſtely or elſe a bony ſubſtance, juſt by the force of the ſame materiall and efficient cauſes, by which ſtones are generated in the reines and bladder. For the more terreſtriall portion of the blood is dried and condenſed by the power of the unnaturall heat contayned in the part affected with an *Aneuriſmae*; whereby it comes to paſſe that the ſubſtance added to the dilated and broken Artery is turned into a body of a bony conſiſtence. In which the ſingular providence of nature, the handmaide of God is ſhewed, as that which, as it were by making and oppoſing a new wall or bancke, would hinder and breake the violence of the raging blood ſwelling with the abundance of the vitall ſpirits; unleſſe any had rather to refer the cauſe of that hardneſſe to the continuall application of refrigerating and aſtringent medicines. Which have power to condenſate and harden, as may not obſcurely be gathered by the writings of *Galen*. But beware you be not deceived by the forementioned ſignes; For ſometimes in large *Aneuriſmaes* you can perceive no pulſation, neither can you force the blood into the Artery by the preſſure of your fingers, either becauſe the quantity of ſuch blood is greater than which can be contayned in the ancient receptacles of the Artery, or becauſe it is condenſate and concrete into Clods, whereupon wanting the benefit of ventilation from the heart, it preſently putrifies; Thence enſue great paine, a Gangren, and mortification of the part, and laſtly the death of the Creature.

OF PARTICULAR TUMORS AGAINST NATURE.

THE EIGHT BOOKE.

The Preface.

BEcauſe the Cure of diſeaſes muſt be varied according to the variety of the temper, not onely of the body in generall, but alſo of each part thereof; the ſtrength, figure, forme, ſite, and ſence thereof being taken into conſideration: I thinke it worth my paines, having already ſpoken of Tumors in Generall, if I ſhall treate of them in particular which affect each part of the body, beginning with thoſe which aſſayle the head. Therefore the Tumor either affects the whole head, or elſe onely ſome particle thereof, as the Eyes, Eares, Noſe, Gumms and the like. Let the *Hydrocephalos*, and *Phyſocephalos* be examples of thoſe tumors which poſſeſſe the whole head.

CHAP. I.

Of an Hydrocephalos *or watry tumor which commonly affects the heads of Infants.*

What it is. THe Greekes call this diſeaſe *Hydrocephalos*, as it were a Dropſie of the Head, by a wateriſh humor; being a diſeaſe almoſt peculiar to Infants newly borne. **The cauſes.** It hath for an externall cauſe the violent compreſſion of the head by the hand of the Midwife or otherwiſe at the birth, or by a fall, contuſion and the like. For hence comes a breaking of a veine or Artery, and an effuſion of the blood under the skinne. Which by corruption becomming whayiſh, laſtly, degenerateth into a certen wateriſh humor. It hath alſo an inward cauſe, which is the abundance of ſerous and acride blood, which by its tenuity and heat ſweats through the Pores of the veſſells, ſometimes betweene the Muſculous ſkinne of the head and the *Pericranium*, **Differences by reaſon of place** ſometimes betweene the *Pericranium* and the ſkull, and ſometimes betweene the ſkull and the membrane called *Dura mater*, and otherwhiles in the ventricles of the braine.

Signes. The ſignes of it, contained in the ſpace betweene the Muſculous ſkinne and the *Pericranium*, are a manifeſt tumor without paine, ſoft, and much yeeelding to the preſſure of the fingers. The Signes, when it remayneth betweene the *Pericranium* and the skull, are for the moſt part like the forenamed, unleſſe it be that the Tumor is a little harder, and not ſo yeelding to the finger, by reaſon of the parts betweene it and the finger; And alſo there is ſomewhat more ſence of paine. But when it is in the ſpace betweene the skull and *Dura mater*, or in the ventricles of the Braine or the whole ſubſtance thereof, there is a dulneſſe of the ſences as of the ſight and hearing; the tumor doth not yeeld to the touch, unleſſe you uſe ſtrong impreſſion, for then it ſincketh ſomewhat downe, eſpecially in infants newly borne; who have their ſculls almoſt as ſoft as waxe, and the junctures of their Sutures laxe, both by nature, as alſo by accident, by reaſon of the humor conteined therein moiſtening and relaxing all the adjacent parts; the humor conteined here lifts up the Scull ſomewhat more high, eſpecially at the meetings of the Sutures, which you may thus know, becauſe the Tumor being preſſed, the humor flyes backe into the ſecret paſſages of the braine.

To conclude, the paine is more vehement, the whole head more ſwollen, the forehead ſtands ſomewhat further out, the eye is fixt and immoveable, and alſo weepes by reaſon of the ſerous humor ſweating out of the braine.

A Hiſtory.

Veſalius writes that hee ſaw a girle of two yeares old, whoſe head was thicker than any mans head by this kinde of Tumor, and the Scull not bonie, but membranous, as it uſeth to be in abortive birthes, and that there was nine pound of water ran out of it.

Abucraſis tells that he ſaw a child whoſe head grew every day bigger by reaſon of the watery moiſture conteined therein, till at length the tumor became ſo great, that his necke could not beare it neither ſtanding nor ſitting, ſo that hee died in a ſhort time. I have obſerved and had in cure foure children troubled with this diſeaſe, one of which being diſſected after it died, had a braine no bigger than a Tennis Ball. But of a Tumor and humor conteined within under the *Cranium*, or Scull, I have ſeene none recover; but they are eaſily healed of an externall Tumor.

Therefore whether the humor lye under the *Pericranium*, or under the muſculous skin of the head, it muſt firſt be aſſailed with reſolving medicines, but if it cannot be thus overcome, you muſt make an inciſion, taking heede of the Temporall Muſcle, and thence preſſe out all the humor, whether it reſemble the waſhing of fleſh newly killed, or blackiſh blood, or congealed or knotted blood, as when the tumor hath beene cauſed by contuſion; then the wound muſt be filled with dry lint, and covered with double boulſters, and laſtly bound with a fitting ligature.

CHAP. II.

Of a Polypus, *being an eating diſeaſe in the Noſe.*

The reaſon of the name.

THe *Polypus* is a Tumor of the Noſe againſt nature, commonly ariſing from the *Os Ethmoides* or ſpungye bone. It is ſo called, becauſe it reſembles the feet of a Sea *Polypus* in figure, and the fleſh thereof in conſiſtence. This Tumor ſtops the Noſe, intercepting and hindering the liberty of ſpeaking and blowing the Noſe. *Celſus* ſaith the *Polypus* is a caruncle or Excreſcence one while white, another while reddiſh, which adheres to the bone of the Noſe, and ſometimes fills the Noſthrils hanging towards the lipps, ſometimes it deſcends backe through that hole, by which the ſpirit deſcends from the Noſe to the throtle; it growes ſo that it may he ſeene behinde the *Vvula*, and often ſtrangles a man by ſtopping his breath.

Lib.6.Cap.8.

The differences thereof.

There are five kinds thereof, the firſt is, a ſoft membrane, long and thin like the relaxed and depreſſed *Vvula*, hanging from the middle griſtle of the noſe, being filled with a Phlegmaticke and viſcide humor. This in exſpiration hangs out of the Noſe, but is drawne in and hid by inſpiration; it makes one ſnaffle in their ſpeech and ſnort in their ſleepe. The ſecond, hath hard fleſh, bred of Melancholy blood without aduſtion, which obſtructing the noſthrils intercepts the reſpiration made by that part. The third, is fleſh hanging from the Griſtle, round, and ſoft, being the offſpring

ſpring of Phlegmaticke blood. The fourth is an hard Tumor, like fleſh, which when it is touched yeelds a ſound like a ſtone; it is generated of Melancholike blood dryed, being ſomewhat of the nature of a *Scirrhus* confirmed and without paine. The fifth is as it were compoſed of many cancrous ulcers ſpred over the tranſverſe ſurface of the griſtle.

Which of them admit no manuall operation.

Of all theſe ſorts of *Polypi*, ſome are not ulcerated, others ulcerated, which ſend forth a ſtinking and ſtrong ſmelling filth. Such of them as are painefull, hard, reſiſting, and which have a livide, or leaden colour, muſt not be touched with the hand, becauſe they ſavour of the Nature of a *Cancer*, as into which they oft degenerate; yet by reaſon of the paine which oppreſſes more violently, you may uſe the Anodyne medicines formerly deſcribed in a *Cancer*, ſuch as this following.

An Anodyne.

℞. *Olei de vitell. ovorum* ℥ij, *Lytharg. auri, & Tuthiæ præp. an.* ℥j. *ſucci plant. & ſolani an.* ℥ſſj. *Lapid. hæmatit. & camphoræ, an* ℥ſſ. Let them be wrought a long time in a leaden mortar, and ſo make a medicine to be put into the noſethrills. Thoſe which are ſoft, looſe and without paine, are ſometimes curable, being plucked away with an inſtrument made for that purpoſe, or elſe waſted by actuall cauteries put in through a pipe, ſo that they touch not the ſound part; or by potentiall cauteries, as *Ægyptiacum* compoſed of equall parts of all the ſimples with vitrioll which hath a facultie to waſte ſuch like fleſh. *Aquafortis* and oyle of vitrioll have the ſame facultie, for theſe take away a *Polypus* by the rootes; for if any part thereof remayne it will breede againe. But Cauteries and acride medicines muſt be put into the noſtrills with this Caution, that in the meane time cold repelling and aſtringent medicines be applied to the noſe and parts about it to aſſwage the paine, and hinder the inflammation. Such as are *Vnguentum de bolo*, and *vnguentum nutritum*, whites of Egges beate with Roſe leaves, and many other things of the like nature.

Why it muſt be taken cleare away.

CHAP. III.

Of the Parotides *that is, Certaine ſwellings about the Eares.*

What it is.

The *Parotis* is a Tumor againſt nature, affecting the Glandules and thoſe parts ſeated behinde and about the Eares, which are called the Emunctories of the braine; for theſe becauſe they are looſe and ſpungy, are fit to receive the excrements thereof. Of theſe ſome are criticall, the matter of the diſeaſe ſomewhat diſgeſted being ſent thither by the force of nature. Others Symptomaticall, the excrements of the braine increaſed in quantity or quality ruſhing thither of their owne accord. Such abſceſſes often have great inflammation joyned with them, becauſe the byting humor which flowes thither is more vitiated in quality than in quantity. Beſides alſo they often cauſe great paine, by reaſon of the diſtention of the parts indued with moſt exquiſit ſence, as alſo by reaſon of a Nerve of the fifth Conjugation ſpread over theſe parts; as alſo of the neighbouring membranes of the braine, by which meanes the patient is troubled with the Head-ach and all his face becomes ſwolne. Yet many times this kinde of Tumor uſeth to be rayſed by a tough, viſcous, and groſſe humor.

The differences. Their ſignes and Symptomes.

This diſeaſe doth more grievouſly afflict young men than olde; it commonly brings a Feaver and watching. It is difficult to be cured, eſpecially when it is cauſed by a groſſe, tough, and viſcide humor, ſent thither by the *Criſis*.

Prognoſticke.

The cure muſt be performed by diet, which muſt be cōtrary to the quality of the humor in the temper & conſiſtence of the meates. If the inflamation & redneſſe be great, which

The cure.

Lib.3.de comp. med.ſec.Locos, Hip.aph.21 lib.1.

which indicate abundance of bloud, Phlebotomie will be profitable, yea very neceſſary. But here we muſt not uſe the like judgement in application of locall medicines as wee doe in others tumors, as *Galen* admoniſheth us; that is, wee muſt not uſe repercuſſives at the beginning, eſpecially if the abſceſſe be criticall; for ſo, we ſhould infringe or foreſlow the indeavors of nature forcibly freeing it ſelfe from the morbifique matter. But wee muſt much leſſe repell or drive it backe if the matter which hath flowed thither be venenate, for ſo the reflow thereof to the noble parts would prove mortall. Wherefore the Chirurgion ſhall rather aſſiſt nature in attracting and drawing forth that humor. Yet if the defluxion ſhall be ſo violent, if the paine ſo fierce that thence there may be feare of watchings and a Feaver, which may deject the powers, *Galen* thinks it will be expedient with many reſolving medicines to mix ſome repelling. Wherefore at the beginning let ſuch a Cataplaſme be applyed.

℞. *Far. hord. & ſem. lin. ana.* ℥ij. *coquantur cum mulſa aut decocto cham. addendo but. recen. & olei cham. ana* ℥j. *fiat Cataplaſma.* And the following oyntment wil alſo be good.

Gentle reſolving medicines

℞. *But. recen.* ℥ij, *olei cham. & lilior. an.* ℥j. *unguen. de Althea* ℥ß. *ceræ parum*: make an oyntment to be applyed with moiſt and greaſie wooll to mitigate the paine, alſo ſomewhat more ſtrong diſcuſſing and reſolving medicins will be profitable, as:

Stronger reſolvers.

℞. *Rad. altheæ & bryon. an.* ℥ij. *fol. rutæ, puleg. orig. an. m.* j. *flo. chamæm. melil. an. p.* j. *coquantur in hydromelite, piſtentur, traijciantur, addendo farin. fænugræc. orobi, an.* ℥j. *pul. Ireos, cham. melilot. an.* ℥ij. *olei aneth. rutac. an.* ℥j. *fiat cataplaſma.* But if you determine to reſolve it any more, you may uſe *Emplaſtrum Oxycroceum & Melilot-Plaiſter.* If the humor doth there concrete and grow hard, you muſt betake you to the medicines which were preſcribed in the Chapter of the *Scirrhus*; but if it tend to ſuppuration, you ſhall apply the following medicine.

A Ripening medicine.

℞. *Rad. liliorum & ceparum ſub cineribus coct. an.* ℥iij. *Vitell. ovor. num.* ij. *axung. ſuillæ & unguent. baſilicon, an.* ℥j. *far. ſem. lini* ℥iß. *fiat Cataplaſma.* But if the matter doe ſo require, let the tumor be opened as we have formerly preſcribed.

CHAP. IIII.

Of the Epulis, *or overgrowing of the fleſh of the Gums.*

What it is.

THe *Epulis* is a fleſhy excreſcence of the Gums betweene the teeth, which is by litle and litle oft times encreaſed to the bignes of an Egge, ſo that it both hinders the ſpeach and eating; it caſts forth ſalivous and ſtincking filth, and not ſeldome degenerates into a *Cancer*, which you may underſtand by the propriety of the colour, paine and other accidents; for then you muſt by no meanes touch it with your hand. But that which doth not torment the Patient with paine, may be pluckt away; and let this be the manner thereof.

The Symptomes.

The Chirurgicall cure.

Let it be tyed with a double thred, which muſt be ſtraiter twitched untill ſuch time as it fall off; when it ſhall fall away, the place muſt be burnt with a cautery put through a trunke or pipe, or with *Aqua fortis*, or oyle of *Vitrioll*, but with great care that the ſound parts adjoyning thereto be not hurt, for if ſo be that it be not burnt, it uſually returnes.

I have often by this meanes taken away ſuch large tumors of this kinde, that they hung out of the mouth in no ſmall bignes, to the great diſſiguring of the face, which when as no Chirurgion durſt touch, becauſe the fleſh looked livide, I ventured upon becauſe they were free from paine; and by taking them away and cauterizing the place, I perfectly healed them; not truly ſodainly and at once; for although I burnt the place after diſſection; yet nevertheleſſe they ſprung up againe, becauſe a certaine portion of the bone and ſockets in which the Teeth ſtand faſtened, were become rotten

Why the cure muſt not be deferred.

I have often obſerved ſuch like fleſh by continuance of time to have turned into a griſtlely & bony ſubſtance. Wherfore the cure muſt be begun as ſpeedily as may be; for being but litle, and having faſtened no deepe roots, it is more eaſily taken away, being then only filled with a viſcide humor, which in ſucceſſe of time is hardened, and makes the taking away thereof more difficult.

Chap.

Chap. V.

Of the Ranula.

The Reaſon why it is ſo called.

THere is oft times a tumor under the tongue, which takes away the liberty of pronuntiation, or ſpeech; wherefore the Greeks call it *Batrachium*, the Latines *Ranula*, becauſe ſuch as have this diſeaſe of the tongue, ſeeme to expreſſe their minds by croaking rather than by ſpeaking.

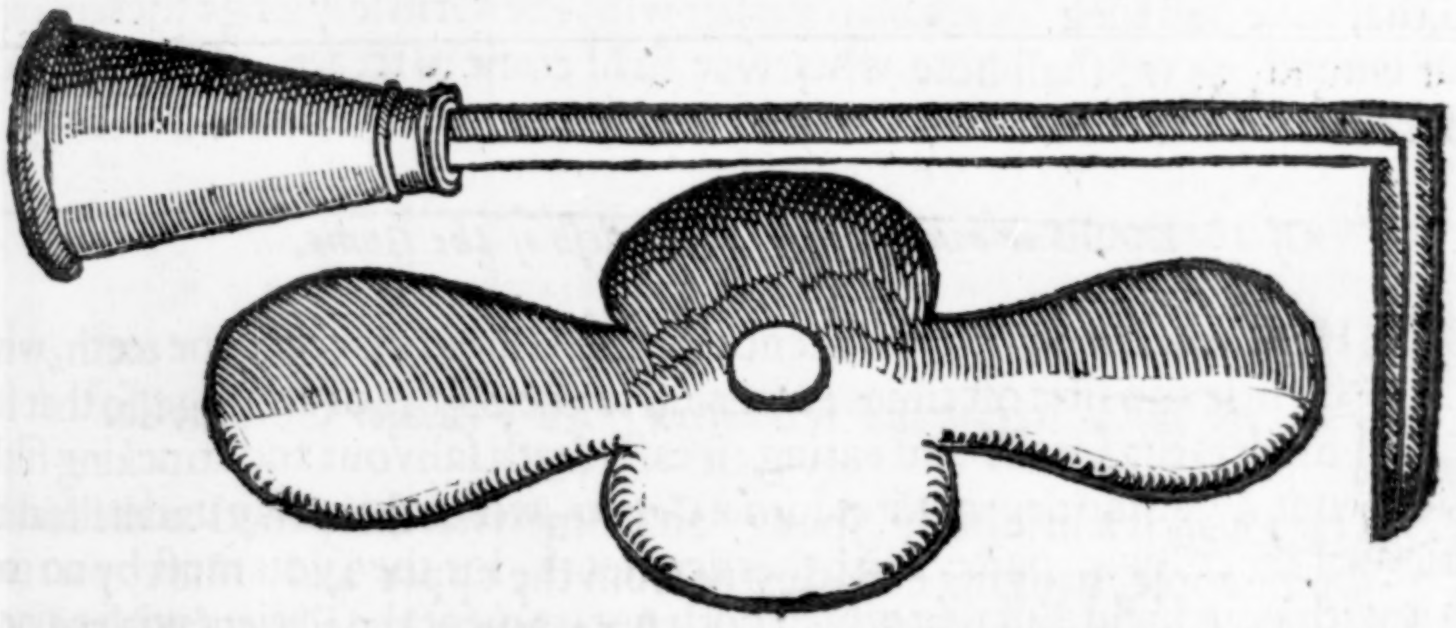
The Cauſe.

It is cauſed by the falling downe of a cold, moiſte, groſſe, tough viſcide and Phlegmaticke matter, from the braine upon the tongue, which matter in colour and conſiſtence reſembles the white of an egge, yet ſometimes it lookes of a Citrine or yellowiſh colour.

The Cure.

That you may ſafely performe the cure, you muſt open the Tumor rather with a cautery or hot Iron, than with a Knife, for otherwiſe it will returne againe. The manner of opening of it muſt be thus. You ſhall get a bended hollow and perforated iron plate with a hole in the midſt, and making the patient to hold open his mouth, you ſhall ſo fit it, that the hole may be upon the part which muſt be opened. Then there you muſt open it with an hot Iron, for ſo you ſhall hurt no part of the mouth which is whole; but when you are ready to burne it, by thruſting your thumbe under the Patients Chin, you may ſomewhat elevate the Tumor, whereby you may open it with more certainty; when it is opened you muſt thruſt out the matter conteined therein, and then waſh the patients mouth with ſome barly water, hony, and Sugar of Roſes; for ſo the ulcer will be ſafely and quickly healed.

The deliniation of the Iron plate and crooked actuall Cautery.



Chap. VI.

Of the ſwelling of the Glandules, or Almonds of the Thro ate.

Why the Glandules are called Almonds.

Their uſe.

NAture at the jawes neare the roots of the Tongue, hath placed two Glandules oppoſite to one another; in figure and magnitude like to Almonds, whence alſo they have their name; Their office is to receive the ſpittle falling downe from the braine, both leaſt that the too violent falling downe of the humor ſhould hinder the tongue in ſpeaking, as alſo that the tongue might alwayes have moiſture, as it were laid up in ſtore, leſt by continuall ſpeaking it ſhould grow dry and faile. For thus this ſpittle being conſumed by feaveriſh heats, the patients are ſcarſe able to ſpeake, unleſſe they firſt moiſten their tongue by much waſhing of their mouth.

The Cauſe of their tumor.

Theſe Glandules becauſe they are ſeated in an hot and moiſt place, are very ſubject to inflammations; for there flowes into theſe oft times together with the blood, a great quantity of crude, phlegmaticke and viſcous humors, whence ariſes a tumor;

which is not ſeldome occaſioned by drinking much and that vaporous wine, by too much Gluttony, and ſtaying abroad in the open aire.

Symptomes.

Swallowing is painfull and troubleſome to the Patient, and commonly hee hath a Feaver. Oft times the neighbouring Muſcles of the Throtle and necke are ſo ſwolne together with theſe Glandules, that (as it uſually happens in the *Squinzye*) the paſſage of the breath and aire is ſtopped, and the Patient ſtrangled.

Cure.

Extreme diſeaſes muſt have extreme remedies.

How you muſt open the Weazon.

We reſiſt this imminent danger by purging and blood-letting, by applying Cupping-Glaſſes to the Necke and ſhoulders, by frictions and ligatures of the extreme parts, and by waſhing and gargling the mouth and throte with aſtringent gargariſmes. But if they come to ſuppuration, you muſt with your inciſion Knife make way for the evacuation of the *Pus*, or Matter; but if on the contrary, theſe things performed according to art, defluxion be encreaſed, and there is preſent danger of death by ſtopping and intercepting the breath, for the ſhunning ſo great and imminent danger, the top or upper part of the *Aſpera arteria* or Weazon muſt be opened, in that place where it uſes to ſtand moſt out; & it may be done ſo much the ſafer, becauſe the jugular veines, and arteryes are furtheſt diſtant from this place, and for that this place hath commonly litle fleſh upon it. And that the inciſion may be the fitlyer made, the patient muſt be wiſhed to bend his head backe, that ſo the Artery may be the more eaſily come to by the inſtrument; then you ſhal make an inciſion overtwhart with a crooked knife betweene two rings (not hurting nor touching the Griſtlely ſubſtance) that is to ſay, the membrane which tyes together the Griſtlely rings being onely cut; you ſhall then judge that you have made the inciſion large enough, when you ſhall perceive the breath to breake out by the wound; the wound muſt be kept open ſo long, untill the danger of ſuffocation be paſt; and then it muſt be ſowed up not touching the Griſtle: But if the lipps of the wound ſhall be hard and callous, they muſt be lightly ſcarified, that ſo they may become bloody for their eaſier agglutination and union, as we ſhall ſhew more at large in the cure of Hare lips. I have had many in cure, who have recovered, that have had their Weazon together with the Griſtlely rings thereof cut with a great wound, as we ſhall note when wee ſhall come to treate of the cure of the wounds of that part.

Chap. VII.

Of the inflammation and relaxation of the Vvula, or Columella.

What the *Vvula* is, and what the uſe therof.

The Cauſe of the ſwelling thereof.

Symptomes.

The *Vvula* is a litle body, ſpongy and ſomewhat ſharpened to the forme of a pine apple, hanging even downe from the upper and inner part of the palat, ſo to breake the force of the Aire drawn in, in breathing and carryed to the Lungs, and to be as a quill to forme and tune the voyce. It often growes above meaſure by receiving moyſture falling downe from the braine, becomming ſharpe by litle and litle from a broader and more ſwolne *Baſis*. Which thing cauſes many Symptomes; for by the continuall irritation of the diſtilling humor the Cough is cauſed, which alſo hinders the ſleepe, and intercepts the liberty of ſpeech; but alſo by hindring reſpiration the patients cannot ſleepe unleſſe with open mouth: they are exerciſed with a vaine endeavoring to ſwallow (having as it were a morſell ſticking in their jawes) and are in danger of being ſtrangled.

The Cure.

The Cure by Chirurgery.

This diſeaſe muſt be reſiſted and aſſailed by purging, bleeding, Cupping, taking of chyſters, uſing aſtringent Gargles, and a convenient diet; but if it cannot thus be overcome, the cure muſt be tryed by a cauſticke of *Aqua fortis*, which I have divers times done with good ſucceſſe. But if it cannot be ſo done, it will be better to put to your hand, than through idleneſſe to ſuffer the patient to remaine in imminent and deadly danger of ſtrangling; yet in this there muſt very great caution be uſed; for the Chirurgeon ſhall not judge the *Vvula* fit to be touched with an inſtrument or cauſtick, which is ſwolne with much enflamed, or blacke blood after the manner of a *Cancer*; but hee ſhall boldly put to his hand if it be longiſh, grow ſmall by litle and litle into a ſharpe, looſe & ſoft point; if it be neither exceeding red, neither ſwolne with too much blood

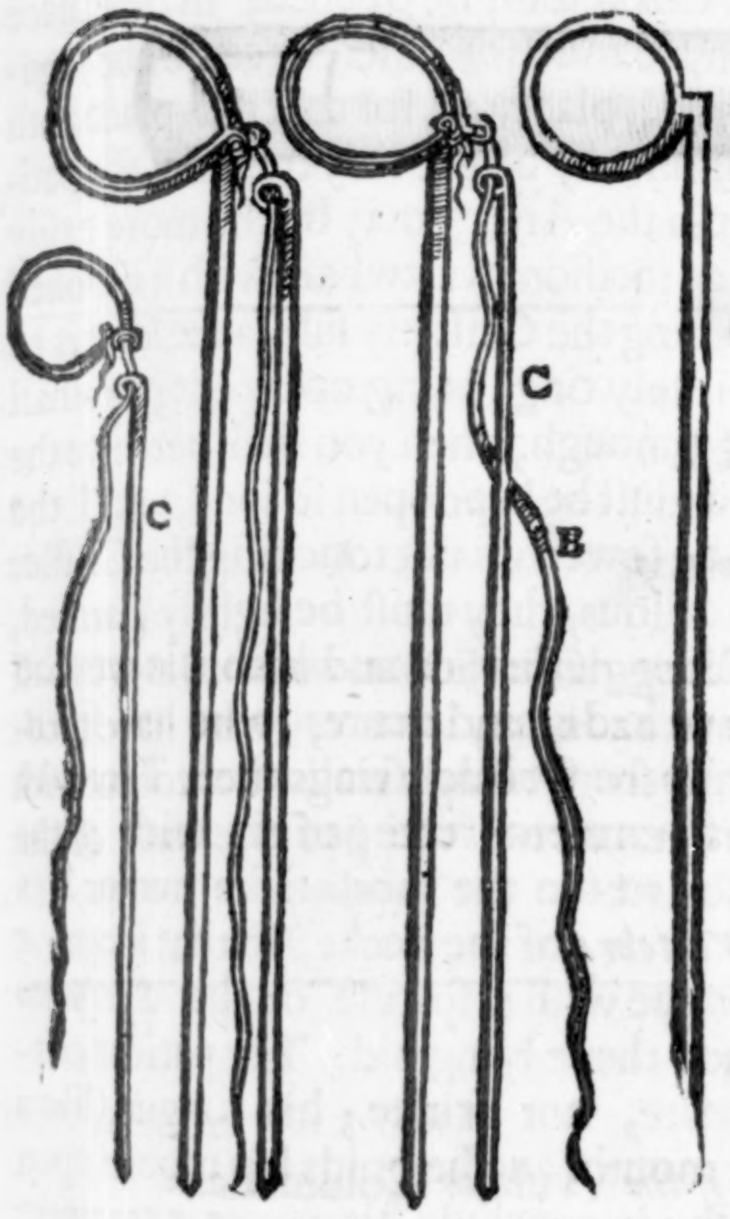
but whitiſh and without paine. Therefore that you may more eaſily and ſafely cut away, that which redounds and is ſuperfluous, deſire the patient to ſit in a light place, and hold his mouth open; then take hold of the top of the *Vvula* with your ſizers, and cut away as much thereof as ſhall be thought unprofitable. Otherwiſe you ſhall binde it with the inſtrument here under deſcribed; the invention of this inſtrument is to be aſcribed to *Honoratus Taſtellanus* that diligent and learned man, the Kings Phyſition in ordinary, and the chiefe Phyſition of the Queene mother; Which alſo may be uſed in binding of *Polypi* and warts in the necke of the Wombe.

The Deliniation of conſtrictory rings fit to twitch, or binde the Columella, *with a twiſted thred.*

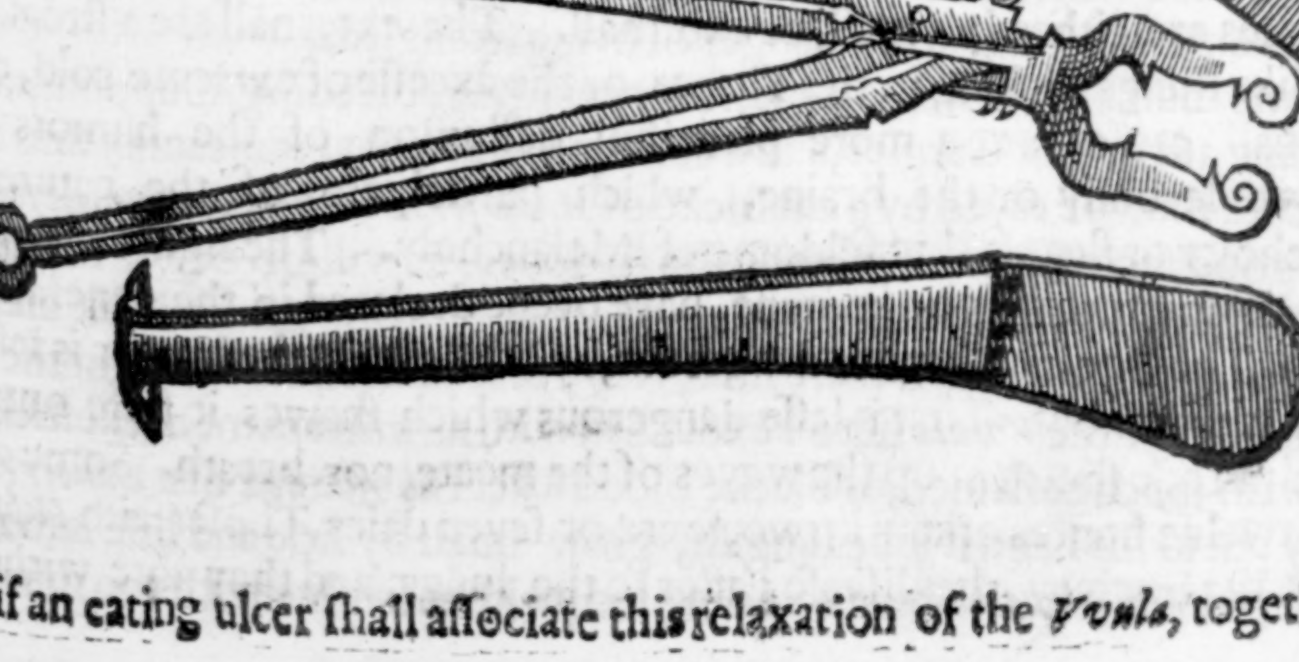


A. Shewes the ring whoſe upper part is ſomewhat hollow.

B. A double waxed thred, which is couched in the hollowneſſe of the ring, and hath a running, or looſe knot upon it.

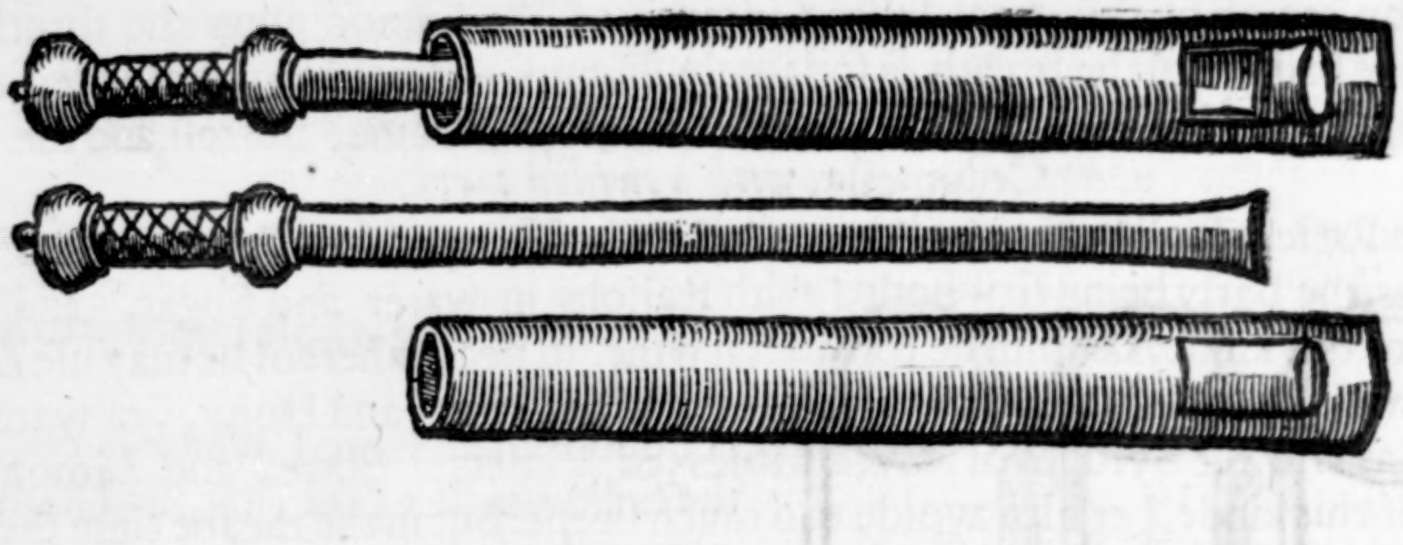
C. An iron rod, into the eye whereof the forementioned double thred is put, and it is to twitch the *Columella* when as much thereof is taken hold of, as is unprofitable, and ſo to take it away without any fluxe of blood. When you would ſtraiten the thred, draw it againe through this iron rod, and ſo ſtraine it as much as you ſhall thinke good, letting the end of the thred, hang out of the mouth. But every day it muſt be twitched harder than other, untill it fall away by meanes thereof, and ſo the part and patient be reſtored to health. I have deliniated three of theſe inſtruments, that you may uſe which you will, as occaſion ſhall be offered.

A Figure of the Speculum oris, *by which the mouth is held and kept open, whileſt the Chirurgion is buſied in the cutting away or binding the* Vvula.



But if an eating ulcer ſhall aſſociate this relaxation of the *Vvula*, together with a fluxe of blood, then it muſt be burnt and ſeared with an hot iron, ſo thruſt into a Trunke, or Pipe with an hole in it, that no ſound part of the mouth may be offended therewith.

A hollow Trunke with a hole in the ſide, with the hot iron inſerted, or put therein.



Chap. VIII.

Of the Angina, *or Squinzy.*

What it is. The Squinancy, or Squinzy, is a ſwelling of the jawes, which hinders the entring of the ambient aire into the weazon, and the vapours and ſpirit from paſſage forth, and the meate alſo from being ſwallowed. There are three differences thereof. The differences. The firſt kind. The firſt torments the patient with great paine, no ſwelling being outwardly apparent, by reaſon the morbificke humor lyes hid behinde the almonds or Glandules at the *Vertebra* of the necke, ſo that it cannot be perceived, unleſſe you hold downe the tongue with a ſpatula or the *Speculum oris*, for ſo you may ſee the redneſſe and tumor there lying hid. The Symptomes. The patient cannot draw his breath, nor ſwallow downe meate, nor drinke; his tongue, (like a Gray-hounds after a courſe,) hangs out of his mouth, and he holds his mouth open that ſo hee may the more eaſily draw his breath; to conclude, his voyce is as it were drownd in his jawes and noſe; he cannot lye upon his backe, but lying is forced to ſit, ſo to breathe more freely: and becauſe the paſſage is ſtopt, the drinke flyes out at his noſe; the eyes are fiery and ſwollen, and ſtanding out of their orbe. Thoſe which are thus affected are often ſuddainely ſuffocated, a foame riſing about their mouthes.

The ſecond kinde. The ſecond difference is ſaid to be that, in which the tumor appeares inwardly, but litle or ſcarſe any thing at all outwardly, the tongue, Glandules, and jawes appearing ſomewhat ſwollen.

The third. The third being leaſt dangerous of them all, cauſes a great ſwelling outwardly, but litle inwardly.

The Cauſes. The Cauſes are either internall, or externall. The externall are a ſtroake, ſplinter or the like things ſticking in the Throat, or the exceſſe of extreme cold, or heat. The internall cauſes are a more plentifull defluxion of the humors either from the whole body or the braine, which participate of the nature either of blood, choler or flegme, but ſeldome of Melancholy. The ſignes by which the kinde and commixture may be knowne, have beene declared in the generall treatiſe of tumors. The Squincy is more dangerous, by how much the humor is leſſe apparent within and without. That is leſſe dangerous which ſhewes it ſelfe outwardly, becauſe ſuch an one ſhuts not up the wayes of the meate, nor breath. Some dye of a Squincy in twelue houres others in two, foure or ſeven daies. Hip. ſect.3. prog.2. Aphor. 10. ſect.5. Thoſe (ſaith *Hippocrates*) which ſcape the Squincy, the diſeaſe paſſes to the lungs, and they dye within ſeven dayes; but if they ſcape theſe dayes, they are ſuppurated; but alſo often times this kind of diſeaſe is terminated by diſappearing, that is, by an obſcure reflux of the humor into ſome noble part, as into the Lungs (whence the *Empyema* proceeds) and into other principall parts, whoſe violating brings inevitable death; ſometimes by reſolution, otherwiſe by ſuppuration.

The way of Reſolution is the more to be deſired; it happens when the matter is ſmall, and that ſubtle, eſpecially if the Phyſition ſhall draw blood by opening a veine, and the patient uſe fitting Gargariſmes. A Criticall Squincy divers times proves deadly by reaſon of the great falling downe of the humor upon the throtle, by which the paſſage of the breath is ſodainely ſhut up. Brothes muſt be uſed made with Capons, and Veale, ſeaſoned with Lettuce, Purſlaine, Sorrell, and the cold ſeeds.

Diet.

Cure.

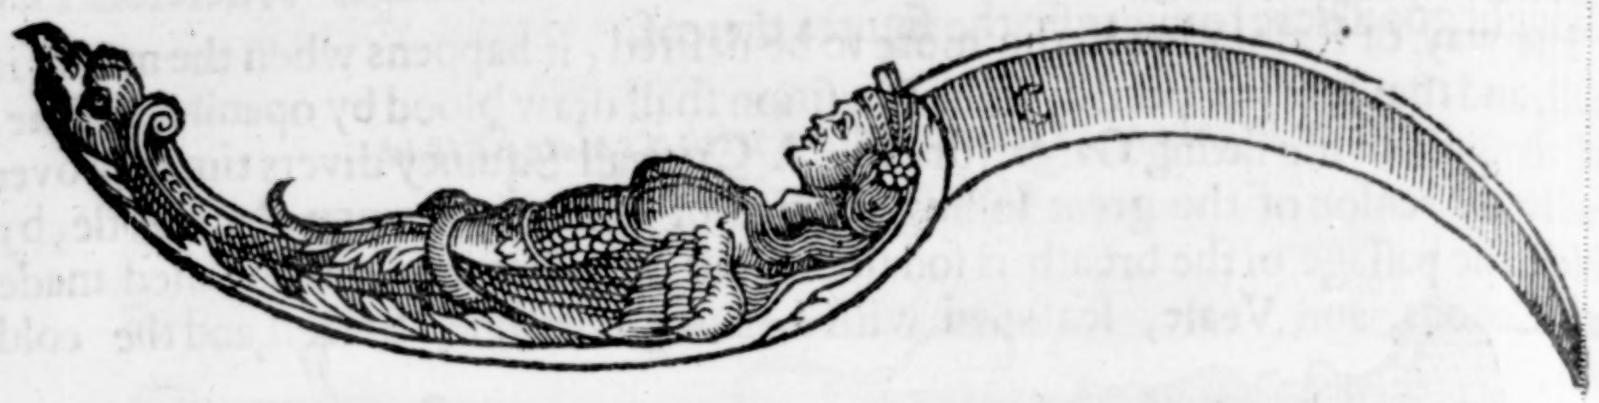
Repelling Gargariſmes.

Ripening Gargariſmes.

Detergent Gargariſmes.

If the Patient ſhall be ſomewhat weake, let him have potched Egges, and Barly Creames, the Barly being firſt boiled with Raiſons in water and Sugar, and other meates of this kinde. Let him be forbidden wine, in ſtead whereof he may uſe *Hydromelita*, and *Hydroſachara* (that is, drinkes made of water and Hony, or water and Sugar) as alſo the Syrupes of dryed Roſes, of Violets, Sorrell and Limons, and others of this kinde. Let him avoide too much ſleepe. But in the meane time the Phyſition muſt be carefull of all, becauſe this diſeaſe is of their kinde, which brooke no delayes. Wherefore let the *Baſilica* be preſently opened, on that ſide the tumor is the greater; then within a ſhort time after the ſame day, for evacuation of the conjunct matter, let the veine under the tongue be opened; let cupping-Glaſſes be applyed, ſometimes with ſcarification, ſometimes without, to the necke and ſhoulders, and let frictions and painefull Ligatures be uſed to the extreme parts. But let the humor impact in the part be drawne away by gliſters and ſharpe ſuppoſitories. Whileſt the matter is in defluxion, let the mouth without delay be waſhed with aſtringent gargariſmes to hinder the defluxion of the humor, leaſt by its ſuddaine falling downe it kill the Patient, as it often happens, all the Phyſitions care and diligence notwithſtanding. Therefore let the mouth be frequently waſhed with Oxycrate, or ſuch a gargariſme: ℞ *Pomorum ſilveſt. nu.* iiij. *ſumach, Roſar. rub. an. m. ſſ. berber.* ʒij. let them be all boyled with ſufficient quantity of water to the conſumption of the halfe, adding thereunto of the wine of ſoure Pomegranats ℥iiij. of *diamoron* ℥ij, let it be a litle more boyled and make a gargle according to arte. And there may be other Gargariſmes made of the waters of Plantaine, Night-ſhade, Verjuice, Iulep of Roſes and the like. But if the matter of the defluxion ſhall be Phlegmaticke, Alume, Pomgranate pill, Cypreſſe nuts, and a litle Vinegar may be ſafely added. But on the contrary, repercuſſives muſt not be outwardly applyed, but rather Lenitives, whereby the externall parts may be relaxed and rarified, and ſo the way be open either for the diffuſing or reſolving the portion of the humor. You ſhall know the humor to begin to be reſolved, if the Feaver leave the patient, if he ſwallow, ſpeake and breathe more freely, if he ſleepe quietly, and the paine begin to be much aſwaged. Therefore then natures endeavor muſt be helped by applying reſolving medicines, or elſe by uſing ſuppuratives inwardly and outwardly, if the matter ſeeme to turne into *Pus*. Therefore let gargariſmes be made of the roots of March-Mallowes, Figgs, Iujubes, damaſke Prunes, Dates, perfectly boyled in water. The like benefit may be had by Gargariſmes of Cowes milke with Sugar, by oyle of ſweete Almonds, or Violets warme, for ſuch things helpe forward ſuppuration and aſwage paine; let ſuppurating cataplaſmes be applyed outwardly to the necke and throate, and the parts be wrapped with wooll moiſtened with oyle of Lillyes. When the Phyſition ſhall perceive that the humor is perfectly turned into *pus*, let the patients mouth be opened with the *Speculum oris*, and the abſceſſe opened with a crooked and long inciſion knife; then let the mouth be now and then waſhed with clenſing gargles; as ℞. *Aquæ hordej lib. ſſ. mellis roſ. & ſyr. roſar. ſic. an* ℥j. *fiat gargariſma.* Alſo the uſe of *œnomel*, that is wine, and Hony will be fit for this purpoſe. The ulcer being clenſed by theſe means, let it be cicatrized with a litle roch-Alume added to the former gargariſmes.

The Figure of an inciſion knife opened out of the hafte, which ſerves for a ſheath thereto.



Chap. IX.

Of the Bronchocele, *or* Rupture *of the throate.*

The reaſon of the name.

THat which the French call Goetra, that the Greeks call ***Bronchocele***, the Latines ***Gutturis Hernia***, that is, the Rupture of the throate. For it is a round tumor of the throate, the matter wherof comming from within outwards, is conteined betweene the skin and weazon; it proceeds in weomen from the ſame cauſe as an ***Aneuriſma***.

The differences.

But this generall name of ***Bronchocele*** undergoes many differences, for ſometimes it retaines the nature of ***Melicerides***, other whiles of ***Steatom'as***, ***Atheroma's*** or ***Aneuriſma's***, in ſome there is found a fleſhy ſubſtance having ſome ſmall paine; ſome of theſe are ſmall, others ſo great, that they ſeeme almoſt to cover all the throate; ſome have a Cyſte, or bagge, others have no ſuch thing; all how many ſo ever they be, and what end they ſhall have, may be knowne by their proper ſignes; theſe which ſhall be cureable, may be opened with an actuall or potentiall cautery, or with an inciſion knife. Hence if it be poſſible, let the matter be preſently evacuated, but if it cannot be done at once, let it be performeed at diverſe times, and diſcuſſed by fit remedies, and laſtly let the ulcer be conſolidated and cicatrized.

The Cure.

Chap. X.

Of the Pleuriſie.

What it is.

THe Pleuriſie is an inflammation of the membrane, inveſting the ribbes, cauſed by ſubtile and cholericke bloud, ſpringing upwards with great violence from the hollow veine into the ***Azygos***, and thence into the intercoſtall veines, & is at length powred forth into the emptie ſpaces of the intercoſtall muſcles, and the mentioned membrane. Being contained there, if it tend to ſuppuration, it commonly infers a pricking paine, a Feaver and difficulty of breathing. This ſuppurated bloud is purged and evacuated one while by the mouth; the Lungs ſucking it, and ſo caſting it into the Weazon, and ſo into the mouth, otherwhiles by urine, and ſometimes by ſtoole.

Of a Pleuriſie comming to ſuppuration.

Of the change thereof into an *Empyema*.

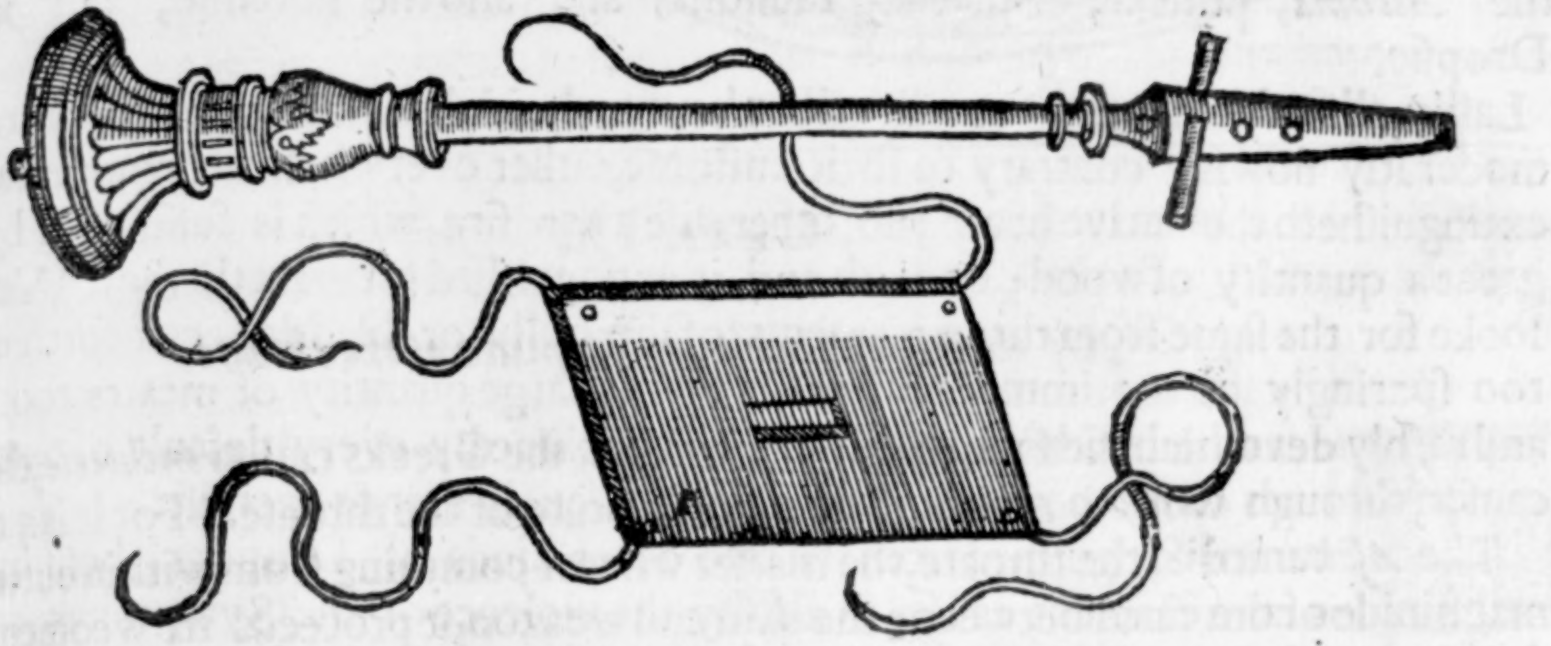
But if nature being too weake, cannot expectorate the purulent blood poured forth into the capacity of the Cheſt the diſeaſe is turned into an ***Empyema***, wherefore the Chirurgion muſt then be called, who beginning to reckon from below upwards, may make a vent betweene the third and fourth true and legitimate ribs; & that muſt be done either with an actuall or potentiall cautery, or with a ſharpe knife drawne upwards towards the backe, but not downwards, leſt the veſſells ſhould be violated which are diſſeminated under the rib. This apertion may be ſafely and eaſily performed by this actuall caurtry; it is perforated with foure holes, through one whereof there is a pin put higher or lower according to the depth & manner of your inciſion:

Of the apertion of the ſide in an *Empyema*

the

then the point thereof is thruſt through a plate af iron perforated alſo in the midſt, into the part deſigned by the Phyſition, leſt the wavering hand might peradventure touch, and ſo hurt the other parts not to be medled withall. This ſame plate muſt be ſomewhat hollowed, that ſo it might be more eaſily fitted to the gibbous ſide, and bound by the corners on the contrary ſide with foure ſtrings. Wherefore I have thought good here to expreſſe the figures thereof.

The Figure of an actuall cautery with its plate fit to be uſed in a pleuriſie.



But if the patient ſhall have a large body, Cheſt and ribs, you may divide and perforate the ribs themſelves with a Trepan; howſoever the apertion be made, the *pus* or matter muſt be evacuated by little and litle at ſeverall times; and the capacity of the Cheſt clenſed from the purulent matter by a detergent injection of vj ounces of Barly water, and ℥ij hony of Roſes, and other the like things mentioned at large in our cure of wounds.

CHAP. XI.

Of the Dropſie.

What the Dropſie is.

THe Dropſie is a Tumor againſt nature by the aboundance of a wateriſh humor, of flatulencies, or Phlegme, gathered one while in all the habite of the body, otherwhiles in ſome part, and that eſpecially in the capacity of the belly betweene the *Peritonæum* and entrailes. From this diſtinction of places and matters there ariſe divers kinds of Dropſies.

The differences thereof.

Firſt that Dropſie which fils that ſpace of the belly, is either moiſt or dry. The moiſt is called the *Aſcites*, by reaſon of the ſimilitude it hath with a leather bottle, or *Borachio*, becauſe the wateriſh humor is contained in that capacity, as it were in ſuch a veſſell.

The dry is called the *Tympanites*, or Timpany, by reaſon the belly ſwolne with winde, ſounds like a (*Tympanum*) that is, a Drum. But when the whole habit of the body is diſtended with a Phlegmaticke humor, it is called *Anaſarca* or *Leucophlegmatia*.

The Symptomes.

In this laſt kinde of Dropſie the lower parts firſt ſwell, as which by reaſon of their ſite are more ſubject to receive defluxions, and more remote from the fountaine of the native heate; wherefore if you preſſe them downe, the print of your finger will remaine ſometime after; the patients face will become pale and puffed up, whereby it may be diſtinguiſhed from the two other kinds of Dropſie. For in them firſt the belly, then by a certaine conſequence the thighes and feet doe ſwell. There are beſides alſo particular Dropſies contained in the ſtrait bounds of certaine places, ſuch are the *Hydrocephalos* in the head; the *Bronchochele* in the throat; the *Pleurocele* in the Cheſt; the *Hydrocele* in the *Scrotum*, or Cod; and ſo of the reſt.

The Cauſes.

Yet they all ariſe from the ſame cauſe; that is, the weakneſſe or defect of the altering or concocting faculties, eſpecially of the liver, which hath beene cauſed by a *Scyrrhus*, or any kinde of great diſtemper, cheifly cold, whether it happen primarily, or ſecondarily by reaſon of ſome hote diſtemper diſſipating the native and inbred heate, ſuch a Dropſie is uncureable; or elſe it comes by conſent of ſome other higher or lower part; for if in the Lungs, Midriffe, or Reines there be any diſtemper, or diſeaſe bred, it is eaſily communicated to the gibbous part of the Liver by the branches of the hollow veine, which runne thither. But if the miſchiefe proceed from the Spleene, Stomacke, Meſentery, Guts, eſpecially the *jejunum* and *Ileum*, it creeps into the hollow ſide of the Liver by the meſeraicke veines, and other branches of the *Vena porta* or Gate-veine. For thus ſuch as are troubled with the *Aſthma*, ptiſicke, Spleene, Iaundiſe, and alſo the Phrenſie, fall into a Dropſie.

How divers diſeaſes turne into Dropſies.

Laſtly, all ſuch as have the menſtruall or hæmorrhoidall bloud ſuppreſſed or too immoderatly flowing contrary to their cuſtome, either overwhelmes, diminiſheth or extinguiſheth the native heate; no otherwiſe than fire, which is ſuffocated by too great a quantity of wood; or dieth and is extinguiſhed for want thereof. We muſt looke for the ſame from the excrements of the belly or bladder, caſt forth either too ſparingly or too immoderatly: Or by too large quantity of meates too cold, and raſhly devoured without any order; To conclude by every default of externall cauſes, through which occaſion, error may happen, in diet or exerciſe.

The ſignes of an *Aſcites*.

The *Aſcites* is diſtinguiſhed from the two other kinds of Dropſies, both by the magnitude of the efficient cauſe, as alſo by the violence of the Symptomes, as the dejected appetite, thirſt, and ſwelling of the *Abdomen*. And alſo when the body is moved or turned upon either ſide, you may heare a ſound as of the jogging of water in a veſſell halfe full. Laſtly the humor is diverſely driven upwards or downewards, according to the turning of the body and compreſſion of the *Abdomen*; It alſo cauſeth various Symptomes by preſſure of the parts to which it floweth. For it cauſeth difficultie of breathing and the cough by preſſing the Midriffe; by ſweating through into the capacity of the Cheſt it cauſeth like Symptomes as the *Empyema*. Beſides alſo the Patients often ſeeme, as it were, by the ebbing and flowing of the wateriſh humor, one while to be carryed to the skies, and another whiles to be drowned in the water; which I have learnt not by reading of any author, but by the report of the patients themſelves. But if theſe wateriſh humors be fallen downe to the lower parts, they ſuppreſſe the excrements of the Gutts and bladder by preſſing & ſtraitning the paſſages. When the patient lies on his backe the tumor ſeemes leſſe, becauſe it is ſpread on both ſides; On the contrary when hee ſtands or ſits, it ſeemes greater, for that all the humor is forced or driven into the lower belly, whence hee feeles a heavines in the *Pecten* or ſhare. The upper parts of the body fall away by defect of the bloud fit for nouriſhment in quality and conſiſtence; but the lower parts ſwell by the flowing downe of the Serous and watriſh humor to them. The pulſe is little, quicke, and hard with tention.

The Symptoms.

Prognoſtickes.

This diſeaſe is of the kinde of Chronicall or long diſeaſes; wherefore it is ſcarce, or never cured, eſpecially in thoſe who have it from their mothers wombe, who have the Action of their Stomacke depraved, and thoſe who are cachecticke, old, and laſtly all ſuch as have the naturall facultie languiſhing and faultie.

On the contrary young and ſtrong men, eſpecially if they have no Feaver, and finally all who can endure labour and thoſe exerciſes which are fit for curing this diſeaſe, eaſily recover, principally if they uſe a Phyſition before the water which is gathered together doe putrifie and infect the bowells by its contagion.

Chap. XII.

Of the cure of the Dropſie.

THe beginning of the cure muſt be with gentle and milde medicines; neither muſt we come to a *Paracenteſis*, unleſſe we have formerly uſed and tried theſe. Therefore it ſhall be the part of the Phyſition to preſcribe a drying diet, and ſuch medicines as carry away water, both by ſtoole and urine. *Hippocrates* ordaines this powder for Hydropicke perſons. ℞, *Canthar. ablatis capitib. & alis* ʒß. *Comburentur in furno, & fiat pulvis*; of which adminiſter two graines in white wine, for nature helped by this, and the like remedies hath not ſeldome beene ſeene to have cured the dropſie. But that we may haſten the cure, it will be availeable to ſtirre up the native heate of the part by application of thoſe medicines which have a diſcuſſing force: as bagges, baths, ointments, and emplaiſters. Let bagges be made of drie and harſh Bran, Oates, Salt, Sulphure, being made hot, or for want of them, of Sander, or Aſhes often heated.

Hip. lib. 4. de acut. & lib. de intern.

Bagges.

The more effectuall baths are ſalt, nitrous, and ſulphurous waters, whether by Nature or Art, that is, prepared by the diſſolution of Salt niter, and Sulphur; to which, if Rue, Marjarom, the leaves of Fennell, and tops of Dill, of *Stœchas*, and the like be added, the buſineſſe will goe better forwards. Let the ointments be made of the oyles of Rue, Dill, Baies, and Squills, in which ſome *Euphorbium*, Pellitory of Spaine, or Pepper have beene boyled. Let plaiſters be made of Franckinſence, Myrrhe, Turpintine, *Coſtus*, Baiberies, Engliſh galengall, hony, the dung of Oxen, Pigeons, Goats, Horſes, and the like, which alſo may be applied by themſelves. If the diſeaſe continue, we muſt come to *Synapiſmes* and *Phœnigmes*, that is, to rubrifying and veſicatory medicines. When the bliſters are raiſed, they muſt be annointed againe, that ſo the water may by little and little flow ſo long untill all the humor be exhauſted, and the patient reſtored to health.

Bathes.

Liniments.

Emplaiſters.

Veſicatories.

Galen writes, the Husbandmen in *Aſia*, when they carried wheat out of the country into the city in Carrs, when they will ſteale away and not be taken, hidde ſome ſtone juggs fild with water in the middeſt of the wheat; for that will draw the moiſture through the juggs into it ſelfe, and increaſe both the quantitie and weight. When certaine pragmaticall Phyſitions had read this, they thought that wheat had force to draw out the water, ſo that if any ſicke of the Dropſie ſhould be buried in a heape of wheat, it would draw out all the water.

Gal. lib. de facul. natur. 1.

But if the Phyſition ſhall profit nothing by theſe meanes, he muſt come to the exquiſitely chiefe remedy, that is, to *Paracenteſis*. Of which becauſe the opinions of the ancient Phyſitions have beene divers, we will produce and explaine them.

Divers opinions of *Paracenteſis*, or opening of the belly.

Thoſe therefore which diſallow *Paracenteſis*, conclude it dangerous for three reaſons. The firſt is, becauſe by powring out the contained water, together with it, you diſſipate and reſolve the ſpirits, and conſequently the naturall, vitall, and a nimall faculties; another opinion is, becauſe the Liver wanting the water by which formerly it was borne up; thence forward hanging downe by its weight, depreſſeth and draweth downewards the Midriffe and the whole Cheſt, whence a drie cough, and a difficulty of breathing proceede. The third is, becauſe the ſubſtance of the *Peritonæum*, as that which is nervous, cannot be pricked or cut without danger, neither can that which is pricked or cut be eaſily agglutinated and united, by reaſon of the ſpermatique and bloudleſſe nature thereof. *Eraſiſtratus* moved by theſe reaſons condemned *Paracenteſis* as deadly: alſo he perſwaded that it was unprofitable for theſe following reaſons, *viz.* becauſe the water powred forth, doth not take away with it the cauſe of the Dropſie, and the diſtemper and hardneſſe of the Liver, and of the other bowels, whereby it comes to paſſe that by breeding new waters they may eaſily againe fall into the Dropſie. And then the feaver, thirſt, the hot and drie diſtemper of the bowels, all which were mitigated by the touch of the included water, are aggravated by the abſence thereof, being powred forth: which thing ſeemeth to have moved *Avicen* and *Gordonius* that he ſaid none; the other ſaid very few lived after the *Paracenteſis*: but the refutation of all ſuch reaſons is very eaſie.

Reaſons againſt it.

Eraſiſtratus his Reaſons againſt it.

Reaſons for it.

For, for the firſt *Galen* inferres, that harmefull diſſipation of ſpirits, and reſolving the faculties happens, when the Paracenteſis is not diligently, and artificially performed. As in which the water is preſently powred forth; truly if that reaſon have any validity, Phlebotomy muſt ſeeme to be removed farre from the number of wholeſome remedies, as whereby the bloud is powred forth, which hath farre more pure and ſubtile ſpirits, than thoſe which are ſaid to be diffuſed and mixed with the Dropſie-waters.

Lib.3.Cap.21.

Lib. de morb. Ch. cap. de Hydrope.

The places of the apertion muſt be divers, according to the parts chiefely affected.

The manner of making apertion.

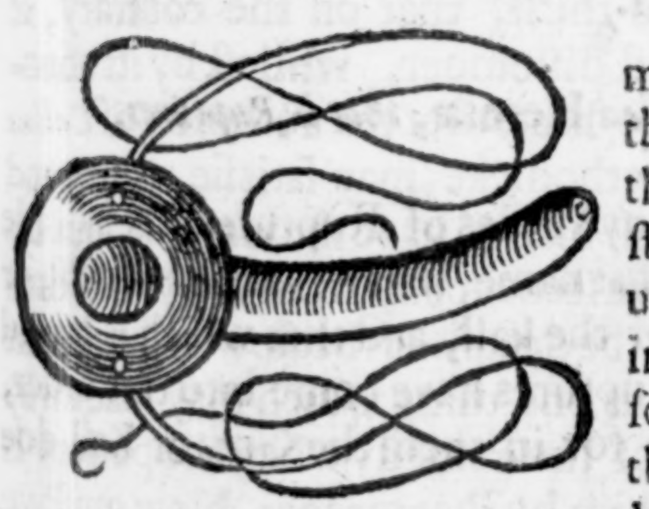
But that danger which the ſecond reaſon threatens ſhall eaſily be avoided; the patient being deſired to lie upon his backe in his bed, for ſo the Liver will not hang downe. But for the third reaſon, the feare of pricking the *Peritonæum*, is childiſh: for thoſe evils which follow upon wounds of the nervous parts, happen by reaſon of the exquiſite ſence of the part, which in the *Peritonæum* ill affected and altered by the contained water, is either none or very ſmall. But reaſon and experience teach, many nervous parts, alſo the very membranes themſelves being farre removed from a fleſhie ſubſtance, being wounded, admit cure; certainely much more the *Peritonæum*, as that which adheres ſo ſtraitly to the muſcles of the *Abdomen*, that the diſſector cannot ſeparate it from the fleſh, but with much labour. But the reaſon which ſeemes to argue the unprofitableneſſe of the *Paracenteſis* is refelled by the authority of *Celſus*. I, ſaith he, am not ignorant that *Eraſiſtratus* did not like *Paracenteſis*; for he throught the Dropſie to be a diſeaſe of the Liver, and ſo that it muſt be cured, and that the water was in vaine let forth, which the Liver being vitiated, might grow againe. But firſt this is not the fault of this bowell alone, and then although the water had his originall from the Liver, yet unleſſe the water which ſtaieth there contrary to nature being evacuated, it hurteth both the Liver, and the reſt of the inner parts, whileſt it either encreaſeth their hardneſſe, or at the leaſt keepeth it hard, and yet notwithſtanding it is fit the body be cured. And although the once letting forth of the humor profit nothing, yet it make way for medicines, which while it was there contained, it hindered. But this ſerous, ſalt, and corrupt humor, is ſo farre from being able to mitigate a Feaver and thirſt, that on the contrary, it encreaſeth them. And alſo it augmenteth the cold diſtemper, whileſt by its abundance it overwhelmes and extinguiſheth the native heate. But the authority of *Cælius Aurelianus* that moſt noble Phiſition, though a Methodicke, may ſatisfie *Avicen* and *Gordonius*. They, ſaith he, which dare avouch that all ſuch as have the water let out by opening their belly have died, doe lie; for we have ſeene many recover by this kind of remedy: but if any died, it happened either by the default of the ſlow or negligent adminiſtration of the *Paracenteſis*. I will adde this one thing which may take away all error of controverſies: we unwiſely doubt of the remedy when the patient is brought to that neceſſity, that we can onely helpe him by that meanes. Now muſt we ſhew how the belly ought to be opened. If the Dropſie happen by fault of the Liver, the ſection muſt be made on the left ſide; but if of the Splene, in the right: for if the patient ſhould lie upon the ſide which is opened, the paine of the wound would continually trouble him, and the water running into that part where the ſection is, would continually droppe, whence would follow a diſſolution of the faculties. The Section muſt be made three fingers bredth below the Navell, to wit, at the ſide of the right muſcle, but not upon that which they call the *Linea Alba*; neither upon the nervous parts of the reſt of the muſcles of the *Epigaſtrium*; that ſo we may prevent paine and difficulty of healing. Therefore wee muſt have a care that the patient lie upon his right ſide, if the inciſion be made in the left, or on the left, if on the right. Then the Chirurgion both with his owne hand, as alſo with the hand of his ſervant aſſiſting him, muſt take up the ſkinne of the belly, with the fleſhie pannicle lying under it, and ſeparate them from the reſt; then let him divide them ſo ſeparated with a Section even to the fleſh lying under them, which being done, let him force as much as hee can the devided ſkinne upwards towards the ſtomacke, that when the wound, which muſt preſently be made in the fleſh lying there under, ſhall be conſolidated, the ſkinne by its falling therein, may ſerve for that purpoſe: then therefore let him divide the muſculous fleſh and *Peritonæum* with a ſmall wound, not hurting the Kall or Guts.

Then put into the wound a trunke, or golden, or ſilver crooked pipe, of the thickneſſe of a Gooſes-quill, and of the length of ſome halfe a finger. Let that part of it which goes into the capacity of the belly have ſomething a broad head, and that perforated with two ſmall holes, by which a ſtring being faſtened, it may be bound ſo about the body, that it cannot be moved, unleſſe at the Chirurgions pleaſure. Let a ſpunge be put into the pipe, which may receive the dropping humor: and let it be taken out when you would evacuate the water: but let it not be powred out all together, but by little and little, for feare of diſſipation of the ſpirits, and reſolution of the faculties, which I once ſaw happen to one ſicke of the Dropſie. He being impatient of the diſeaſe and cure thereof, thruſt a Bodkin into his belly, and did much rejoyce at the powring forth of the water, as if he had bin freed from the humor and the diſeaſe, but died within a few houres, becauſe the force of the water, running forth, could by no meanes be ſtaied, for the inciſion was not artificially made. But it will not be ſufficient to have made way for the humor by the meanes aforementioned, but alſo the externall orifice of the pipe muſt be ſtopped and ſtrengthened by double cloathes, and a ſtrong ligature, leaſt any of the water flow forth againſt our wills. But we muſt note that the pipe is not to be drawne out of the wound, before as much water ſhall be iſſued forth as we deſire, & the tumor requireth; for once drawne forth, it cannot eaſily be put in againe, and without force & paine be fitted to the lips of the wound, becauſe the skin and fleſhy pannicle cover it by their falling into the wound of the fleſh or muſcle. But whileſt the water is in evacuation, we muſt have a diligent care of feeding the Patient, as alſo of his ſtrength, for if that faile, and he ſeeme to be debilitated, the effuſion of the water muſt be ſtaied for ſome dayes; which at the length performed according to our deſire, the wound muſt be ſo conſolidated that the Chirurgion beware it degenerate not into a Fiſtula.

A Hiſtory.

A Caution for taking out the Pipe.

The Figure of a Pipe in forme of a Quill, to evacuate the water in Dropſies.



Others performe this buſineſſe after another manner; for making an inciſion, they thruſt through the lipps of the wound with a needle and threed: but they take up much of the fleſhie ſubſtance with the needle, leaſt that which is taken up ſhould be rent and torne by the forcible drawing of the lippes together. Then the threed it ſelfe is wrapped up and downe over both ends of the needle, ſo thruſt through, as is uſually done in a hare-lippe, that ſo the lippes of the wound may ſo cloſely cohere, that not a drop of water may get out againſt the Chirurgions will. Sometimes ſuch as are cured and healed of the Dropſie, fall into the Iaundiſe, whom I uſually cure after this manner. ℞, *ſterc. anſer.* ʒij, diſſolve it in ℥iij, *vini alb. coletur*, make a Potion, and let it be given two houres before meate.

Another manner of evacuating the water after the apertion.

A medicine for the Iaundiſe.

Chap. XIII.

Of the tumor and relaxation of the Navell.

THe *Exomphalos* or ſwelling of the Navell, is cauſed by the *Peritonæum*, either relaxed or broken: for by this occaſion oft-times the Guts, and oft-times the Kall, fall into the ſeat of the Navell, and ſometimes ſuperfluous fleſh is there generated; otherwiſe this tumor is as an *Aneuriſma* by too great a quantity of bloud powred forth in that place: otherwiſe by a flatulent matter, and ſometimes by a wateriſh humor. If the humor be occaſioned by the Kall, the part it ſelfe will retaine his proper colour, that is, the colour of the skinne; the tumor will be ſoft and almoſt without paine, and which will reſide without noiſe, either by the preſſure of your fingers, or of it ſelfe when the Patient lieth on his backe; but the tumor

The divers cauſes thereof.

Signes hereof occaſioned by the Kall.

By the guts:
By fleſh,

tumor cauſed by the guts, is more unequall, and when it is forced inby the preſſure of your fingers, there is ſuch a noiſe heard, as in the *Enterocele*; but if the tumor proceede of ſuperfluous fleſh, it will be harder and more ſtubborne, not eaſily retiring into the body, although the Patient lie upon his backe, and you preſſe it with your fingers.

By winde.
By a wateriſh humor.
By bruiſed blood.
Which may be cured by Chirurgery, which not.
The cure by Chirurgery.

The tumor is ſofter which proceeds of winde, but which will not retire into the body, and ſounds under your naile like a taber. If the ſwelling be cauſed by a wateriſh humor, it hath all things common with the flatuous tumor, except that it is not ſo viſible, and without noiſe. If it be from effuſion of bloud, it is of a livid colour, but if the effuſed bloud ſhall be arteriall, then there are the ſignes of an *Aneuriſma*. Wherefore when the tumor is cauſed by the Guts, Kall, Winde, or a wateriſh humour, it is cured by Chirurgery: but not if it proceede from a fleſhie excreſcence or ſuffuſion of bloud. The tumor of the Navell proceeding from the Kall, and Guts, the Patient muſt lie upon his backe to be cured, and then the Kall, and Guts, muſt with your fingers be forced into their due place: then the ſkinne with which the tumor is circumſcribed muſt be taken up with your fingers, and thruſt through with a needle, drawing after it a double twined and ſtrong threed; then it muſt be ſcarified about the ſides, that ſo it may be the eaſier agglutinated. Then muſt it be thruſt through with a needle, three or foure times, according to the manner and condition of the diſtention and tumor. And ſo twitch it ſtrongly with a threed, that the ſkinne which is ſo bound may at length fall off together with the ligatures. But alſo you may cut off the ſkinne ſo diſtended even to the ligature, and then cicatrize it, as ſhall be fit. A flatulent tumor of the Navell ſhall be cured with the ſame remedies, as we ſhall hereafter mention in the cure of a windy rupture, but the watery may be powred forth by making a ſmall inciſion. And the wound ſhall be kept open, ſo long, untill all the water be drained forth.

Chap. XIIII.

Of the Tumors of the Groines and Codds, called Herniæ, *that is, Ruptures.*

There are onely 3. ſorts of Ruptures.

THe ancient Phiſitions have made many kindes of Ruptures, yet indeede there are onely three to be called by that name, that is, the *Inteſtinalis*, or that of the guts, the *Zirbalis*, or that of the kall, and that which is mixed of them both. The other kindes of Ruptures have come into this order, rather by ſimilitude, than any truth of the thing: for in them the Gut, or Kall doe not forſake their places.

Bubonocele.
Enterocele and *Epiplocele.*
Hydrocele. *Phyſocele.*
Sarcocele.
Cirſocele.
The Cauſes.
The ſignes.

The Greekes have given to all theſe ſeverall names, both from the ſeat of the tumor, as alſo from their matter. For thus they have called an unperfect rupture which deſcends not beyond the Groines, nor falls downe into the Codds, *Bubonocele*: but the compleate which penetrates into the Codde, if it be by falling downe of the Gut, *Enterocele*: if from the Kall, *Epiplocele*; if from them both together, they name it *Enteroepiplocele*: but if the tumor proceede from a wateriſh humor, they terme it *Hydrocele*; if from winde, *Phyſocele*, if from both, *Hydrophyſocele*; if a fleſhie excreſcence ſhall grow about the teſticle, or in the ſubſtance thereof, it is named *Sarcocele*. If the veines interwoven, and divaricated diverſe wayes ſhall be ſwollen in the Codde and Teſticles, the tumor obtaines the name of a *Cirſocele*. But if the humors ſhall be ſhut up, or ſent thither, the name is impoſed upon the tumor, from the predominant humor, as we have noted in the beginning of our Tractate of tumors. The cauſes are many, as all too violent motions, a ſtroake, a fall from a high place, vomiting, a cough, leaping, riding upon a trotting horſe, the ſounding of trumpets, or ſackbuts, the carrying, or lifting vp of a heavy burden, racking, alſo the too immoderate uſe of viſcide and flatulent meates; for all ſuch things may either relaxe or breake the *Peritonæum*, as that which is a thinne and extended membrane. The ſignes of a *Bubonocele* are a round tumor in the Groine, which preſſed, is eaſily forced in. The ſignes of an *Enterocele*, are a hard tumor in the Codde, which forced, returneth backe and departeth with a certaine murmour and paine; but the tumor proceeding of the Kall, is laxe and feeles ſoft like Wooll, and which is more difficultly forced in, than that which proceeds from the Guts, but yet without murmuring and paine: for the ſubſtance of the Guts, ſeeing it is one, and continued to it ſelfe, they doe not onely mutually ſucceede each other, but by a certaine conſequence doe, as in a dance draw each other, ſo to avoide diſtention, which in their membranous body cannot be without paine, by reaſon of their change of place from that which is naturall, into that againſt nature: none of all which can befall the Kall, ſeeing it is a ſtupide body, and almoſt without ſence, heavy, dull, and immoveable. The ſignes that the *Peritonæum* is broken, are the ſudden increaſe of the tumor, and a ſharpe and cutting paine; for when the *Peritonæum* is onely relaxed, the tumor groweth by little and little, and ſo conſequently with ſmall paine; yet ſuch paine returnes ſo often, as the tumor is renewed by the falling downe of the Gut, or Kall, which happens not the *Peritonæum* being broken: for the way being once open, and paſſable to the falling body, the tumor is renued without any diſtention, and ſo without any paine to ſpeake of. The reſt of the ſignes ſhall be handled in their places. Sometimes it happens that the Guts, and Kall, do ſo firmely adhere to the proceſſe of the *Peritonæum*, that they can not be driven back into their proper ſeate. This ſtubborne adheſion happens by the intervention of the viſcide matter, or by meanes of ſome excoriation cauſed by the rude hand of a Chirurgion, in too violently forcing of the Gut, or Kall, into their place. But alſo, too long ſtay of the gut in the codde, and the neglect of wearing a Truſſe, may give occaſion to ſuch adheſion. A perfect and inveterate rupture by the breaking of the proceſſe of the *Peritonæum* in men of full growth, never, or very ſeldomes admits of cure. But you muſt note, that by great ruptures of the *Peritonæum*, the Guts may fall into the codde, to the bigneſſe of a mans head, without much paine and danger of life, becauſe the excrements, as they may eaſily enter, by reaſon of the largeneſſe of the place and rupture, ſo alſo they may eaſily returne.

What rupture is uncurable.

Chap. XV.

Of the cure of Ruptures.

Becauſe children are very ſubject to Ruptures, but thoſe truely not fleſhy or varicous, but watry, windy, and eſpecially of the Guts, by reaſon of continuall and painefull crying and coughing: Therefore in the firſt place we will treate of their cure. Wherefore the Chirurgion, called to reſtore the Gut which is fallen downe, ſhall place the child, either on a table, or in a bed, ſo that his head ſhall be low, but his buttocks, and thighes higher; then ſhall he force with his hands by little and little, and gently, the Gut into its proper place; and ſhall foment the Groine with the aſtringent fomentation, deſcribed in the falling downe of the wombe. Then let him apply this remedy, ℞, *Præſcript. decoctionis quantum ſufficit, farinæ hordei & fabarum, an.* ℥j, *pulver. Aloes, Maſtiches, Myrtyll. & Sarcoco. an.* ʒß, *Boli Armeni* ℥ij. Let them be incorporated and made a cataplaſme according to Art. For the ſame purpoſe he may apply *Emplaſtrum contra Rupturam*: but the chiefe of the cure conſiſts in folded clothes, and Truſſes, and ligatures artificially made, that the reſtored gut may be contained in its place, for which purpoſe he ſhall keepe the child ſeated in his cradle for 30. or 40. dayes, as we mentioned before; and keepe him from crying, ſhouting, and coughing. *Aetius* bids ſteepe paper 3. dayes in water, and apply it made into a ball to the groine, the gut being firſt put up; for that remedy by 3. dayes adheſion wil keep it from falling down. But it wil be, as I ſuppoſe more effectuall, if the paper be ſteeped not in common, but in the aſtringent water, deſcribed in the falling downe of the wombe. Truely I have healed many by the helpe of ſuch remedies, and have delivered them from the hands of Gelders, which are greedy of childrens teſticles, by reaſon of the great gaine they receive from thence. They by a crafty cozenage, perſwade the Parents, that the falling downe of the Gut into the Codde, is uncurable: which thing notwithſtanding, experience convinceth to be falſe, if ſo be the cure be performed acccording to the forementioned manner, when the *Peritonæum* is onely relaxed, and not broken: for the proceſſe thereof by which the

To what ruptures children are ſubject.

An aſtringent cataplaſme.

Ser. 1. Cap. 24.

The craft and covetouſneſſe of Gelders.

Another way to cure Ruptures.

the Gut doth fall as in a ſteepe way, in progreſſe of time and age is ſtraitned and knit together, whileſt alſo in the meane time the guts grow thicker.

A certaine Chirurgion who deſerveth credit, hath told me that he hath cured many children as thus: He beates a loadſtone into fine powder, and gives it in pappe, and then hee annointes with hony the Groine, by which the gut came out, and then ſtrewed it over with fine filings of iron. He adminiſtred this kinde of remedy for ten or twelve dayes: The part, for other things, being bound up with a ligature and truſſe as was fitting. The efficacie of this remedy ſeemeth to conſiſt in this; that the loadeſtone by a naturall deſire of drawing the iron which is ſtrewed upon the Groine, joynes to it the fleſhy and fatty particles interpoſed betweene them, by a certaine violent impetuoſity, which on every ſide preſſing and bending the looſeneſſe of the *Peritonæum*, yea verily adjoyning themſelves to it, in proceſſe of time by a firme adheſion intercept the paſſage and falling downe of the Gut or Kall; which may ſeeme no more abhorring from reaſon, than that we behold the loadſtone it ſelfe through the thickneſſe of a table, to draw iron after it any way. The ſame Chirurgion affirmed, that he frequently and happily uſed the following medicine. Hee burnt into aſhes in an Oven red Snailes, ſhut up in an earthen pot, and gave the powder of them to little children in pappe, but to thoſe which were bigger, in broath.

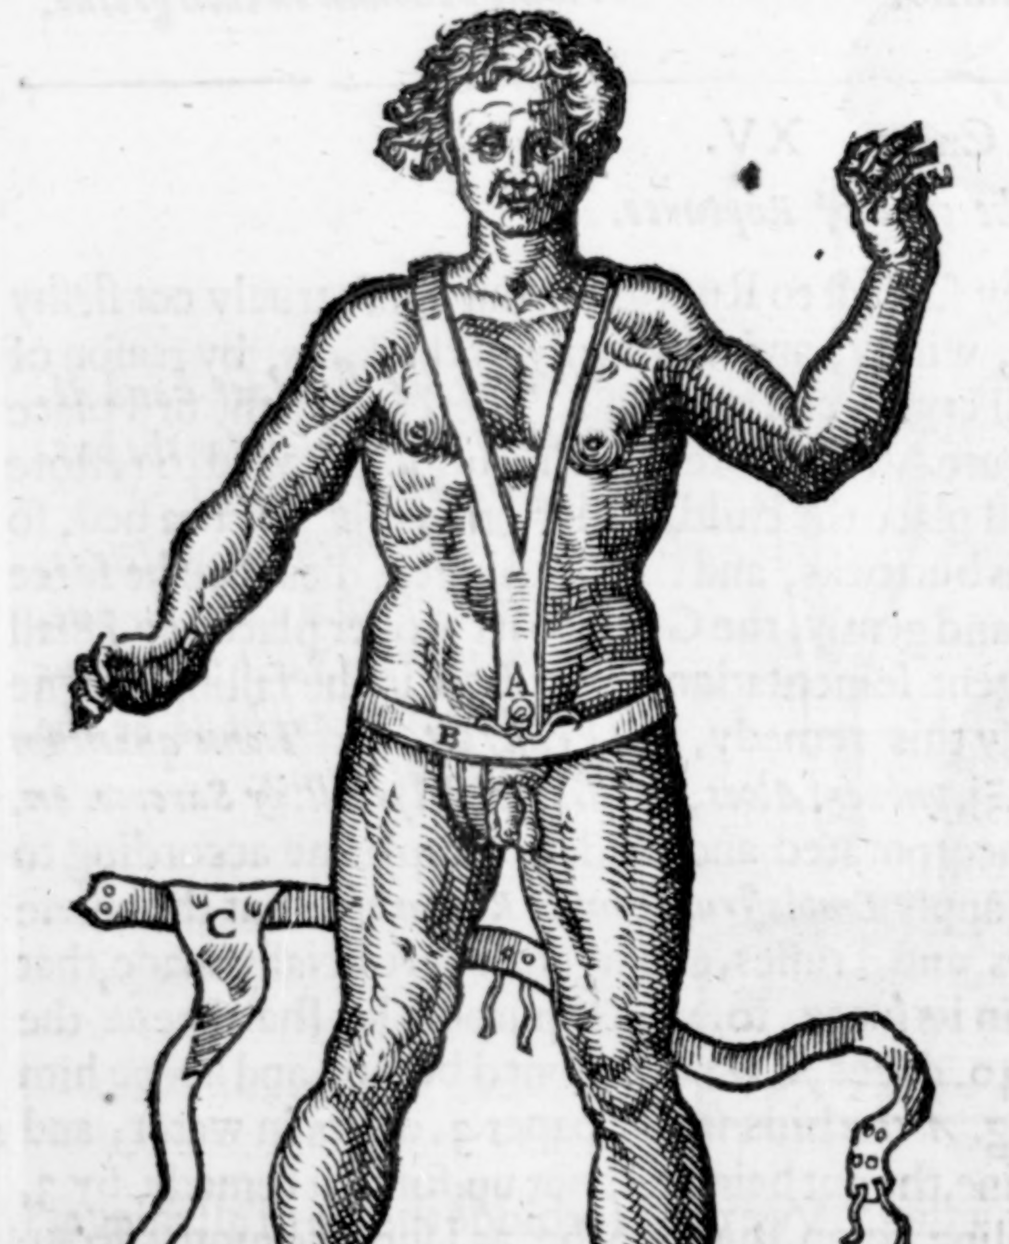
The reaſon of this cure.

Another medicine.

But we muſt deſpaire of nothing in this diſeaſe, for the cure may happily proceede in men of full growth, as of fortie yeare old, who have filled the three demenſions of the body, as this following relation teſtifies.

A notable Hiſtory.

There was a certaine Prieſt in the Pariſh of Saint *Andrewes*, called *Iohn Moret*, whoſe office it was to ſing an Epiſtle with a loud voice as often as the ſolemnitie of the day, and the thing required. Wherefore ſeeing he was troubled with the *Enterocele*, he came to me, requiring helpe, ſaying, he was troubled with a grievous paine, eſpecially then, when he ſtretched his voice in the Epiſtle.



The Figure of a man broken on one ſide, wearing a Truſſe, whoſe bolſter muſt have three Tuberoſities, two on the upper, and one on the lower part; and there muſt be a hollowneſſe betweene them in the middeſt, that they may not too ſtraitly preſſe the ſharebone, and ſo cauſe paine. The manner of ſuch a Truſſe, I found out not long agoe, and it ſeemed better and ſafer than the reſt for to hinder the falling downe of the Gut and Kall.

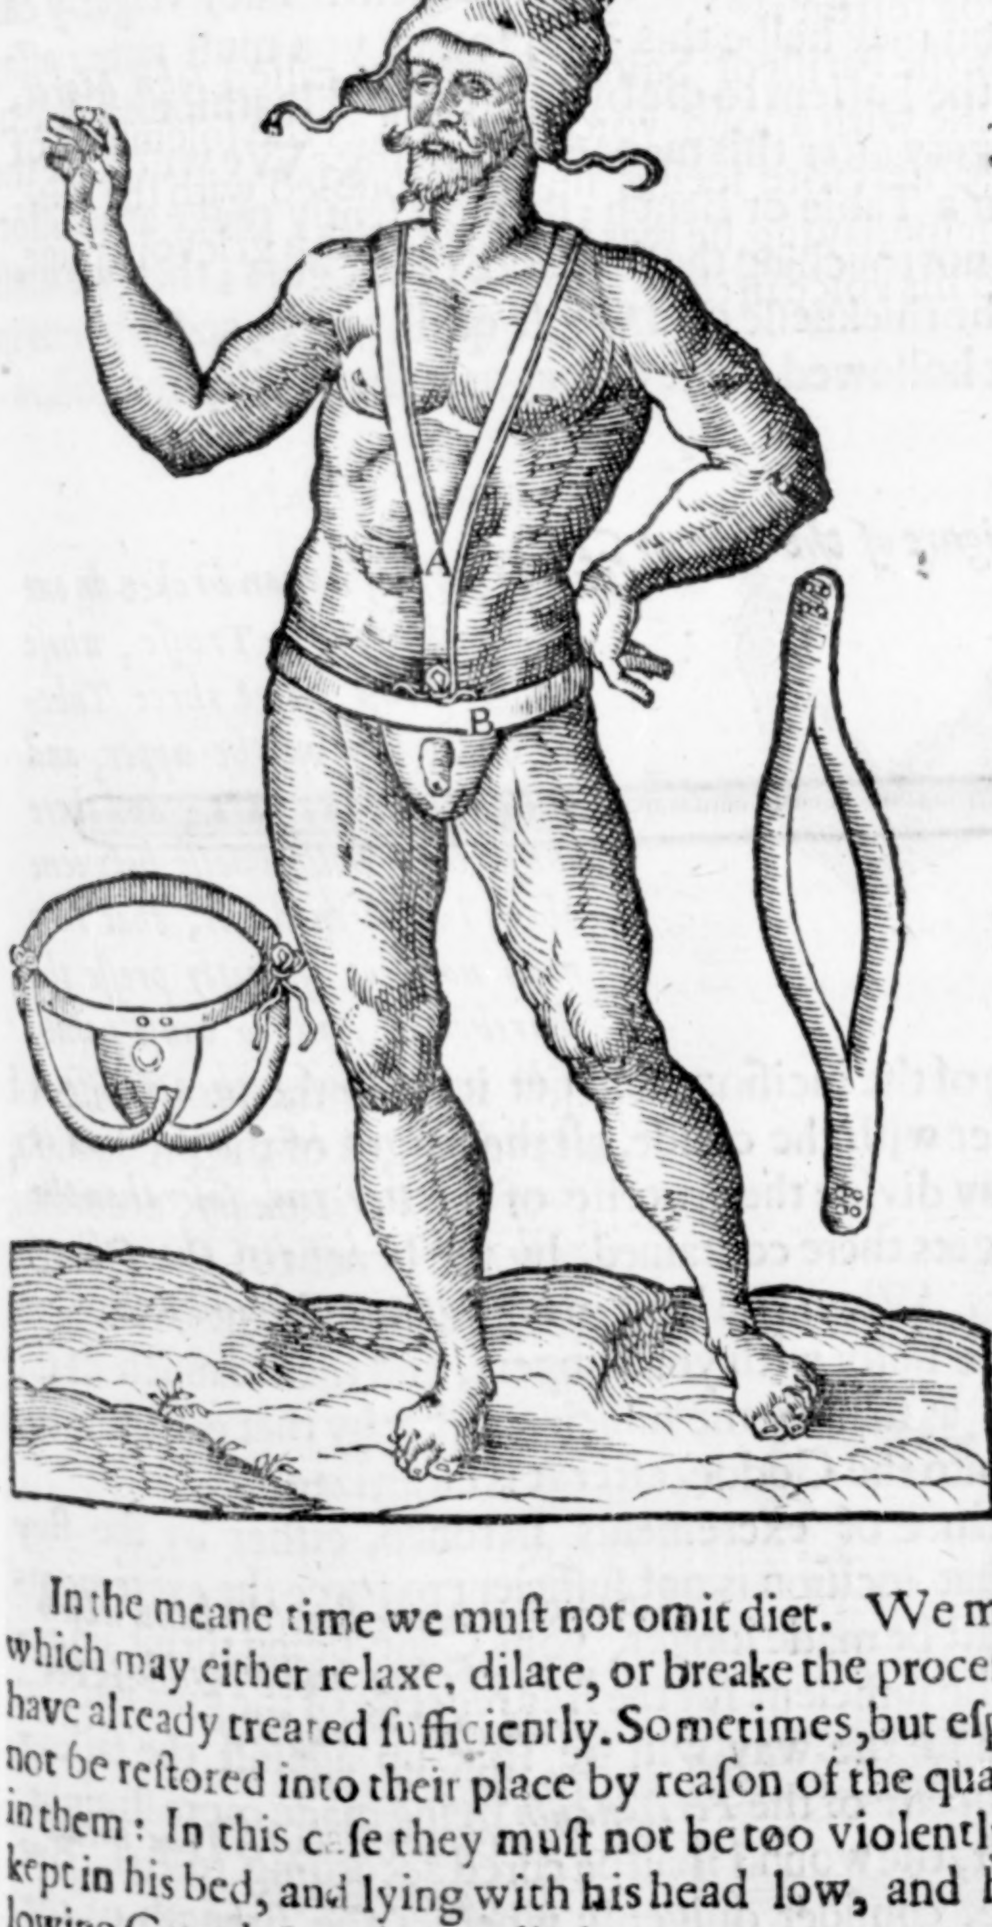
A. *Shewes the ſhoulder band which is tied before and behinde to the girdle of the Truſſe.*

B. *The Truſſe.*

C. *The Cavitie left in the midſt of the Tuberoſities.*

When I had ſeene the bigneſſe of the *Enterocele*, I perſwaded him to get another to ſerve in his place; ſo having gotten leave of M. **Curio** Clearke, and Deacon of Divinity, he committed himſelfe unto me: I handled him according unto Art, and commanded him he ſhould never goe without a Truſſe; and he followed my directions. When I met him ſome five or ſixe yeares after, I asked him how he did, he anſwered very well, for he was wholy freed from the diſeaſe with which he was formerly troubled; which I could not perſwade my ſelfe of, before that I had found that hee had told mee the truth, by the diligent obſervation of his genitals. But ſome ſixe moneths after, he dying of a Pleuriſie, I came to *Curio's* houſe where hee died, and deſired leave to open his body, that I might obſerve whether nature had done any thing at all in the paſſage through which the gut fell down, I call God to witneſſe, that I found a certaine fatty ſubſtance about the proceſſe of the *Peritonæum* about the bigneſſe of a little egge, and it did ſticke ſo hard to that place, that I could ſcarce pull it away without the rending of the neighbouring parts. And this was the ſpeedy cauſe of his cure. But it is moſt worthy of obſervation, and admiration, that Nature but a little helped by Art, healeth diſeaſes which are thought incurable. The chiefe of the cure conſiſts in this, that we firmerly ſtay the gut in its place, after the ſame manner as theſe two Figures ſhew.

We muſt never deſpaire in diſeaſes if ſo be nature be aſſociated by Art.



Another Figure of a man having a Rupture on both ſides, ſhewing by what meanes, what kinde of Truſſe, and what ſhoulder-band he muſt be bound on each groine.

A. *Sheweth the ſhoulder-band divided in the middeſt for the putting through of the head.*

B. *The Truſſe, with two bolſters, betweene which is a hole for putting through the yard. The forme of both bolſters ought to be the ſame with the former.*

In the meane time we muſt not omit diet. We muſt forbidde the uſe of all things, which may either relaxe, dilate, or breake the proceſſe of the *Peritonæum*, of which I have already treated ſufficiently. Sometimes, but eſpecially in old men, the guts cannot be reſtored into their place by reaſon of the quantity of the excrements hardened in them: In this caſe they muſt not be too violently forced, but the Patient muſt be kept in his bed, and lying with his head low, and his knees higher up; let the following Cataplaſmes be applied.

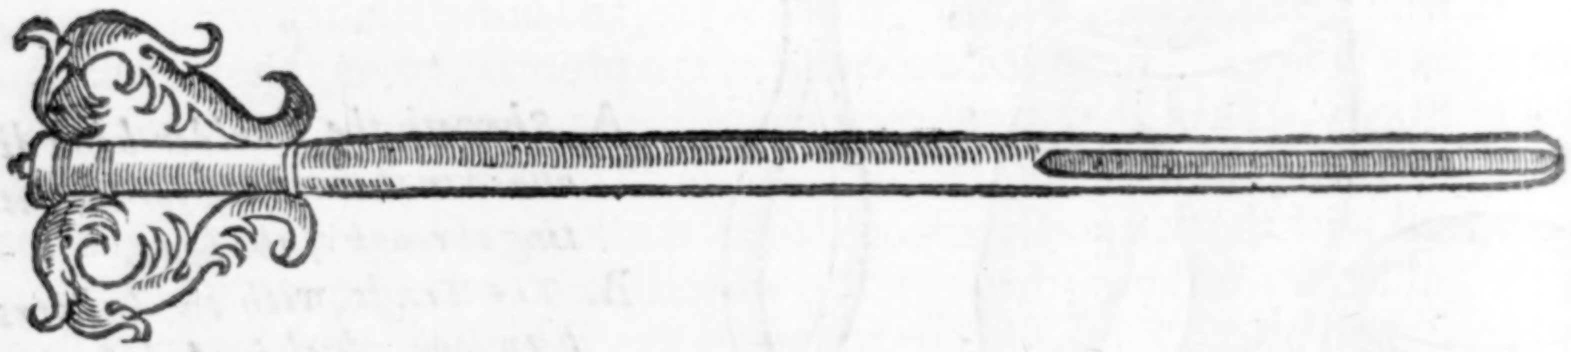
A Cataplaſme to ſoften the excrements.

℞. *rad. alth. & lil ana.* ℥ij. *ſeminis lini. & fœnug. an.* ℥ß, *fol. malvæ, viol. & pariet. an. m.* ß. Let them be boiled in faire water, afterwards beaten, and drawne through a ſearſe, adding thereto of new Butter without ſalt, and oyle of Lillies, as much as ſhall ſuffice. Make a Cataplaſme in the forme of a liquid pultis. Let it be applied hot to the Codde, and bottome of the belly; by the helpe of this remedy when it had beene applied all night, the guts have not ſeldome beene ſeene of themſelves, without the hand of a Chirurgion, to have returned into their proper place. The windineſſe being reſolved, which hindered the going backe of the excrements into another gut, whereby they might be evacuated and expelled. But if the excrements will not goe backe thus, the flatulencies, yet reſiſting and undiſcuſſed, an emollient and carminative Clyſter is to be admitted with a little Chymicall oyle of Turpentine, Dill, Iuniper or Fennill. Clyſters of Muſcadine, oyle of Wallnuts and *Aqua vitæ*, and a ſmall quantitie of any the aforeſaid oyles, are good for the ſame purpoſe.

Chymicall oyls.

It often happens that the guts cannot yet be reſtored, becauſe the proceſſe of the *Peritonæum* is not wide enough. For when the excrements are fallen downe with the gut into the codde; they grow hard by little and little, and encreaſe by the acceſſe of flatulencies cauſed by reſolution, which cauſe ſuch a tumor as cannot be put up through that hole, by which a little before it fell downe: whereby it happens that by putrifaction of the matter there contained, come inflammations, and a new acceſſe of paine; and laſtly, a vomitting and evacuation of the excrements by the mouth being hindered from the other paſſage of the fundament. They vulgarly call this affect *Miſerere mei.* That you may helpe this ſymptome, you muſt rather aſſay extreame remedies, than ſuffer the Patient to die by ſo filthy and loathſome a death. And we muſt cure it by Chirurgery after this manner following. We will binde the Patient lying on his backe, upon a Table or Bench; then preſently make an inciſion in the upper pard of the codde, not touching the ſubſtance of the guts; then we muſt have a ſilver Cane or Pipe, of the thickneſſe of a Gooſe quill, round, and gibbous in one part thereof, but ſomewhat hollowed in the other, as is ſhewed by this following Figure.

The Figure of the Pipe or Cane.



We muſt put it into the place of the inciſion, and put it under the production of the *Peritonæum* being cut together with the codde, all the length of the production; that ſo with a ſharpe knife we may divide the proceſſe of the *Peritonæum*, according to that cavity ſeparated from the guts there contained, by the benefit of the Cane in a right line not hurting the guts. When you have made an indifferent inciſion, the guts muſt gently be put up into the belly with your fingers, and then ſo much of the cut *Peritonæum* muſt be ſowed up, as ſhall ſeeme ſufficient, that by that paſſage made more ſtraight, nothing may fall into the Codde, after it is cicatrized.

But if there be ſuch abundance of excrements hardned, either by the ſtay or heate of inflammation, that that inciſion is not ſufficient to force the excrements into their place, the inciſion muſt be made longer, your Cane being thruſt up towards the belly: ſo that it may be ſufficient for the free regreſſe of the guts into the belly. Then ſow it up as is fit, and the way will be ſhut up againſt the falling downe of the guts or kall; the proceſſe of the *Peritonæum* being made more ſtraight, by reaſon of the ſuture; for the reſt, the wound ſhall be cured according to Art. But before you undertake this worke, conſider diligenly whether the ſtrength of the Patient be ſufficient, neither attempt any thing before you have foretold, and declared the danger to the Patients friends.

CHAP. XVI.

Of the golden Ligature, or the Punctus Aureus, as they call it.

The Chirurgicall cure by the golden Tye.

IF the Rupture will not be cured by all theſe meanes, by reaſon of the great ſolution of the continuity of the relaxt, or broken *Peritonæum*, and the Patient by the conſent of his friends there preſent, is ready to undergoe the danger in hope of recovery; the cure ſhall be attempted by that which they call the *Punctus Aureus*, or Golden tie.

For which purpoſe a Chirurgion which hath a skilfull and ſure hand, is to be imploied. He ſhall make an inciſion about the ſhare bone, into which he ſhall thruſt a Probe like to the Cane, a little before deſcribed; and thruſt it long wayes under the proceſſe of the *Peritonæum*, and by lifting it up, ſeparate it from the the adjoining fibrous, and nervous bodies, to which it adheres; then preſently draw aſide the ſpermatique veſſels, with the *Cremaſter*, or hanging muſcle of the teſticle; which being done, he ſhall draw aſide the proceſſe it ſelfe, alone by it ſelfe: And he ſhall take as much thereof, as is too lax, with ſmall and gentle mullets, perforated in the middeſt, and ſhall with a needle, having five or ſixe threeds, thruſt it through as neere as hee can to the ſpermaticke veſſels, and cremaſter muſcles. But the needle alſo muſt be drawne againe into the middeſt of the remnant of the proceſſe, taking up with it the lipps of the wound; then the threed muſt be tied on a ſtrait knot, and ſo much thereof muſt be left after the ſection, as may be ſufficient to hang out of the wound. This threed will of it ſelfe be diſſolved by little and little by putrefaction: neither muſt it be drawne out before that nature ſhall regenerate and reſtore fleſh into the place of the ligature, otherwiſe all our labour ſhall be ſpent in vaine.

And laſtly, let the wound be clenſed, filled with fleſh, and cicatrized, whoſe callous hardneſſe may withſtand the falling of the gut, or kall.

Another manner thereof.

There are ſome Chirurgians who would performe this golden Ligature after anothe manner. They cut the skinne above the ſhare-bone where the falling downe commonly is, even to the proceſſe of the *Peritonæum*, and they wrap once or twice about it, being uncovered, a ſmall golden wyre, and onely ſtraiten the paſſage as much as may ſuffice, to amend the looſeneſſe of this proceſſe, leaving the ſpermatique veſſels at liberty. Then they twiſt the ends of the wyre twice or thrice with ſmall mullets, and cut off the remnant thereof; that which remaines after the cutting, they turne in, leaſt with the ſharpneſſe it ſhould prick the fleſh growing upon it. Then leaving the golden wyre there, they cure the wound like to other ſimple wounds, and they keepe the Patient ſome fifteene or twenty day in his bed, with his knees ſome thing higher, and his head ſome thing lower.

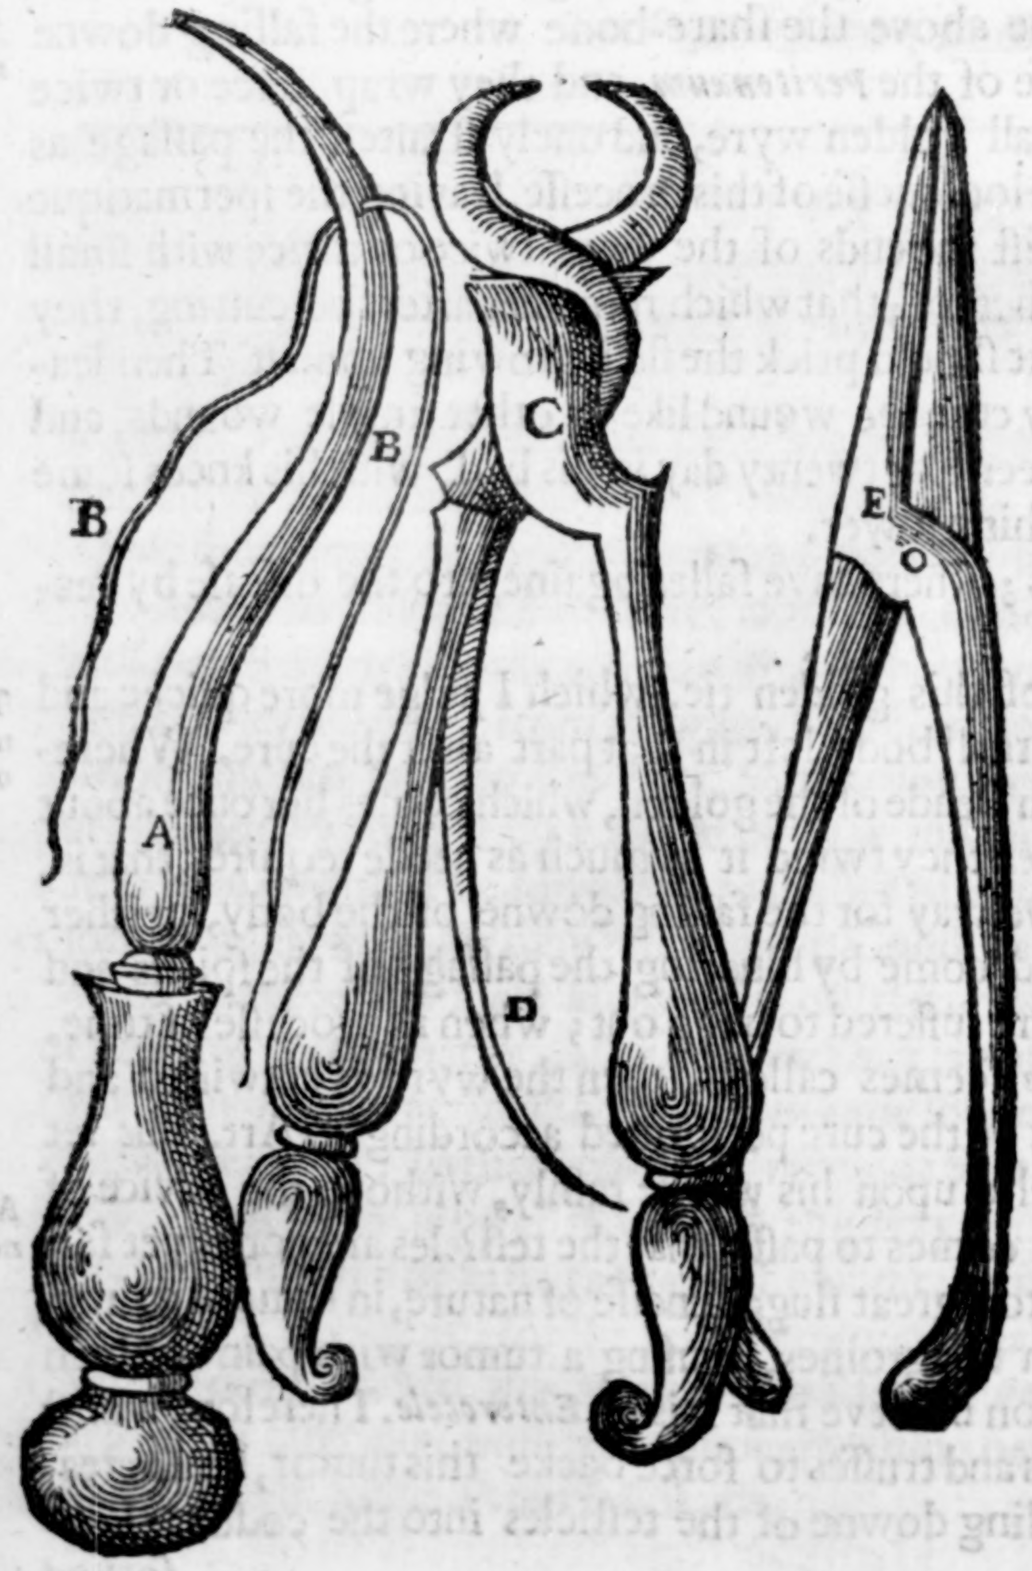
Many are healed by this meanes; others have fallen againe into the diſeaſe by reaſon of the ill twiſting of the wire.

The third manner thereof.

There is alſo another manner of this golden tie, which I judge more quicke and ſafe, even for that there is no externall body left in that part after the cure. Wherefore they wrappe a leaden wyre in ſteade of the golden, which comes but once about the proceſſe of the *Peritonæum*, then they twine it as much as neede requires, that is, not too looſely, leaſt it ſhould leave way for the falling downe of the body, neither too ſtraitly, leaſt a Gangrene ſhould come by hindring the paſſage of the ſpirits and nouriſhment. The ends thereof are ſuffered to hang out; when in proceſſe of time, this contraction of the *Peritonæum* ſeemes callous, then the wyre is untwiſted and gently drawne out. And the reſt of the cure performed according to Art. But let not the Chirurgion thruſt himſelfe upon his worke raſhly, without the advice of the Phyſition, for it diverſe times comes to paſſe, that the teſticles are not as yet fallen downe into the Codde by the too great ſluggiſhneſſe of nature, in ſome of a pretty growth, but remaines long in the groines, cauſing a tumor with paine, which thing may make a good Chirurgion beleeve that it is an *Enterocele*. Therefore whilſt he labours by repelling medicines and truſſes to force backe this tumor, he encreaſeth the paine, and hinders the falling downe of the teſticles into the codde. I obſerved

A thing to be noted.

A Hiſtory. ſerved this not long agoe in a Boy, which an unskilfull Chirurgion had long, and grievouſly troubled, as if he had had a rupture: for when I had obſerved that there was but one ſtone in the Codde, and knew the Boy was never gelt, I bid them caſt away the plaſters, and truſſes, and wiſht his Parents that they ſhould ſuffer him to run and leape, that ſo the idleing ſtone might be drawne into the Codde, which thing by little and little, and without paine, had the event, as I foretold. That the reaſon of this affect may be underſtood, we muſt know a man differs from a woman, onely in efficacie of heat; but it is the nature of ſtrong heat to drive forth, as of cold to keepe in. Hence it is that the ſtones in men hang forth in the codde, but in women they lie hid in the lower belly. Therefore it happens that in ſome males more cold by nature, the teſticles are ſhut up ſome certaine time, untill at length they are forc'ſt downe into the codde by youthfull heat. But that we may returne to our former treatiſe of the codde, although that way of cuting ruptures wants not paine and danger, yet it is ſafer than that which is performed by gelding, which by the cruelty thereof expoſes the Patient to manifeſt danger of death. For the Gelders whilſt they feare leaſt when the cure is finſhed, the relaxation may remaine, pull with violence the proceſſe of the *Peritonæum* from the parts to which it adheres, and together with it a nerve of the ſixth conjugation which runnes to the ſtones; they offer the ſame violence to the ſpermaticke veſſels; by which things enſue great paine, convulſion, effluxe of bloud, inflammation, putrefaction, and laſtly death, as I have obſerved in many whom I have diſſected, having died a few dayes after their gelding. Although ſome eſcape theſe dangers, yet they are deprived of the faculty of generation for all their life after, for performance whereof nature hath beſtowed the teſticles, as parts principally neceſſary for the conſervation of mankinde. Through which occaſion *Galen* hath not *Lib de arte medica.* feared to preferre them before the heart; becauſe the heart is the beginning of life, but the teſticles of a better life; for it is farre more noble to live well, than ſimply and *Lib. de ſem.* abſolutely to live; therefore Eunuches degenerate into a womaniſh nature, for they



A. *Shewes a croked needle, having an eye not farre from the point, through which you may put the golden wyre.*

B. B. *The golden wyre put through the eye of the needle.*

C. *The mullets or Pincers, to cut away the waſt or ſuperfluous ends of the wyre.*

D. *The ſpringe of the mullets.*

E. *The mullets to twiſt the ends of the wyre together.*

remaine without beards, their voice is weake, their courage failes them, and they turne cowards; and ſeeing they are unfit for all humane actions, their life cannot but be miſerable. Wherefore I will never ſubſcribe to the cutting out of the ſtones, unleſſe a *Sarcocele* or Gangrene invade them. But that the way of performing the *Punctus aureus* may be better knowne, I have thought good here to ſet the inſtruments, by which this operation is performed, before your view.

Another more eaſie and ſafe way to reſtore the Gut and Kall.

Lib.3. Cap.33.

THeodoricke and *Guido* have invented another way of performing this operation. They put backe into their places the Gut and Kall being fallen downe, the Patient being ſo placed, that his thighs are high and his head is ſomewhat low; then they draw aſide the lower portion of the production of the *Peritonæum*, and alſo the ſpermaticke veſſels, and cremaſter muſcle to the *Iſchium*; then by applying a cauſticke fitted to the age and diſeaſe, they burne the other part of the proceſſe, directly perpendicular to the ſhare-bone, where the Gut did fall downe. Then they pull off the eſchar thus made with a knife even to the quicke, then they apply another cauſticke in the ſame place, which may go even to the bone, then procure the falling of this Eſchar made on the foreſaid proceſſe. And afterwards they heale the ulcer which remaines, which preſently contracting ſomewhat a thicke *Callus*, ſo keeps up the Guts and Kall, that it bindes them from falling down into the Cod. This way of reſtoring the Gut and Kall, though it be ſafer and more facile; yet the Chirurgion muſt not attempt it, if the Guts or Kall ſticke ſo faſt, agglutinated to the proceſſe of the *Peritonæum*, that they cannot be ſevered, nor put backe into their places (for from the guts ſo burnt and violated, greater miſchiefe would enſue) if by the broken and too much dilated proceſſe, the bodies thereby reſtrained, make an exceeding great tumor by their falling downe; if the teſticle yet lying in the groine as in a *Bubonocele*, a kinde of *Enterocele*, being not yet deſcended into the *Scrotum* or Codde; if the Patients be not come to ſuch age as they can keepe themſelves from ſtirring, or hold their excrements whiles the operation is performed.

CHAP. XVII.

Of the cure of other kinds of Ruptures.

EPiplocele is the falling downe of the Kall into the Groine, or Codde, it hath the ſame cauſes as an *Enterocele*. The ſignes have beene explained. It is not ſo dangerous, nor infers a conſequence of ſo many evill ſymptomes, as the *Enterocele* doth, yet the cure is the ſame with the other.

What a Hydrocele is.

The ſignes.

The cure.

Hydrocele is a wateriſh tumor in the Codde, which is gathered by little and little betweene the membranes encompaſſing the teſticles, eſpecially the *Dartos* and *Erythroides*; it may be called a particular dropſie, for it proceeds from the ſame cauſes, but chiefely from the defect of native heate. The ſignes are a tumor encreaſing ſlowly without much paine, heavy, and almoſt of a glaſſie cleareneſſe, which you may perceive by holding a candle on the other ſide, by preſſing the Codde above, the water flowes downe, and by preſſing it below, it riſes upwards, unleſſe peradventure in too great a quantity it fills up the whole capacity of the Codde, yet it can never be forced or put up into the belly as the Kall or Guts may, for oft times it is contained in a Cyſte, or bagge; it is diſtinguiſhed from a *Sarcocele*, by the ſmoothneſſe and equality thereof. The cure muſt firſt be tried with reſolving, drying, and diſcuſſing medicines, repeated often before, and in the Chapter of the Dropſie; this which followes I have often tried and with good ſucceſſe.

A medicine to draw forth the contained matter.

℞, *Vng. comitiſſæ, & deſiccat. rub. an.* ℥ij. *malaxentur ſimul*; and make a medicine for your eaſe. The water by this kinde of remedy is digeſted and reſolved, or rather dried up, eſpecially if it be not in too great quantity. But if the ſwelling, by reaſon of the great quantity of water will not yeeld to thoſe remedies, there is neede of Chirurgery; the Cod and membranes wherein the water is contained, muſt be thruſt through with a Seton, that is, with a large threeſquarepointed needle, thred with a skeane of ſilke; you muſt thruſt your needle preſently through the holes of the mullets made for that purpoſe, not touching the ſubſtance of the Teſticles. The skean of thred muſt be left there, or removed twiſe or thriſe a day, that the humor may drop downe, and be evacuated by little and little. But if the paine be more vehement by reaſon of the Seton, and inflammation come upon it, it muſt be taken away, and neglecting the proper cure of the diſeaſe, we muſt reſiſt the ſymptomes.

Some Practitioners uſe not a Seton, but with a Razor, or inciſion knife, they open the lower part of the Cod, making an inciſion ſome halfe fingers breadth long, penetrating even to the contained water; alwayes leaving untouched the ſubſtance of the Teſticles and veſſels, and they keepe the wound open, untill all the water ſeemes evacuated; truly by this onely way the cure of a watery rupture whoſe matter is contained in a Cyſte, is ſafe, and to be expected; as wee have ſaid in our Treatiſe of Tumors in generall.

What a *Pneumatocele* is.

The *Pneumatocele*, is a flatulent tumor in the Codde, generated by the imbecility of heate reſiding in the part.

The Cure.

It is knowne by the roundneſſe, lenity, renitencie and ſhining. It is cured by preſcribing a convenient diet, by the application of medicines which reſolve and diſcuſſe flatulencies, as the ſeeds of Annis, Fennell, Fænugreeke, *Agnus Caſtus*, Rue, *Origanum*, other things ſet downe by *Avicen* in his Treatiſe of Ruptures. I have often uſed with good ſucceſſe for this purpoſe, *Emplaſtrum Vigonis cum mercurio*; and *Emplaſtrum Diacalcitheos*, diſſolved in ſome good wine, as Muſcadine, with oyle of Bayes.

What a *Sarcocele* is.

The ſignes.
Prognoſticks,

A *Sarcocele* is a tumor againſt nature, which is generated about the ſtones by a ſchyrrhus fleſh. Groſſe and viſcide humors breed ſuch kind of fleſh, which the part could not overcome and aſſimulate to it ſelfe; whence this over-abundance of fleſh proceeds, like as Warts doe. *Varices*, or ſwollen veines often aſſociate this tumor; and it increaſes with paine. It is knowne by the hardneſſe, aſperitie, inequality, and roughneſſe. It cannot be cured but by amputation or cutting it away; but you muſt diligently obſerve, that the fleſh be not growne too high, and have already ſeazed upon the Groine, for ſo nothing can be attempted without the danger of life.

The cure.

But if any may thinke, that he in ſuch a caſe may ſomewhat eaſe the patient by the cutting away of ſome portion of this ſame ſoft fleſh, he is deceived. For a *Fungus* will grow, if the leaſt portion thereof be but left, being an evill fure worſe than the former; but if the tumor be either ſmall or indifferent, the Chirurgion taking the whole tumor, that is, the teſticle, tumefied through the whole ſubſtance, with the proceſſe encompaſſing it, and adhering thereto on every ſide, and make an inciſion in the Codde, even to the tumor; then ſeparate all the tumid body, that is, the teſticle from the Codde: then let him thruſt a needle with a ſtrong threed in it, through the middeſt of the proceſſe above the region of the ſwolne teſticle; and then preſently let him thruſt it the ſecond time through the ſame part of the proceſſe; then ſhall both the ends of the threed be tied on a knot, the other middle portion of the *Peritonæum* being comprehended in the ſame knot. This being done, he muſt cut away the whole proceſſe with the teſticle comprehended therein. But the ends of the threed, with which the upper part of the proceſſe was bound, muſt be ſuffered to hang ſome length out of the wound, or inciſion of the Codde. Then a repercuſſive medicine ſhall be applied to the wound, and the neighbouring parts with a convenient ligature. And the cure muſt be performed as we have formely mentioned.

What a *Cirſocele* is.

The *Cirſocele* is a tumor of veines dilated, and woven with a various and mutuall implication about the teſticle and codde, and ſwelling with a groſſe and melancholy bloud. The cauſes are the ſame as thoſe of the *Varices*. But the ſignes are maniſeſt.

The Cure,

To heale this tumor, you muſt make an inciſion in the codde, the bredth of two fingers to the *Varix*. Then you muſt put under the varicous veine, a needle having a double threed in it, as high as you can, that you may binde the rootes thereof: then let the needle be againe put after the ſame manner about the lower part of the ſame veine, leaving the ſpace of two fingers betweene the Ligatures. But before you binde the thread of this loweſt Ligature, the *Varix* muſt bee opened in the middeſt, almoſt after the ſame manner as you open a veine in the arme to let bloud: That ſo this groſſe blood cauſing a tumor in the Cod, may be evacuated as is uſually done in the Cure of the *varices*. The wound that remaines ſhall be cured by the rules of Art after the manner of other wounds: Leaving the threads in it, which will preſently fall away of themſelves. To conclude then, it being growne callous eſpecially in the upper part thereof, where the veine was bound, it muſt be Cicatrized, for ſo afterwards the bloud cannot be ſtrained or run that way.

Hernia Humoralis.

Hernia Humoralis is a tumor generated by the confuſed mixture of many humors in the Cod or betweene the tunicles which involue the teſticles, often alſo in the proper ſubſtance of the teſticles. It hath like cauſes, ſignes and cure as other tumors. While the cure is in hand, reſt, truſſes, and fit rowlers to ſuſtaine and beare up the teſticles are to be uſed.

Chap. XVIII.

Of the falling downe of the Fundament.

The cauſes.

WHen the muſcle called the *Sphincter* which ingirts the Fundament is relaxed, then it comes to paſſe that it cannot ſuſtaine the right gut. This diſeaſe is very frequent to Children by reaſon of the too much humidity of the belly; which falling downe upon that muſcle mollifieth and relaxeth it or preſſeth it downe by an unaccuſtomed weight, ſo that the muſcles called *Levatores Ani* or the lifters up of the Fundament, are not ſufficient to beare up any longer. A great bloudy flux gives occaſion to this effect. A ſtrong endevour to expell hard excrements, the *Hamorrhoides*, which ſuppreſſed doe over-loade the right gut, but flowing relaxe it: Cold as in thoſe which goe without breeches in winter, or ſit a long time upon a cold ſtone, a ſtroake or fall upon the Holy-bone: a palſie of nerves which goe from the Holy-bone to the Muſcles the lifters up of the fundament: the weight of the ſtone being in the bladder.

The cure.

That this diſeaſe may be healed, we muſt forbid the Patient too much drincking, too often eating of broth, and from feeding on cold fruits. For locall medicines the part muſt be fomented with an aſtringent decoction made of the rinds of Pomegranetts, galls, myrtles, knotgraſſe, ſheapheards purſe, Cypreſſe nutts, Alume, and common ſalt boyled in ſmiths water or red wine. After the fomentation, the gut be annointed with oyle of Roſes or myrtles, and then let it bee gently put by little and little into its place, charging the childe if he can underſtand your meaning, to hold his breath. When the gut ſhall be reſtored, the part muſt bee diligently wiped leaſt the gut fall downe againe by reaſon of the ſlipperineſſe of the unction. Then let the powder preſcribed for the falling downe of the wombe be put into the fundament as farre as you can: Then you muſt ſtraitly binde the loynes with a ſwathe, to the middeſt whereof behinde let another be faſtned which may be tied at the *Pubes* comming along the *Perinæum*, ſo to hold up to the fundament; the better to containe it in its place, a ſpunge dipt in the aſtringent decoction. The Patient if he be of ſufficient age to have care of himſelfe, ſhall be wiſhed when hee goes to ſtoole that he ſit upon two peeces of wood being ſet ſome inch a ſunder, leaſt by his ſtrayning hee thruſt forth the gut together with the excrement; but if he can doe it ſtanding, he ſhalll never by ſtrayning thruſt forth the gut.

Hippocrates his cure.

But if the gut cannot by the preſcribed meanes bee reſtored to its place, *Hippocrates* bids that the Patient hanging by the heeles be ſhaken, for ſo the gut by that ſhaking will returne to his place: but the ſame *Hippocrates* wiſheth to annoint the fundament, becauſe that remedie having a drying faculty, hath alſo power to reſolve the flatulent humors without any acrimony, by reaſon of which the gut was the leſſe able to be contained in his place.

Chap. XIX.

Of the Paronychia.

What the *Paronychia* is.

THe *Paronychia* or *Panaris* is a tumor in the ends of the fingers, with great inflammation, comming of a maligne and venemous humor, which from the bones by the *Perioſtium* is communicated to the tendons and nerves of that part which it affecteth, whereof cruell ſymptomes doe follow, as pulſifique paine, a feaver, reſtleſſeneſſe, ſo that the affected through impatiencie of the paine are variouſly agitated like thoſe tormented with Carbuncles: for which cauſe *Guido* and *Iohannes de Vigo* judge this diſeaſe to be mortall; wherefore you muſt provide a skilfull Phyſitian for the cure of this diſeaſe, which may appoint convenient diet, purging and Blood letting. In the meane time the Surgeon, ſhall make way for the virulent and venenate matter, by making inciſion in the inner part of the finger, even to the bone alongſt the firſt joynt thereof; for *Vigo* ſaith there is not a preſenter remedy, if ſo be that it be quickly done and before the maturation of the matter; for it vindicates the finger from the corruption of the bone and nerves, and aſſwages paine, which I have often and happily tried immediatly at the beginning, before the perfect impreſſion of the virulencie.

Lib. 2. cap. 4. tract. 8.

But the wound being made you muſt ſuffer it to bleede well, then preſently let him dip his finger in ſtrong and warme vinegar, in which ſome treakle being diſſolved may draw forth the virulencie. But to appeaſe the Paine, the ſame remedies muſt be applyed to the affected part as are uſed in Carbuncles, as the leaves of Sorrell, Henbane, Hemlocke, Mandrake roaſted under the Embers and beaten in a Morter with new *Vnguentum Populeon*, or oyle of Roſes or new butter without ſalt: for ſuch like medicines alſo helpe forward ſupppuration, whileſt by their coldneſſe, they repreſſe the extraneous heat affecting the part; and ſo ſtrengthen the native heate being the author of ſuppuration: which reaſon moved the ancient Phyſitians to uſe ſuch medicines in a Carbuncle: but if by reaſon of the fearefulneſſe of the patient, or unskilfulneſſe of the Surgion, no inciſion being made, a Gangren and Sphacel ſhall poſſeſſe the part, it remaines that you cut off with your cutting mulletts as much of the part as ſhall be corrupt, and performe the reſt of the cure according to Art. Yet it doth not ſeldome happen that there may bee no neede to cut off ſuch a finger, becauſe it being corrupted together with the bone doth by little and little diſſolve into a purulent or rather ſanious and much ſtincking filth. But in this affect there is often cauſed an Eſchar by the aduſtion of putredinous heat, and ſuperfluous fleſh indued with moſt exquiſit ſence groweth underneath it, which muſt in like manner be cut off with the Mulletts that the part may receive comfort, the paine being aſwaged by the copious effuſion of blood.

Chap. XX.

Of the ſwelling of the knees.

Gal. comm. ad ſent. 1. ſer. 4. lib. 6 Epid. Gal. Com. ad ſent. 67. ſect. 2. prog.

AFter long and dangerous diſeaſes there oftentimes ariſe Tumors in the knees, and alſo in plethoricke bodies and ſuch as have evill juyce after labours and exerciſe. This kinde of diſeaſe is frequent becauſe the humor eaſily falles into the part which hath beene heated by Labour. But if ſuch tumors follow long diſeaſes, they are dangerous and difficult to cure, and therefore not to bee neglected, for bitter paine accompanieth them, becauſe the humor falling thither diſtends the Membranes, which being many involve the part; beſides that this humor participateth of a certaine virulent and maligne quality whether it be cold or hot, when it hath ſetled into thoſe parts, being ſuch as wee finde in the paines of the joynts, and in the bitings of venemous creatures.

The cure.

For the cure, if the tumor bee cauſed by blood, let a ſlender and refrigerating diet be appointed, and phlebotomy for the revulſion of the antecedent cauſe; diverſe locall medicines ſhall be uſed according to the variety of the foure times. But for to aſſwage the paine, *Anodyne* or mitigating medicines ſhall be appointed: of all which wee have ſufficiently treated in the Chapter of the cure of a Phlegmon.

And becauſe theſe parts are of exact ſence, if there be neceſſity to open the tumor, yet muſt we not doe it raſhly or unconſiderately, for feare of paine and evill accidents.

This kinde of tumor is oft times raiſed by winde contained there; in which caſe the Chirurgion muſt bee very provident, that hee bee not deceived with the ſhew of flowing of the humor, which hee ſeemes to perceive by the preſſure of his fingers, as if there were matter and humor contained therein, and ſo bee brought to open the tumor. For the winde breaking forth in ſtead of the humor, cauſeth evill ſymptomes by reaſon of the ſection raſhly made in a part ſo ſenſible.

But if watriſh humors ſhall tumifie the part, the body ſhall firſt be purged with medicines purging flegme: And then inciding, attenuating, rarifying, diſcuſſing and very drying locall medicines ſhall be uſed.

Of which wee have abundantly ſpoken in the Chapter of the *Oedema*. Yet this humor, divers times lyes deepe betweene the whirle bone and the joynt, which cauſeth it that it cannot be diſcuſſed and reſolved by reaſon of the weakeneſſe of the part and defect of heate, ſo that the adventitious humor often moves and excludes the bones from their ſeate. As I have obſerved it to have happened to many.

In which cauſe Irrigations of red wine falling ſomething high, whereby the force of the medicine may enter and more eaſily penetrate, are much commended.

CHAP. XXI.

Of the Dracunculus.

It is not as yet ſufficiently knowne what *Dracunculi* are.

I Cannot chuſe, but explaine in this place thoſe things which may bee ſpoken of that kinde of tumor againſt nature, which by the ancients is called *Dracunculus*. The matter and reaſon of theſe hath beene variouſly handled by diverſe Authours, ſo that hitherto wee have nothing written of them to which wee may by right and with good reaſon adhere as a firme foundation of their eſſence.

For firſt for *Galens* opinion, *Lib. 6. de Loc. affect cap.* 3. The generation, ſaith he, of thoſe hayres which are evacuated by the Vrine is worthy no leſſe admiration than the *Dracunculi*, which as they ſay, in a certaine place of *Arabia* breede in the legges of men being of a nervous nature and like wormes in colour and thickeneſſe.

Therefore ſeeing I have heard many who have ſayd they have ſeene them, but I my ſelfe never ſaw them, I cannot conjecture any thing exactly neither of their originall nor eſſence.

Lib.4.cap. ult.

Paulus Ægineta writes that the *Dracunculi* are bred in *India* and the higher parts of *Ægypt*, like wormes in the muſculous parts of mans body, that is, the armes, thighes and legges, and alſo creepe by the intercoſtall muſcles in children with a manifeſt motion.

The cure out of *Egineta.*

But whether they be creatures indeede, or onely have the ſhape of creatures, they muſt bee cured with a hot fomentation, by which the *Dracunculus* raiſed to a juſt tumor, may put forth it ſelfe, and be pluckt away peece meale with the fingers: alſo ſuppurating Cataplaſmes may be applyed, compoſed of water, honey, wheate and barly meale.

Cap 21.lib.4. fen.3.tract.3.

Avicen being various, having no certainty whereon to reſt, inclineth one while to this, and another while to that opinion: for now he ſpeaketh of the *Dracunculi* as of creatures, then preſently of a matter and humor ſhut up in a certaine place; for the reſt he rightly delivers the cure and eſſence of this diſeaſe, as we ſhall afterwards ſhew.

Lib.14.cap. ult.

Aetius ſaith, the *Dracunculi* are like wormes, and that they are found ſometimes great, ſometimes ſmall, and that their generation is not unlike to that of flat wormes, which are bred in the guttes, for they move under the skinne without any trouble, but in proceſſe of time, the place becomes ſuppurate about the end of the *Dracunculus.* The skinne openeth, and the head thereof is thruſt forth.

But if the *Dracunculus* bee pulled, it cauſeth great greefe; eſpecially if it bee broken by too violent pulling. For that which is left cauſeth moſt vehement paine.

The cure out of *Aetius.*

Wherefore that the creature may not runne backe, the arme muſt bee bound with a ſtrong threed, and this muſt bee done every day, that the *Dracunculus* going forward by little and little, may bee intercepted by this binding, but not broken off.

The place muſt bee bathed with *Aqua Mulſa* and oyle in which wormewood or ſouthernewood hath beene boyled, or ſome other of thoſe medicines which are preſcribed for the wormes of the belly.

But if the *Dracunculus* going forward of its owne accord, may be eaſily drawne forth, we muſt doe nothing elſe: but if it bee turned to ſuppuration wee muſt not leave off the Cataplaſmes, the *Aqua Mulſa* and anointing with oyle: It was uſuall with him after the taking away of the Cataplaſmes, to apply *Emplaſtrum E Baccis Lauri*: but when it is come to ſuppuration the skinne muſt bee opened long wayes, and the *Dracunculus* ſo layd open muſt be taken away, but the skinne muſt be filled with lint, and the reſt of the ſuppurative cure uſed, ſo that the creature being ſuppurated and drawne forth, the wound may bee incarnated and cicatriſed.

Tractat.7. cap.34.
The cure out of *Rhaſis.*

Rhaſis writeth, that when the part is lifted up into a bliſter, and the veine haſtneth its egreſſe, it is good for the patient to drinke the firſt day halfe a dramme of *Aloies*, the next day a whole dramme, the third day two drammes; and in like manner the place affected muſt bee fomented with *Aloes*, for ſo that which lyes hid will breake forth: that which ſhall come forth muſt be rolled in a pipe of lead, which may equall the weight of a dramme ſo that it may hang downe, for the veine drawne by the weight will come more forth; and when that which ſhall come forth is growne much and long, it muſt be cut off, but not by the roote, but ſo that a portion thereof may remaine and hang forth, to which the leaden pipe may be faſtned, for otherwiſe it would withdraw it ſelfe into its skinne and its lurking hole, and ſo cauſe a putrid and maligne ulcer.

Therefore wee muſt gently meete with this diſeaſe, and the veine muſt be drawne by little and little out of the body untill it be all come forth that no worſe thing happen: but if by chance it ſhall happen that as much of the veine as ſhall bee come forth ſhall be cut off by the rootes, then the ulcer muſt be opened long wayes with an inciſion knife, and that ſo that whatſoever remaines thereof may bee wholy taken away. Then for ſome dayes the part muſt be annointed with butter untill whatſoever of ſuch a ſubſtance adheres, being conſumed with putrifaction ſhall flow away. Then the ulcer muſt be cured with ſarcoticke things.

Therefore *Rhaſis* thus in the ſame text expreſſeth the ſame thing by diverſe names, and armed with Iron and Lead, hee comes to the cure thereof, as if hee meant to encounter with ſome fierce beaſt.

His opinion of them.

Soranus the Phyſtian, who lived in the times of *Galen*, was of a quite contrary opinion, as *Paulus Ægineta* in the place being before cited, relates of him; as who denies the *Dracunculus* to be a living creature, but onely a condenſation of a certaine ſmall nerve, which ſeemes both to the Phyſitions and Patients to have ſome motion under the skinne.

Soranus his opinion.

Wherefore *Soranus* ſeemes to have come neerer the truth than the reſt, but yet not ſo, as throughly to underſtand, and know the eſſence of this diſeaſe, as we ſhall demonſtrate hereafter.

Manardus writes, that the *Dracunculi* are generated of evill and unlaudable blood, groſſe, hot, and melanckolicke, or of aduſt phlegme very much dryed.

Epiſt.2, lib.7.

Gorraus a moſt learned Phyſition of our time, *Lib. de Deſinitionib. medic.* denies any of our Phyſitions to be able to ſay any thing of the *Dracunculi*, becauſe it is a diſeaſe ſo unfrequent in theſe our regions, that it is ſcarce ever met withall in practice.

The Author of the Introduction, and Medicinall definitions, defines the *Dracunculus* to be a diſeaſe very like the *Varices*; then cauſing great paine, when increaſing by little, and little, it begins to bee moved: Therefore to bee cured after the ſame manner, and by the ſame method of Section and inciſion, as the *varices* are. Which thing chiefely ſeemes to have moved *Guido* to referre this kinde of diſeaſe to the *Varices* in his Tractate of Impoſtumes, becauſe it hath the ſame cauſe, and is healed with the ſame remedy as the *varices*.

But ſeeing that diverſe names have beene impoſed upon this diſeaſe by ſeverall writers, yet they all have expreſſed it by the name of a veine: for it is called by *Avicen* and *Guido*, *Vena Meden*, becauſe it is a diſeaſe frequent in the Citty *Medina*: by *Albucraſis*, *vena civilis*. *Haliabbas* hath called it *vena famoſa*; others have called it *Vena Cruris* or the legge veine. Truely the contrariety of ſo many opinions repugnant not onely amongſt themſelves, but alſo with themſelves, eaſily argueth how little certainty they had of the eſſence of this diſeaſe, who have written of it unto us: To which alſo this may be added, that none of the latter Phyſitions have written any things thereof. For although *Iacobus Dalechamphius* a man moſt converſant in every part of Phyſicke, hath written much of this matter in his booke of the French Surgery which he ſet forth ſome yeares agoe: Yet he hath left us no amplier teſtimony of his induſtry, than that hee was very diligent in collecting the writings of the Ancients concerning this thing, interpoſing no judgement of his owne, the better to aſſure us of a thing ſo controverted.

But my modeſty cannot ſo containe me, but that I ſhall chuſe rather to undergoe the cenſure of being thought too daring, than (as much as in me lyeth,) to ſuffer this queſtion of the *Dracunculi* to remaine longer ambiguous and undecided. Therefore for the preſent, I will thus order it, that refuting the opinions of the Ancients I may ſtrengthen by certaine reaſons, my opinion of the eſſence and cure of this diſeaſe.

For firſt, that *Dracunculi* are no living things, not like unto wormes, nor of like generation as the flat wormes of the belly, which was the opinion of *Aetius*, is eaſie to diſprove both by his writings, as alſo by reaſon it ſelfe. For he writes that the broad worme which hee calls *Tænia*, is as it were a certaine *Metamorphoſis* or tranſmutation of the inner tunicle of the ſmall guttes, into a quicke living and moveable body.

Aetius opinion confuted. *Tract.3.ſermo.1.cap.48.*

But no man ever ſayd, neither will he confeſſe that the *Dracunculi* have the materiall cauſes of their beginning from the tunicle of the veine, in which they are incloſed, or from the fibers of a nervous body, to which often they are adjoyned; but much leſſe from the skinne under which they lie, may they draw their materiall cauſes of their originall.

Moreover, neither can there bee any generation of wormes, nor of any other living creatures whatſoever, who have their originall from putrifaction, unleſſe

4. Meteorolog.

unleſſe by the Corruption of ſome matter, of whoſe better and more benigne part, nature by the force of the vitall heat, produceth ſome animate body, as *Ariſtotle* teacheth. Wherefore to produce this effect, it is fit the matter ſhould have ſuch a diſpoſition to putrefaction as is required for the generation of ſuch a creature as they would make the *Dracunculus* to be: It is fit the helping cauſes ſhould concurre as aſſiſtants to the principalls in the action. And it is meete the place ſhould be opportune or fit.

Naturall Melancholicke humor is moſt unapt to putrifie.

Stinke an unſeparable companion to putrifaction.

But there may be many cauſes found which may give life to the *Dracunculi*, for by the common conſent of all thoſe who have written of them, their generation proceedes from an humor melancholicke, terreſtriall and groſſe, which by its qualities both by the firſt coldneſſe and drineſſe, as alſo by the ſecond, that is Aciditie, is not onely thought moſt unfit of all others for putrefaction, but alſo is judged to reſiſt putrefaction, as that which is cauſed by heate and ſuperfluous heate humidity. Beſides, if the materiall cauſe of this diſeaſe ſhould be from an humor putrifying and turning by putrefaction into ſome living creature, it was fit there ſhould be ſtench alſo, as being an unſeparable accident of putrefaction, for thus the excrements in the guts of which the wormes are generated, doe ſmell or ſtinke.

What things uſually breed wormes.

Therefore that which exhales from their bodies which are troubled with the *Dracunculi*, ſhould be ſtincking, as it happens to thoſe ſicke of the *Pthiriaſis* or *Lowſie-evill*. But none of thoſe who have delivered the accidents or ſymptomes of the *Dracunculi* are found to have made mention hereof. But for the efficient cauſe whereby ſo great heat may be rayſed in the places next under the skin, by the efficacy whereof ſuch a creature may be formed of a matter melancholicke and moſt unapt to putrifie, as they make the *Dracunculus* to be who faine our bodies to be fruitfull monſters; eſpecially ſeeing the ſurface of the body is continually ventilated by the ſmall Arteries ſpread under the skinne, as alſo by the benefit of inſenſible tranſpiration, and breathed with the coolenes of the Aire incompaſſing us. But now the materiall and efficient cauſes being defective, or certainely very weake, for the generation of ſo laborious an effect; what coadjutory cauſe can yeeld aſſiſtance? Can the humidity of meates? for thoſe bodies which are fed with warme and moyſt meates, as milke, Cheeſe, Summer fruits, uſually breed wormes, as we are taught by experience in Children.

But on the Contrary, *Avicen* in the place before cited writeth, that meats of a hot and drie temper chiefely breed this kinde of diſeaſe, and that it is not ſo frequent to moyſt bodies and ſuch as are accuſtomed to the Bath, moyſt meats and wine moderatly taken. But whether may the condition of the Aire of thoſe regions in which it is as it were, an Endemiall diſeaſe, conferre any thing to the generation of ſuch creatures? Certainely for this purpoſe a cloudy warme and thicke ayre, ſuch as uſeth to be at the beginning of the Spring when all places reſound with frogges, toades and the like creatures bred of putrifaction.

Cap. 83. Chir. Gallic.

But on the Contrary *Iacobus Dalechampius* by the opinion of all the Phiſitions that have written of the *Dracunculi*, writes that this diſeaſe breedes in the drie and Sun burnt regions of *India* and *Arabia*; but if at the leaſt that part of our body which is next under the skinne ſhould have any opportunity to engender and nouriſh ſuch creatures, they may be judged to have written that the *Dracunculus* is a living creature with ſome probability, But if there bee no opportunity for generation in that place, nor capacity for the nouriſhment of ſuch like creatures as in the guts, if that region of the body be breathed upon with no warmeneſſe and ſmothering heat, if it be defiled with none of the groſſe excrements, as the gutts uſually are, but onely by the ſubtiller exhalation, which have an eaſie and inſenſible tranſpiration by the pores of the skin, which may ſeeme to be a juſt cauſe of ſo monſtrous and prodigious an effect: but we ſhall little profit with theſe engines of reaſon unleſſe we caſt downe at once all the Bulwarkes, with which this old opinion of the *Dracunculi* may ſtand and be defended.

For firſt they ſay, why have the ancients expreſſed this kind of diſeaſe by the name of a living thing, that is, of a *Dracunculus* or little Serpent? I anſwere, because in Phyſicke names are often impoſed upon diſeaſes rather by ſimilitude than from the truth of the thing; for the confirmation whereof, the examples of three diſeaſes may ſuffice, that of the *Cancer*, *Polypus*, and *Elephas*. For theſe have thoſe names not becauſe any Crabb, Polypus, or living Elephant may breede in the Body by ſuch like diſeaſes, but becauſe this by its propagation into the adjacent parts repreſents the feete and clawes of a Crabbe: the other repreſents the fleſh of the Sea-Polypus in its ſubſtance; and the third becauſe ſuch as have the Leproſie have their skinne wrinckled, rough, and horrid with ſcales and knots, as the skinne of a living Elephant. So truely this diſeaſe of which wee now enquire ſeemes by good right to have deſerved the name *Dracunculus*, becauſe in its whole conformation, colour, quality and production into length and thickneſſe it expreſſeth the image of a Serpent. But whence, will they ſay (if it be without life) is that manifeſt motion in the matter? We reply that the humor the cauſe of this diſeaſe is ſubtill and hot, and ſo runnes with violence into the part whence it may ſeeme to move. But when the *Dracunculi* are ſeparated, why doe they put their heads as it were out of their holes? we anſwer, in this the ancients have beene very much deceived, becauſe after the ſuppuration the ulcer being opened, ſome nervous body being layde bare, thruſt forth and ſubjected it ſelfe to the ſight, which by the convulſive and ſhaking motion might expreſſe the crooked creeping of a Serpent. But they will ſay, paine happens not unleſſe to things indued with ſence and life, but this *Dacunculus* when he is drawne too violently eſpecially if hee be broken, thereby will cauſe extreame paine: we doe anſwer, that the concluſion doth not follow and is of no conſequence, for theſe paines happen not unleſſe when the unprovident Surgeon drawes or pulls inſteed of the *Dracunculus* ſome nervous or membranous body ſwolne and repleate with an aduſt humor, whence there cannot but be great paine that part being pulld which is the author of ſence. But it is childiſh to ſay that the *Dracunculus* feeles, for that it cauſeth ſharpe paines to the living body in which it is. Therefore that at laſt we may determine ſomething of the nature, eſſence and generation of theſe *Dracunculi*, I dare boldly affirme it is nothing elſe but a tumor and abſceſſe bred from the heat of the bloud in a venenate kinde. Such bloud driven by the expulſive facultie through the veines to the Externall parts, eſpecially the limits, that is the Armes and Legges, cauſeth a tumor round and long often ſtretched from the joynt of the ſhoulder even to the wriſt, or from the groine even to one of the Anckles with tenſion, heat, renitency, pricking paine, and a feaver. But this tumor is ſomewhiles ſtretched forth ſtraight, otherwhiles into oblique and crooked tumors, which hath beene the cauſe that many taken with this kind of diſeaſe, and having their limbes ſo infolded as with the twinings of a Serpent would ſay they had a Serpent. I have thus much to ſay of the *Dracunculi*, eſpecially of thoſe of our owne country.

Why they are called *Dacunculi*.

For the cure, it is not unlike to the cure of a Phlegmon ariſing from a defluxion, for heere alſo in like manner the remedies muſt bee varied according to the foure times of the diſeaſe, and the ſame rule of diet, phlebotomy and purging muſt be obſerved which is before preſcribed in the cure of a Plegmon.

The Cure.

The mention of the *Dracunculi* calls to my memorie another kinde of Abſceſſe, altogether as rare. This our French men name *Cridones*, I thinke *a Crinibus*.i. from hayres: it chiefly troubles children and prickes their backes like thornes. They toſſe up & downe being not able to take any reſt. This diſeaſe ariſeth from ſmall haires which are ſcarce of a pins length, but thoſe thicke and ſtrong. It is cured with a fomentation of water more than warme, after which you muſt preſently apply an oyntment made of honey and wheaten flower; for ſo theſe haires lying under the skin are allured and drawne forth; and being thus drawne, they muſt be plucked out with ſmall mullets. I imagine this kinde of diſeaſe was not knowne to the ancient Phiſitions.

So the *Malum pilare in Ariſtotle cap.* 1. *lib.* 7. *hiſt. animal.*

The End of the Eighth Booke.

OF VVOUNDS IN GENERALL.

THE NINTH BOOKE.

CHAP. I.

What a Wound is, what the kindes and differences thereof are, and from whence they may be drawne, or derived.

What a Wound properly is,

A Wound is a ſolution of Continuity, cauſed by a ſtroake, fall, or bite, newly done, bloody, and with putrifaction, and filth. They alſo call it a new ſimple ulcer; for the ſolution of continuity happens to all parts of the body; but according to the diverſity of the parts, it hath divers names amongſt the Greekes. For in the fleſh it is called *Helcos*, in the bone *Catagma*, in the nerve *Spaſma*, in the ligament *Thlaſma*, in the veſſelles *Apoſpaſma*, in the Muſcles *Regma*: and that ſolution of continuity, which happens in the veſſells, their mouths being open, is termed *Anaſtomaſis*, that which happens by eroſion, *Anauroſis*; that which is generated by ſweating out and tranſcolation, *Diapedeſis*. That theſe may bee the more eaſily underſtood, I have thought good to deſcribe them in the following table.

Divers appellations of wounds according to the varieties of the parts.

A Table of the differences of Wounds.

The differences of wounds are drawne or taken,	*From the nature of the parts in which they are made or happen. But theſe parts are*	*Either ſimilar and theſe,*	*Either ſoft as the*	*Glandules,* *Fleſh, Fat,* *Marrow.*
			Or hard as	*A Bone,* *A Griſtle.*
			Or of a middle conſiſtence, as the	*Membranes,* *Ligaments,* *Fibers, Veſſells,* *Nerves, Veines,* *Arteries.*
		Or Organicall and theſe either.	*Principall as the*	*Braine, Heart, Liver, to which ſome ad the womb and Teſticles.*
			Or ſerving the principall, as	*The Weaſon,* *Lungs, gullet,* *Stomacke, Gutts,* *Bladder.*
			Or neither	*The Eares, Noſe, Feete, Hands, and other of the ſame kinde.*

- *From their proper eſſence, from whence they are called,*
  - *Simple wounds*
    - *When there is no complication of any other diſeaſe or ſymptome beſides.*
  - *Or compound,*
    - *When there is a complication of ſome one or more diſeaſes, which unleſſe they be taken away, wee muſt not hope for to cure the wound.*
- *From their quantity according to which they are called,*
  - *Great;*
  - *Indifferent,*
    - *Long, Broad,*
    - *Deepe.*
    - *Short, Narrow,*
    - *Superficiarie.*
  - *Little,*
- *From their figure, according to which they are named,*
  - *Straight,*
  - *Oblique,*
  - *Cornered:*

Chap. II.

Of the cauſes of Wounds.

Divers denominations from their cauſes,

ALL things which may outwardly aſſayle the body with force and violence, may be counted the cauſes of wounds; which are called greene, and properly bloody. Theſe things are either animate, or inanimate. The animate, as the bitings, and prickings of beaſts. The Inanimate, as the ſtroake of an arrow, ſword, clubb, gunne, ſtone, a dagger, and all ſuch like things.

From the variety of ſuch like cauſes, they have divers names: for thoſe which are made by ſharpe and pricking things are called punctures: thoſe cauſed by cutting things, are called wounds or gaſhes: and thoſe which are made by heavy and obtuſe things are named Contuſions, or wounds with Contuſions.

Chap. III.

Of the ſignes of wounds.

A caution for making reports of Wounds,

WOunds are firſt knowne by ſight, and by the ſignes drawne from thence. The Chirurgion ought firſt and chiefely, to conſider, what wounds are cureable, and what not; what wounds will ſcarce admit of cure, and what may be eaſily cured; for it is not the part of a prudent Chirurgion, to promiſe cure in a deadly or dangerous and difficult wound; Leaſt he may ſeeme to have killed him, whom not the unſufficiencie of the Art, but the greatneſſe of the wound hath ſlaine.

But when the wound is dangerous, but yet without deſpaire of recovery, it belongs to him to admoniſh the Patients friends which are by, of the preſent danger, and doubtfull ſtate of the wound; that if Art ſhall be overcome by the greatneſſe thereof, hee ſhall not be thought ignorant of the Art, neither to have deceived them.

A Iugling cheating Chirurgion,

But as this is the part and duty of a good and prudent Chirurgion, ſo it is the tricke of a cheating and jugling knave, to enlarge ſmall wounds, that ſo he may ſeeme to have done a great cure, when it is nothing ſo.

But it is agreeable to reaſon, that the Chirurgion profeſſing the diſeaſe eaſie to be cured, will thinke himſelfe in credit bound by ſuch promiſes and his duty, and therefore ſeeke all meanes for the quicke recovery of the patient; leſt that which was of its owne nature ſmall, may by his negligence become great. Therefore it is expedient, he ſhould know what wounds are to be accounted great.

Lib.4.Meth. cap.6,1.

Wounds are called great out of three reſpects.

This (as *Galen* ſaith) is three wayes to be knowne; The firſt is by the magnitude and principallity of the part affected; for thus the wounds of the Braine, Heart, and of the greater veſſells, though ſmall of themſelves, yet are thought great. Then from the greatneſſe of the ſolution of continuity; for which cauſe wounds may be judged great, in which much of the ſubſtance of the part is loſt in every dimenſion, though the part be one of theſe which are accounted ſervile. Then from the malignitie; through which occaſion the wounds of the joynts are accounted great, becauſe for the moſt part, they are ill conditioned.

Chap. IIII.

Of Prognoſtickes to be made in VVounds.

What wounds are dangerous.

Thoſe Wounds are thought dangerous, wherein any large Nerve, Veine, or Artery are hurt. From the firſt there is feare of convulſion, but from the other large effuſion of the veinous, or arterious blood, whence the powers are debilitated; alſo theſe are judged evill, which are upon the arme pitts, groines, leskes, joynts and betweene the fingers; and likewiſe thoſe which hurt the head or taile of a Muſcle. They are leaſt dangerous of all other which wound onely the fleſhy ſubſtance. But they are deadly which are inflicted upon the Bladder, Braine, Heart, Liver, Lungs, Stomacke and ſmall guts. But if any Bone, Griſtle, Nerve or portion of the cheeke or prepuce, ſhall be cut away, they cannot bee reſtored. Contuſed wounds are more difficult to cure, than thoſe which are onely from a ſimple ſolution of continuity; for before you muſt thinke to heale them up, you muſt ſuppurate and clenſe them; which cannot be done in a ſhort time. Wounds which are round and circular are ſo much the worſe; for there can be no unity unleſſe by an angle, that is, a meeting together of two lines, which can have no place in round wounds, becauſe a circular figure conſiſts of one oblique line. Beſides, wounds are by ſo much thought the greater, by how much their extremes and lipps are the further diſ-joyned, which happens to round Wounds. Contrary to theſe are cornered wounds or ſuch as are made alongſt the fibers, as ſuch as may bee eaſily healed.

What leaſt dangerous. What deadly. *Hip.aphor.19, Lib.6.*

Why round Wounds are difficult to heale.

Wounds may be more eaſily healed in young men, than in old, becauſe in them nature is more vigorous, and there is a greater plenty of fruitefull, or good blood, by which the loſſe of the fleſh may be the better and more readily reſtored, which is ſlowlier done in an old body, by reaſon their blood is ſmaller in quantity and more dry, and the ſtrength of nature more languide.

Hip.lib.de ulcer.Hip.aph. 66,lib.5.

Wounds received in the Spring, are not altogether ſo difficult to heale as thoſe taken in Winter or Summer. For all exceſſe of heate and cold is hurtfull to them; it is ill for a convulſion to happen upon a Wound, for it is a ſigne that ſome Nervous body is hurt; the braine ſuffering together therewith, as that which is the originall of the Nerves. A Tumor comming upon great Wounds is good; for it ſhewes the force of nature is able to expell that which is harmefull, and to eaſe the wounded part. The organicall parts wholly cut off cannot againe be united: becauſe a vitall part once ſevered and plucked from the trunke of the body cannot any more receive influence from the heart as from a roote without which there can bee no life. The looſed continuity of the Nerves, Veines, Arteries, and alſo the bones, is ſometimes reſtored, not truely, and as they ſay, according to the firſt intention, but by the ſecond, that is, by repoſition of the like, but not of the ſame ſubſtance. The firſt intention takes place in the fleſhie parts by converting the Alimentary bloud into the proper ſubſtance of the wounded part. But the ſecond, in the ſpermatique parts in which the loſt ſubſtance may be repaired by interpoſition of ſome heterogeneous body, which nature, diligent for its owne preſervation, ſubſtitutes in place of that which is loſt: for thus the body, which reſtores and agglutinats, is no bone but a *Callus*, whoſe originall matter is from an humor ſomewhat groſſer than that, from whence the bones have their originall and beginning.

What a *Callus* is and whence it proceedes.

This humor, when it ſhall come to the place of the fracture, agglutinateth the ends of the bones together, which otherwiſe could never bee ſo knit by reaſon of their hardneſſe. The bones of children are more eaſily and ſpeedily united by reaſon of the pliantneſſe of their ſoft and tender ſubſtance. Laſtly wee muſt here admoniſh the Chirurgion, that ſmall Wounds and ſuch as no Artiſan will judge deadly, doe divers times kill by reaſon of a certaine occult and ill diſpoſition of the wounded, and incompaſſing bodies; for which cauſe we reade it obſerved by *Hippocrates*, that it is not ſufficient for the Phyſition to performe his duty, but alſo externall things muſt be rightly prepared, and fitted.

Small and contemptible Wounds often prove mortall

Aphor. 1. ſect. 1

Chap. V.

Of the Cure of Wounds in generall.

The Generall Indication of Wounds.

THe Chirurgion ought for the right cure of wounds to propoſe unto himſelfe the common and generall indication: that is, the uniting of the divided parts, which indication in ſuch a caſe is thought upon and knowne even by the vulgar: for that which is diſ-joyned deſires to bee united, becauſe union is contrary to diviſion. But by what meanes ſuch union may be procured, is onely knowne to the ſkilfull Artiſan. Therefore we attaine unto this chiefe and principall Indication by the benefit of nature as it were the chiefe Agent, and the work of the Chirurgion as the ſervant of nature. And unleſſe nature ſhall be ſtrong the Chirurgion ſhall never attaine to his conceived, and wiſhed for end: therefore that he may attaine hereto, he muſt performe five things; the firſt is, that if there bee any ſtrange bodies, as peeces of Wood, Iron, Bones, bruiſed fleſh, congealed blood, or the like, whether they have come from without, or from within the body, and ſhall be by accident faſtened or ſtucke in the wound, he muſt take them away, for otherwiſe there is no union to be expected.

Five things neceſſary for uniting wounds.

Another is, that he joyne together the lippes of the Wound; for they cannot otherwiſe be agglutinated and united. The third is, that he keepe cloſe together the joyned lippes. The fourth, that he preſerve the temper of the wounded part, for the diſtemper remaining, it is impoſſible to reſtore it to its unity. The fifth is, that he correct the accidents, if any ſhall happen, becauſe theſe urging, the Phyſition is often forced to change the order of the cure.

All ſtrange and externall bodies muſt bee taken away, as ſpeedily as is poſſible, becauſe they hinder the action of nature intending unity, eſpecially if they preſſe or pricke any Nervous body, or Tendon, whence paine or an Abſceſſe may breede in any principall part, or other ſerving the principall.

Yet if by the quicke and too haſty taking forth of ſuch like bodies there bee feare of cruell paine or great effuſion of bloud, it will bee farre better to commit the whole worke to nature than to exaſperate the Wound by too violent haſtening.

For nature by little and little will exclude, as contrary to it, or elſe together with the *Pus*, what ſtrange body ſoever ſhall be contayned in the wounded part. But if there ſhall be danger in delay, it will bee fit the Chirurgion fall to worke quickely, ſafely, and as mildely as the thing will ſuffer: for effuſion of blood, ſwooning, convulſion and other horrid ſymptomes, follow upon the too rough and boyſtrous handling of Wounds, whereby the patient ſhall be brought into greater danger than by the wound it ſelfe.

Therefore he may pull out the ſtrange bodies, either with his fingers, or with inſtruments, fit for that purpoſe: but they are ſometimes more eaſily and ſometimes more hardly pulled forth, according as the body infixed is either hard or eaſie to be found or pulled out. Which thing happens according to the variety of the figure of ſuch like bodies; according to the condition of the part it ſelfe, ſoft, hard, or deepe, in which theſe bodies are faſtened more ſtraitly or more looſely;

and then for feare of inferring any worſe harme, as the breaking of ſome Veſſell; but how wee may performe this firſt intention, and alſo the expreſſion of the inſtruments neceſſary for this purpoſe, ſhall be ſhowne in the particular treaties of wounds made by Gun-ſhot, Arrowes and the like.

Ligatures and Sutures for to conjoyne and hold together the lippes of wounds.

But the Surgeon ſhall attaine to the ſecond and third ſcope of curing wounds by two and the ſame meanes, that is, by ligatures and ſutures: which notwithſtanding before hee uſe, hee muſt well obſerve whether there be any great fluxe of blood preſent, for he ſhall ſtoppe it if it be too violent; but provoake it, if too ſlow, (unleſſe by chance it ſhall be powred out into any capacity or belly) that ſo the part freed from the ſuperfluous quantity of blood may be leſſe ſubject to inflammation. Therefore the lippes of the wounds ſhall be put together, and ſhall bee kept ſo joyned by ſuture and ligatures: Not truly of all, but onely of thoſe which both by their nature, and magnitude, as alſo by the condition of the parts in which they are, are worthy and capable of both the remedies. For a ſimple and ſmall ſolution of continuity, ſtands onely in neede of the Ligature which we call incarnative, eſpecially, if it be in the Armes or Legges; but that which divides the Muſcles tranſverſly, ſtands in need of both Suture and Ligature; that ſo the Lippes which are ſomewhat farre diſtant from each other, and as it were drawne towards their beginnings, and ends, may bee conjoyned.

If any portion of a fleſhy ſubſtance by reaſon of ſome great cut ſhall hang downe, it muſt neceſſarily be adjoyned and kept in the place by ſuture. The more notable and large Wounds of all the parts, ſtand in need of Suture, which doe not eaſily admit a Ligature, by reaſon of the figure and ſite of the part in which they are, as the Eares, Noſe, Hairy-ſcalpe, Eie-liddes, Lippes, Belly and Throat.

Three ſorts of Ligatures:

What an incarnative Ligature is.

There are three ſorts of Ligatures, by the joynt conſent of all the Ancients. They commonly call the firſt, a Glutinative or Incarnative; the ſecond Expulſive, the third Retentive. The Glutinative or Incarnative is fit for ſimple, greene, and yet bloody wounds. This conſiſts of two ends, and muſt ſo be drawne, that beginning on the contrary part of the wound, wee may ſo goe upwards, partly croſſing it, and going downewards againe, we may cloſely joyne together the lippes of the Wound. But let the Ligature be neither too ſtrait, leaſt it may cauſe inflammation or paine; nor too looſe, leaſt it be of no uſe, and may not well containe it.

What an expulſive.

The Expulſive Ligature is fit for ſanious and fiſtulous ulcers, to preſſe out the filth contained in them. This is performed with one Rowler, having one ſimple head; the beginning of binding muſt bee taken from the bottome of the *Sinus*, or boſome thereof; and there it muſt be bound more ſtraightly, and ſo by little and little going higher, you muſt remit ſomething of that rigour, even to the mouth of the Vlcer. That ſo (as we have ſaid) the ſanious matter may be preſſed forth.

What the retentive.

The Retentive Ligature is fit for ſuch parts as cannot ſuffer ſtraight binding, ſuch are the Throat, Belly, as alſo all parts oppreſſed with paine; For the part vexed with paine, abhorreth binding. The uſe thereof, is to hold to locall Medicines. It is performed with a Rowler, which conſiſts ſome whiles of one, ſome whiles of more heads. All theſe Rowlers ought to be of linnen, and ſuch as is neither too new, nor too old; neither too courſe, nor too fine. Their breadth muſt be proportionable to the parts to which they ſhall bee applyed; the indication of their largeneſſe being taken from their magnitude, figure and ſite. As wee ſhall ſhew more at large in our Tractates of Fractures and Diſlocations.

What the rowlers muſt bee made of.

Why and how the temper of the wounded part muſt be preſerved.

The Chirurgion ſhall performe the firſt ſcope of curing Wounds, which is of preſerving the temper of the Wounded part, by appointing a good order of Diet by the Preſcript of a Phyſition, by uſing univerſall and locall Medicines. A ſlender, cold, and moyſt Diet muſt be obſerved, untill that time be paſſed, wherein the patient may be ſafe and free from accidents which are uſually feared. Therefore let him bee fed ſparingly, eſpecially if he be plethorick; he ſhall abſtaine from ſalt and ſpiced fleſh, and alſo from wine; If he ſhall be of a Cholerick or Sanguine nature: In ſteed of wine he ſhall uſe the decoction of Barly or Liquerice, or Water and Sugar. He ſhall keepe himſelfe quiet; for reſt is (in *Celſus* opinion) the very beſt Medicine. Hee ſhall avoyde Venery, Contentions, Brawles, Anger, and other perturbations of the mind, When hee ſhall ſeeme to bee paſt danger, it will bee time to fall by little and little to his accuſtomed maner of diet and life. Vniverſall remedies are Phlebotomies and purging, which have force to divert and hinder defluxion, wherby the temper of the part might be in danger of change.

In what wounds blood letting is not neceſſary.

For Phlebotomy it is not alwayes neceſſary, as in ſmall wounds and bodies, which are neither troubled with ill humours, nor plethoricke: But it is onely required in great wounds, where there is feare of defluxion, paine, *Delirium*, Raving and unquietneſſe; and laſtly in a body that is Plethoricke, and when the joynts, tendons, or nerves are wounded. Gentle purgations muſt bee appointed, becauſe the humours are moved and inraged by ſtronger; whence there is danger of defluxion and inflammation: wherefore nothing is to be attempted in this caſe, without the advice of a Phyſition.

What medicines are to be judged agglutinative,

The Topick and particular Medicines are Agglutinative, which ought to be induced with a drying and aſtrictive quality, whereby they may hold together the lips of the wound, and drive away defluxion, having alwayes regard to the nature of the part and the greatneſſe of the diſeaſe. The Simple Medicines are *Olibanum*, *Aloes*, *Sarcocolla*, *Bole-Armenick*, *Terra ſigillata*, *Sanguis Draconis*, Common and Venice Turpentine, Gumme *Elemni*, Plantane, Horſe-tayle, the greater Comfery, *Farina Volatilis*, and many other things of this kind, which wee ſhall ſpeake of hereafter in our Antidotary.

The fifth ſcope of healing wounds, is the Correction of thoſe Symptomes or Accidents which are accuſtomed to follow wounds, which thing verily makes the Chirurgion have much to doe; For he is often forced to omit the proper cure of the diſeaſe, ſo to reſiſt the accidents and ſymptomes, as bleeding, paine, inflammation, a feaver, convulſion, palſie, talking idly, or diſtraction, and the like. Of which wee ſhall treat briefly and particularly, after we have firſt ſpoken of Sutures as much as we ſhall thinke fitting for this place.

Chap. VI.

Of Sutures.

What wounds ſtand in no need of a ſuture

WHen Wounds are made alongſt the thighes, Legs, and armes, they may eaſily want Sutures, becauſe the ſolution of continuity is eaſily reſtored by Ligatures, but when they are made overthwart, they require a Suture, becauſe the fleſh and all ſuch like parts, being cut are drawne towards the ſound parts; whereby it comes to paſſe that they part the further each from other; wherefore that they may be joyned and ſo kept, they muſt be ſowed, and if the wound be deepe, you muſt take up much fleſh with your needle; for if you onely take hold of the upper part, the wound is onely ſuperficially healed: but the matter ſhut up, and gathered together in the bottome of the wound, will cauſe abſceſſes and hollow Vlcers: Wherefore now wee muſt treate of making of Sutures.

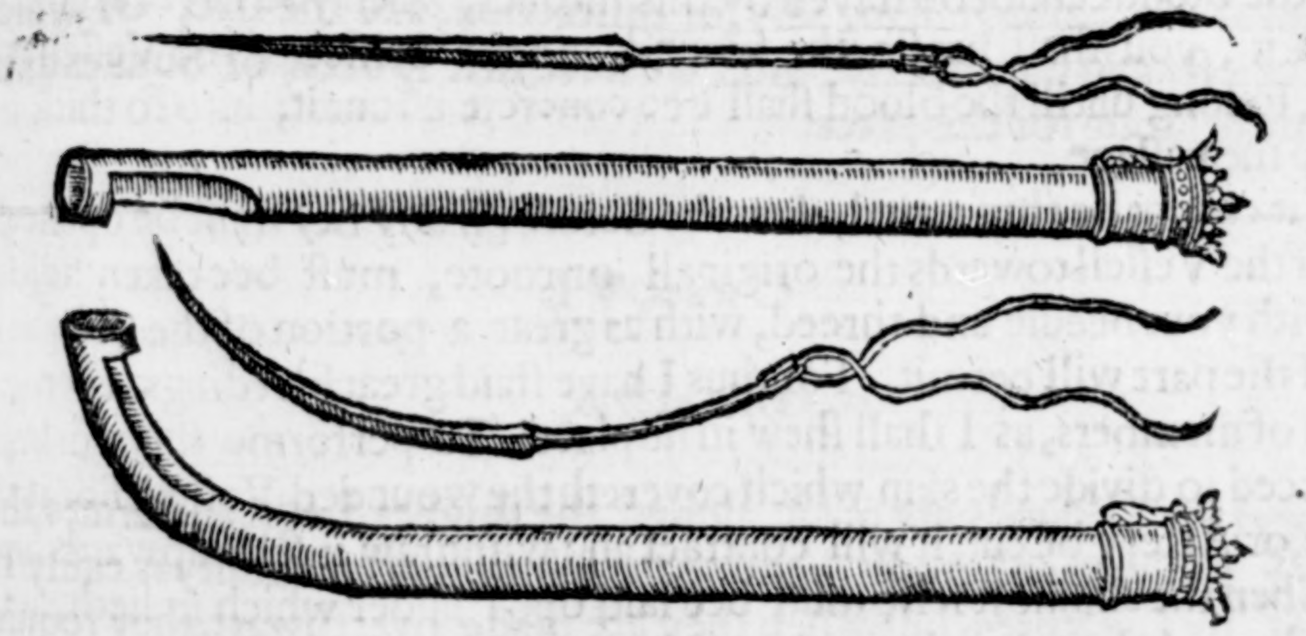
The firſt manner of ſuture.

The forme of your needle.

The forme of the pipe, with a window in it.

The firſt, called *Interpunctus*, leaves the diſtance of a fingers breadth, and therfore is fit for the greene wounds of the fleſhy parts, which cannot be cured with a Ligature, and in which no heterogeneous or ſtrange body remaines; It is performed after this manner. You muſt have a ſmooth needle with a threed in it, having a three ſquare point, that ſo it may the better enter the skin, with the head of it ſome what hollowed, that the threed may lie therein; for ſo the needle will the better goe through. You muſt alſo have a little pipe with a hole or window in the end, which you muſt hold and thruſt againſt the lip of the wound, that it bee not moved to the one ſide or other, whileſt you thruſt thorough the needle: And that wee may ſee thorough that window when the needle is thruſt thorough, and alſo draw it together with the threed, and withall hold the lip of the wound in more firmly, that it follow not at the drawing forth of the needle and threed. Having thus pierced the lips of the wound, tie a knot, neere to which cut off the threed; leaſt that if any of it bee left below the knot, it may ſo ſtick to the Emplaſters that it cannot be plucked and ſeparated from them without paine, when they are taken off. But you muſt note, the firſt ſtitch muſt be thruſt through the midſt of the wound, and then the ſecond muſt be in that ſpace which is betweene the midſt and one of the ends; but when you have made your ſtitches, the lips of the wound muſt not be too cloſely joyned, but a little ſpace muſt be left open betweene them, that the matter may have free paſſage forth, and the inflammation and paine may be avoyded: otherwiſe if they ſhall be cloſely joyned together without any diſtance betweene, a tumor after ariſing when the matter ſhall come to ſuppuration, the lips will be ſo much diſtended that they may eaſily be broken by the ſtifneſſe of the threed. But you muſt neither take hold of too much nor too little fleſh with your needle, for too little will not hold, and too much cauſeth paine and inflammation. And beſides leaves an ill ſavoured ſcarre. Yet in deepe wounds, ſuch as are thoſe which are made in the thicker Muſcles, the needle muſt be thruſt home, that ſo it may comprehend more of the fleſhy ſubſtance; leaſt the thred drawne away by the weight of the fleſh not taken hold of, may bee broken. But oft times wounds are ſeene made in ſuch places as it will be needfull, the Chirurgion ſhould have a crooked needle and pipe, otherwiſe the Suture will not ſucceede according to his deſire. Wherefore I have thought good to ſet forth both their figures, that you may uſe either as occaſion ſhall ſerve.

The Figure of Pipes with feneſtels in them, and Needles fit for Sutures.



The 2. manner of Suture.

The ſecond Suture is made juſt after the ſame manner as the Skinners ſowe their fels or furrs. And the guts muſt be ſowed with this kind of Suture, (if they ſhall be at any time wounded) that the excrements come not forth by the wound.

The third manner of Suture.

The third Suture is made by one or more needles having threed in them, thruſt through the wound, the threed being wrapped to and againe at the head and the point of the needle, as boyes uſe to faſten their needle, for feare of loſing it, in their caps, or clothes. This kind of Suture is fit in the curing and healing of Hare-lips, as we ſhall ſhew you hereafter expreſſed by a Figure.

The 4. kind of Suture termed *Gaſtroraphia.*

The fourth kind of Suture is tearmed *Gaſtroraphia*, invented for the reſtoring and uniting the great Muſcles of the *Epigaſtrium*, or lower belly, cut with a great wound together with the *Peritonæum* lying under them. The manner whereof we will ſhew in due place.

The 5. kind called the Dry Suture.

The fifth kind is called the Dry Suture, which we uſe onely in the wounds of the face, which alſo we will deſcribe in its proper place.

CHAP. VII.

Of the Flux of blood, which uſually happens in wounds.

The ſignes of bood flowing from an artery

OFt times great bleeding followes upon wounds, by reaſon of ſome veſſell cut, broken, or torne, which there is neede to heale and helpe diligently, becauſe the blood is the treaſure of nature, without which life cannot conſiſt. The Blood which floweth from an Artery, is thus knowne. It is more ſubtile, it runs forth as it were leaping, by reaſon of the vitall ſpirit contained together with it in the Arteries. On the contrary that which floweth from a Veine is more groſſe, blacke, and ſlow. Now there are many wayes of ſtenching blood.

The firſt way of ſtaying bleeding.

The firſt and moſt uſuall is that, by which the lips of the wound are cloſed, and unleſſe it be ſomewhat deepe, are contained by Medicines which have an aſtringent, cooling, drying, and glutinous faculty; As *terræ ſigill. Boli Armeni, ana.* ℥.ß. *thuris, Maſtichis, Myr hæ, Aloes, ana.* ʒ.ij. *Farinæ volat. molend.* ℥.j. *Fiat pulvis qui albumine ovi excipiatur.* Or ℞. *Thuris & Aloes, ana. partes æquales.* Let them bee mixt with the white of an Egge, and the downe of a hare, and let the pledgets bee dipped in theſe Medicines, as well thoſe which are put unto the wound as thoſe which are applied about it. Then let the wound be bound up with a double clop and fit Ligature, and the part bee ſo ſeated as may ſeeme the leaſt troubleſome and moſt free from paine.

The 2. manner of ſtanching it.

But if the blood cannot be ſtayed by this meanes, when you have taken off all that covereth it, you ſhall preſſe the wound and the orifice of the Veſſell with your thumbe, ſo long untill the blood ſhall bee concrete about it, into ſo thick a clot as may ſtop the paſſage.

The 3. way by binding of the veſſels.

But if it cannot be thus ſtaied, then the Suture (if any be) muſt be opened, and the mouth of the Veſſell towards the originall or roote, muſt bee taken hold of, and bound with your needle and threed, with as great a portion of the fleſh as the condition of the part will permit. For thus I have ſtaid great bleedings, even in the amputation of members, as I ſhall ſhew in fit place. To performe this worke, wee are often forced to divide the skin which covereth the wounded Veſſell. For if the Iugular veine, or Artery be cut, it will contract and withdraw it ſelfe upwards and downwards. Then the skinne it ſelfe muſt bee laid open under which it lieth, and thruſting a needle and threed under it, it muſt be bound as I have often done. But before you looſe the knot, it is fit the fleſh be growne up, that it may ſtop the mouth of the Veſſell, leaſt it ſhould then bleed.

An admonitiõ

But if the condition of the part ſhall be ſuch as may forbid this comprehenſion, and binding of the Veſſell, we muſt come to *Eſcharoticks*, ſuch as are the powder of burnt *Vitriol*, the powder of Mercury, with a ſmall quantity of burnt Allume; and Cawſticks which cauſe an Eſcar. The falling away of which muſt be left to Nature, and not procured by art, leaſt it ſhould fall away before that the orifice of the Veſſel ſhall be ſtopt with the fleſh, or clotted blood.

The 4. way by Eſcharoticks.

The 5. way by cutting off the veſſels.

But ſome times it happens that the Chirurgion is forced wholly to cut off the veſſell it ſelfe, that thus the ends of the cut veſſell withdrawing themſelves, and ſhrincking upwards and downewards, being hidden by the quantity of the adjacent and incompaſſing parts, the fluxe of blood, which was before not to bee ſtaid, may bee ſtopped with leſſe labour. Yet this is an extreame remedy and not to bee uſed, unleſſe you have in vaine attempted the former.

CHA.

CHAP. VIII.

Of the paine which happens upon wounds.

Paines weakens the body, and cauſes defluxious.

THe paines which followes upon wounds ought to be quickly aſwaged, becauſe nothing ſo quickly dejects the powers; and it alwayes cauſes a defluxion, of how good ſoever a habite and temper the body be of; for Nature ready to yeeld aſſiſtance to the wounded part, alwayes ſends more humours to it, than are needfull for the nouriſhment thereof, whereby it comes to paſſe that the defluxion is eaſily encreaſed, either by the quantity, or quality, or by both.

Divers Anodines or medicines to aſſwage paine.

Therefore to take away this paine the author of defluxion, let ſuch Medicines bee applyed to the part as have a repelling and mitigating faculty; as ℞. *Olei Myrtini, & Roſarum, ana* ℥. ij. *Ceræ alb.* ℥. j. *Farinæ hordei,* ℥. ß. *Boli armeni, & terræ ſigillat. ana.* ʒ. vj. Melt the Waxe in the Oyles, then incorporate all the reſt, and according to Art, make a Medicine to be applyed about the part, or ℞. *Emplaſt. Diacalcith.* ℥. iv. *Ole. Roſar. & aceti, ana,* ℥. ß. *liquefiant ſimul*, and let a Medicine be made for the fore mentioned uſe. Irrigations of oyle of Roſes and Mirtiles, with the white of an Egge, or a whole Egge added thereto, may ſerve for lenitives, if there be no great inflammation; Rowlers and double cloathes moiſtened in Oxycrate, will be alſo convenient for the ſame purpoſe. But the force of ſuch Medicines muſt be often renewed, for when they are dryed, they augment the paine. But if the paine yeld not to theſe, we muſt come to narcoticke Medicines, ſuch as are the Oyle of Poppy, of Mandrake, a Cataplaſme of Henbane and Sorrell, adding thereto Mallowes and Marſh-mallows, of which we ſpoke formerly in treating of a Phlegmon.

Laſtly, we muſt give heed to the cauſe of the paine, to the kind and nature of the humour that flowes down, and to the way which Nature affects: for according to the variety of theſe things, the Medicines muſt be varied, as if heat cauſe paine, it will be aſwaged by application of cooling things; and the like reaſon obſerved in the contrary; if Nature intend ſuppuration, you muſt helpe forwards its endeavours with ſuppurating Medicines.

CHAP. IX.

Of Convulſion by reaſon of a wound.

What a Convulſion is.

A Convulſion is an unvoluntary contraction of the Muſcles (as of parts moveable at our pleaſure, towards their originall, that is, the Braine and Spinall Marrow, for by this the Convulſed member or the wholle body (if the Convulſion be univerſall) cannot be moved at our pleaſure. Yet motion is not loſt in a Convulſion as it is in a Palſie, but it is onely depraved: and becauſe ſometimes the Convulſion poſſeſſeth the whole body, otherwhiles ſome part thereof, you muſt note that there are three kinds of Convulſions in Generall.

Three kinds of an univerſal Convulſion.

The firſt is called by the Greekes, *Tetanos*, when as the whole body growes ſtiffe like a ſtake that it cannot be moved any way.

The ſecond is called *Opiſthotanos*, which is when as the whole body is drawn backwards.

Three cauſes of a convulſion. Cauſes of Repletion.

The third is termed *Emproſthotonos*, which is when the whole body is bended or crooked forwards. A particular Convulſion is, when as the Muſcle of the Eye, Tongue, and the like parts which is furniſhed with a Nerve, is taken with a Convulſion. Repletion or Inanition, Sympathy or conſent of paine cauſe a Convulſion. Abundance of humours cauſe Repletion, dulling the body by immoderate eating and drinking, and omiſſion of exerciſe, or any accuſtomed evacuation, as ſuppreſſion of the Hemorrhoids and Courſes: for hence are ſuch like excrementious humours drawne into the Nerves, with which they being replete and filled, are dilated more than is fit, whence neceſſarily becoming more ſhort, they ſuffer Convulſion. Examples whereof appeare in Leather and Lute or Viol-ſtrings, which ſwolne with moyſture in a wet ſeaſon are broken by repletion.

Cauſes of Inanition.

Immoderate vomitings, fluxes, bleedings, cauſe Inanition or Emptineſſe, wherefore a Convulſion cauſed by a wound, is deadly: as alſo by burning feavers. For by theſe and the like cauſes, the inbred and primigeneous humidity of the Nerves is waſted, ſo that they are contracted like leather which is ſhrunke up, by being held too neere the fire, or as fidle ſtrings which dryed with Summers heat, are broken with violence; ſuch a Convulſion is incurable: For it is better a Feaver follow a Convulſion, than a Convulſion a Feaver; as we are taught by *Hippocrates*, ſo that ſuch a Feaver bee proportionall to the ſtrength of the convulſifique cauſe, and the Convulſion proceede from Repletion; for the abundant and groſſe humour cauſing the Convulſion is digeſted and waſted by the feaveriſh heat.

Aph. 26. ſec. 2.

Cauſes of convulſion by conſent of paine.

The cauſes of a Convulſion by reaſon of paine, are either the puncture of a Nerve, whether it be by a thing animall, as by the biting of a venemous beaſt; or by a thing inanimate, as by the prick of a needle, thorne, or pen-knife: or great and piercing cold, which is hurtfull to the wounds, principally of the nervous parts; whereby it comes to paſſe, that by cauſing great and bitter paine in the nerves they are contracted towards their originall, that is, the Braine, as if they would crave ſuccour from their parents in their diſtreſſed eſtate. Beſides alſo, an ill vapour carried to the braine from ſome putrefaction ſo vellicateth it, that contracting it ſelfe, it alſo contracteth together with it all the Nerues and Muſcles, as we ſee it happeneth in thoſe which have the falling ſickneſſe. By which it appeares that not onely the braine it ſelfe ſuffereth together with the Nerves, but alſo the Nerves with the Braine.

Signes of a convulſion.

The ſignes of a Convulſion are difficult, painefull and depraved motions, either of ſome part or of the whole body, turning aſide of the Eyes and whole Face, a Contraction of the Lippes, a drawing in of the Cheekes as if one laughed, and an Vniverſall ſweat.

CHAP. X.

The cure of a Convulſion.

The cauſe of a Convulſion by Repletion.

THe cure of a Convulſion, is to bee varied according to the variety of the Convulſive cauſe, for that which proceeds from Repletion muſt be otherwiſe cured, than that which is cauſed by Inanition; and that which proceeds of paine, otherwiſe than eyther of them. For that which is cauſed by Repletion is cured by diſcuſſing and evacuating Medicines: as by diet conveniently appointed, by purging, bleeding, digeſtive locall Medicines, exerciſe, frictions, ſulphurious Baths and other things appointed by the preſcription of ſome learned Phyſition which ſhall overſee the cure, which may conſume the ſuperfluous and excrementitious humours that poſſeſſe the ſubſtance of the Nerves, and habit of the body. The locall remedies are Oyles, Vnguents and Liniments, with which the Neck, Back-bone and all the contracted parts ſhall be annointed. The Oyles are, the Oyle of Foxes, Bayes, Camomill, Wormes, Turpentine, of *Coſtus*, of *Caſtoreum*: The Oyntments are *Vnguentum Arragon, Agrippæ, de Althæa, Martiatum.* This may be the forme of a Liniment; ℞. *Olei Chamæm. & Laurin. ana.* ℥. ij. *Olei Vulp.* ℥. j. *Vnguenti de Althæa & Marti. an.* ℥. ß. *Axungiæ vulpis,* ℥. j. *Aquæ vitæ,* ℥. j. ß. *Ceræ quantum ſufficit.* Make a Liniment for your uſe, or ℞. *Olei Lumbric. de Spica & de Caſtoreo, ana.* ℥. iij. *Axung. hum.* ℥ j. *Sulphuris vivi,* ℥. ß. *Ceræ quantū ſufficit.* Make a Liniment, or ℞. *Vnguenti Martiati, & Agrip. an.* ℥. iij. *Olei de Terebinth.* ℥. j. ß. *Olei Salviæ,* ℥. ß. *Aquæ vitæ* ℥. j. *Ceræ* ℥. j. ß. *fiat linimentum.* But this diſeaſe is cured by ſlender diet, and ſweating with the Decoctions of *Guiacum*, becauſe by theſe remedies the groſſe, tough, and viſcide excrements, which are in fault, are digeſted.

A Convulſion proceeding of Inanition is to be cured by the uſe of thoſe things, The cure of a Convulſion cauſed by inanition.

which doe wholeſomly and moderately nouriſh. And therefore you muſt preſcribe a diet conſiſting of meats full of good nouriſhment, as broaths and cullices of Capons, Pigeons, Veale, and Mutton, boyling therein Violet and Mallow leaves. Conſerves muſt be ordained, which may ſtrengthen the debilitated powers, and humect the habit of the body, ſuch as are, the Conſerves of Bugloſſe, Violets, Borage and water Lillies. The following broath will be profitable, ℞. *Lactucæ, Bugloſ. & portul. ana. M.j. quatuor ſeminum frigid. major. an.* ℥ß. *ſeminis Barberis*, ʒ.j. Let them al be boiled with a Chicken, and let him take the broath every morning. If thirſt oppreſſe him, the following Iulep will be good. ℞. *Aquæ roſar.* ℥.iv. *Aquæ viol.* ℔.ß. *Saccari albiſſimi* ℥.vj. *fiat Iulep, utatur in ſiti.* If the patient be bound in his body, emollient and humecting Clyſters ſhall bee appointed, made of the decoction of a ſheeps head and feet, Mallowes, Marſh Mallowes, Pellitory of the wall, Violet leaves, and other things of the like faculty; or that the remedy may be more ready and quickly made: let the Clyſters be of Oyle and Milke. Topick remedies ſhall be Liniments and Bathes. Let this be the example of a Liniment. ℞. *Olei Viol. & Amygdal. dulc. ana.* ℥ ij. *Olei Lilior. & Lumbric. ana.* ℥.j. *Axungiæ porci recentis*, ℥.iij. *Ceræ novæ quantum ſufficit, fiat Linimentum*, with which let the whole ſpine and part affected be annointed: This ſhall bee the forme of an emollient and humecting Bath. ℞. *Fol. Malvæ, Bis Malvæ, Pariet. ana. M.vj. Seminis Lini & fænug. ana.* ℔.ß. *Coquantur in Aqua communi, addendo Olei Lillior.* ℔.viij. Make a Bath: Into which let the patient enter when it is warme. When he ſhall come forth of the Bath, let him be dried with warme Clothes, or reſt in his bed avoyding ſweat. But if the patient be able to undergoe the charge, it will be good to ordaine a Bath of Milk, or Oyle alone, or of them equally mixt together.

An Emolient Liniment for any Convulſion.

An Emolient and humecting Bath.

Chap. XI.

Of the cure of a Convulſion, by ſympathy and paine.

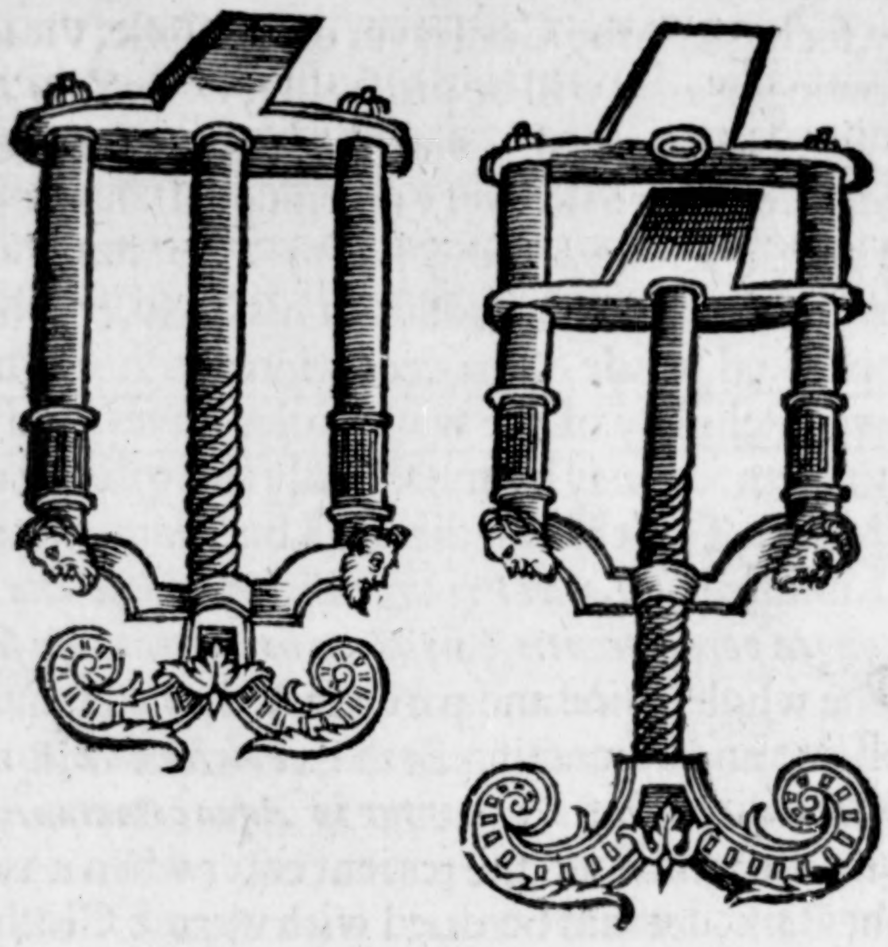
The cure of a Convulſion by a puncture, or bite.

A Convulſion which is cauſed both by conſent, of paine and Communication of the affect, is cured by remedies which are contrary to the dolorifique cauſe. For thus if it proceede from a puncture or venemous bite, the wound muſt be dilated and inlarged by cutting the skin, that ſo the venenate matter may flow forth more freely, for which purpoſe, alſo Medicines which are of a thin and liquid conſiſtence, but of a drying and digeſtive faculty ſhall be powred in, to call forth & diſſolve the virulency, as Treacle & Mithridate, diſſolved in *Aqua vitæ*, with a little of ſome Mercuriall powder: for this is a noble Antidote. Alſo cupping glaſſes and ſcarrifications will be good. Laſtly the condition of all dolorifique cauſes, ſhall bee oppugned by the oppoſition of contrary remedies, as if paine by reaſon of a pricked Nerve or Tendon, ſhall cauſe a Convulſion, it muſt preſently be reſiſted by proper remedies, as Oyle of Turpentine, of *Euphorbium*, mixt with *Aqua vitæ*, and alſo with other remedies appropriated to punctures of the Nerves. If the paine proceede from exceſſe of cold, becauſe cold is hurtfull to the Braine, the Spinall marrow, and Nerves; the patient ſhall bee placed in a hot aire, ſuch as that of a Hot-houſe or Stoave; all the Spine of his back and Convulſed parts, muſt be annoynted with the hot Liniments above mentioned: For that is much better, than ſuddenly to expoſe him from the conceaved convulcifique, cauſe to a moſt hot fire or warme Bath. In the meane time the Chirurgion muſt take diligent heede, that as ſoone as the ſignes of the Convulſion to come, or already preſent, or at hand, doe ſhew themſelves, that he put a ſticke betweene the patients teeth, leaſt they bee faſt locked by the pertinacious contraction of the Iawes: for many in ſuch a caſe have bit off their tongues, for which purpoſe he ſhall bee provided of an inſtrument called *Speculum Oris*, which may be dilated and contracted according to your mind by the meanes of a ſcrew, as the figures underneath demonſtrate, the one preſenting it open and ſomewhat twined up, and the other as it is ſhut.

A worthy *Alexipharmacum* or Antidote:

You muſt hinder the locking of the teeth.

The Figure of a Speculum Oris, *to open the teeth when they are locked or held faſt together.*



Chap. XII.

Of the Palſie.

What a Palſie is.

The differences thereof.

THe Palſie is the reſolving or mollification of the Nerves, with privation of ſenſe and motion, not truly of the whole body, but of the one part therof, as of the right or left ſide. And ſuch is properly named the Palſie: for otherwiſe and leſſe properly the reſolution of ſome one member is alſo called the Palſie: For when the whole body is reſolved, it is an Apoplexy. Therfore the Palſie ſometimes takes halfe the body, otherwhiles the uper parts which are betweene the navell and the head, otherwhiles the lower which are from the navell to the feet; ſomtimes the tongue, gullet, bladder, yard, eyes, and laſtly any of the particles of the body.

How it differs from a Convulſion.

It differs from a Convulſion in its whole nature. For in a Convulſion, there is a contention and contraction of the part, but in this a reſolving and relaxation thereof: beſides, it commonly happeneth that the ſenſe is either aboliſhed or very dull, which uſually remaines perfect in a Convulſion. There are ſome which have a pricking, and as it were great paine in the part.

The cauſes.

The cauſes are internall or externall, the internall are humors obſtructing one of the ventricles of the braine, or one ſide of the ſpinall marrow, ſo that the Animall faculty, the worker of ſenſe and motion, cannot by the Nerves come to the part to performe its action. The external cauſes are a fall, blow, and the like injuries, by which oft times the joynts are diſlocated, the ſpinall marrow wreſted aſide, and conſtrictions and compreſſions of the *Vertebræ* ariſe, which are cauſes that the Animall ſpirit cannot come to the Organes in its whole ſubſtance. But it is eaſy by skill in Anatomy perfectly to underſtand by the reſolved part the ſeat of the morbifique cauſe, for when there is a Palſie properly ſo called, that is when the right, or left ſide is wholly ſeized upon, then you may know that the obſtruction is in the braine, or ſpinall marrow; but if the parts of the head being untoucht, either of the ſides being wholly reſolved, the fault remaines in the Originall of the ſpinall marrow; if the armes bee taken with this diſeaſe, we may certainly think that the matter of the diſeaſe lies hid in the 5. 6. and 7. *Vertebra* of the neck. But if the lower members languiſh, we muſt judge the Paralitick cauſe to be contained in the *Vertebræ* of the loynes and holy bone. Which thing the Chirurgion muſt diligently obſerve that he may alwaies have recourſe to the originall of the diſeaſe. The Palſie which proceedes from a Nerve cut, or

or exceedingly bruiſed, is incurable, becauſe the way to the part by that meanes is ſhut againſt the Animall ſpirit. Old men ſcarce or never recover of the palſie, becauſe their native heat is languid, and they are oppreſſed with abundance of excrementitious humors, neither doth an inveterat palſie which hath long poſſeſt the part, neither that which ſucceeds an Apoplexy, yeeld us any better hope of cure. It is good for a feaver to come upon a Palſie, for it makes the diſſipation of the reſoloving and relaxing humor, to be hoped for. When the member affected with the palſie, is much waſted, and the oppoſite on the contrary, much encreaſed in quantity, heat and colour, it is ill: For this is a ſigne of the extreame weakeneſſe of the afflicted part, which ſuffers it ſelfe to be defrauded of its nouriſhment, all the proviſion flowing to the ſound or oppoſite ſide.

It is good for a feaver to happen upon a Palſie.

CHAP. XIII.

Of the cure of the Palſie.

IN the cure of the Palſie we muſt not attempt any thing, unleſſe we have firſt uſed generall remedies, diet and purging; all which care lyeth upon the learned and prudent Phyſition. The Decoction of *Guaiacum* is very fit for this purpoſe, for it procures ſweat and attenuates, digeſts and drieth up all the humidity which relaxeth the nerves: but when ſweat doth not flow it ſhall not be unprofitable to put about the reſolved members, bricks heated red hot in the fire and quenched in a decoction of Wine, Vineger, and reſolving herbs, or alſo ſtone bottles, or Oxe and Swines bladders, halfe filled with the ſame decoction; for ſuch heat which is actuall reſuſcitateth & ſtrengtheneth the heat of the part, which in this diſeaſe is commonly very languid: Then the Patient ſhall go into a Bathing-tub, which is vailed or covered over juſt as we have deſcribed in our Treatiſe of Bathes, that ſo he may receave the vapour of the following Decoction. ℞. *Fol. Salviæ, Lavend. Lauri. major. Abſinth. Thym. Angelicæ, Rutæ, ana. M.ß. Florum Chamæm. Melil. Anethi, Anthoſ. ana. P. ij. Baccar. Laur. & Iuniper. Conquaſſatar. ana.* ℥. j. *Caryophyl.* ʒ. ij. *Aquæ fontanæ & Vini albi, ana.* ℔. iv. Let them be all put in the Veſſell mentioned in the Treatiſe lately deſcribed for uſe. The patient ſhall keepe himſelfe in that Bathing-tub, as long as his ſtrength will give him leave, then let him be put into his bed well covered, where he ſhall ſweat againe, bee dried and reſt. Then let him be preſently anointed with the following ointment, which *Leonellus Faventinus* much commends, ℞. *Olei Laurini & de Terebinth. ana* ℥. iij. *Olei Nardini & petrolei, ana* ℥. j *Vini malvatici,* ℥. iv. *Aquæ vitæ,* ℥. ij. *Pyrethri, Piperis, Synap. Granor. Iunip. Gummi hederæ, anacard. Ladani puri, an.* ℥ j. ß *Terantur & miſceantur omnia cum Oleis & Vino: bulliant in vaſi duplici uſque ad Vini conſumptionem, facla forti expreſſione, adde Galbani, Bdellii, Euphorbii, Myrrhæ, Caſtorei, adipis urſi, Anatis, Ciconiæ, an.* ʒ ij. Make an ointment in forme of a liniment, adding a little wax if need ſhall require. Or you ſhall uſe the following remedy approved by many Phyſitions, ℞ *Myrrhæ & aloes, Spicænardi, Sanguinis draconis, thuris, opopanacis, Bdellii, Carpobalſami, amomi, ſarcocollæ, croci, maſtic. gummi arabici, ſtyrac. liquidæ, ladani, caſtorei, ana* ℥. ij. *Moſchi,* ʒ. j. *aquæ vitæ,* ℥. j *Terebinthinæ venetæ, ad pondus omnium, pulverabuntur pulveriſanda & gummi eliquabuntur cum aqua vitæ & aceti tantillo.* And let them all be put in fit veſſels, that they may be diſtilled in *Balneo Mariæ,* and let the ſpine of the back, and paralytick limbes be anointed with the liquor which comes from thence. I have often tried the force of this following Medicine. ℞. *rad. Angel. Ireos, floren. gentian. cyperi, ana.* ℥. j. *Calami aromat. Cinam. Caryophil. nucis Moſch. macis, ana.* ʒ. ij. *Salviæ, major. Iuæ arthriticæ, Lavend. roriſm. ſatureiæ, puleg. calament. mentaſtri, ana. M.* ß. *florum chamæm. melil. hyperic. anthos, ſtæchad. ana. P.* j. *Conciſa omnia contundantur, & in Aqua vit. & Vini malvat. an.* ℔. ij. *infundantur.* And let them be diſtilled in *Balneo Mariæ,* like the former, let the affected parts be moiſtened with the diſtilled liquor, of which alſo you may give the patient a ſpoone full to drinke in the morning with ſome Sugar. For thus the ſtomach will be heated, and much phlegme contained therein as the fuell of this diſeaſe, will be conſumed.

The decoctiō of Guaiacum is good for a Palſie.

Things actually hot good for to be applied to paraliticke mēbers.

Leon. Faventi. his ointment.

An approved ointment for the Palſie.

A diſtilled water good to waſh them outwardly, & to drinke inwardly.

Exerciſes and frictions.

Chymicall oyles.

You muſt alſo appoint exerciſes of the affected parts and frequent and hard frictions, with hot linnen clothes, that the native heat may be recalled and the excrements contained in the parts digeſted: You may alſo uſe the Chymicall oyles of Roſemary, Tyme, Lavander, Cloves, Nutmegs, and laſtly of all ſpices, the maner of extracting whereof we ſhall hereafter declare in a peculiar Treatiſe.

Chap. XIV.

Of Sowning.

What Sowning is.

Three cauſes of ſowning.

Sowning is a ſuddaine and pertinacious defect of all the powers, but eſpecially the Vitall; In this the Patients lie without motion and ſenſe, ſo that the Ancients thought that it differed from death onely in continuance of time. The cauſe of ſowning, which happens to thoſe that are wounded, is bleeding, which cauſeth a diſſipation of the ſpirits: or feare which cauſeth a ſuddaine and joint retirement of the ſpirits to the heart. Whence followes an intermiſſion of the proper duty as alſo of the reſt of the faculties, whileſt they being thus troubled, are at a ſtand. Alſo Sowning happens by a putrid and venenate vapour, carried to the heart by the Arteries, and to the Braine by the Nerves; by which you may gather that all ſowning happens by three cauſes. The firſt is, by diſſipation of the ſpirits and native heat, as in great bleeding. And then by the oppreſſion of theſe ſpirits by obſtruction, or compreſſion as in a feare, or tumult; For thus the ſpirits fly back haſtily from the ſurface and habit of the body, unto the heart and center. Laſtly, by corruption, as in bodies filled with ill humors, and in poyſonous wounds. The ſignes of Sowning are Palenes, a dewy and ſudden ſweat ariſing, the failing of the pulſe, a ſudden falling of the body upon the ground without ſenſe & motion, a coldneſſe poſſeſſing the whole body, ſo that the Patient may ſeeme rather dead, than alive. For many of theſe who fall into a ſowne dye unleſſe they have preſent helpe.

The cure of ſowning cauſed by diſſipation of ſpirits.

The cure of ſowning cauſed by a venenate aire.

The cure of Sowning cauſed by oppreſſion and obſtruction.

Therefore you ſhall helpe them, if when they are ready to fall, you ſprinckle much cold water in their face, if that the ſowning happen by diſſipation of the ſpirits, or if they ſhall be ſet with their faces upwards, upon a bed or on the ground, as gently as may be; and if you give them bread dipt in wine to hold and chew in their mouths. But if it be cauſed by a putrid vapour and poyſonous aire, you ſhall give them a little Mithridat or Treacle in *Aqua vitæ* with a ſpoone, as I uſually do to thoſe which have the plague, or any part affected with a Gangreene, or ſphacell. But if the patients cannot be raiſed out of their ſownes, by reaſon of the pertinatious oppreſſion and compreſſion of the ſpirits about the heart, you muſt give them all ſuch things as have power to diffuſe, call forth and reſuſcitat the ſpirits, ſuch as are, ſtrong wines to drink, ſweet perfumes to ſmell: You muſt call them by their owne name, lowd in their eare, and you muſt pluck them ſomewhat hard by the haires of the Temples, and neck. Alſo rub the temples, noſtrils, wreſts and palmes of the Hands with *Aqua vitæ*, wherin Cloves, Nutmegs, and Ginger have beene ſteeped.

Chap. XV.

Of Delirium (i.) Raving, *Talking idly or Doting.*

What a Symptomaticall *Delirium* is. The cauſes thereof.

Doting, or talking idly, here is uſed for a ſymptome which commonly happeneth in feavers cauſed by a wound, and inflammation; and it is a perturbation of the phantaſie, and function of the mind, not long induring. Wherefore ſuch a doting happens upon wounds, by reaſon of vehement paine, and a feaver, when as the nervous parts as the joynts, ſtomach, and middriffe ſhall be violated.

Why the brain ſuffers with the midriffe.

For the Ancients did therefore call the Middriffe *Phrena*, becauſe when this is hurt as if the mind it ſelfe were hurt, a certaine phrenſie enſues, that is, a perturbation of the Animall faculty, which is imployed in ratiocination; by reaſon of the community which the *Diaphragma* hath with the Braine, by the nerves, ſent from the ſixth

The Cure.

Conjugation, which are carried to the ſtomach. Therefore doting happens by too much bleeding, which cauſeth a diſſipation of the ſpirits, whereby it happens that the motions and thoughts of the mind erre, .as we ſee it happens to thoſe who have bled much in the Amputation of a member. And it happens by the puncture of a venemous beaſt, or from ſeed retained or corrupted in the womb, or from a Gangreen or Sphacel, from a venenate and putrid aire carried up to the braine, or from a ſudden tumult and feare. Laſtly, what things ſoever with any diſtemper eſpecially hot, do hurt and debilitate the minde. Theſe may cauſe doting by the afflux of humors, ſpecially cholerick, by diſſipation, oppreſſion or corruption of the ſpirits. Therefore if it ſhall proceede from the inflammation of the braine, and *Meninges* or Membranes therof; after purging and blood letting by the preſcription of a Phyſition, the haire being ſhaved or cut off, the head ſhall be fomented with roſe vineger, and then an Emplaſter of *Diacalcitheos* diſſolved in oyle and vineger of Roſes, ſhall be laid thereupon. Sleep ſhall be procured with Barley creames, wherein the ſeeds of white Poppy have been boyled, with broaths made of the Decoction of the cold ſeedes of Lettuce, Purſlaine, Sorrell and ſuch like. Cold things ſhall be applyed to his noſtrils, as the ſeeds of Poppy gently beaten with Roſe-water and a little vineger. Let him have merry and pleaſant Companions that may divert his mind from all cogitation of ſorrowfull things, and may eaſe and free him of cares, and with their ſweet intreaties may bring him to himſelfe againe. But if it happen by default of the ſpirits, you muſt ſeeke remedy from theſe things which have beene ſet downe in the Chapter of Sowning.

The End of the Ninth Booke.

OF THE GREENE AND BLOODY VVOVNDS OF EACH PART.

THE TENTH BOOKE.

CHAP. I.

Of the kinds or differences of a broken Scull.

NOw that we have briefly treated of wounds in generall, that is, of their differences, ſignes, cauſes, prognoſticks and cure, and alſo ſhewed the reaſon of the accidents and ſymptomes which uſually follow and accompany them; it remaines that we treate of them as trey are incident to each part, becauſe the cure of wounds muſt be diverſly performed according to the diverſity of the parts. Now we will begin with the wounds of the head. Therefore the head hath the hayry ſcalpe lightly bruiſed without any wound, otherwhiles it is wounded without a Contuſion, and ſometimes it is both contuſed and wounded: but a fracture made in the Scull, is ſometimes ſuperficiary, ſometimes it deſcends even to the *Diploe*, ſometimes it penetrats through the 2. Tables, and the Meninges into the very ſubſtance of the Braine; beſides, the braine is oft times moved and ſhaken with breaking of the internall veines, and diverſe ſymptomes happen when there appeares no wound at all in the head: of all, and every of which we will ſpeak in order, and adde their cure, eſpecially according to the opinion of the divine *Hippocrates*. He in his Booke of the wounds of the head, ſeemes to have made 4. or 5. kinds of fractures of the Scull. The firſt is called a fiſſure or fracture, the 2. a contuſion or colliſion, the 3. is termed *Effractura*, the 4. is named *Sedes*, or a ſeat; the 5. (if you pleaſe to adde it) you may call a Counterfiſſure, or as the interpreter of *Paulus* cals it, a *Reſonitus*. As when the bone is cleft on the contrary ſide, to that which receaved the ſtroake. There are many differences of theſe 5. kinds of a broken Scull. For ſome fractures are great, ſome ſmall, and others indifferent; ſome runne out to a greater length or breadth; others are more contracted; ſome reſide only in the ſuperficies; others deſcend to the *Diploe*, or elſe pierce thorough both the Tables of the Scull; ſome run in a right line, others in an oblique and circular; ſome are complicated amongſt themſelves, as a fiſſure is neceſſarily and alwayes accompanied with a Colliſion or Contuſion; and others are aſſociated with diverſe accidents, as paine, heat, ſwelling, bleeding and the like. Sometimes the Scull is ſo broken, that the membrane lying under it, is preſſed with ſhivers of the bone, as with pricking needles. Somewhiles none of the bones fals off. All which differences are diligently to be obſerved, becauſe they force us to vary the cure, and therefore for the helpe of memory, I have thought good to deſcribe them in the following Table.

The differences of a brokē head.

The kinds of a broken Scul out of *Hippocratus*.

Differences from their quantity.

Differences from their figure.

From their complication.

A Table of the fractures of the Scull.

A fracture, or ſolution of continuity in the Scull is cauſed either, by
- *Contuſion, that is, a colliſion of a thing bruiſing, hard, heavy and obtuſe, which ſhall fall or bee ſmitten againſt the head, or againſt wch the head ſhall bee knocked, ſo that the broken bones are divided, or*
  - *Keepe their naturall figure and ſite, touching each other, whence proceeds that fracture of the Scull which is called a fiſſure, which is*
    - *Either maniſeſt, & apparent, that is*
      - *To your ſight,*
      - *To your feeling,*
      - *Or inſtrument.*
    - *Or obſcure and not maniſeſt, when as not the part which received the blow is wounded, but the contrary thereto; and that happens either.*
      - *In the ſame bone, and that 2 manner of waies as*
        - *On the ſide, as for example, when the right ſide of the bone of the forehead is ſtrucken, the left is cleſt.*
        - *Or from above to below, as when not the firſt Table which received the blow is cleſt, but that which is under it.*
      - *In divers bones to wit in ſuch men as want ſutures, or have them very cloſe, or diſpoſed otherwayes then is fit, and this oppoſition is, either*
        - *From the right ſide to the left, and ſo on the contrary, as when the right* Bregma *is ſtruck, and the left cleſt.*
        - *From before to behind and the contrary, as when the forehead is ſmitten, the nowle is cleſt.*
    - *Or betweene both, that is, the obſcure & maniſeſt, as that which is termed a Capillary fiſſure, and is maniſeſted by ſmearing is over with oyle, and writing inke.*
  - *Or looſe that ſite, and that either*
    - *Wholy ſo that the particles of the broken bone removed from their ſeat, and falling down, preſſe the membrane, whence proceeds that kind of effracture which reteines a kind of attrition, when as the bone ſtrucke upon is broken as it were into many fragments, ſhivers and ſcailes, either apparent, or hid in the ſound bone, ſo that it is preſſed downe.*
    - *Or in ſome ſort; as when the broken bone is in ſome part ſeparated, but in others adheres to the whole bone, whence another kind of effracture ariſes; you may call it Arched, when as the bone ſo ſwels up, that it leaves an empty ſpace below.*
- *Or by inciſion of a ſharpe, or cutting thing, but that inciſion is made, either by*
  - Succiſſion, *when the bone is ſo cut, that in ſome part it yet adheres to the ſound bone.*
  - Reſciſſion, *when the fragment fals down wholly broken off.*
  - *Or* Seate, *when the marke of the weapon remaines imprinted in the wound, that the wound is of no more length, nor breadth than the weapon fell upon.*

Another

Another Table of the differences of a fractured Scull.

The differences of fractures common to theſe of all other parts are drawne, either from

- *Their nature, according to which fractures are cald,*
  - *Simple, as when they are found ſolitary and by themſelves.*
  - Compound and that either
    - *Mutually with themſelves, as a contuſion, or colliſion with inciſion, a fiſſure with an effracture.*
    - Or
    - *with other ſymptomes, as ſwelling, paine, heat, bleeding, convulſion and the like.*
- *Their Quantity whence they are called, great, indifferent and ſmall, according to the triple dimenſion of length, breadth and profunditie.*
- *Their figure, from whence they are called.*
  - *Right,*
  - *Oblique,*
  - *Tranſverſe,*
  - *Round,*
  - *Triangular.*
- *Their ſite, whence they are termed on the fore or backe, or the right or left, or the upper or lower part; or ſuperficiary and profound.*
- *The part, whence it is called a Fracture of the Forehead, Nowle,* Bregma, *and Stony bones; and hence it is judged, what may bee deadly, or hopefull of recovery, eaſie or difficult to cure.*

Chap. II.

Of the cauſes and ſignes of a broken Scull.

The externall cauſes.

The cauſes of a broken Scull are externall, as a fall, a blow or ſtroake with any kind of weapon, ſharpe, obtuſe, heavy, hard, the bitings of Beaſts, and many other things of the like kind. But the ſignes by which we come to know that the Scull is broken, are of two kinds; for ſome of them are found out by the reaſoning and diſcourſe of the mind, other by the ſenſe, as thoſe which lay open the wound to the eye and hand.

Rationall cauſes.

The Rationall ſignes ſhew by theſe things which have happened upon the thing it ſelfe, whether it be, and of what ſort it is. For you may know the Scull is broken, if the patient ſhall fall down with the ſtroake, or if he ſhall fall headlong from a high place upon ſome hard thing. If for ſome time after the ſtroake, he ſhal lie without ſpeaking, ſight, and hearing, if he ſhall have felt and feele much paine, ſo that he is often forced to put his hand to the wound. But alſo the weapon is to be conſidered, that is, whether it be heavy, obtuſe, pricking or ſharpe. Alſo we muſt conſider with what & how great ſtrength the ſtroake was given, and with how great anger and from what diſtance the weapon fell. Alſo he muſt conſider whether the patient receaved the blow with his head unarmed and naked; whether he fell into a ſowne preſently after the blow; whether when he came to himſelfe, he was in his right ſenſes; whether his eies were blinded, whether he was troubled with a giddines or dizines, and whether he bled at the noſe, mouth, eares, or eyes, and laſtly whether he vomited. For ***Hippocrates*** writes, that thoſe who have their braine cut, muſt neceſſarily have a feaver and vomiting of choler to enſue thereupon, which *Galen* confirming in his Commentary ſaith, that the ſame happens alſo when the wound comes to the Membranes of the braine.

Aphor. 50. ſec. 6.

Lib.8,cap.4.

Alſo a dull ſound as from a broken veſſell comming from the skull, (the hairy ſcalpe and *Pericranium* being taken off) and it being lightly ſmitten upon with an Iron probe, is ſayd to be a ſigne of a fracture thereof, as it is recorded by *Paulus Ægineta.* Truely all theſe ſignes make a great conjecture or rather aſſuredneſſe that the skull is wounded, and the braine hurt, as which cannot happen unleſſe the bone be broken, as *Celſus* hath written. Yet many have had their ſculles broken, who had no ſuch ſigne immediatly after the blow; but this is very ſeldome. But I doe not thinke fit amongſt ſo many ſignes, here to omit that which is ſet downe by *Guido.* If any (ſaith he) will know in what place the ſcull is broke, let the patient hold faſt betweene his foreteeth, one end of a lute ſtring or thread, and the Chirurgion hold the other in his hand; then let him lightly touch or play upon the ſtring with his fingers; for in the very inſtant of the ſound or ſtroke, the patient will bee certainely admoniſhed, or perfectly perceive the part of the ſcull that is broken, and as orecome and forcſt by this ſence of paine, will by lifting up his hand make demonſtration thereof. As yet I have not beene able to finde the truth hereof by experience, although I have made triall of it in many. Wherefore I cannot ſay any thing certainely of this ſigne, as neither of that which is mentioned by *Hippocrates* in *Coais Praſ.* In ſuch as you doubt, whether the bones of the ſcull be broken, or not, you muſt judge by giving them the ſtalke of Aſphodill, to chaw on both ſides of their jawes, but ſo that you bid them withall obſerve, whether they perceive any bone to crackle, or make a noyſe in their heades, for theſe which are broken ſeeme to make a noyſe.

Hippocrates and *Guidoes* conjecturall ſignes of a broken ſcull.

But paſſing over theſe things, now let us come to theſe ſignes, which may be obvious to our ſenſes.

CHAP. III.

Of the ſignes of a broken skull, which are manifeſt to our ſenſe.

Senſible ſignes of a broken ſcull before the dividing of the skinne.

These ſignes are here ſayd to be manifeſt to ſenſe, which when the bone is bared, manifeſt the wound to our eyes, fingers and probe. But if the haires ſtand upon one end in the wound, you may know the bone is broke, becauſe the haire which yeelds to the violence of the blow, cannot be ſo cut, the bone which reſiſts the ſtroake being not violated, as it is obſerved by *Hippocrates*; whererefore we may by the ſight of this one thing, before any inſpection of the wound it ſelfe, ſuſpect by a probable conjecture, that the Scull is broken, and perſwade the beholders or ſtanders by ſo much.

Lib. de vulner. cap.

Moreover we may, before we have cut the skinne acroſſe, or baid lare the bone, give a gueſſe by our feeling, whether the ſcull be broken, or no, if wee by preſſing downe our fingers neere the wound ſhall perceive the bone either to ſtand up, or be preſſed downe otherwiſe than it ſhould naturally be.

What a probe muſt be uſed in ſearching for a fracture.

The skinne being cut croſſewiſe and the bone laid bare, if the fracture be not obvious to the eye, you muſt trye with your probe, which muſt neither be too thinne nor to ſharpe, leaſt by falling into ſome naturall cranyes, it may cauſe us to ſuſpect without any cauſe that the bone is broken; neither let it be too thick, leſt the little clifts may deceive you. If when your probe comes to the bone, it meetes with nothing but that which is ſmooth and ſlippery, it is a ſigne that it is whole.

But on the contrary, if you finde it any thing rough, ſpecially where there is no ſuture, it ſhewes the bone is broken. But let the Chirurgion conſider, that the fractures are not ſeldome upon the ſutures; and that the ſutures have not alwayes one and their naturall ſite; as alſo it often comes to paſſe that the broken clefte, or cut bone can neither be perceived by your ſight, nor inſtrument; wherefore if you thinke there is any ſuch thing, by the rationall ſignes above mentioned, annointe the place with writing Incke, and oyle, and ſo you ſhall find the cracke or clift, by the meanes we ſhall ſhew you hereafter.

When you are certaine of the fracture, then you muſt diligently conſider the greatneſſe

neſſe of the diſeaſe, and apply medicines ſpeedily. Verily when a fracture chances to light upon any ſuture, the diſeaſe is hard to be knowne, unleſſe the fracture be very great, becauſe the ſutures by their clifts and roughneſſe reſemble fractures; wherefore *Hippocrates* ſaith that he was deceived by them. Now having briefely delivered the differences and ſignes of a broken ſcull, it is time to come to the ſeverall kindes thereof, with a Fiſſure.

Lib. 5. Epid. in Autonomus of *Omilum Hippocrates* was deceived by the ſutures.

CHAP. IIII.

Of a Fiſſure, being the firſt kinde of a broken ſcull.

IF the Chirurgion by the forementioned ſignes ſhall know that the ſcull is broken, or crackt, and if the Wound made in the muſculous skin ſhall not be thought ſufficient for ordering the fiſſure, then muſt he ſhave off the haire, and cut with a razour, or inciſion knife, the muſculous skinne with the *Pericranium* lying under it, in a triangular or quadrangular figure to a proportionable bigneſſe, alwayes ſhunning, as much as in him lies, the ſutures and temples; neither muſt he feare any harme to enſue hereof; for it is farre better to bare the bone by cutting the skinne, then to ſuffer the kinde and nature of the fracture to remaine unknowne, by a too religious preſervation of the skinne; for the skinne is cured without any great adoe, though pluckt off to no purpoſe.

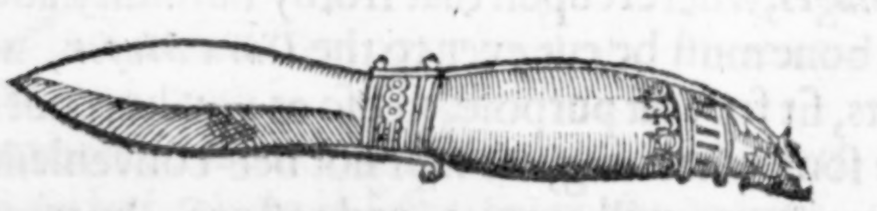
Vpon what occaſion the hairy ſcalpe muſt be cut.

Celſus.

For it is much more expedient (in *Hippocrates* opinion) to cure diſeaſes ſafely and ſecurely though not ſpeedily; than to doe it in a ſhorter time with feare of relapſe and greater inconveniencies. Let this diſſection bee made with a razour, or ſharpe knife, and if there be any Wound made in the skinne by the weapon, let one of your inciſions be made agreeable thereto.

Hippocrates.

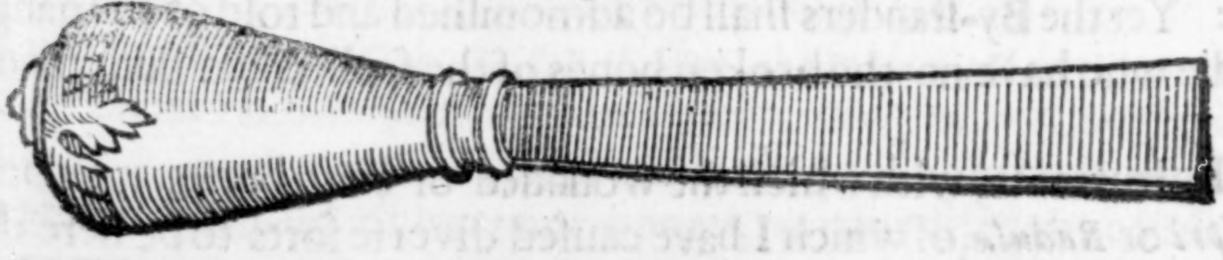
A Razour, or Inciſion knife.



Now therefore the Muſculous skinne together with the *Pericranium* muſt be divided and cut with a ſharpe razour preſſed and guided with a ſtrong and ſteddy hand; then muſt it be ſo pluckt from the bone, or ſcull lying under it, that none thereof remaine upon the bone; for if it ſhould be rent or torne with the Trepane, it would cauſe vehement feavers with inflammation. You muſt beginne to pull it backe at the corners of the lines croſſing each other with right angles, with this Chiſſell whoſe figure you ſee here expreſſed.

The manner how to pull the hairie ſcalp from the broken ſcull.

A Chiſſell or Inſtrument to pull backe or ſeparate the Pericranium *from the Scull.*



Then you muſt fill all the wound with boulſters of fine ſoft linte, that ſo the lippes may be kept further a ſunder. But you ſhall apply upon it medicines fit to ſtanch blood. But if it come ſo to paſſe that the blood flowes forth ſo violently, that it can be ſtayed by no meanes, the veſſell it ſelfe muſt be bound, after this manner

Firſt thruſt thorough the muſculous skinne on the outſide with a needle and thred, then thruſt the needle backe againe; then tye the thred on a knot on the outſide, but firſt put ſome lint rolled up to the bigneſſe of a Gooſe quill betweene the thred and the hairy ſcalpe on both ſides thereof, leaſt the ſtrait twitching of the

The manner to binde a veſſell in caſe of too much bleeding.

thred which may ſerve to ſtay the bleeding, may cut and teare the ſkinne, or cauſe paine: then muſt you raiſe his head ſomewhat higher.

A Hiſtory.

I have lately tried, and performed this upon a certaine Coach-man, who throwne from the Coach upon his head on a pavement of freeſtone, exceedingly bruiſed the hind part of the *Bregma*, for which cauſe it was fit to open the Muſculous skinne, with a croſſe inciſion, both that the congealed blood might bee preſſed out, as alſo that the fracture (if there were any) might be obſerved. But an Artery being cut in performance hereof, when as the Chirurgion who was there preſent could not ſtay the blood leaping out with violence; and the Coachman already had loſt ſo great a quantity thereof, that his ſtrength was ſo much decayed, that hee could not ſtirre himſelfe in his bed, or ſcarce ſpeake: I being called, ſhewed them by experience, that whereas aſtringent medicines were uſed before to no purpoſe, it was better to ſtay the bleeding by binding the veſſell, than to let the patient die for a childiſh feare of pricking him.

A way to finde a fracture in the ſcull, when it preſents not it ſelfe to the view at the firſt.

But that we may returne to our former matter, the Chirurgion ſhall the next day conſider with what kinde of fracture the bone is hurt; and if no ſignes of hurt appeare to the eyes, nor be perceived with your fingers and probe, yet ſome of the rationall ſignes may cauſe one to have a conjecture that there is a fracture: Then you muſt annoint as we told you before, the bared bone with writing Inke, and a little oyle of Roſes; that the cleſt or cracke may be dyed or coloured therewith, if that there be any there. Then the next dreſſing you muſt drie the bone with a linnen cloth, and ſcrape off the Inke, and oyle, with ſcraping Inſtruments made for the purpoſe: if any part thereof, ſhall be ſuncke into the bone; for if there be any cracke, it will bee black; Wherfore you muſt continue ſcraping untill no ſigne of the fiſſure remaine, or elſe untill you come even to the *Dura Mater*. But that he may be more certaine whether the fiſſure pierce thorough both the Tables of the ſcull, he muſt bid the Patient, that ſtopping his noſe & mouth, he ſtrive to breathe with a great endevour. For then bloody matter or *ſanies* will ſweat thorough the fiſſure: For the breath driven forth of the cheſt, and prohibited paſſage forth, ſwells and lifts up the ſubſtance of the braine, and the *Meninges*, whereupon that frothy humidity and *Sanies* ſweats forth.

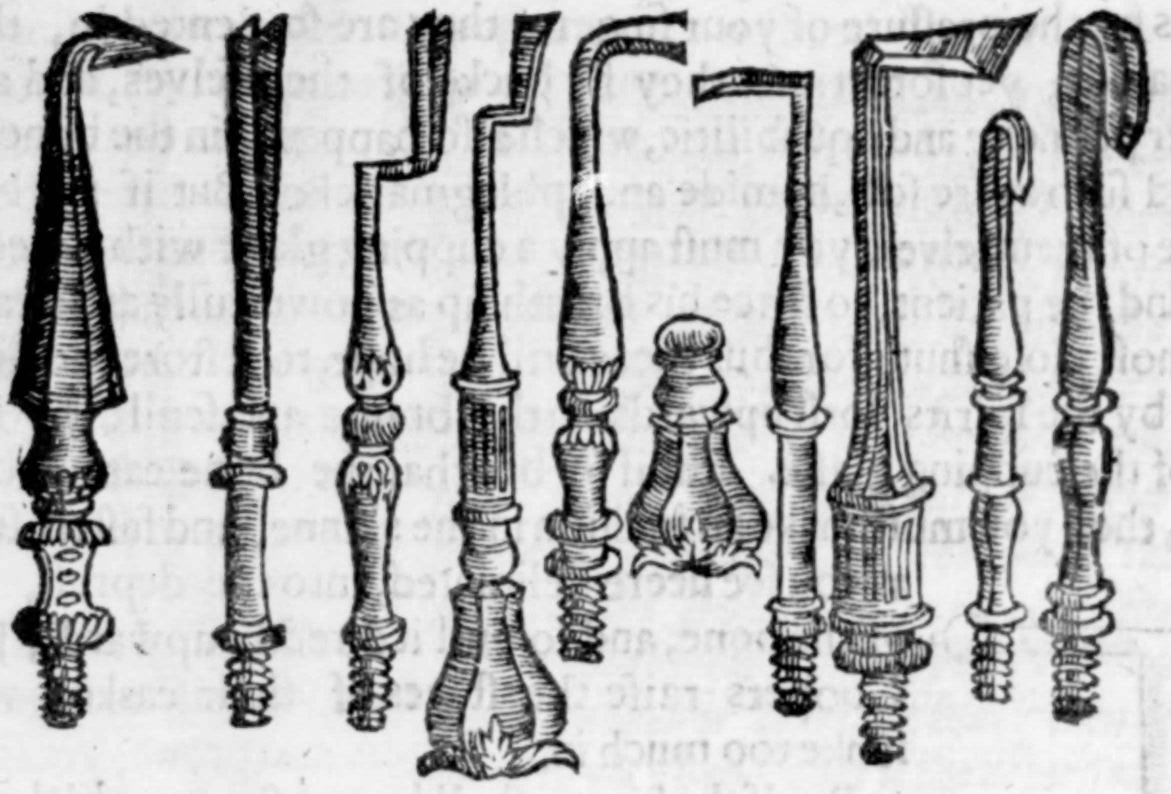
A ſigne that both the Tables are broken.

Therefore then the bone muſt be cut even to the *Dura Mater*, with *Radulæ* and other ſcraping Inſtruments, fit for that purpoſe, yet ſo as you hurt not the membrane; but if the fiſſure ſhall be ſomewhat long, it will not bee convenient to follow it all the extent thereof: for nature will repaire and reſtore the remnant of the fiſſure by generating a *Callus*; beſides alſo the Chirurgion according to *Celſus* opinion muſt take away as little of the bone as he can, becauſe there is nothing ſo fit to cover the braine, as the ſcull. Therefore it ſhall ſuffice to make a paſſage, whereby the blood and *Sanies* may paſſe and be drawne forth, leaſt that matter being ſuppreſſed may corrupt the bone, and cauſe an inflammation in the braine. But the broken bone muſt bee taken forth within three dayes if it be poſſible, eſpecially in Sommer for feare of inflammation. Yet I have oftentimes taken forth with a Trepan and with Scrapers the bones of the ſcul, after the ſeaventeenth day, both in Winter & Sommer; and that with happy ſucceſſe. Which I have the rather noted, leaſt any ſhould, at any time, ſuffer the wounded to be left deſtitute of remedie: for it is better to trie a doubtfull remedie than none: Yet the By-ſtanders ſhall be admoniſhed and told of the danger, for many more die who have not the broken bones of the ſcull taken out, than thoſe that have.

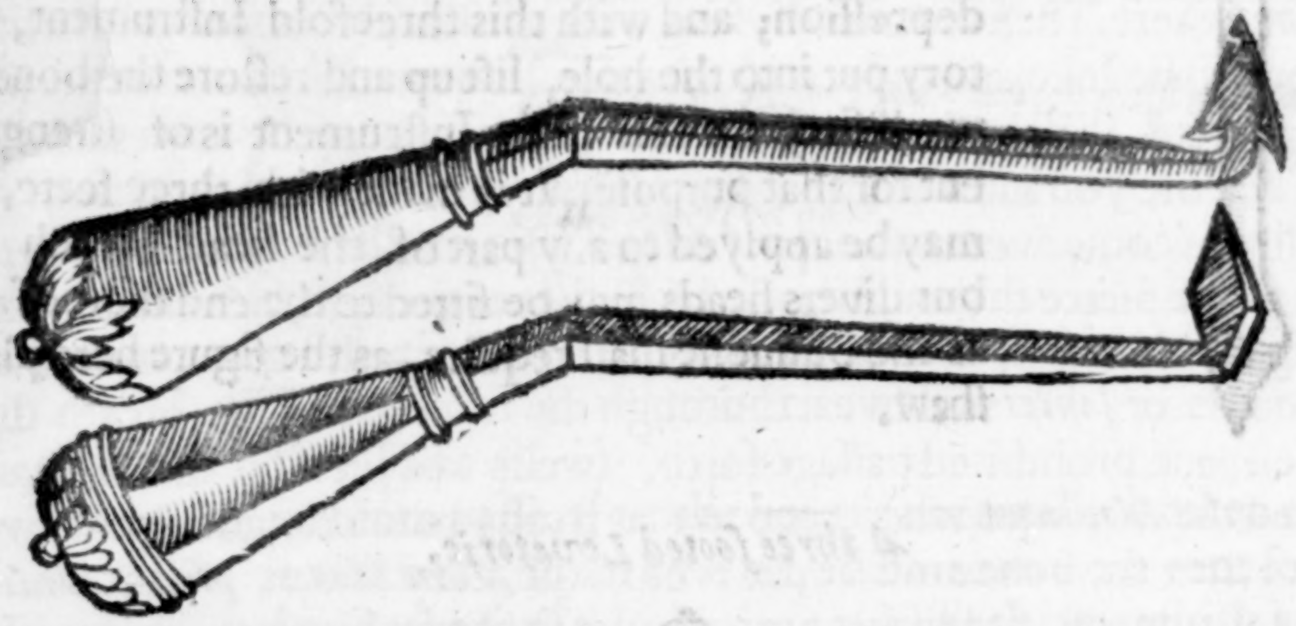
You may uſe the Trepan after the tenth day.

But the Inſtruments, with which the wounded or cleſt bones may be cut out are called *Scalpri* or *Radulæ*, of which I have cauſed diverſe ſorts to be here decyphered, that every one might take his choice, according to his minde, and as ſhall bee beſt for his purpoſe. But all of them may be ſcrued into one handle, the figure whereof I have here exhibited.

Radulæ *or* Scalpri *(i) Shavers or Scrapers.*



Radulæ *of another forme, for the better cutting of the greater bones.*



To conclude, when the ſcull ſhall be wounded or broken with a ſimple fiſſure, the Chirurgion muſt thinke he hath done ſufficient to the patient; and in his *Art*, if hee ſhall divide the bone and dilate the fiſſure or cleft with the deſcribed Inſtruments, though he have uſed no Trepan, although the fiſſure pierce thorough both the Tables. But if it doth not exceed the firſt Table, you muſt ſtay your ſcrapers as ſoone as you come to the ſecond, according to the opinion of *Paulus*: but if the bone ſhall be broken, and ſhivered into many peeces, they ſhall be taken forth with fit Inſtruments, uſing alſo a Trepan if neede ſhall require, after the ſame manner as we ſhall ſhew you hereafter.

It it ſufficient in a ſimple fiſſure to dilate it with your *Scalpri* onely and not to Trepan it.

Chap. V.

Of a Contuſion, which is the ſecond ſort of fracture.

An *Ecchymoſis*, that is, an effuſion of blood, preſently concreating under the muſculous skinne, without any wound, is oft cauſed by a violent Contuſion. This Contuſion if it ſhall be great, ſo that the skinne be devided from the ſcull, it is expedient, that you make an inciſion, whereby the blood may bee evacuated and emptied. For in this caſe you muſt wholy deſiſt from ſuppurative medicines, (which otherwiſe would be of good uſe in a fleſhy part) by reaſon that all moyſt things are hurtfull to the bones, as ſhall be ſhowne hereafter.

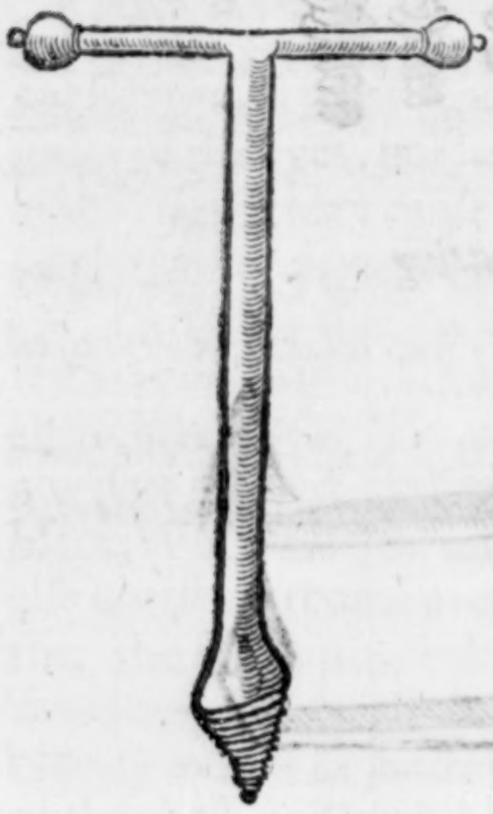
What an *Ecchymoſis* is.

How a contuſion of the ſcull muſt be cured.

Such like Contuſions more frequently happen in children, being eaſily perceived by the ſoftneſſe, and inundation of the contuſed part: forth of which oft times when I have opened them with my inciſion knife, ſerous, clotted and blackiſh blood hath

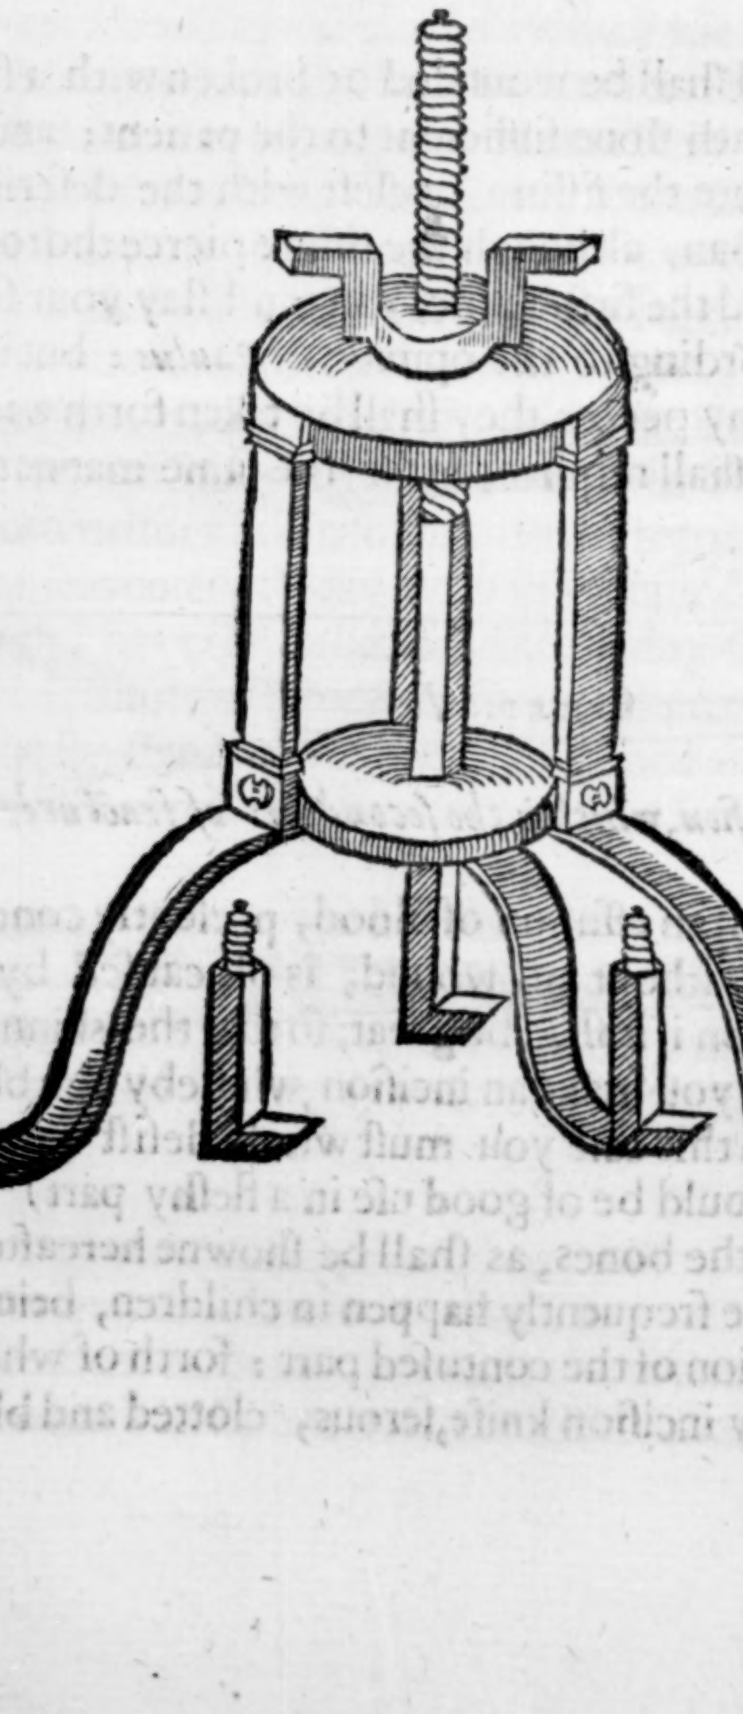
Different cures of a depreſſed ſcull.

iſſued. The reſidue of the cure is perfected by moderate compreſſion of the part, and drying medicines. Moreover the ſcull of a child, may bee preſſed downe, by a great contuſion, even as wee ſee it happens in thin veſſels of braſſe, lead, or pewter, for oft times by the preſſure of your finger, they are ſo dented in, that the print thereof remaines; yet ſometimes they fly backe of themſelves, and againe acquire their former plaineſſe and equabilitie, which alſo happens, in the bones of children, women, and ſuch as are ſoft, humide and phlegmaticke. But if the bones doe not ſpring backe of themſelves, you muſt apply a cupping glaſſe with a great flame; withall commaund the patient, to force his breath up as powerfully as he can, keeping his mouth and noſe cloſe ſhut; for thus there will be hope, to reſtore the depreſſed bone to its place, by the ſpirits forſt upwards to the braine and ſcull, by the powerfull attraction of the cupping glaſſe. But if ſo bee that the bone cannot by this meanes be reſtored, then you muſt make an inciſion in the skinne, and faſten ſuch a Trepan, as you ſee heere deliniated, into the depreſt, or ſetled part of the bone, and ſo pull it directly upwards, juſt as wee ſee Coopers raiſe the ſtaves of their caske, when they are ſunke too much in.

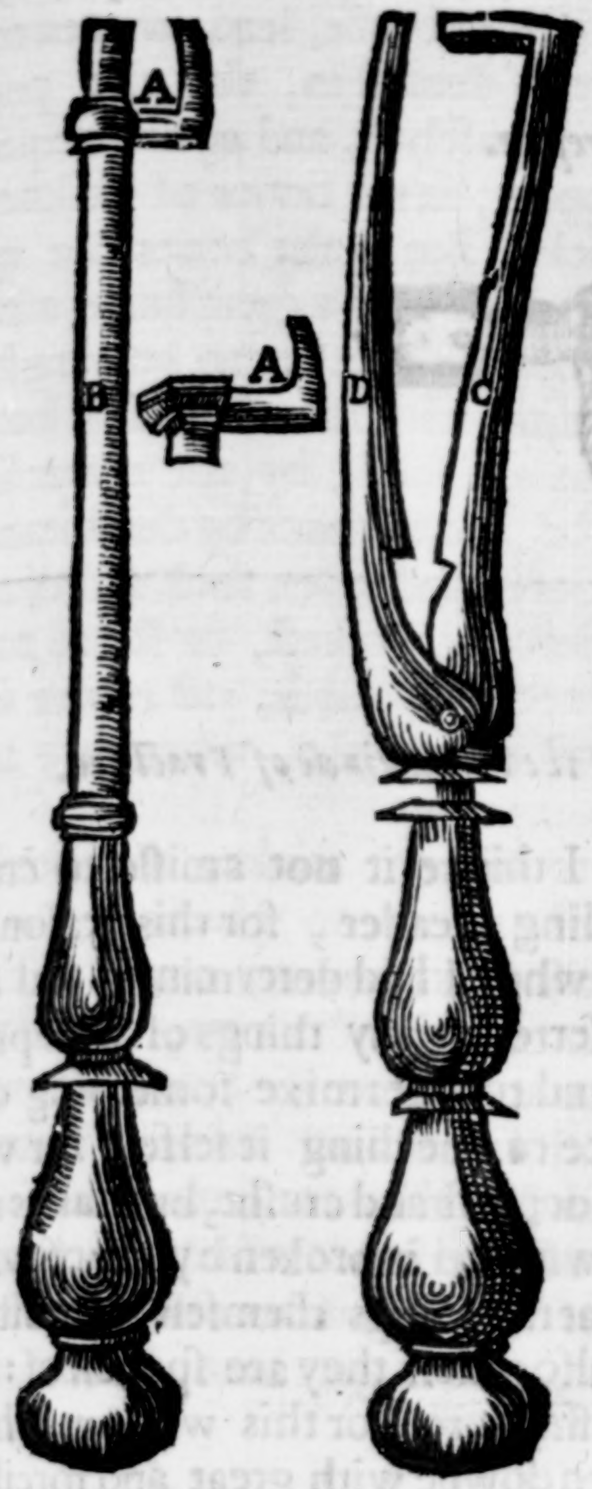


But if the bone ſhall be too ſtrong, thicke, and denſe, ſo that this Inſtrument will not ſerve to plucke it forth; then you muſt perforate the ſcull, in the very center of the depreſſion; and with this threefold Inſtrument, or Levatory put into the hole, lift up and reſtore the bone to its naturall ſite; for this ſame Inſtrument is of ſtrength ſufficient for that purpoſe. It is made with three feete, that ſo it may be applyed to any part of the head which is round; but divers heads may be fitted to the end thereof according as the buſineſſe ſhall require, as the figure here placed doth ſhew.

A three footed Levatorie.



A deliniation of other Levatories.



A A. *Shewes the point or tongue of the Levatory, which muſt be ſomewhat dull, that ſo it may bee the more gently and eaſily put betweene the* Dura Mater *and the ſcull, and this part thereof may be lifted up ſo much by the head or handle taken in your hand, as the neceſſity of the preſent operation ſhall require.*

B. *Intimates the body of the Levatory, which muſt bee foure ſquare, leſt the point or tongue put thereon ſhould not ſtand faſt, but the end of this Body muſt reſt upon the ſound bone, as on a ſure foundation.*

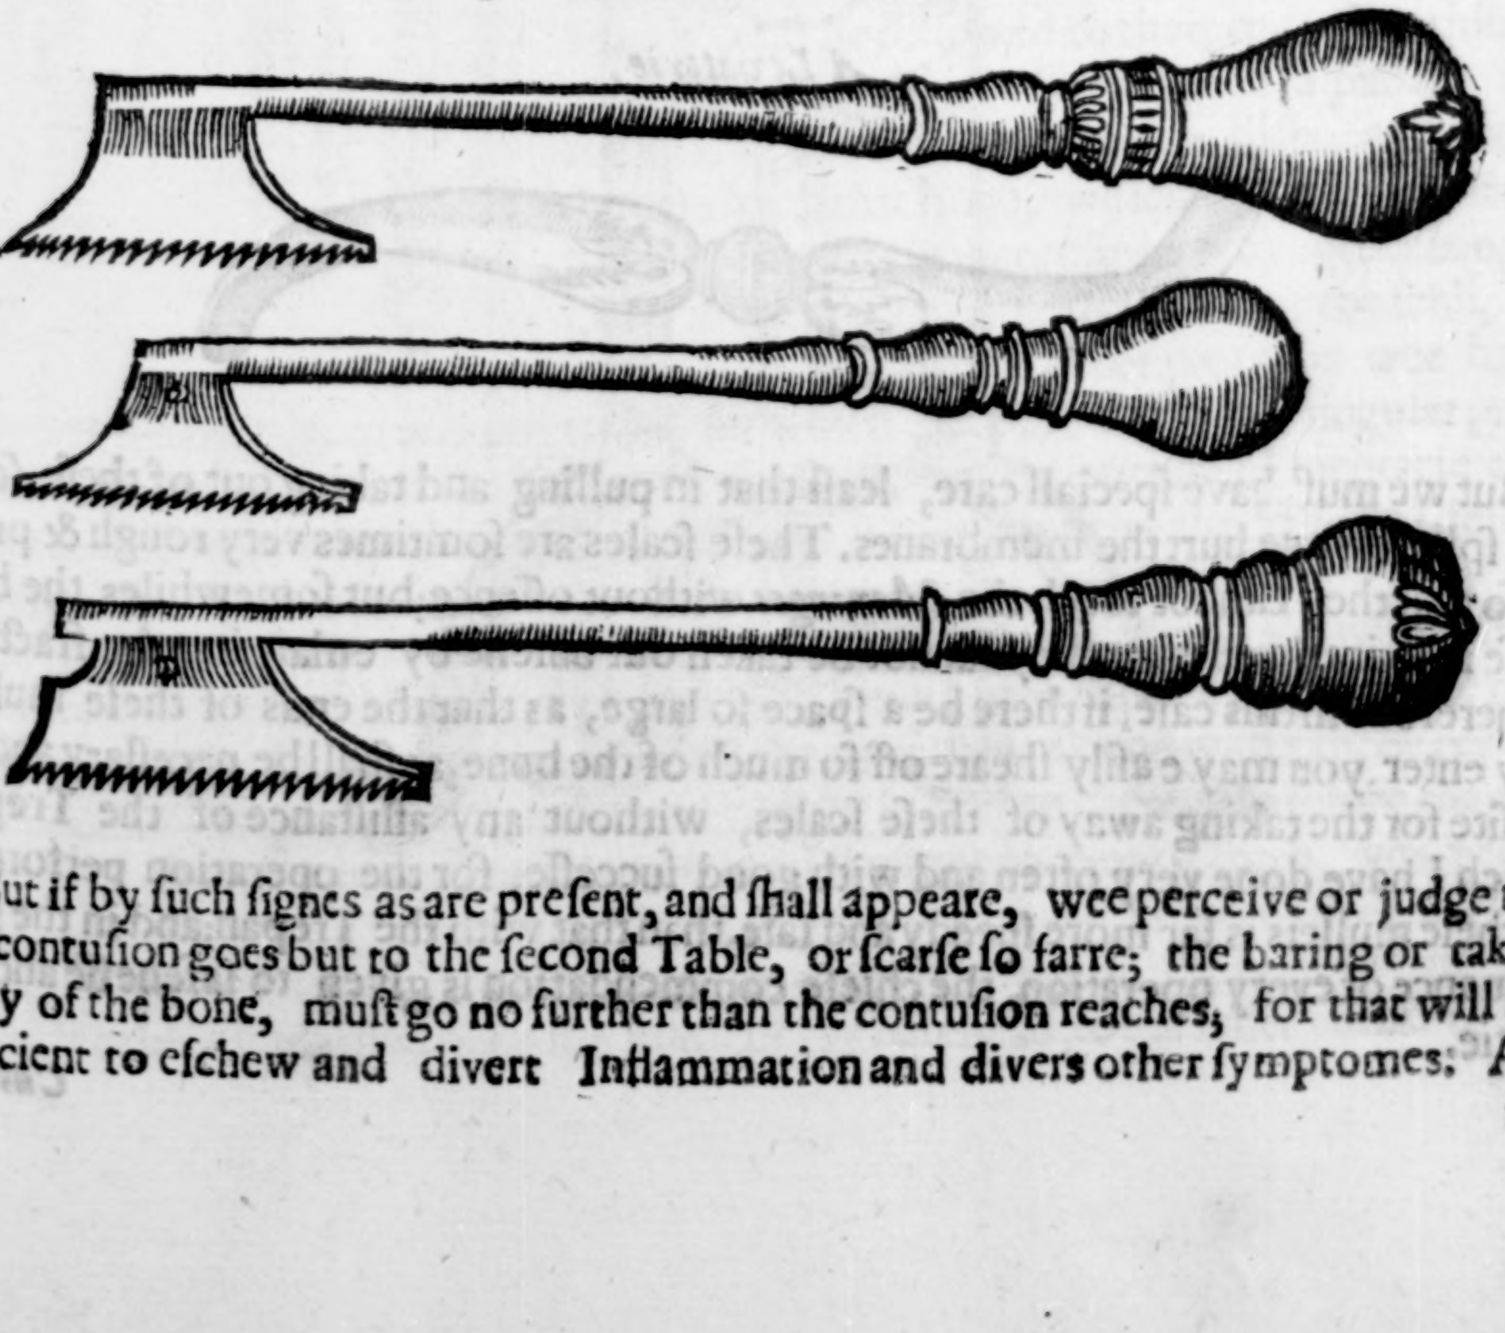
The uſe thereof is, thus; put the point or tongue under the broken or depreſſed bone, then lift the handle up with your hand, that ſo the depreſſed bone may bee elevated.

C. *Shewes the firſt Arme of the other Levatory, whoſe crooked end muſt bee gently put under the depreſſed bone.*

D. *Shewes the other Arme, which muſt reſt on the ſound bone, that by the firme ſtanding thereof, it may liſe up the depreſſed bone.*

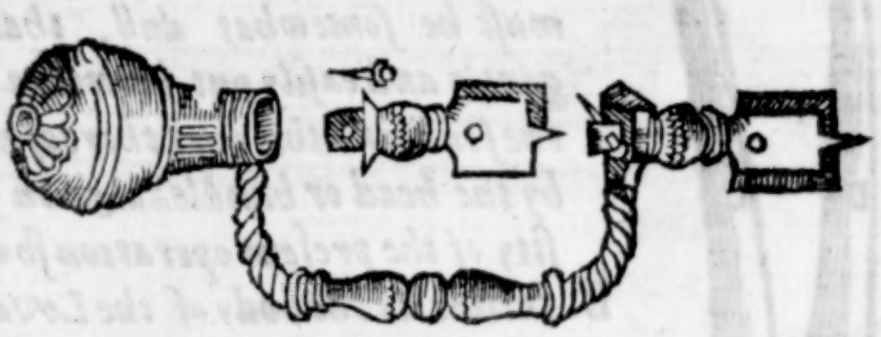
But if at any time it comes to paſſe, that the bone is not totally broken or depreſt, but onely on one ſide; it will be fit, ſo to lift it up, as alſo to make a vent for the iſſuing out of the filth, to devide the ſcull with little ſawes like theſe, which ye ſee here expreſſed, for thus ſo much of the bone, as ſhall be thought needefull, may be cut off without compreſſion, neither will there be any danger of hurting the braine or membrane with the broken bone.

The Figures of Sawes fit to divide the ſcull.



But if by ſuch ſignes as are preſent, and ſhall appeare, wee perceive or judge that the contuſion goes but to the ſecond Table, or ſcarſe ſo farre; the baring or taking away of the bone, muſt go no further than the contuſion reaches, for that will bee ſufficient to eſchew and divert Inflammation and divers other ſymptomes. And this ſhall be done with a ſcaling or Deſquamatory Trepan (as they terme it) with which, you may eaſily take up as much of the bone, as you ſhall thinke expedient: And I have here given you the figure thereof.

A Deſquamatorie or Scaling Trepan.



CHAP. VI.

Of an Effracture, depreſſion of the bone, being the third kinde of Fracture.

What a contuſion is.

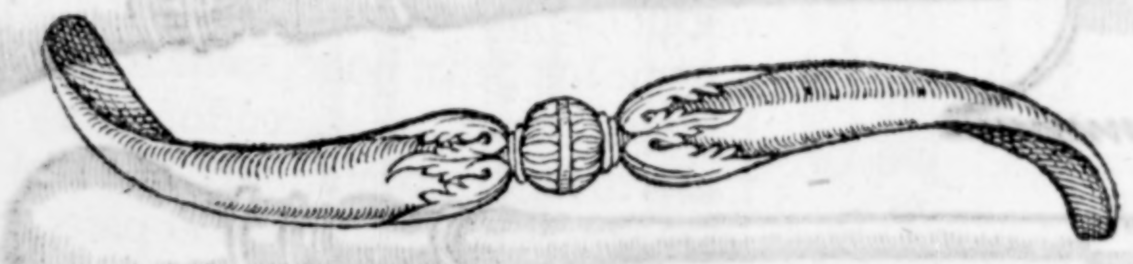
What an Effracture is.

The cauſes of Effractures.

The cure.

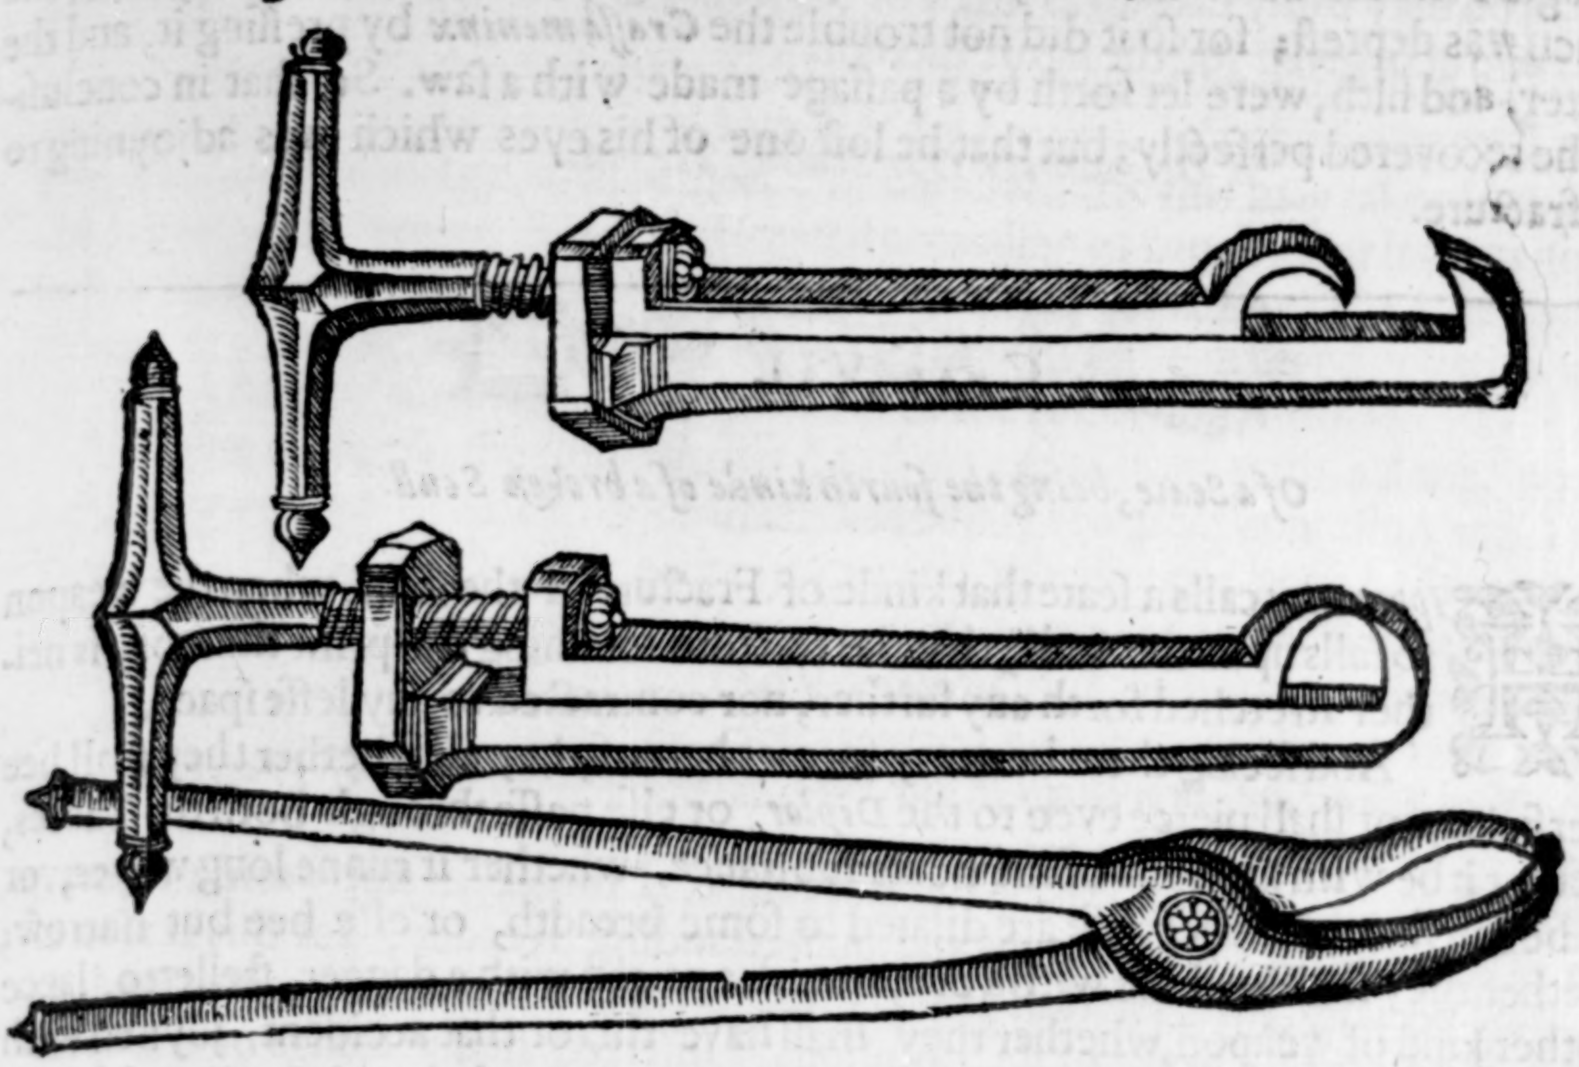
BEfore I come to ſpeake of an Effracture, I thinke it not amiſſe to crave pardon of the courteous and underſtanding Reader, for this reaſon eſpecially, that as in the former Chapter, when I had determined and appointed to ſpeake of a Contuſion, I inſerted many things of a Depreſſion; ſo alſo in this chapter of an Effracture, I intend to intermixe ſomething of a Contuſion; wee doe not this through any ignorance of the thing it ſelfe; for wee know that it is called a contuſion, when the bone is depreſt and cruſht, but falles not downe. But an Effracture is when the bone falls downe and is broken by a moſt violent blow. But it can ſcarſe come ſo to paſſe, but that the things themſelves muſt be confounded and mixt, both as they are done; and alſo when they are ſpoken of: ſo that you ſhall ſcarſe ſee a Contuſion without an Effracture, or this without that. Therefore the bones are often broken off and driven downe with great and forcible blowes, with clubbes whether round or ſquare, or by falling from a high place directly downe, more or leſſe according to the force of the blow, kinde of weapon, and condition of the part receiving the ſame: Wherefore you muſt bee provided with diverſity of remedies and Inſtruments to encounter therewith. Wherefore admit the bone is preſſed downe, and ſhivered into many peeces, now for that theſe ſplinters neede not be taken out with a Trepan: you may do the buſineſſe with Levatories made and neatly faſhioned for that purpoſe; ſuch as theſe, which are here expreſt.

A Levatorie.



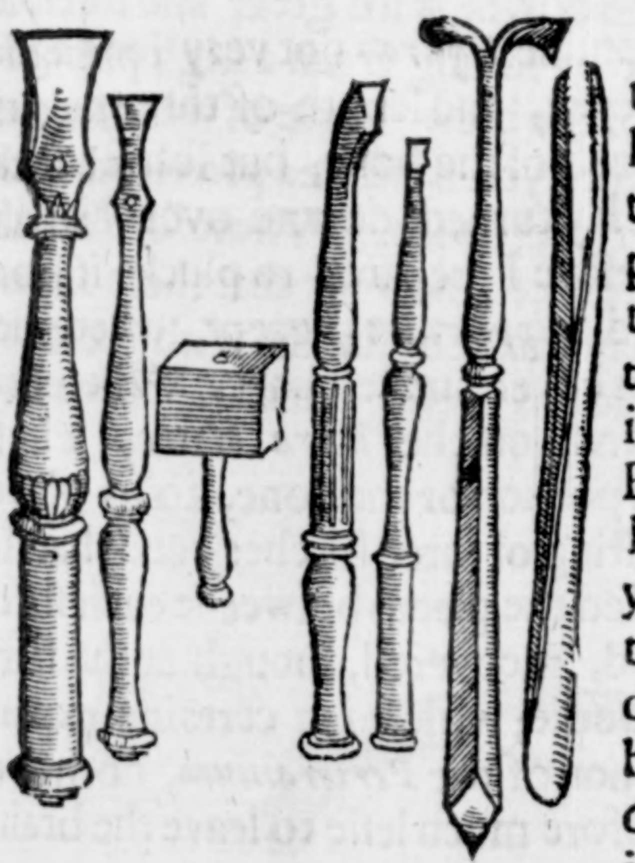
But we muſt have ſpeciall care, leaſt that in pulling and taking out of theſe ſcales and ſplinters, we hurt the membranes. Theſe ſcales are ſomtimes very rough & prickly, ſo that they cannot touch the *Meninges* without offence; but ſomewhiles the buſineſſe is ſo intricate, that they cannot be taken out unleſſe by enlarging the fracture. Wherefore in this caſe, if there be a ſpace ſo large, as that the ends of theſe mullets may enter, you may eaſily ſheare off ſo much of the bone, as ſhall be neceſſary and requiſite for the taking away of theſe ſcales, without any aſſiſtance of the Trepan, which I have done very often and with good ſucceſſe; for the operation performed by theſe mullets is far more ſpeedy and ſafe, than that with the Trepan; and in the performance of every operation, the chiefe commendation is given to ſafeneſſe and celeritie.

Cutting Mullets, commonly called, Roſtra Pſittaci, *or Parrots-beakes.*



Moreover I have thought good here to give you the figures of chiſſells, ſcrapers, and Pincers, together with a leaden mallet, becauſe ſuch Inſtruments are not onely very neceſſary to take forth the ſcales of bones which are broken, but alſo to plaine, and ſmooth thoſe which remaine whole.

The Figures of Scrapers, Pincers, a Leaden Mallet, &c.



But here you muſt note, that a Trepan nor Levatorie muſt never bee applyed to a bone quite broken, leſt the membranes lying under it bee hurt by the compreſſion thereof. Therefore you muſt apply them to a ſound bone, but as neare as you can to the fracture, ſo that you take away as little of the ſcull as is poſſible, leaſt the braine deſpoiled of its bonie cover, take ſome harme thereby. Neither Effractures, nor yet fiſſures if they bee of ſome length, muſt be followed to their ends, but thinke your ſelfe well, if you have made a paſſage for the iſſuing forth of the *Sanies* or filth, and have drawne forth that bone, which pricked the membranes. For nature is accuſtomed by generating a *Callus* to ſouder, or unite the bones of the ſcull, as it alſo doth theſe of the other parts; as wee have read it written by *Hippocrates* and *Galen*; for which purpoſe it hath by ſingular providence repleniſhed both the Tables of the ſcull, with a certaine alimentarie and bloody matter, that with this, as with marrow it might repaire the loſſe and defect of the bone.

Hip. lib. de Vuln. cap. Gal. lib. 6. meth. cap. ult.

The truth hereof was lately manifeſted in the ſervant of Maſter *Grolo*, who had an Effracture on the coronall bone, by a greevous blow, given him with the foote of a Mule; which when I underſtood, I devided the muſculous skinne with a three cornered ſection in that place, with an intent to apply a Trepan there; wherefore the day following, the bone being bored, and when I thought to draw it forth, yea verily endevoured to plucke it forth, being already divided with the Trepan; I perceived a fearefull production of an Effracture; by the moveableneſſe of the bone ſhaking under my hand; for it reached from the midſt of the forehead, to the leſſer corner of the eye.

A Hiſtory.

eye. Wherefore omitting both my determination and endeavour to pull it forth, I thought I ſhould doe ſufficiently for the patient: if I ſhould only raiſe up the bone which was depreſt; for ſo it did not trouble the *Craſſa meninx* by preſſing it, and the matter, and filth, were let forth by a paſſage made with a ſaw. So that in concluſion, he recovered perfectly, but that he loſt one of his eyes which was adjoyning to the fracture.

CHAP. VII.

Of a Seate, being the fourth kinde of a broken Scull.

What a ſeate is.

H*ippocrates* calls a ſeate that kinde of Fracture of the ſcull, when the weapon ſo falls upon the ſcull, that the fracture reteining the print thereof, is neither ſtretched forth any further, nor contracted to any leſſe ſpace.

The cure.

And ſeeing there be many formes hereof, they all whether they ſhall bee ſuperficiary, or ſhall pierce even to the *Diploe*, or elſe paſſe through both the Tables, whether it be with any loſſe of the bonie ſubſtance, whether it runne long wayes, or elſe be but ſhort; or otherwiſe are dilated to ſome breadth, or elſe bee but narrow; whether they ſhall be done with a cut, or with a pricke with a dagger, ſtelletto, lance or other kind of weapon, whether they ſhall have this or that accident joyned with them, I ſay all of them, how many and various ſoever they be, ought and muſt be cured by ſome of the formerly deſcribed Inſtuments and meanes. Yet this muſt be noted, which as yet wee have not remembred, that if it happen by a violent ſtroake, and great wound, that a portion of the bone is wholy ſo cut off, that it is cleane ſevered from the reſt of the ſcull, and hang only by the *Pericranium* and muſculous skinne; yet you muſt not plucke it from the *Pericranium*, and caſt it away as unprofitable, but reſtore it to its proper ſeate and place, ſo by the force of nature, to be glewed by a *Callus*, as *Celſus* hath obſerved.

Lib.8.cap.4.

A Hiſtory.

I have tryed the truth of this experiment, in captaine *Hydron* not very long agoe. He had the middle part of the *Os Coronale*, of the bredth, and length of three fingers, ſo cut with a ſharpe ſword, that it ſtucke not to the reſt of the bone; but ſcarſe adhearing to the *Pericranium* and muſculous skinne; but lay turned downe over his face, ſo that the *Dura Mater* was plainely ſeene; wherefore I prepared to plucke it from the skinne, and caſt it away, but that I remembred *Hippocrates* precept, where hee bids, that the Braine ſhould not be robbed of its cover and left bare. Wherefore firſt of all I wiped away the blood which was fallen upon the *Dura Mater*, whoſe motion you might plainely ſee, then I reſtored the portion of the bone, to its place, and faſtned it on the upper ſide with a ſuture conſiſting of three ſtitches; and that the reſidue of the matter might have paſſge forth, I filled the places betweene each ſtitch with linte; by this meanes, he by the mercy of God, recovered, though at the ſame time he received many other large wounds in his bodie; which is a certaine experiment, that we muſt caſt away no part of the ſcull, nor of the *Pericranium*, no not of the muſculous skinne, unleſſe neceſſity urge; therefore much leſſe to leave the braine naked and deſpoiled of its coverings.

CHAP. VIII.

Of a Reſonitus, *or Counter-fiſſure, being the fifth kinde of Fracture.*

What a *Reſonitus* is.

SOmetimes the fracture is made in the part oppoſite to that which received the blow; as if the right ſide be ſtrucke, the left is cloven; this kinde of fracture is very dangerous, becauſe wee cannot finde it out by any certaine ſigne, as it is written by *Hippocrates Lib. de vuln. Capitis*. Wherefore if at any time the patient dye of ſuch a fracture, the Chirurgion muſt be pardoned.

And although *Paulus Ægineta* laugh at this kinde of fracture and thinkes that it cannot happen to a mans head, as that which is hard and full, as it happens in empty glaſſe bottles, yet I have ſometimes ſeene and obſerved it.

Lib.6. cap.90.

Neither is their reaſon of any validity, who thinke nature therefore to have framed the head of many bones knit together by ſutures, leſt the fracture of the one ſide, ſhould be ſtretched to the other. For peradventure this may take place, in ſuch as have expreſſe ſutures, ſeated and framed according to nature. But it takes no place in ſuch as either want them, or have them not ſeated according to nature, or have them very cloſe and ſo defaced that it may ſeeme one bone growne together of many; This ſhall be made manifeſt by recitall of the following Hiſtorie.

In whom this fracture may take place in diverſe bones of the ſcull.

A Hiſtory.

A ſervant of *Maſſus* the Poſte-maſter had a greevous blow with a ſtone, upon the right *Bregma*, which made but a ſmall wound, yet a great contuſion and Tumor: Wherefore that it might more plainely appeare, whether the bone had received any harme, and alſo that the congealed blood might be preſſed forth, the wound was dilated, the skinne being opened by *Theodore Hereus* the Chirurgion, who as hee was a skillfull workeman and an honeſt man, omitted nothing which Art might doe for his cure. When he had divided the skinne, the bone was found whole, although it was much to bee feared, that it was broken, becauſe he fell preſently to the ground with the blow, vomited and ſhewed other ſignes of a fractured ſcull; ſo it happened that he dyed on the one & twentieth day of his ſicknes. But I being called to learne, & ſearch how he came by his death, deviding the ſcul with a ſaw, found in the part oppoſite to the blow, a great quantity of *Sanies* or bloody matter, and an Abſceſſe in the *Craſſa meninx*, and alſo in the ſubſtance of the very braine, but no ſutures, but the two ſcaly ones. Therefore that is certaine which is now confirmed by the authority of *Hippocrates*; as alſo by reaſon and experience, that a blow may bee received on the one ſide, and the bone may be fractured on the oppoſite, eſpecially in ſuch as have either no ſutures, or elſe ſo firmely united and cloſed, that they are ſcarſe apparent.

The *Reſonitus* may be in the ſame bone of the ſcull.

Neither is it abſurde, that the part, oppoſite to that which received the ſtroake, of the ſame bone and not of diverſe bones may be cloven, and in thoſe men who have their ſculls well made, and naturally diſtinguiſhed and compoſed with ſutures; and this both was and is, the true meaning of *Hippocrates*. That this may bee the better underſtood, we muſt note that the oppoſite part of the ſame bone may be underſtood two manner of wayes. Firſt, when the fracture is in the ſame ſurface of the ſmitten bone, as if that part of one of the bones of the *Bregma* which is next to the Lambdall ſuture be ſmitten, and the other part next to the Coronall ſuture be cloven. Secondly, when as not the ſame ſuperficies and table which receives the blow, but that which lyes under it is cleft, which kind of fracture I obſerved, in a certaine Gentleman a Horſman of Captaine *Stempans* troope; He in defending the breach of the wall of the Caſtle of *Hiſdin* was ſtrucke with a Musket bullet upon the *Bregma*, but had his helmet on his head; the bullet dented in the Helmet but did not breake it, no nor the muſculous skinne, nor ſcull, for as much a could be diſcerned, yet notwithſtanding hee died apoplecticke upon the ſixt day after.

A Hiſtory.

But I being very deſirous to know, what might be the true cauſe of his death, dividing his ſcull, obſerved that the ſecond table was broken, and caſt off ſcales and ſplinters, wherewith as with nedles the ſubſtance of the braine was continually pricked, the firſt and upper table being whole, for all this: I afterwards ſhewed the like example to *Capellanus* and *Caſtellanus* the King and Queenes chiefe Phiſitions in the expedition of *Roane*.

Why *Hippocrates* ſet downe no way to cure a *Reſonitus*.

The manner to know when the ſcull is fractured by a *Reſonitus*.

But *Hippocrates* preſcribes no method of curing this fifth kind of fracture, by reaſon he thinks it cannot be found out by any circumſtance, whence it happens that it is for the moſt part deadly. Yet muſt we endeavour to have ſome knowledg & conjecture of ſuch a fracture; if it ſhall at any time happen. Wherefore having firſt diligently ſhaved away the haire, we muſt apply an Emplaiſter of Pitch, Tarre, Waxe, Turpentine, the powder of *Iris*, or floure deluce rootes, and maſtich; now if any place of the head ſhall appeare more moyſt, ſoft and ſwollne, it is ſomewhat likely that the bone is cleft in that place, ſo that the patient, though thinking of no ſuch thing, is now & then forcſt to put his hand to that part of the ſcull. Confirmed with theſe and other ſignes formerly mentioned, let him call a counſell of learned Phyſitions; and foretell the danger to the Patients friends which are there preſent, that there may no occaſion of calumnie remaine, then let him boldely perforate the ſcull; for that is far better, than forſake the patient ready to yeelde to the greatneſſe of the hidden diſeaſe, and ſo conſequently to dye within a ſhort while after. There are foure ſorts, or conditions of fractures, by which the Chirurgion may be ſo deceived, that when the ſcull is broken indeed, yet he may thinke there is no fracture. The firſt is when the bone is ſo depreſſed, that it preſently riſes up into its true place, and native equability. The ſecond is when the fiſſure is onely capillary, The third is when the bone is ſhaken on the inſide, the utter ſurface nevertheleſſe remaining whole, foraſmuch as can be dediſcerned. The fourth is, when the bone is ſtricken on the one ſide and cleft on the other.

CHAP. IX.

Of the moving, or Concuſſion, of the Braine.

Gal.lib. 2 de comp.medic. cap.6.& Com. ad Aph.58, 8 ſect.7.

BEſides the mentioned kindes of fractures by which the braine alſo ſuffers; there is another kinde of affect beſides nature, which alſo aſſailes it by the violent incurſion of a cauſe, in like manner, externall; they call it the Commotion or ſhaking of the braine, whence Symptoms like thoſe of a broken ſcull enſue. Falling from aloft upon a ſolide and hard body, dull and heavie blowes, as with ſtones, clubbes, ſtaves, the report of a peece of Ordinance, or cracke of Thunder, and alſo a blow with ones hand.

Lib.5.Epidem.

Thus as *Hippocrates* tells, that beautifull damoſell the daughter of *Nerius*, when ſhe was twenty yeeres old, was ſmitten by a woman, a friend of hers, playing with her, with her flat hand upon the fore part of the head, and then ſhe was taken with a giddines, and lay without breathing, & when ſhe came home, ſhe fell preſently into a great Feaver, her head aked, and her face grew red. The ſeaventh day after there came forth ſome two or three Ounces of ſtincking and bloody matter about her right eare, and ſhee ſeemed ſome what better and to be at ſomewhat more eaſe. The feaver encreaſed againe, and ſhe fell into a heavie ſleepineſſe, and loſt her ſpeech, and the right ſide of her face, was drawne up, and ſhe breathed with difficulty, ſhe had alſo a convulſion and trembling; both her tongue failed her, and her eyes grew dull, on the ninth day ſhe dyed. But you muſt note, that though the head be armed with a helmet, yet by the violence of a blow, the Veines, and Arteries may be broken, not onely theſe which paſſe through the ſutures, but alſo theſe which are diſperſed betweene the two tables in the Diploe, both that they might binde the *Craſſa Meninx* to the ſcull, that ſo the braine might move more freely, as alſo that they might carry the alimentary juice to the braine wanting marrow, that is, blood to nouriſh it, as we have formerly ſhewed in our Anatomie.

The veſſels of the braine broken by the commotion thereof.

Signes.

Celſus.

But from hence proceeds the effluxe of blood running betweene the ſcull, and membraines, or elſe betweene the membraines and braine; the blood congealing there, cauſeth vehement paine, and the eyes become blinde, vomitting is cauſed, the mouth of the ſtomacke ſuffering together with the braine; by reaſon of the Nerves of the ſixt conjugation, which runne from the braine thither, and from thence are ſpread over all the capacitie of the ventricle; whence becomming a partaker of the offence it contracts it ſelfe, and is preſently as it were overturned; whence firſt, theſe things that are conteined therein are expelled, and then ſuch as may flow, or come thither from the neighbouring and communne parts, as the Liver and Gall; from all which choler, by reaſon of its naturall levity and velocity, is firſt expelled and that in greateſt plenty; and this is the true reaſon of that vomiting, which is cauſed and uſually followes upon fractures of the ſcull and concuſſions of the Braine.

The cauſe of vomiting when the head is wounded.

Within a ſhort while after inflammation ſeizes upon the membranes and braine it ſelfe, which is cauſed by corrupt and putrid blood proceeding from the veſſels broken by by the violence of the blow, and ſo ſpread over the ſubſtance of the braine. Such inflammation communicated to the heart, and whole body by the continuation of the parts, cauſes a feaver. But a feaver, by altering the braine cauſes Doting; to which if ſtupidity ſucceed; the Patient is in very ill caſe, according to that of *Hippocrates*; Stupidity, and doting, are ill in a wound, or blow upon the head. But if to theſe evills, a ſphacell, and corruption of the braine enſue, together with a great difficulty of breathing, by reaſon of the diſturbance of the Animall facultie, which from the braine imparts the power of moving to the muſcles of the Cheſt, the inſtruments of reſpiration, then death muſt neceſſarily follow.

Aphor. 14, ſect. 7

A Hiſtory.

A great part of theſe accidents appeared in King *Henry* of happy memory, a little before he dyed. He having ſet in order the affaires of France, and entred into amitie with the neighbouring Princes, deſirous to honour the marriages of his daughter, and ſiſter, with the famous and noble exerciſe of Tilting, and hee himſelfe running in the Tilt-yard, with a blunt lance received ſo great a ſtroake upon his breſt, that with the violence of the blow, the viſour of his helmet flew up, and the trunchion of the broken Lance, hit him above the left eye-brow, and the muſculous skinne of the fore-head was torne even to the leſſer corner of the left eye, many ſplinters of the ſame trunchion being ſtrucke into the ſubſtance of the fore mentioned eye, the bones being not touched or broken; but the braine was ſo moved and ſhaken, that he dyed the eleaventh day after the hurt. His ſcull being opened after his death, there was a great deale of blood found betweene the *Dura*, and *Pia Mater*, poured forth in the part oppoſite to the blow, at the middle of the ſuture of the hinde part of the head; and there appeared ſignes by the native colour turned yellow, that the ſubſtance of the braine was corrupted, as much as one might cover with ones thumbe. Which things cauſed the death, of the moſt Chriſtian King, and not onely the wounding of the eye, as many have falſly thought. For wee have ſeene many others, who have not dyed of farre more greevous wounds in the eye.

What was the neceſſary cauſe of the death of King Henry the ſecond of France.

A Hiſtory.

The hiſtory of the Lord Saint *Iohns* is of late memory: he in the Tilt-yarde, made for that time before the Duke of *Guiſes* houſe, was wounded with a ſplinter of a broken Lance, of a fingers length and thickneſſe, through the viſour of his Helmet, it entring into the Orbe under the eye, and peircing ſome three fingers bredth deepe into the head; by my helpe and Gods favour hee recovered, *Valeranus* and *Duretus* the Kings Phyſitions and *Iames* the Kings Chirurgion aſſiſting me.

A Hiſtory.

What ſhall I ſay of that great and very memorable wound of *Francis* of *Loraine* the Duke of *Guiſe*? He in the ſight of the Citty of *Bologne* had his head ſo thruſt thorough with a Lance, that the point entring under his right eye by his noſe, came out at his necke betweene his eare and the *vertebra*, the head or Iron being broken and left in by the violence of the ſtroke, which ſtuck there ſo firmely, that it could not be drawn or plucked forth, without a paire of Smiths pincers. But although the ſtrength & violence of the blow was ſo great, that it could not be without a fracture of the bones, a tearing and breaking of the Nerves, Veines, Arteries and other parts; yet the generous Prince by the favour of God recovered.

By which you may learne, that many die of ſmall wounds; and other recover of great, yea very large and deſperate ones. The cauſe of which events is chiefly and primarily to be attributed to God, the author and preſerver of mankinde; but ſecondarily to the variety and condition of temperaments. And thus much of the commotion or concuſſion of the braine; whereby it happens that although all the bone remaines perfectly whole, yet ſome veines broken within by the ſtroake, may caſt forth ſome bloud upon the membranes of the braine, which being there concreate may cauſe great paine, by reaſon whereof it blindes the eyes; if ſo be that the place can be found againſt which the paine is, and when the skinne is opened, the bone looke pale, it muſt preſently be cut out, as *Celſus* hath written. Now it remaines, that we tell you how to make your prognoſtickes, in all the forementioned fractures of the ſcull.

Why ſome die of ſmall wounds and others recover of great.

Chap. X.

Of Pregnoſtickes to be made, in fractures of the ſcull.

Hippoc. de vul. cap.

WEE muſt not neglect any wounds in the head, no not theſe which cut or bruiſe but onely the hairy ſcalpe; but certainely much leſſe, theſe which are accompanied by a fracture in the ſcull; for oft times all horride ſymptomes follow upon them, and conſequently death it ſelfe, eſpecially in bodies full of ill humors, or of an ill habite, ſuch as are theſe which are affected with the *Lues venerea*, leproſie, dropſie, Pthiſicke and conſumption; for in theſe, ſimple wounds are hardly or never cured; for union is the cure of wounds, but this is not performed, unleſſe by ſtrength of nature, and ſufficient ſtore of laudible blood: but thoſe which are ſicke of hecticke feavers and conſumptions, want ſtore of blood: and thoſe bodies which are repleate with ill humors, and of an ill habite have no affluxe or plenty of laudible blood: but all of them want the ſtrength of nature; the reaſon is almoſt the ſame in thoſe alſo which are lately recovered of ſome diſeaſe.

Whether the wounds of children, or old people are better to heale.

Thoſe wounds which are bruſed are more difficult to cure, than thoſe which are cut. When the ſcul is broken, than the continuity of the fleſh lying over it muſt neceſſarily be hurt & broken, unleſſe it be in a *Reſonitus*. The bones of children are more ſoft, thin and repleniſhed with a ſanguine humidity, than thoſe of old men, and therefore more ſubject to putrefaction; Wherefore the wounds which happen to the bones of children, though of themſelves, and their owne nature they may be more eaſily healed, (becauſe they are more ſoft, whereby it comes to paſſe, that they may bee more eaſily agglutinated, neither is there fit matter wanting for their agglutination by reaſon of the plenty of blood laudible both in conſiſtence and quality) than in old men, whoſe bones are dryer and harder, and ſo reſiſt union, which comes by mixture, and their bloud is ſerous, and conſequently a more unfit bond of unitie and agglutination; yet oft times through occaſion of the ſymptomes which follow upon them, that is putrefaction and corruption, which ſooner ariſe in a hot and moyſt body, and are more ſpeedily encreaſed in a ſoft and tender, they uſually are more ſuſpected and difficult to heale.

The Patient lives longer of a deadly fracture in the ſcull, in Winter than in Summer, for that the native heat is more vigorous in that time than in this; beſides, alſo the humors putriſie ſooner in Summer, becauſe unnaturall heat is then eaſily enflamed and more predominant, as many have obſerved out of *Hippocrates*.

Aph. 15. ſect. 1.

The Wounds of the braine and of the *Meninges* or membranes thereof are moſt commonly deadly, becauſe the action of the muſcles of the cheſt, and others ſerving for reſpiration, is divers times diſturbed & intercepted, whence death inſues. If a ſwelling happening upon a wound of the head preſently vaniſh away, it is an ill ſigne, unleſſe there be ſome good reaſon therefore, as blood-letting, purging, or the uſe of reſolving locall medicines, as may be gathered by *Hippocrates* in his Aphoriſmes. If a feaver enſue preſently after the beginning of a wound of the head, that is, upon the fourth or ſeaventh day, which uſually happens, you muſt judge it to bee occaſioned by the generating of *Pus* or Matter, as it is recited by *Hippocrates*. Neither is ſuch a feaver ſo much to be feared, as that which happens after the ſeaventh day, in which time it ought to be determinated; but if it happen upon the tenth or foureteenth day with cold or ſhaking, it is dangerous, becauſe it makes us conjecture that there is putrefaction in the braine, the *Meninges*, or ſcull, through which occaſion it may ariſe, chiefely if other ſignes ſhall alſo concurre, which may ſhew any putrifaction, as if the wound ſhall be pallide and of a faint yellowiſh colour, as fleſh lookes after it is waſhed.

Aphor. 65, ſect. 5

Aph. 47, ſect. 2.

Wounds which are dry, rough, livide and black are evill,

For, as it is in *Hippocrates Aphoriſ. 2. ſect. 7.* It is an ill ſigne if the fleſh looke livide, when the bone is affected; for that colour portends the extinction of the heate, through which occaſion, the lively, or indifferently red colour of the part, faints and dyes, and the fleſh thereabouts is diſſolved into a viſcide *Pus* or filth.

Commonly another worſe affect followes hereon, wherein the wound becomming withered and dry, lookes like ſalted fleſh, ſends forth no matter, is livide and blacke, whence you may conjecture, that the bone is corrupted, eſpecially if it become rough, whereas it was formerly ſmooth and plaine; for it is made rough when *Caries* or corruption invades it; but as the *Caries* encreaſes, it becomes livide and blacke, ſanious matter withall ſweating out of the *Diploe*, as I have obſerved in many: all which are ſignes that the native heat is decayed, and therefore death at hand; but if ſuch a feaver be occaſioned from an *Eryſipelas* which is either preſent or at hand, it is uſually leſſe terrible. But you ſhall know by theſe ſignes, that the feaver is cauſed by an *Eryſipelas* & confluxe of cholericke matter; if it keepe the forme of a Tertian, if the fit take them with coldnes and end in a ſweat; if it be not terminated before the cholerike matter is either converted into *Pus* or elſe reſolved; if the lips of the wound be ſomwhat ſwollne, as alſo all the face; if the eyes be red and fiery; if the necke and chappes bee ſo ſtiffe, that he can ſcarſe bend the one, or open the other; if there be great exceſſe of biting and pricking paine, and heate, and that farre greater than in a *Phlegmon*. For ſuch an *Eryſipelous* diſpoſition generated of thinne and hot blood, chiefely aſſailes the face, and that for two cauſes.

The ſignes of a feaver cauſed by an *Eryſipelas*.

The firſt is, by reaſon of the naturall levity of the cholericke humor; the other becauſe of the rarity of the ſkinne of theſe parts.

Why an *Eryſipelas* chiefely aſſailes the face.

The cure of ſuch an affect muſt be performed by two meanes, that is, evacuation, and cooling with humectation. If choler alone cauſe this tumor, we muſt eaſily bee induced to let blood, but we muſt purge him with medicines evacuating choler. If it be an *Eriſipelas phlegmonodes*, you muſt draw blood from the Cephalicke veine of that ſide, which is moſt affected, alwayes uſing adviſe of a phiſition. Having uſed theſe generall meanes, you muſt apply refrigerating and humecting things, ſuch as are the juice of Night-ſhade, Houſleeke, Purſlaine, Lettuce, Navell wort, Water Lentill, or Ducks-meate, Gourdes; a liniment made of two handfulls of Sorrel boiled in faire water, then beaten and drawne through a ſearſe, with ointment of Roſes, or ſome *vnguent. Populeon* added thereto, will bee very commodious. Such and the like remedies muſt be often and ſo long renued untill the unnaturall heat be extinguiſhed. But we muſt be carefull to abſtaine from all unctuous and oyly thing, becauſe they may eaſily be enflamed, and ſo increaſe the diſeaſe. Next we muſt come to reſolving medicines; but it is good when any thing comes from within, to without; but on the contrary it is ill, when it returnes from without inwards, as experience and the Authority of *Hippocrates* teſtifie: If when the bone ſhall become purulent, puſtles ſhall breake out on the tongue, by the dropping downe of the acride filth or matter by the holes of the pallate upon the tongue, which lyes under. Now when this ſymptome appeares, few eſcape. Alſo it is deadly when one becomes dumbe and ſtupid, that is, Apolecticke by a ſtroake or wound on the head; for it is a ſigne that not onely the bone, but alſo the braine it ſelfe is hurt. But oft times the hurt of the Braine proceedes ſo farre, that from corruption it turnes to a Sphacell, in which caſe, they all have not onely puſtles on their tongues, but ſome of them dye ſtupide and mute, otherſome with a convulſion of the oppoſite part; neither as yet have I obſerved any which have dyed with either of theſe ſymptomes, by reaſon of a wound in the head, who have not had the ſubſtance of their braine tainted with a Sphacell, as it hath appeared when their ſculls haue beene opened after their death.

The cure of an *Eryſipelas* on the face.

Why oyly things muſt not be uſed in an *Eryſipelas* of the face.

Aph. 25. ſect. 6

Deadly ſignes in wounds of the head.

CHAP. XI.

Why, when the braine is hurt by a wound of the head, there may follow a Convulſion of the oppoſite part.

MAny have to this day enquired, but as yet as farre as I know it hath not bin ſufficiently explained, why a convulſion in wounds of the head ſeazes on the part oppoſite to the blow. Therefore I have thought good to end that controverſie in this place. My reaſon is this, that kinde of Symptome happens in the ſound part by reaſon of emptineſſe and dryneſſe

A convulſion is cauſed by dryneſſe.

A twofold cauſe of conſvulſificke dryneſſe.

dryneſſe; but there is a twofold cauſe, and that wholy in the wounded part, of this emptineſſe and dryneſſe of the ſound or oppoſite part; to wit, paine, and the concourſe of the ſpirits and humors thither by the occaſion of the wound, and by reaſon of the paines drawing and natures violently ſending helpe to the afflicted part.

The ſound part exhauſted by this meanes both of the ſpirits and humors, eaſily falls into a Convulſion.

Lib. 4. de uſu partium.

For thus *Galen* writes; God the creatour of nature, hath ſo knit together, the triple ſpirituous ſubſtance of our bodies, with that tye, and league of concord, by the productions of the paſſages; to wit of Nerves, Veines, and Arteries, that if one of theſe forſake any part, the reſt preſently neglect it, whereby it languiſheth, and by little, and little dyes, through defect of nouriſhment. But if any object that nature hath made the body double, for this purpoſe, that when one part is hurt, the other remaining ſafe and ſound, might ſuffice for life and neceſſity: but I ſay, this axiome hath no truth in the veſſells and paſſages of the body. For it hath not every where doubled the veſſels, for there is but one onely veine, appointed for the nouriſhment of the braine, and the membranes thereof, which is that they call the *Torcular*, by which when the left part is wounded, it may exhauſt the nouriſhment of the right and ſound part, and though that occaſion cauſe it to have a convulſion, by too much dryneſſe; Verily it is true, that when in the oppoſite parts, the muſcles of one kinde are equall in magnitude, ſtrength, and number, the reſolution of one part, makes the convulſion of the other by accident; but it is not ſo in the braine.

For the two parts of the braine, the right and left, each by its ſelfe performes that which belongs thereto, without the conſent, conſpiration, or commerce of the oppoſite part; for otherwiſe it ſhould follow, that the Palſie properly ſo called, that is of halfe the body, which happens by reſolution, cauſed either by mollification or obſtruction reſiding in either part of the braine, ſhould inferre together with it a Convulſion of the oppoſite part. Which notwithſtanding dayly experience convinces as falſe. Wherefore wee muſt certainely thinke, that in wounds of the head wherein the braine is hurt, that inanition and want of nouriſhment are the cauſes, that the ſound and oppoſite part ſuffers a convulſion.

Opinion of *Champhius.*

Francis Daleſchampius in his French Chirurgiry renders another reaſon of this queſtion; That, (ſaith he) the truth of this propoſition may ſtand firme and ratified, we muſt ſuppoſe, that the convulſion of the oppoſite part mentioned by *Hippocrates*, doth then onely happen, when by reaſon of the greatneſſe of the inflammation in the hurt part of the braine, which hath already inferred corruption; and a Gangræne to the braine and membranes thereof, and within a ſhort time is ready to cauſe a ſphacell in the ſcull, ſo that the diſeaſe muſt be terminated by death; for in this defined ſtate of the diſeaſe, and theſe conditions, the ſenſe and motion muſt neceſſarily periſh in the affected part, as we ſee it happens in other Gangrænes, through the extinction of the native heate. Beſides, the paſſages of the animall ſpirit muſt neceſſarily bee ſo obſtructed by the greatneſſe of ſuch an inflammation or phlegmon, that it cannot flow from thence to the parts of the ſame ſide lying there under, and to the neighbouring parts of the braine; and if it ſhould flow thither, it will be unprofitable to carry the ſtrength and facultie of ſenſe and motion, as that which is infected and changed by admixture of putred and Gangrænous vapours. Whereby it cometh to paſſe, that the wounded part deſtitute of ſenſe, is not ſtirred up to expell that which would be troubleſome to it, if it had ſenſe; wherefore neither are the Nerves thence ariſing ſeaſed upon, or contracted by a Convulſion.

It furthermore comes to paſſe, that becauſe theſe ſame nerves are deprived of the preſence and comfort of the animall ſpirit, and in like manner the parts of the ſame ſide, drawing from thence their ſenſe and motion are poſſeſſed with a palſie; for a palſie is cauſed either by the cutting or obſtruction of a Nerve, or the madefaction, or mollification thereof by a thinne and watry humor, or ſo affected by ſome vehement diſtemper, that it cannot receive the Animall ſpirit.

But for the oppoſite part and the convulſion thereof, it is knowne and granted by all, that a convulſion is cauſed either by repletion which ſhortens the Nerves by diſtending them into bredth, or by inanition, when as the native and primitive heate of the Nerves being waſted, their proper ſubſtance becommiug dry is wrinckled up and contracted; or elſe it proceedes from the vellication, and acrimonie of ſome vapour, or ſanious and biting humor, or from vehemencie of paine. So wee have knowne the falling ſickneſſe cauſed by a venenate exhalation carried from the foote to the braine. Alſo wee know that a convulſion, is cauſed in the puncture of the Nerves, when as any acride and ſanious humor is ſhut up therein, the orifice thereof being cloſed; but in wounds of the Nerves when any Nerve is halfe cut, there happens a convulſion by the bitterneſſe of the paine.

But verily in the oppoſite part, there are manifeſtly two of theſe cauſes of a convulſion; that is to ſay, a putride and carionlike vapour, exhaling from the hurt, and Gangrænate part of the braine; and alſo a virulent acride and biting *Sanies*, or filth, ſweating into the oppoſite ſound part, from the affected and Gangrænous; the malignitie of which *Sanies*, *Hippocrates* deſirous to decipher, in reckoning up the deadly ſignes of a wounded head, hath expreſſed it by the word *Ichor*; and in his booke of fractures he hath called this humor *Dacryodes et non Pyon.* [*that is, weeping and not digeſted.*] Therefore it is no mervaile if the oppoſite and ſound part endewed with exquiſite and perfect ſenſe, and offended by the flowing thereto of both the vaporours and ſanious matter, uſing its own force, contend and labour as much as it can, for the expulſion of that which is trouble ſome thereto. This labouring or concuſſion is followed (as we ſee in the falling ſickneſſe) by a convulſion, as that which is undertaken in vaine, death being now at hand; and nature over-ruled by the diſeaſe. Thus (ſaith *Dalechampius*) muſt we in my judgement determine of that propoſition of *Hippocrates* and *Avicen.*

But he addes further, in wounds of the head, which are not deadly, practitioners obſerve that ſometimes the hurt part is taken with the palſie, and the ſound with a convulſion; otherwhiles on the contrary, the wounded part is ſeazed by a Convulſion and the ſound by a Palſie; otherwhiles both of them by a convulſion or Palſie; and ſomewhiles the one of them by a convulſion or Palſie, the other being free from both affects; the cauſes of all which belong not to this place to explaine. Thus much *Dalechampius.*

Chap. XII.

A Concluſion of the deadly ſignes in the Wounds of the head.

The ſignes of a deadly wound from the depraved faculties of the minde.

Now that we may returne to our former diſcourſe; you may certainely foretell the patient will dye; when his reaſon and judgement being perverted, hee ſhall talke idly, when his memory failes him; when he cannot governe his tongue, when his ſight growes darke and dimme, his eares deafe, when he would caſt himſelfe headlong from his bed, or elſe lyes therein without any motion; when he hath a continuall feaver with a *delirium*, when the tongue breakes out in puſtles, when it is chopt, and become blacke, by reaſon of too much dryneſſe; when the wound growes dry, and caſts forth little or no matter, when as the colour of the wound which was formerly freſh, is now become like ſalted fleſh yellow and pale; when the Vrine, and other excrements are ſuppreſt; when the Palſie, convulſion, apoplexie, and laſtly often ſowning, with a ſmall and unequall pulſe, invade him. All ſuch ſignes ſometimes appeare preſently after the wound, otherwhiles ſome few dayes after; therefore when as the braine is hurt and wounded by the violence of the inciſion, or fiſſure, of the contuſion, compreſſion, puncture, concuſſion or any other fracture, the forementioned ſignes appeare preſently in the firſt dayes; but when they doe not appeare till many dayes after the blow, you may know that they riſe and appeare, by reaſon of an inflammation and phlegmon in the braine, occaſioned by the putrefaction of the blood poured forth upon it.

From habits of the body.

From the time that ſuch ſignes appeare.

Celſus lib.8. ca.4.

But we muſt obſerve this by the way, which alſo belongs to the prognoſtickes, that fleſh is eaſily regenerated, and reſtored in all parts of the head, except in that part of the forehead, which is a little above that which lyes betweene the eye-browes, ſo that it will be ulcerated ever after, and muſt be covered with a plaiſter. I beleeve that, in that place there is an internall cavity in the bone, full of ayre which goes to the ſive-like bones of the noſe, by which the growth of fleſh may be hindered; or elſe that the bone is very denſe or compact in that place, ſo that there can ſcarſe ſufficient juice ſweat forth, which may ſuffiſe for the regeneration of fleſh; adde hereunto a great confluxe of excrements flowing to this ulcer, which ſhould otherwiſe bee evacuated by the eyes and noſe, which hinder by that meanes the dryneſſe of the ulcer, and conſequently the healing thereof.

Hence certainely it comes to paſſe, that if you deſire the patient thus affected to breathe, ſhutting his mouth and noſe, the ayre or breath will come forth of the ulcer with ſuch force, as it will eaſily blow forth a lighted candle of an indifferent bigneſſe held thereto. Which thing I proteſt, I obſerved in a certaine man, whom I was forced to trepan in that place, by reaſon the bone of the forehead was broken and depreſſed.

CHAP. XIII.

Of ſalutarie ſignes in wounds of the head.

BVt on the contrary theſe are ſalutary ſignes, when the patient hath no feaver, is in his right minde, is well at the application or taking of any thing, ſleepes well, hath his belly ſoluble, the wound lookes with a freſh and lively colour, caſts forth digeſted and laudible matter, the *Craſſa Meninx* hath its motion free and no way hindered.

When the patients are out of danger.

Yet we muſt note, which alſo is obſerved by the Ancients and confirmed by experience; that we muſt thinke none paſt danger, and free from all chance, untill the hundreth day be paſt. Wherefore the Phyſitian ought ſo long to have a care of his patient, that is, to conſider how he behaves and governes himſelfe in meate, drinke, ſleepe, venerie and other things.

The patient muſt beware of cold.

But let the Patient diligently avoyd and ſhunne cold, for many when they have beene cured of wounds of the head, by careleſſe taking cold have beene brought into danger of their lives. Alſo you muſt know that the *Callus* whereby the bones of the ſcull are knit together, requires almoſt the ſpace of fortie or fifty dayes to its perfect coagmentation and concretion. Though in very deed one cannot ſet downe a certaine number of dayes, by reaſon of the variety of bodies, or tempers. For it is ſooner finiſhed in young men, and more ſlowly in old; And thus much may ſerve for prognoſtickes. Now will we treat as breefely and perſpicuouſly as we can of the cure both in generall and particular, wherefore beginning with the generall we will firſt preſcribe a convenient diet by the moderate uſe of the ſixe things not naturall.

CHAP. XIIII.

Of the generall cure of a broken ſcull, and of the Symptomes uſually happening thereupon.

How the ayre ought to be.

THe firſt cure muſt bee, to keepe the patient in a temperate aire; and if ſo bee, that it bee not ſuch of it ſelfe and its owne proper nature, it muſt be corrected by Art. As in winter he muſt have a cleare fire made in his chamber, leſt the ſmoake cauſe ſneeſing and other accidents; and the windowes and doores muſt be kept ſhut to hinder the approach of the cold ayre and winde. All the time the wound is kept open to bee dreſt, ſome body ſtanding by ſhall hold a chafendiſh full of coales or a heated Iron barre over the wound, at ſuch a diſtance, that a moderate heate may paſſe thence to the wound; and the frigidity of the encompaſſing ayre may be corrected by the breathing of the diffuſed heate. For cold according to the opinion of *Hippocrates*, is an enemie to the Braine, Bones, Nerves, and ſpinall marrow; it is alſo hurtfull to ulcers, by ſuppreſſing their excrements, which ſuppreſt

Aphor. 18. ſect. 5.

doe not onely hinder ſuppuration, but alſo by corroſion makes them ſinuous. Therefore *Galen* rightly admoniſheth us, to keep cold from the braine, not only in the time of Trepaning, but alſo afterwards. For there can no greater, nor more certaine harme befall the fractured ſcull, than by admitting the aire, by ſuch as are unskilfull. For if the ayre ſhould be hotter than the braine, then it could not thence be refrigerated; but if the braine ſhould be layd open to the ayre, in the midſt of Summer, when it is at the hotteſt, yet would it be refrigerated, and unleſſe it were releeved with hot things, take harme: this is the opinion of *Galen*, whereby you may underſtand that many who have their ſculls broken, dye more through default of skill in the curing, than by the greatneſſe of the fracture.

Lib. 2, de uſu part. ca. 2.

The Aire though in ſummer is colder than the braine.

But (when the wound is bound up with the pledgets, clothes, and rowlers as is fit) if the ayre chance to be more hot, than the patient can well endure, let it be amended by ſprinkling, and ſtrawing the chamber with cold water, oxycrate, the branches of Willowes and Vine. Neither is it ſufficient to ſhunne the too cold ayre, unleſſe alſo you take heed of the over light, chieſely untill ſuch time as the moſt feared and maligne ſymptomes are paſt.

For a too great light diſſipates the ſpirits, encreaſes paine, ſtrengthens the feaver and ſymptomes. *Hippocrates* wholy forbids wine, therefore the patient in ſteed thereof muſt drinke, Barly water, faire water boyled and tempered with Julep of Roſes, ſyrupe of Violets, vinegar and the like: water wherein bread crummes have beene ſteeped, water and ſugar, with a little juyce of Lemons, or pomecitron added thereto, and ſuch like as the abilitye and taſte of the patient ſhall require. Let him continue ſuch drinkes, untill he be free from maligne ſymptomes, which uſually happen within fouretee ne dayes.

The diſcommodities of too much light.

What his drink muſt be.

His meat ſhall be pappe, ptiſan, ſhunning Almond milkes; (for Almonds are ſayd to fill the head with vapours and cauſe paine) ſtued damaske Prunes, Raiſons and Currance, ſeaſoned with ſugar, and a little cinamon (which hath a wonderful power to comfort the ſtomack, and revive and exhilarate the ſpirits) Chickens, Pidgeons, Veale, Kid, Leverets, birds of the fields, Pheaſons, blacke-birds, Turtles, Partridges, Thruſhes, Larkes and ſuch like meates of good digeſtion, boiled with lettuce, purſlaine, ſorrell, borage, bugloſſe, ſuccory, endive and the like, are thought very convenient in this caſe. If he deſire at any time to feed on theſe meates roaſted, he may, only dipping them in verjuice, in the acide juices of Oranges, Citrons, Lemons, or Pomegranets, ſometimes in one, and ſometimes in another, according to his taſte and ability. If any have a deſire to eate fiſh, he muſt make choyce of Troutes, Gudgions, Pikes and the like, which live in running and cleare waters, and not in muddy; hee ſhall eſchew all cold ſallets and pulſe, becauſe they flye up and trouble the head: it will be convenient after meate to uſe common drige powder; or Aniſeed, Fennellſeed or Coriander comfits, alſo conſerve of Roſes, or Marmilate of Quinces to ſhut up the orifice of the Ventricle, leſt the head ſhould bee offended with vapoures ariſing from thence.

Almonds encreaſe the paine of the head.

What fiſh he may eate.

Children muſt eate often, but ſparingly; for children cannot faſt ſo long as thoſe which are elder, becauſe their naturall heate is more ſtrong, wherefore they ſtand in neede of more nouriſhment; ſo alſo in winter all ſorts of people require more plentifull nouriſhment, for that then their ſtomackes are more hot than in Summer.

Aphor. 13. & 14 ſect. 1.

When the foureteenth day is paſt, if neither a feaver, nor any thing elſe forbid, hee may drinke wine moderately, and by little and little, encreaſe his dyet, but that reſpectively to each ones nature, ſtrength and cuſtome. He ſhall ſhunne, as much as in him lyes, ſleepe on the day time, unleſſe it happen that a *Phlegmon* ſeaze upon the braine or *Meninges*. For in this caſe it will bee expedient to ſleepe on the day time, eſpecially from morning till noone, for in this ſeaſon of the day, as alſo in the ſpring blood is predominant in the body, according to the opinion of *Hippocrates*. For it is ſo vulgarly knowne, that it need not be ſpoken, that the blood when wee are awake is carryed into the habite and ſurface of the body; but on the contrary by ſleepe it is called into the noble parts, the Heart and Liver. Wherefore if that the blood by the force of the Sunne caſting his beames upon the earth, at his riſing is carryed into the habite of the body, ſhould againe bee more and more diffuſed by the ſtrength

Aphor. 15, ſect. 2

Why ſleepe upon the day-time is good for the braine being enflamed.

Lib. 2. Epidem.

The diſcommodities enſuing immoderate Watching.

ſtrength and motion of watching, the inflammation in the braine and *Meninges* would be much encreaſed. Wherefore it will bee better, eſpecially then to ſtay by ſleepe the violence of the blood running into the habite of the body, when it ſhall ſeeme to rage and more violently to affect that way. Watching muſt in like manner be moderate; for too much depraves the temper of the braine and of the habit of the whole body; it cauſes crudities, paines and heavineſſe of the head, and makes the wounds dry and maligne.

Gal. Meth. 13.

Medicines procuring ſleepe.

The commodities of ſleepe.

But if the patient cannot ſleepe by reaſon of the vehemencie of the inflammation of the braine and *Meninges*, *Galen* wiſhes, to waſh, beſmeare and annoint the head, noſe, temples and eares with refrigerating and humecting things, for theſe ſtupifie, and make drowſie the Braine and membranes thereof, being more hot than they ought to be. Wherefore for this purpoſe let the temples bee anointed with *Vnguentum populeon*, or *Vnguentum Roſatum* with a little roſe vinegar, or oxycrate; Let a ſpunge moiſtened in the decoction of white or blacke poppie ſeed, of the rinds of the rootes of Mandrages, of the ſeedes of Henbane, lettuce, purſlaine, plantaine, night-ſhade and the like. He may alſo have a broath or barly creame, into which you may put an emulſion made of the ſeedes of white poppye, or let him have a potion made with ℥j. or ℥iß. of the ſyrupe of poppie, with ℥ij. of lettuce water; Let the patient uſe theſe things 4 houres after meate, to procure ſleepe. For ſleepe doth much helpe concoction, it repaires the effluxe of the triple ſubſtance cauſed by watching, aſwageth paine, refreſheth the weary, mitigates anger and ſorrow, reſtores the depraved reaſon, ſo that for theſe reſpects it is abſolutely neceſſary that the patient take his naturall reſt.

If the patient ſhall bee plethoricke, let the plenitude be leſſened by blood-letting, purging and a ſlender diet, according to the diſcretion of the Phiſition who ſhall overſee the cure.

But we muſt take heed of ſtrong purgations, in theſe kindes of wounds, eſpecially at the beginning, leſt the feaver, inflammation, paine, and other ſuch like ſymptomes be increaſed by ſtirring up the humors.

Lib. 4. *Meth.*

Phlebotomie according to *Galens* opinion, muſt not onely be made reſpectively to the plenty of blood, but alſo agreeable to the greatneſſe of the preſent diſeaſe, or that which is to come, to divert, and draw backe that humor which flowes downe, by a way contrary to that which is impact in the part; and which muſt be there evacuated, or drawne to the next. Wherefore for example, if the right ſide of the head be wounded, the Cephalicke veine of the right arme ſhall be opened, unleſſe a great *Plethora* or plenitude cauſe us to open the *Baſilica*, or Median, yet if neither of them can be fitly opened, the *Baſilica* may bee opened, although the body is not plethoricke.

Lib. de cur. per ſanguinis Miſſ.

The like courſe muſt be obſerved in wounds of the left ſide of the head; for that is farre better by reaſon of the ſtraightneſſe of the fibers, than to draw blood on the oppoſite ſide; in performance whereof you muſt have diligent care of the ſtrength of the patient, ſtill feeling his pulſe, unleſſe a Phyſition be preſent, to whoſe judgement you muſt then commit all that buſineſſe. For the pulſe is, in *Galens* opinion, the certaineſt ſhewer of the ſtrength. Wherefore we muſt conſider the changes and inequalities thereof, for as ſoone as we finde it to become leſſer and more ſlow, when the fore-head beginnes to ſweate a little, when he feeles a paine at his heart, when he is taken with a deſire to vomit, or goe to ſtoole, or with yawning, and when hee ſhall change his colour and his lips looke pale, then you muſt ſtop the blood as ſpeedily as you can; otherwiſe there will be danger leſt hee poure forth his life together with his blood. Then he muſt bee refreſhed with bread ſteeped in wine, and put into his mouth, and by rubbing his temples and noſethrilles with ſtrong vinegar, and by lying upon his backe.

But the part ſhall bee eaſed and freed from ſome portion of the impact and conjunct humor by gently ſcarifying the lippes of the wound, or applying of Leaches. But it ſhall bee diverted, by opening theſe veines which are nigheſt to the wounded part, as the *Vena Puppis*, or that in the middeſt of the forehead, or of the temples, or theſe which are under the tongue; beſides alſo cupping-glaſſes ſhal be

applyed

applied to the ſhoulders ſometimes, with ſcarification, ſometimes without; neither muſt ſtrong, and long frictions with courſe clothes, of all the whole body, the head excepted, be omitted during the whole time of the cure, for theſe will be available, though but for this, that is; to draw backe and diſſipate by inſenſible tranſpiration the vapours which otherwiſe would aſcend into the head, which matters certainly in a body that lyes ſtill and wants both the uſe and benefit of accuſtomed exerciſe, are much increaſed.

The uſe of Fractures.

A Hiſtory.

But it ſhall bee made manifeſt by this following and notable example, how powerfull blood-letting is, to leſſen and mitigate the inflammation of the Braine, or the membranes thereof in wounds of the head. I was lately called into the ſuburbs of Saint *German*, there to viſite a young man twenty eight yeeres old, who lodged there in the houſe of *Iohn Martiall*, at the ſigne of Saint *Michaell*. This young man, was one of the houſhold ſervants of Maſter *Doncador*, the ſteward of the Lady *Admirall* of *Brion*. He fell downe headlong upon the left *Bregma*, upon a marble pavement, whence he received a contuſed wound, without any fracture of the ſcull, and being he was of a ſanguine temperature, by occaſion of this wound, a feaver tooke him on the ſeaventh day with a continuall *delirium* and inflammation of phlegmonous tumor of the wounded *Pericranium*. This ſame tumor poſſeſſing his whole head and necke by continuation and ſympathy of the parts, was growne to ſuch a bigneſſe, that his viſage was ſo much altred, that his friends knew him not; neither could he ſpeake, heare, or ſwallow any thing but what was very liquide. Which I obſerving, although I knew, that the day paſt, which was the eight day of his diſeaſe, he had foure ſaucers of blood taken from him by *Germaine Agace* Barber-ſurgion of the ſame ſuburbs; yet conſidering the integrity and conſtancie of the ſtrength of the patient, I thought good to bleed him againe; wherefore I drew from him fourteene ſaucers at that one time; when I came to him the day after, and ſaw that neither the feaver, nor any of the fore mentioned ſymptomes were any whit remitted, or aſwaged, I forthwith tooke from him foure ſaucers more, which in all made two & twenty; the day following when I had obſerved, that the ſymptomes were no whit leſſened, I durſt not preſume by my owne onely advice, to let him the fourth time blood as I deſired. Wherefore I brought unto him, that moſt famous Phyſition Doctor *Violene*, who as ſoone as he felt his pulſe, knowing by the vehemencie thereof, the ſtrength of the Patient, and moreover conſidering the greatneſſe of the inflammation and tumor which offered its ſelfe to his ſight, hee bid mee preſently take out my Lancet and open a veine. But I lingred on ſet purpoſe, and told him, that hee had already twenty two ſaucers of blood taken from him: Then ſayd he, Grant it be ſo, and though more have beene drawne, yet muſt we not therefore deſiſt from our enterpriſe, eſpecially ſeeing the two chiefe Indications of blood-letting yet remaine, that is, the greatneſſe of the diſeaſe, and the conſtant ſtrength of the Patient. I being glad of this, tooke three ſaucers more of blood, hee ſtanding by, and was ready to take more but that he wiſhed mee to differ it untill the after noone; wherefore returning after dinner I filled two ſaucers more, ſo that in all, this young man to his great benefit, loſt twenty ſeaven ſaucers of blood at five times, within the ſpace of foure dayes. Now the enſuing night was very pleaſing to him, the feaver left him about noone, the tumor grew much leſſe, the heat of the inflammation was aſwaged in all parts, except in his eyelids, and the lappes of his eares, which being ulcerated caſt forth a great quantitie of *Pus* or matter. I have recited this hiſtory purpoſely, to take away the childiſh feare which many have to draw blood in the conſtant ſtrength of the patient, and that it might appeare how ſpeedy and certaine a remedy it is in inflammations of the head and braine.

The two chiefe Indications in blood letting.

Now to returne from whence we digreſſed, you muſt note that nothing is ſo hurtfull in factures and wounds of the head, as venery; not onely at that time the diſeaſe is preſent, but alſo long after the cure thereof. For great plenty of ſpirits are conteined in a ſmall quantity of ſeed, & the greateſt part thereof flowes from the braine; hence therefore all the faculties, but chiefly the Animall, are reſolved, whence I have divers times obſerved death to enſue in ſmall wounds of the head, yea when they have beene agglutinated and united.

The diſcommoditis of venery in wounds of the head.

All paſſions of the minde muſt in like ſort be avoided, becauſe they by contraction and diſſipation of the ſpirits cauſe great trouble in the body and minde. Let a place be choſen for the Patient as farre from noiſe as can be, as from the ringing of bells, beatings and knockings of Smithes, Coopers, and Carpenters, and from high-wayes through which they uſe to drive Coaches; for noyſe encreaſes paine, cauſes a feaver, and brings many other ſymptomes.

How hurtfull noyſe is to the fractures of the ſcull.

A Hiſtory.

I remember when I was at *Hiſdin* at the time that it was beſeiged by the forces of Charles the fifth, that when the wall beaten with the Cannon, the noiſe of the Ordinance cauſed grievous torment to all thoſe which were ſicke, but eſpecially thoſe that were wounded on their heads, ſo that they would ſay, that they thought at the diſcharging of every Cannon that they were cruelly ſtrucken with ſtaves on that part which was wounded; and verily their wounds were ſo angred herewith, that they bledde much, and by their paine and feavers encreaſed, were forced with much ſighing to breathe their laſt.

Thus much may ſerve to be ſpoken of the cure in generall, now we will out of the monuments of the ancients, treate of the particular.

CHAP. XV.

Of the particular cure of Wounds of the head, and of the muſculous skinne.

Of a ſimple wound of the fleſh and the skinne.

LEt us beginne with a ſimple wound, for whoſe cure the Chirurgion muſt propoſe one onely ſcope, to wit, Vnion; for unleſſe the wound pierce to the ſcull, it is cured like other wounds of the fleſhy parts of our bodies. But if it be compound, as many wayes as it is complicate, ſo many indications ſhew themſelves. In theſe the chiefeſt care muſt bee had of the more urgent order and cauſe.

A degeſtive medicine.

A ſarcoticke Medicine.

An Epuloticke.

Therefore if the wound ſhall be ſimple and ſuperficiary, then the haire muſt firſt bee ſhaven away, then a plaiſter applied made of the white of an egge, bole Armenicke and Aloes. The following day you muſt apply *Emplaſtrum de Ianua*, or elſe *de gratia Dei*, untill the wound be perfectly healed. But if it be deeper and penetrate even to the *Pericranium*, the Chirurgion ſhall not doe amiſſe, if at the ſecond dreſſing he apply a digeſtive medicine (as they call it) which may be made of Venice Turpentine, the yolkes of egges, oyle of Roſes and a little ſaffron, and that ſhall be uſed ſo long, untill the wound come to maturation; for then you muſt adde honey of Roſes and Barly floure to the digeſtive. Hence muſt we paſſe to theſe medicines, into whoſe compoſition no oyly, or unctious bodies enters, ſuch as this; ℞ *Terebinth. venetæ* ℥ij. *ſyrupi roſar.* ℥j. *pul. aloes, Myrrhæ, & maſtich. an* ʒß. Let them all be incorporated and made into an unguent, which ſhall be perfectly regenerated; then it muſt bee cicatriſed with this following powder. ℞ *Aluminis combuſti, corticis granatorum combuſt. an.* ʒj. *Miſceantur ſimul & fiat pulvis*: but if the wound be ſo large that it require a ſuture, it ſhall have ſo many ſtitches with a needle, as need ſhall ſeeme to require.

A Hiſtory.

Whileſt I was at *Hiſdin*, a certaine ſoldier, by falling of the earth whileſt he undermined, had the Hairy ſcalpe ſo preſſed downe even to the *Pericranium*, and ſo whely ſeparated from the beginning of the hinde part of his head, even to his forehead, that it hung over his face. I went about the cure in this manner; I firſt waſht all the wound with wine, a little warmed, that ſo I might waſh away the congealed blood mixed with the earth; then I dryed it with a ſoft linnen cloth, and laid upon it Venice Turpentine mixed with a little *Aqua Vitæ* wherein I had diſſolved ſome *Sanguis Draconis*, Maſtich and Aloes; then I reſtored the hanging skinne to its former place, and there ſtayed it with ſome ſtitches being neither too ſtrait, nor too cloſe together, for feare of paine and inflammation, (which two chiefely happen whileſt the wound comes to ſuppuration) but onely as much as ſhould ſerve to ſtay it on every ſide, and to keepe forth the ayre, which by its entrance doth much harme to wounds:

What things we muſt obſerve in ſoweing.

the lower ſides of the wound, I filled with ſomewhat long and broad tents, that the matter might have paſſage forth. Then I applyed this following cataplaſme to all the head. ℞. *farinæ hord. & fabarum an* ℥vj. *olei roſati* ʒiij, *aceti quantum ſufficit, fiat cataplaſma ad formam pultis*; this hath a faculty to dry, coole, repell mitigate paine and inflammation, and ſtay bleeding.

When we muſt not let blood in wounds.

I did not let him blood, becauſe hee had bled much, eſpecially at certaine arteries which were broken neere his temples; he being dreſſed after this manner grew well in a ſhort time.

A Hiſtory.

But if the wound bee made by the biting of a wilde beaſt, it muſt bee handled after another manner, as ſhall appeare by this following hiſtory. As many people on a time ſtood looking upon the Kings Lyons, who were kept in the Tilt-yard at *Paris* for the delight of King *Henry* the ſecond, and at his charges: it happened that one of the feirceſt of them broke the things wherein he was tyed, and leaping amongſt the company, he with his pawes threw to the ground a Girle of ſome twelve yeeres old, and taking her head in his mouth, with his teeth wounded the muſculous ſkinne in many places, yet hurt not the ſcull. She ſcarſe at length delivered by the Maſter of the Lyons from the jawes of Death and the Lyon, was committed to the cure of *Rowland Claret* Chirurgion; who was there preſent by chance at the ſame time; ſome few dayes after, I was was called to viſite her; ſhe was in a feaver, her head, ſhoulders, breſt and all the places where the Lyon had ſet his teeth, or nailes, were ſwolne, all the edges of the wounds were livide, and did flow with a watriſh, acride, virulent, cadaverous, darke greene and ſtinking matter, ſo that I could ſcarſe endure the ſmell thereof; ſhe was alſo oppreſt with pricking, biting and very great paine; which I obſerving, that old ſaying came into my minde which is: That all wounds made by the bitings of beaſts, or of men alſo, doe ſomewhat participate of poyſon. Wherefore there muſt principally great care bee had of the venenate impreſſion left in the wounds by the nailes and teeth, and therefore ſuch things muſt bee applyed, as have power to orecome poiſon. Wherefore I ſcarrifyed the lips of the wounds in divers places, and applyed Leaches to ſucke out the venenate blood, and eaſe the inflammation of the parts, then I made a Lotion of *Ægyptiacum*, Treacle and Mithridate after the following manner.

The bitings of man and beaſts are venenate.

Theriacall topicke Medicines.

℞. *Mithrid.* ℥j *theriac.* ℥ij. *ægyptiac.* ℥ß. *diſſolvantur omnia cum aqua vitæ, & Cardui ben.* Let the wounds be fomented and waſhed with it warme; beſides alſo Treacle and Mithridate were put in all the medicines which were either applyed or put into the wound; and alſo of the ſame with the conſerves of Roſes and Bugloſſe diſſolved in the water of Sorrell and *Carduus benedictus*, potions were made to ſtrengthen the heart and vindicate it from maligne vapours.

A Cordiall Epithema.

For which purpoſe alſo this following *Epithema* was applyed to the region of her heart. ℞. *aquæ roſar. & nenuphar, an.* ℥iiij. *aceti ſcillitici* ℥j. *corallorum, ſantalorum alborum & rubrorum, roſar rub. pulveris ſpodij. an.* ℥j. *Mithridatij, theriacæ, an.* ʒij. *flo. cordial. pulveriſatorum p. ij. croci* ʒ, j. diſſolve them altogether, make an Epitheme and apply it to the heart with a ſcarlet cloth or ſpunge, and let it bee often renued. Verily ſhe dreſt after this manner, and the former remedies but once uſed, paine, inflammation and all the maligne ſymptomes were much leſſened; to conclude ſhee recovered, but lingred and was leane ſome two yeares after, yet at lengh ſhe was perfectly reſtored to her health and former nature. By which you may underſtand, that ſimple wounds muſt be handled after another manner, than theſe which have any touch of poiſon.

The cure of the Hairy ſcalpe when it is contuſed.

But now that we may proſecute the other affects of the hairy ſcalpe; ſay that it is contuſed with a blow without a wound, that which muſt bee firſt and alway done, (that ſo the affect may better appeare, and the remedies which are applyed may take more effect) the haire muſt be ſhaven away, and at the firſt dreſſing a repelling medicine applyed, ſuch as is this following *Oxyrhodinum.* ℞. *ol. roſ.* ℥iij. *album. ovorum nu.* ij. *pulveris nucum cypreſſi, balauſt. alumin. rochæ, roſar. rub. an.* ʒj. Let them be all incorporated, and make a medicine for the former uſe, or in ſteed thereof, you may apply the cataplaſme preſcribed before conſiſting of *Farina hordei, ſabarum, aceto & oleo roſaceo.* But ſuch medicines muſt be often renued. When the paine aud defluxion

A repelling medicine.

A diſcuſſing Fomentation.

Ceratum de Minio.

Deterſive or clenſing medicines.

are appeaſed, wee muſt uſe diſcuſſing medicines for the diſſipation of that humor which remaines impacted in the part; ℞ *Emplaſtri de mucilagin.* ʒij. *oxicrocei, & emp. de meliloto, an.* ℥j. *olei chamam. & anethi, an.* ℥ß. *malaxentur ſimul & fiat emplaſtrum ad uſum dictum.* Such a fomentation will alſo be good. ℞ *vini rub. lib.* iiij. *lixiuij. com. lib.* ij. *nuces cupreſſi contuſ. nu.* x. *pul. myrtillorum* ℥j. *roſar rub. abſinth. fol. ſalviæ, majoranæ, ſtæchados, florum chamam. melil. an.* M.ß. *aluminis rochæ, radicis cyperi, calami aromatici an.* ℥ß. *bulliant omnia ſimul,* and make a decoction to foment the grieved part. After ſomewhat a long fomenting it, whereby it may the better diſcuſſe, dry and exhauſt the concrete humor; the head muſt be dryed & more diſcuſſing things applyed ſuch as the Cerate deſcribed by *Vigo* called *de minio,* which hath an emollient and digeſtive faculty in this forme. ℞ *Olei chamam. lilior. an.* ℥x. *olei maſtich.* ℥ij. *pinguedinis vervecis lib.* j. *litharg. auri,* ℥viij. *miny* ℥ij. *vini boni cyathum unum, bulliant omnia ſimul baculo agitando, primum quidem lento igne, mox verò luculentiore, donec tota maſſa colorem nigrum vel ſubnigrum contrahat; adde in fine cocturæ Terebinth. lib.* ſ. *pulveris maſtich.* ℥ij. *gum. elemi.* ℥j. *ceræ quantum ſufficit, bulliant rurſus una ebullitione & fiat empl. molle.* But if the humor be not thus diſcuſſed, but onely grow ſoft, then the tumor muſt be quickely opened, for when the fleſh is inflamed and putrifyed through occaſion of the conteined humor, the bone under it putrifies alſo by the contagion of the inflammation and the acrimony of the matter falling upon the bone. When you have opened it, waſh away the filth of the ulcer with this following deterſive medicine. ℞. *ſyrupi roſ. & abſinth. an.* ℥j. *terebinth.* ℥iß. *pul. ireos, aloes, maſtichis, myrrhæ, farinæ hordei an.* ʒß. In ſteed hereof if there be great putrifaction *Ægyptia.* either by it ſelfe, or mixt with an equall quantity of *Vnguentum apoſtolorum* may be put into the ulcer. When the ulcer is clenſed it will be time to uſe ſcarcotike and cicatrizing medicines.

CHAP. XVI.

Of the particular cure of a fractured or broken ſcull.

Why the *Pericranium* hath ſuch exquiſite ſenſe.

Gal. 6. Meth.

The bones are offended with the application of humide things.

IF the ſcull be bebroken, ſo that it be needefull to trepan it, or to elevate and lift it up, or ſcrape it away, the muſculous skinne being cut as wee formerly noted, the *Pericranium* ſhall be plucked from the ſcull, as wee ſayd before; which becauſe it can hardly bee done without great paine, by reaſon of its exquiſite ſenſe and connexion with the membranes of the braine, we muſt labour to mittigate the paine for feare of inflammation and other accidents. Therefore the firſt dreſſing ended and the corners of the wound drawn each from other; at the ſecond dreſſing put to the wound, a digeſtive (as they terme it) made of the yolke of an egge, and oyle of Roſes, but you muſt apply no humide thing to the bone, becauſe we deſire to keepe it ſound and whole. For *Galens* opinion is, that bared bones muſt not be touched with unctuous things; but rather on the contrary all dry things muſt bee applyed to them, which may conſume the ſuperfluous humidity. Therefore we muſt lay ſome linte and the cephalicke powders which we ſhall hereafter deſcribe, upon the bone we intend to preſerve, and muſt have diligent care that it be not offended either by the the ayre, or touch of humide medicines. You muſt in Trepaning have a ſpeciall care of the *Craſſa Meninx.* For I have often obſerved a great quantity of blood to have flowed from ſome broken veſſell, which adhered to the ſecond Table: neither muſt we preſently and forthwith ſtay ſuch bleeding, but ſuffer it to flow according to the plenitude and ſtrength of the patient; for thus the feaver, and together therewith the reſt of the ſymptomes are diminiſhed.

Lib. de ulcer.

For in the opinion of *Hippocrates*, in every greene wound it is good to cauſe often bleeding, except in the bellies; for thus the vehemencie of paine, inflammation and other accidents will bee leſſe troubleſome; alſo it is not amiſſe too for old ulcers to bleed much, for ſo they are freede from the burden of the impact humors. When you thinke it hath bled ſufficiently, it may be ſtanched with this following medicine deſcribed by *Galen.*

Gal. 6. Meth.

℞ *pulveris Aloes* ʒij, *thuris, maſtiches an.* ʒiß. *albumina ovorum nu.* ij.

agitentur ſimul cum pilis leporinis minutim inciſis, fiat medicamentum. When the bleeding is ſtayed, you ſhall for the aſwaging of paine, droppe upon the *Meninx* ſome Pidgions blood, yet warme by opening a Veine under the wing, then it ſhall bee ſtrewed ouer with this following powder, ℞ *Aloes, thuris, myrrhæ, ſanguinis draconis an.* ʒj. *Miſce, fiat pulvis ſubtilis.* Alſo you may make an irrigation with Roſe Vinegar, or ſome repelling medicine; ſuch as is a cataplaſme *ex farinis, & oleo roſaceo.* Which may bee applyed untill the fourth day to aſwage and mittigate paine.

Vigoes Cerate will be of good uſe in this caſe, as that which in my opinion is moſt fit for fractures of the ſcull, becauſe it drawes powerfully, reſolves and dries moderately, and by reaſon of the ſmell refreſhes the animall ſpirits, and ſtrengthens the braine and membranes thereof, as you may eaſily perceive by things which enter into the compoſition thereof.

Vigoes Cerate good for a broken ſcull.

℞ *Olei roſ. Omph. reſinæ pini, gummi Elemi. an* ℥ij. *Maſtiches* ℥iß. *pinguedinis vervecis caſtrati* ℥ijß. *foliorum beton. caprifol. anthos an. M.* j. *ammoniaci* ʒß. *granorum tinctorum* ʒx. *liquata pinguedine terenda terantur, & ammoniacum ſimul cum aceto ſcillitico, eliquetur; deinde bulliant omnia ſimul in lib.* ij. *vini boni, lento igne uſque ad conſumptionem vini, deinde exprimantur; cum expreſſione addantur terebinth, Ven.* ℥iiij. *ceræ albæ quantum ſufficit, fiat cerotum molle ad uſum prædictum.* Alſo let the necke, and all the ſpine of the backe bee annointed with a liniment, which hath force of mollifing the Nerves, leſt they ſhould ſuffer convulſion; ſuch is this.

℞ *Rutæ, marrubij, roriſmar. ebulor, ſaluiæ, herb. paralyſ. an. M. ſ. rad. Ireos, cyperi, baccarum lauri. an.* ℥j. *florum chamæ. melil. hyperici, an. M.* j. *piſtentur & macerentur omnia in vino albo per noctem, deinde coquantur in vaſe duplici cum olei lumbricorum, liliorum, de terebinthina, axungiæ, anſeris & hum. an.* ℥ij *uſque ad conſumptionem vini, poſtea colentur & in colatura adde terebinth. venet.* ℥iij. *aquæ vitæ* ʒß. *ceræ quantum ſufficit. fiat linimentum ſecumdum artem.*

A liniment good againſt convulſions.

But when the paine is aſwaged, we muſt abſtaine from all ſuch unctuous things, leſt they make the wound become ſordide and maligne, and putrifie the adjacent parts, and conſequently the *Craſſa Meninx* and ſcull; for the integrity of all parts may be preſerved by their like, and ſuch are dry things in a fracture of the ſcull. Wherefore all humide and oyely things muſt be ſhunned in the cure thereof, unleſſe peradventure there ſhall bee ſome neede to mitigate paine and bring the humor to ſuppuration.

For according to *Galen*, wee are oft forcſt for a time to omit the proper cure of the diſeaſe, ſo to reſiſt the ſymptomes; furthermore *Hippocrates* would have us not to foment the ſcull, no not with wine, but if we doe, to let it be but with very little. *Vidius* interprets that little to be, when there is feare of inflammation; for wine if it be red, tart and aſtringent, hath a repreſſing refrigerating and drying facultie: for otherwiſe all wine although it heates and dries by its faculty, yet it actually humects and cooles, both which are very hurtfull in wounds of the head, or a fractured ſcull, eſpecially when the bone is bare; for from too much cooling of the braine there is feare of a convulſion, or ſome other evill ſymptome.

Gal.4. Meth.

How farre humide things are good for a fractured ſcull:

Wherefore let this be ratified, that is, We muſt not uſe humide and unctuous medicines in wounds of the head, except for curing of an inflammation, or the mitigation of paine cauſed thereby. Therefore let the bared ſcull bee ſtrewed with catagmaticke and cephalicke powders, (being ſo called by the ancients, for that they are convenient and good in fractures of the ſcull & the reſt of the bones) for by their dryneſſe they conſume the ſuperfluous humiditie, and by that meanes helpe nature in the ſeparating of the broken bones, and the regenerating of fleſh. Such pouders uſually conſiſt of ſuch things as theſe enſuing.

Why Cephalicke or Catagmaticke pouders are good.

Thus, radix Iridos florent. farina Hordei, & Ervi, pulvis Aloes Hepaticæ, ſanguis Draconis, maſtiche, Myrrha, rad. Ariſtolochiæ, Gentianæ: and generally all ſuch ſimples as have a drying and an abſtergent faculty without biting; but you muſt not uſe theſe things before the paine, inflammation and apoſtumation bee paſt; that is then, when the membranes muſt be clenſed, the bones ſcaled, and the fleſh generated.

When to uſed,

For the ſcull by how much it is the dryer, by ſo much it requires and more eaſily endures more powerfull and dryer medicines, than the *Dura Mater* or *Pericranium*, as that which in quickneſſe of ſenſe comes farre ſhort of theſe two. Wherefore when you would apply the forementioned cephalicke pouders to the *Meninges*, they muſt be aſſociated and mixed with honey, ſyrupe of roſes or of wormewood and ſuch other like, that ſo their too violently drying faculty may be alayed and tempered.

How to be mixed when trey are to bee applyed to the Meninges.

Chap. XVII.

Why we uſe Trepaning, in the Fractures of the ſcull.

There are foure cauſes of this remedy. The firſt is, to raiſe up the depreſt bones, and take forth their fragments, which preſſe upon the *Meninges*, or alſo upon the ſubſtance of the braine. The ſecond is, that the *Sanies* or matter may bee evacuated, clenſed, waſted, and dryed up, which by the breaking of any veſſell is poured forth upon the Membraines, whereby they are, and not they onely, but the Braine alſo is in great danger of corruption. The third is, for the fitter application of medicines, convenient for the wound and fracture. The fourth is, that ſo we may have ſomething whereby we may ſupply the defect of a Repelling Ligature, and ſuch an one as may hinder defluxions; for ſuch a Ligature cannot take place here as it may in the other parts of the body, by reaſon of the Sphæricall or Round figure of the head, which doth not eaſily admit binding; and then the denſity and hardneſſe of the interpoſed ſcull is a meanes that the veſſells lying under it (by which uſually the defluxion comes) cannot eaſily be bound with a rowler ſufficiently to repell the running blood. And the externall veſſells, (to whom the force of the Ligature may come) cannot bee bound without great paine, and danger of Inflammation.

Why a repelling Ligature cannot be uſed in fractures of the Scull.

For by ſuch a compreſſion the pulſation of the Arteries would be intercepted, and the effluxe of the fuliginous excrements which uſeth to paſſe through the ſutures of the ſcull, would be ſupreſt, by reaſon of the conſtriction of theſe ſutures.

Beſides alſo, the blood would thus bee forced from the wounded part without, to within into the Membranes and Braine; whence paine, Inflammation, a Feaver, Abſceſſe, Convulſion, Palſie, Apoplexie, and laſtly death it ſelfe would enſue.

And theſe are the chiefe cauſes, that Trepaning is neceſſary in fractures of the ſcull, and not ſo in the fractures of other bones.

How the patient muſt be placed when you Trepan him.

But before you apply or put to your Trepan, the Patient muſt bee fitly placed or ſeated, and a double cloth muſt be many times wrapped about his head, and then his head muſt be ſo laid, or preſſed upon a Cuſhion or pillow, that when yon come to your operation, it may not ſinke downe any further, but remaine firme and ſteddy.

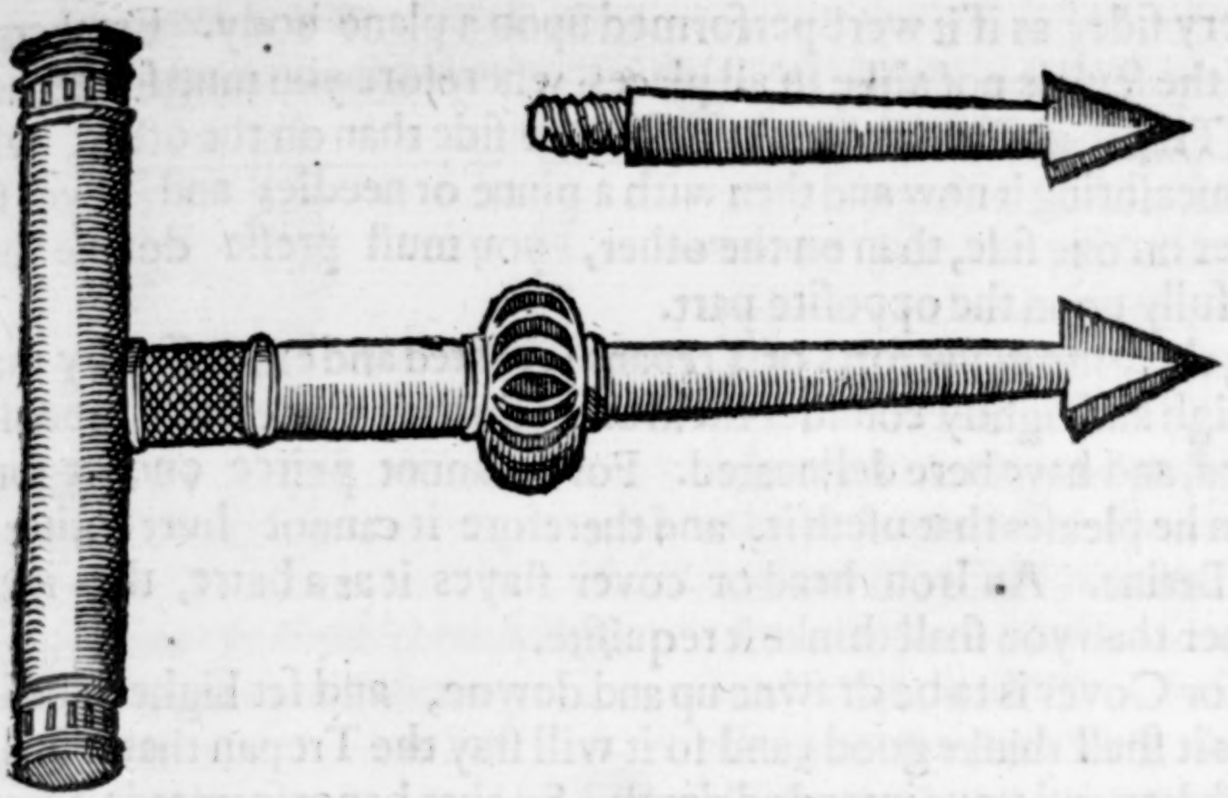
Then you muſt ſtoppe the patients eares with Cotton-wooll, that ſo hee may not heare the noiſe made by the Trepan, or any other Inſtrument.

What to be done before the application of the Trepan.

But before you put to your Trepan the bone muſt be pierced with an Inſtrument, having a three ſquare point, that ſo it may bee the more ſpeedily and certainely perforated The point thereof muſt be no bigger then the pin of the Trepan, that ſo the Trepan which is forthwith to bee applyed may ſtand the more firmer, and not play to and againe in too wide a hole.

The ſhape of this Inſtrument is not much different from a Gimblet, but that the point is three-ſquare, and not twined like a ſcrew; as you may perceive, by this following figure.

A Gimblet or peircer to perforate the ſcull, before the ſetting too of the Trepan.



A. *Shewes the handle.*
B. *The points which may be ſcrewed and fitted into the handle.*

CHAP. XVIII.

A deſcription of Trepans.

TRepans are round ſawes,which cut the bone circularly more or leſſe according to their greatneſſe; they muſt have a pinne ſtanding in the middle a little further out than their teeth,ſo to ſtay and hold faſt the Trepan that it ſtirre neither to this ſide nor that, untill it bee entred and you have cut through the firſt table at the leaſt: then you muſt take forth the pinne, leſt going quite through the bone, it may pricke or hurt the *Craſſa Meninx*.

Wherefore when you have taken forth the pinne, you may ſafely turne it about untill you have cut through both the tables; Your Trepans muſt alſo have a cappe, or ſomewhat to engirt or encompaſſe them, leſt no way hindred they cut more of the bone than we would, and in concluſion runne into the *Meninx*.

They muſt alſo be anointed with oyle, that ſo they may cut the more readily and gently; for thus Carpenters uſe to greaſe their ſawes. But you muſt,during the time of the operation, often dippe them in cold water, leſt the bone by attrition become too hot: for all hard ſolide bodies by quicke and often turning about, become hot; but the bone made more hot and dry, is altered and changeth its nature, ſo that after it is cut,more of it ſcailes and falls away.

The harme the bone receives by being heated with the Trepan.

Now you muſt know that the bone,which is touched with the Trepan,or the Aire, alwayes caſts off ſcailes, for the ſpeedier helping forwards whereof, you muſt ſtrew upon it pouders made of Rocket, Briony,wilde Coucumber and *Ariſtolochia* roots. When the bone is ſufficiently ſcaled let this following powder be put upon it, which hath a faculty to cover the bone with fleſh, and to harden it with dryneſſe convenient to its kinde.

What things haſten the ſcailing of the bone.

℞ *Pulver. Ireos Illyricæ, Aloes, Manna thuris, Myrrhæ, ariſtolochiæ an* ʒj. Fleſh being by this meanes generated, let it be cicatrized by ſtrewing upon it the rindes of Pomegranats and Alome burnt.

Neither ſhal the Chirurgion forcibly take away theſe ſcales, but commit that whole worke to nature, which uſeth not to caſt them off before that it hath generated fleſh under them. For otherwiſe if he doe any thing raſhly, hee brings new corruption to

The bone muſt not be forcibly ſcailed.

the bone; as we ſhall more at large declare, when wee come to treate of the *Caries* or Rottenneſſe of bones.

A caution in Trepaning.

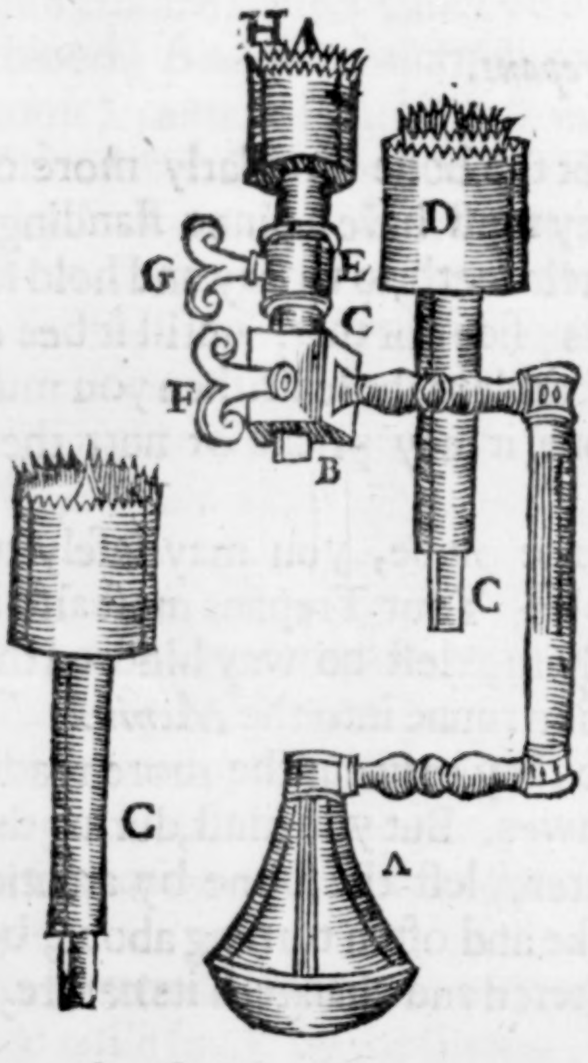
He which uſeth the Trepan, muſt conſider this, that the head is of a round figure, and alſo the Trepan cuts circularly, and therefore it is unpoſſible to cut the bone ſo equally on every ſide, as if it were performed upon a plane body. Furthermore the thickneſſe of the ſcull is not alike in all places; wherefore you muſt looke, and marke whether the Trepan goe not more deepe on one ſide than on the other, which you may doe by meaſuring it now and then with a pinne or needle; and if yee finde that it is cut deeper on one ſide, than on the other, you muſt preſſe downe the Trepan more powerfully upon the oppoſite part.

A ſafe and convenient Trepan.

But ſeeing there are many ſorts of Trepans invented and expreſſed by many men, yet if you weigh and rightly conſider them all, you ſhall finde none more ſafe, than that I invented, and have here delineated. For it cannot peirce one jot further into the ſcull, than he pleaſes that uſeth it, and therefore it cannot hurt either the *Meninges* or the Braine. An Iron head or cover ſtayes it as a barre, that it can penetrate no further than you ſhall thinke it requiſite.

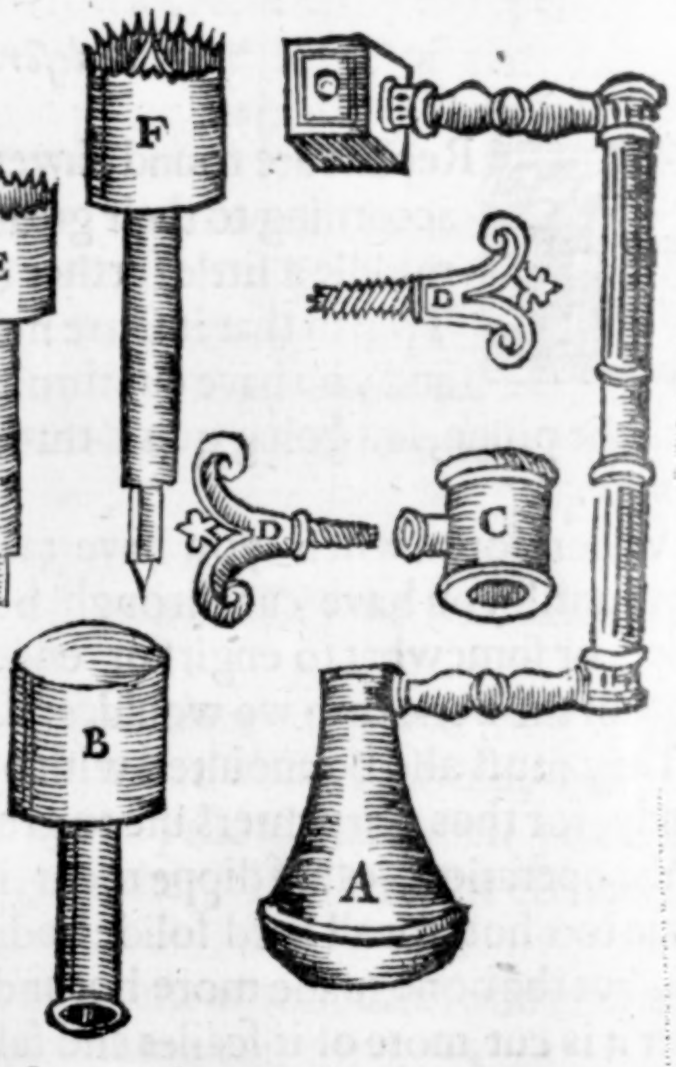
This head or Cover is to be drawne up and downe, and ſet higher and lower, as he which uſes it ſhall thinke good, and ſo it will ſtay the Trepan that it ſhall not goe a haires bredth beyond your intended depth. So that henceforwards there ſhall be no Chirurgion, howſoever ignorant in the performance of his Art, which by the benefit of ſuch a Trepan may not performe this operation without any danger or feare of danger of touching the *Dura Mater*; the hurting whereof, puts the life in jeopardie.

The figure of our Trepan opened and taken in peeces.



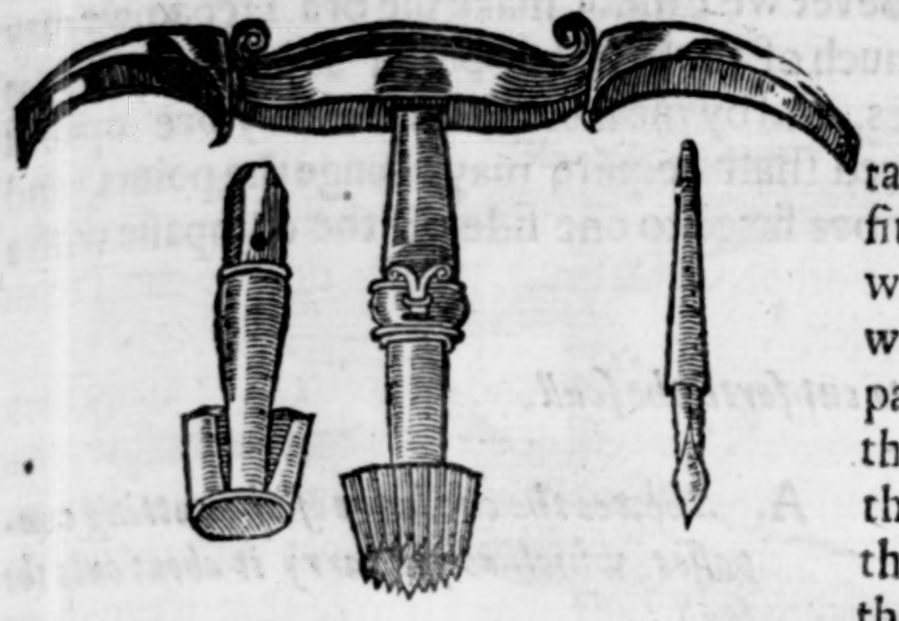
- A. *Shewes the whole handle or Brace of the Trepan.*
- B. *The Cover or Cap of the Trepan.*
- C *The ferule.*
- D.D. *The ſcrew pins which hold and ſtay the ferule and Trepan.*
- E. *The Trepan without his pinne.*
- F. *The Trepan furniſhed with its pinne.*

The figure of the ſame Trepan fitted and put together.



- A. *Shewes the Brace and Trepan fitted in every point.*
- B. *The place into which the Trepan is put and fitted.*
- C.C.C. *The upper end of the Trepan which is to be fitted and put into the Braine.*
- D. *The Trepan with its cover or cap upon it.*
- E. *The ferule.*
- F. *A ſcrew pin by the twining whereof the Trepan is faſtened in the Brace.*
- G. *Another ſcrew pin which faſtnes the ferule closer to the Trepan.*
- H. *The Three ſquare point.*

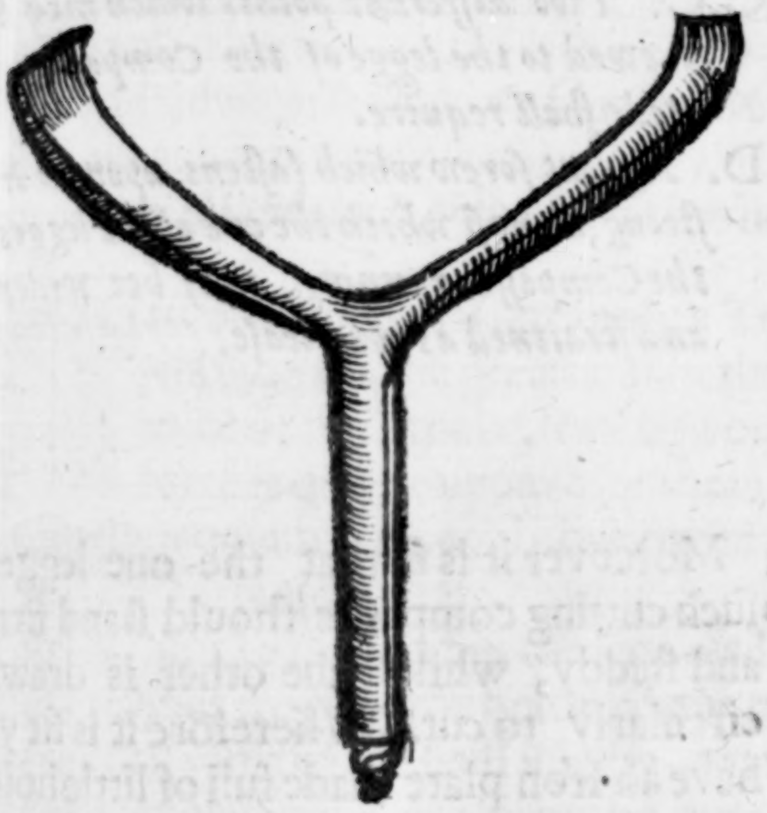
In ſtead of the other Trepan ſet forth by the Author, I have thought fit to give you the figure of that Trepan that is here moſt in uſe, and the fitteſt therefore, as it is ſet forth by Mr. Doctor *Crooke*.



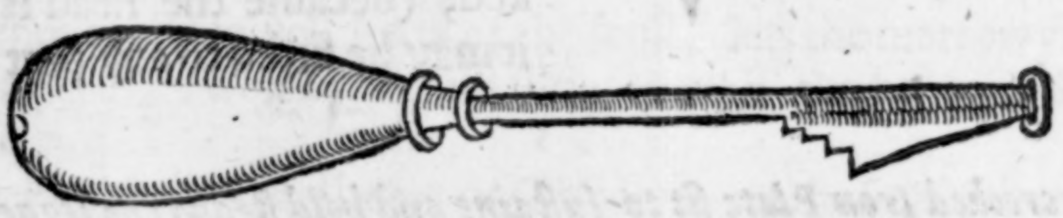
A Terebellum *or Gimblet conſiſting of three branches.*

All theſe particulars of the Trepan taken in ſunder, you may ſee united and fitted together in the other figure. But when you cannot bring out the bone which you have cut off with your Trepan; then you may take it forth with the *Terebellum* or Gimblet here expreſt, that is, ſcrewing the point thereof into the hole made by the threeſquare pin; the handle of this Inſtrument may alſo ſerve in ſteed of a Levatorie.

When with the Gimblet you have drawne or taken forth that part of the ſcull which was cut away by the Trepan; if there ſhall bee any ſharpe ſplinters in the ſecond table, which may hurt and pricke the *Meninx*, when it is heaved up by the motion of the braine, they muſt be ſhaved away and planed with this Lentill faſhioned ſcraper, being ſo called, becauſe it hath the head thereof faſhioned and ſmooth like a Lentill, leſt being ſharpe it ſhould hurt and pricke the membrane in the ſmoothing thereof.



A Lentill-like cutting Scraper.



But if by reaſon of the thickneſſe, the ſcull cannot bee cut with this Lentill-like ſcraper, you may uſe the cutting ſcrapers and a mallet. The mallet muſt be of leade, that ſo it may ſhake the braine as little as may be. But you muſt diligently with your mullets take forth the ſharpe ſplinters, and peeces of the bone. But if the fractured part of the ſcull bee ſuch, that it will not admit that ſection which is requiſite for the bared bone, as when the fracture is upon the temporall muſcle, or at the ſutures; then in the ſteed of one Trepan, two or three muſt be applyed, if the neceſſity of the preſent caſe ſo require, and that within a very ſmall compaſſe; but they muſt not bee applyed to the fractured part, but nigh thereto, as we ſhall ſhew more at large in the following chapter.

The uſe of a Leaden Mallet.

Why a Trepan muſt not be applyed to the ſutures.

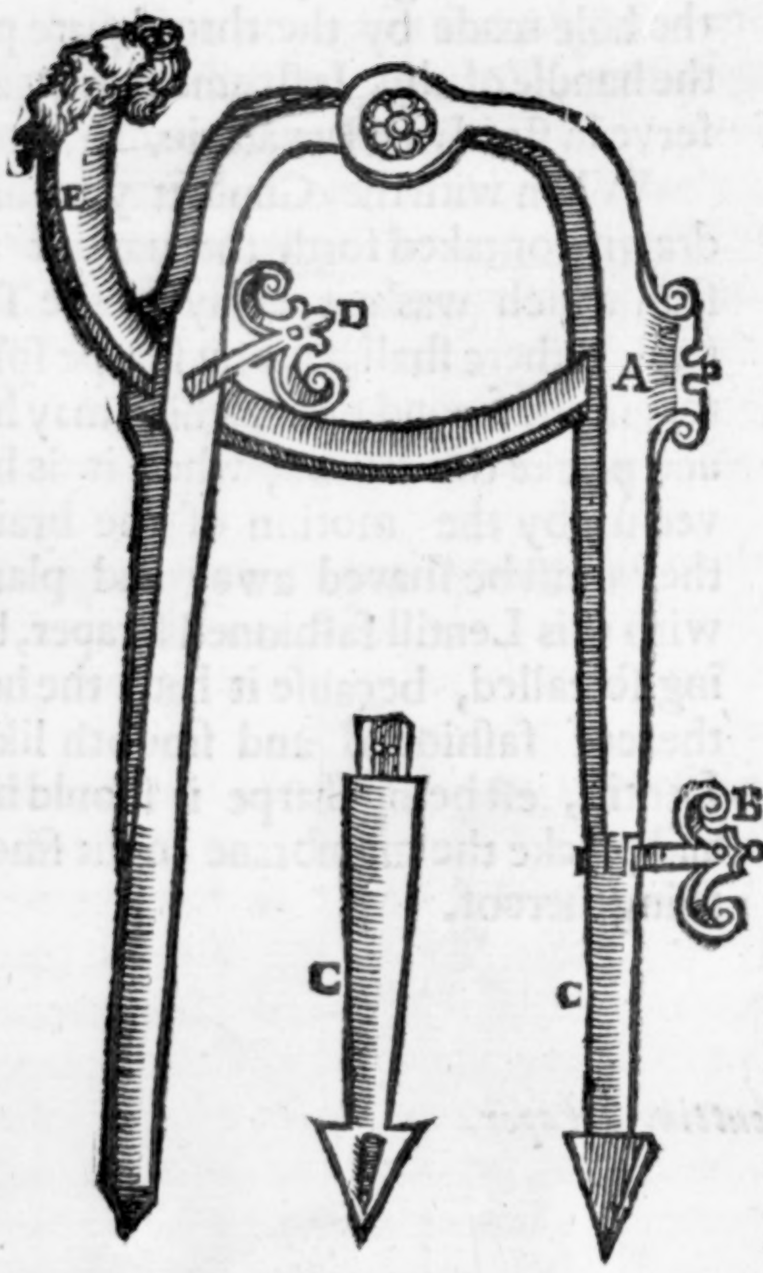
But the Trepans ſhall be applyed ſo neere to each other, that the ring of the ſecond may be joyned with the ring of the firſt and third. But if a fracture ſhall happen to light upon a ſuture, then you muſt not apply a Trepan to it, but uſe two thereto on each ſide; he that ſhall doe otherwiſe, ſhall teare in ſunder the nervous and membranous fibers, and alſo the veines and arteries by which the *Dura Mater* is faſtned to the ſcull, and yeelds matter to the *Pericranium*. He which ſhall apply one Trepan, that

Why two Trepans are to be uſed to a fractured ſuture.

that is, but upon one ſide of the ſuture, he ſhall not bee able to get forth all the *Sanies* which is fallen downe on both ſides by reaſon of the partition of the *Craſſa Meninx* which lyes betweene, and riſes up by the ſutures of the ſcull.

To conclude, when for what cauſe ſoever we cannot make uſe of a Trepan, we may imploy this inſtrument, if ſo bee as much of the bone bee bared as is needfull. It is made in forme of a paire of Compaſſes, and by meanes of a ſcrew may bee opened more or leſſe as you pleaſe. You as need ſhall require may change the points, and put other in their places, for they may bee fitted to one ſide of the compaſſe with a ſcrew.

A paire of cutting Compaſſes to cut forth the ſcull.



A. *Shewes the one legge of the cutting compaſſes, which as you carry it about cuts the ſcull.*

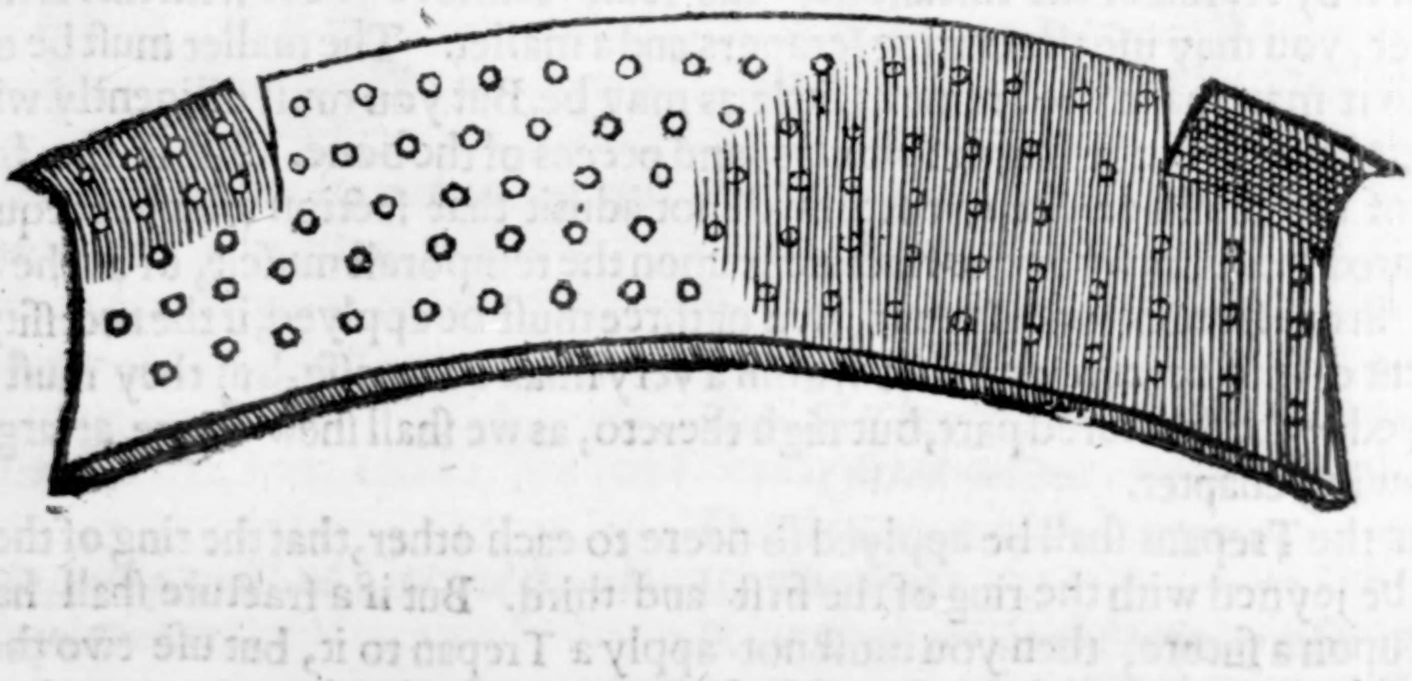
B. *The ſcrew which faſtens the point to the legge of the compaſſes.*

C.C. *Two different points which may bee ſcrewed to the legge of the Compaſſes, as neede ſhall require.*

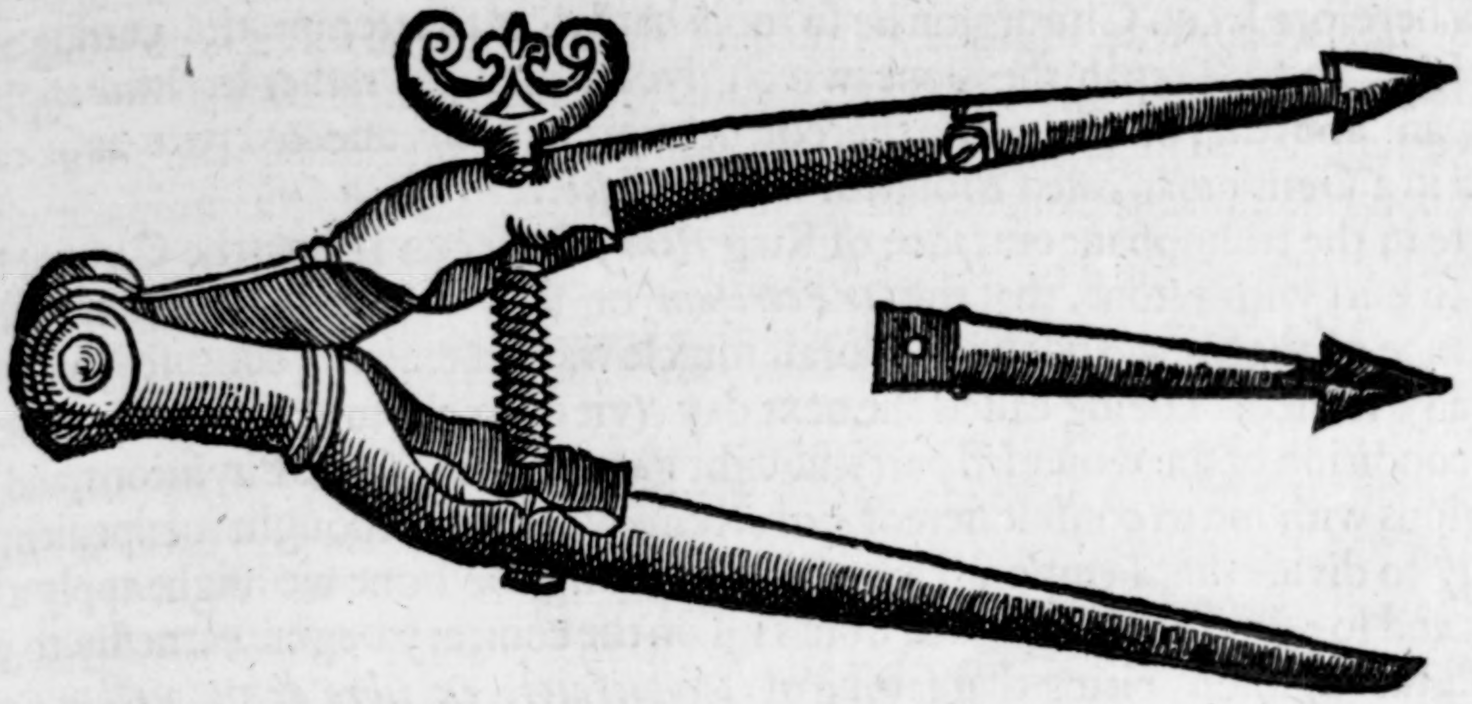
D. *A great ſcrew which faſtens upon an Iron ſtring, alongſt which the one of the legges of the Compaſſe running, may bee widened and ſtraitned as you pleaſe.*

Moreover it is fit that the one legge of ſuch cutting compaſſes ſhould ſtand firme and ſteddy, whileſt the other is drawne circularly to cut. Wherefore it is fit you have an Iron plate made full of little holes, whereiny ou may firmely ſtay that legge of the compaſſe, leaſt it waver againſt your will; it is requiſite that this plate be crooked, (becauſe the head is round) that ſo it may be fitted to any part thereof.

A crooked Iron Plate fit to ſuſtaine and hold ſteddy one legge of the Compaſſe upon the head.



Another paire of Compaſſes of the like nature and uſe, which may be widened and ſtraightned by a ſcrew.



CHAP. XIX.

Of the places of the ſcull whereto you may not apply a Trepan.

FIrſt of all, you ſhal not apply a Trepan, to a bone that is ſo broken that it is wholy, or in the greater part thereof divided from the ſcull by the violence of the ſtroake, leaſt by your weight and preſſing of the Trepan, you force it downe upon Membrane.

A bone almoſt ſevered from the ſcull muſt not be Trepaned.

Secondly, you muſt not apply one to the fractured Sutures, for the reaſons mentioned in the former chapter.

Thirdly, nor to that part of the forehead which is a little above the eye-browes, for theſe reaſons we gave you before in the twelfth chapter. For there is in that place under the firſt table of the ſcull it ſelfe, a large cavitie repleniſhed with a certaine white and tough humor, as alſo with a certaine ſpirituous and ayrie ſubſtance, placed there by nature, to prepare the aire which aſcends to the braine by the Noſe-thrills: unleſſe the Chirurgion obſerve and be mindfull hereof, he may bee deceived, ſuppoſing this cavity to be an Effracture of the bone and a depreſſion thereof.

A notable cavitie in the forehead bone.

Fourthly, neither in the loweſt parts of the ſcull, leſt the marrowy ſubſtance of the Braine, by reaſon of its weight, ſhould ſlide through the hole made by the Trepan.

Fiſthly, neither to the *Bregma* bones of Children, as thoſe which as yet have not acquired juſt ſoliditie, to endure the impreſſion of a Trepan.

Sixtly, nor to the temples by reaſon of the Temporall muſcle, the cutting whereof in the opinion of *Hippocrates* cauſes convulſion of the oppoſite part. For being cut athwart it looſes its proper action, that is, to move and lift up the lower Iaw; but then the oppoſite Temporall muſcle being whole and perfect, uſing its ſtrength, (his Antagoniſte ſuffering it, and not reſiſting or labouring any thing at all to the contrary) it drawes the ſame Iaw to it, whereupon the mouth and all the parts of the face are drawne awry, and ſuffer a Convulſion towards the ſound part, the other being reſolved according to *Hippocrates* his rule.

Lib. de Vul. ca.

For as often as the muſcles of one kinde are equall in number, magnitude and ſtrength on each ſide, the reſolution of the one part, cauſes the Convulſion of the other.

A rule out of *Hippocrates.*

Neither doth this danger alone ariſe from the cutting of the Temporall muſcle, but alſo another, which is, that this muſcle when we eate and ſpeake, is in perpetuall motion, whereby it comes to paſſe, that being once cut, it is ſcarſe ever united againe, beſides alſo the commiſſure or joyning together of the ſtonie bones lye under it.

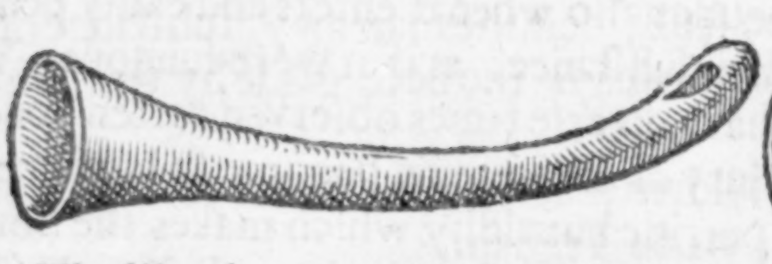
What diſcommodities ariſe from cutting the temporall muſcle.

But by the ſecond caution we are forbid to Trepan upon the ſutures; moreover alſo many Veines, Arteries and Nerves are ſpred over the ſubſtance thereof, ſo that by cutting of them, there is danger of many and maligne ſymptomes, as paine, inflammation, a feaver, a convulſion not onely of the part it ſelfe, but alſo of the whole body, whence laſtly death enſues.

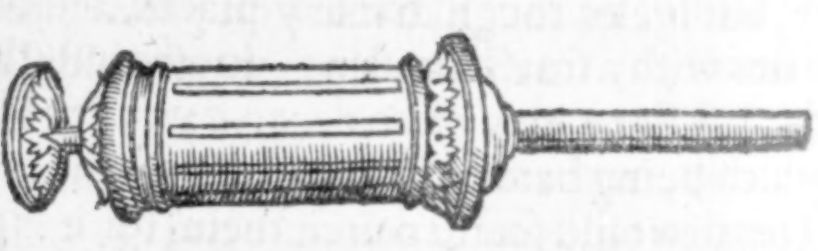
Wherefore let no Chirurgion be ſo foole hardy, as to attempt the cutting of this muſcle, ſo to Trepan the bone which lyes under it; rather let him apply his Trepan above it, or on the ſide thereof, or as neere to the affected part as he can, as I did in a Gentleman caled Monſieur *de la Breteſche*.

A hiſtory.

He in the triumphant entrance of King *Henry* the ſecond, into the City of *Paris*, was ſo hurt with a ſtone, that the *Os Petroſum* or ſcaly bone, was broken with the violence of the blow, and the temporall muſcle was vehemently contuſed, yet without any wound. I being called the next day (viewing the manner of the hurt, and the condition of the wounded part) thought good to bring ſome Phyſitions, and Chirurgions with me to conſult hereof, of whom when ſome thought it expedient preſently to divide the Temporall muſcle, that baring the bone we might apply a Trepan, and ſo take forth the broken bones: I on the contrary begun earneſtly to withſtand that opinion, citing that ſaying of *Hippocrates, ex libro de vulneribus Capitis*, wherein Chirurgions are forbidden to cut ſuch muſcles, for feare of the forementioned ſymptomes; alſo I cited experience, how that I had often obſerved all thoſe which had this muſcle cut, dyed with a convulſion; but that it ſhould be farre better, that neere above the fracture the bone ſhould be Trepaned, not touching the Temporall muſcle at all if he could. When all of them at the laſt had inclined to my opinion, I preſently divided the muſculous ſkinne which was over the upper part of the fracture with a three cornered ſection: the day following which was the third of his diſeaſe I Trepaned him, and after I had done, ſome few dayes after, I tooke out ſome foure ſplinters of the broken bone; and I put in a plaine leaden pipe, by which (I wiſhing the patient ever when I dreſt him to hold downe his head, to ſtoppe his mouth and his noſe, and then ſtrive as much as in him lay to put forth his breath) much ſanious matter came forth, which was gathered betweene the ſcull and *Craſſa Meninx*. Other filth which ſtucke more faſt, I waſhed out with a detergent decoction, injected with ſuch a ſyring as is heere expreſt; And I did ſo much, God bleſſing my endeavours, that at length he recovered.



A Plane leaden pipe for to carry forth the Sanies gathered under the ſcull.



A little ſyring fit to make injections withall.

A hiſtory.

The like chance and fortune befell Monſieur *de Pienne* at the ſeige of *Mets*. For he as hee fought at the breach of the wall, had the bone of his Temples broken with a ſtone ſtrucke out of the adjacent wall, by a peece of Ordinance ſhot from the Emperours campe; he preſently fell downe with the blow, and caſt blood out of his mouth, noſe and eares, with much vomiting, and remained dumbe & as it were ſenceleſſe almoſt foureteene dayes, ſo that he knew none of the by-ſtanders. He had often palpitations, and convulſiue twitchings, and his face was ſwollne. His forehead bone was Trepaned at the ſide of the Temporall muſcle by the hand of *Peter Aubert* the Kings Chirurgion: and although on the 25. day, ſoft fleſh, endued with exquiſite ſenſe grew out of the hole made with the Trepan, whoſe growth could not bee hindred by Cathæreticke pouders, yet at the length he recovered.

The Ancients called this kinde of growing fleſh a *Fungus* [*i.* a Muſhrome] for that it is ſoft, and growes with a ſmall roote and broad top like a muſhrome: but it encreaſes and decreaſes, according to the plenty of the flowing matter, and induſtry of the Chirurgion hindring by art the growth thereof.

This fleſh ſtinkes exceedingly, they commonly call it *Ficus ſancti Piacrÿ* [*i.* the

figge

The generation of a *Fungus*.

Figge of S. *Fiacrye.*] This diſeaſe commonly hath its originall after this manner. Even as in the bodies of Trees from the excrements of nouriſhment, a certaine halfe putrid groſſe and viſcous humor ſweats through the barke, and gathered together by little and little growes into a Muſhrom, ſo blood melancholly both in temper and conſiſtence, ſprings from the broken veſſells of the ſcull and *Craſſa Meninx*, which alſo is ſent ſometimes by nature for the neceſſary repairing of the fleſh in theſe parts, whereupon a certaine *fungus* breedes, which in *Galens* opinion, ſavors or partakes of the nature and condition of the parts to which it growes; though in generall it bee of the nature of maligne warts, or excreſcences. But for to take away ſuch *Fungi*, you muſt apply medicines which have a ſpecifick faculty to waſte ſuperfluous fleſh; ſuch are theſe which ſtrongly dry, and gently waſte and eate, ſuch as this which followes.

℞ *Sabinæ* ʒij. *ocræ* ʒj. *pulveriſentur ſimul, aſpergatur caro excreſcens.* or elſe. ℞ *Hermodactylorum combuſtorum* ʒß. make a pouder for the ſame uſe. But if ſo be that this fungous fleſh come to ſuch growth, (as it often happens,) as to equall the bigneſſe of an egge, it muſt be tyed and ſtraite twitched, cloſe to the roote with a ſilken thred; and when it ſhall fall away by reaſon of this binding, the place muſt be ſtrewed with the forementioned powders, for ſo it will be more certainely cured, than with more acride cathæretickes.

CHAP. XX.

Of the corruption and Caries, *or rottenneſſe of the bones of the Head.*

Why when the ſcull is broken the bones ſometimes become foule or rotten.

THere ſometimes followes a corruption and Sphacell of the fractured bones of the ſcull upon wounds of the head; which happens either becauſe they are touched by the ayre, which they are not ſenſible of; or for that the *Sanies* putrifying and detained under them, hath infected them with like putrifaction; or by the cure unskillfully handled, they becoming more moyſt, by the raſh application of ſuppurating and oyly medicines and ſo undergoing an unnaturall change of their proper complexion and native temper, as we ſhall ſhew more at large when we ſhall treate of the reaſon of the *Caries* in the *Lues venerea.* We ſhall know this unnaturall change and corruption, partly by ſight, that is, when from white they become to be yellowiſh, livide and black; partly alſo by putting downe a probe; when as it meets with nothing ſmooth and ſlippery, but feeles rough in many places, and beſides alſo when it enters and eaſily penetrates with a ſmall thruſting downe into their ſubſtance, as if it were fungous. Yet this laſt ſigne may often deceive you, for I have diverſe times obſerved rotten bones, which being bare had long ſuffered the injury of the ayre, to become ſo hard that a Trepan would ſcarſe peirce them; for it is putride humidity which makes the bones ſoft and fungous; but the ayre by drying them exhauſts this humiditie and laſtly dryes it, whence followes ſuch contumacious hardneſſe. This ſigne will bee farre more certaine, if the fleſh which is growne upon the bone be more ſoft than is fit, looſe and have little or no ſenſe or feeling. You may correct and amend this corruption of the bone with cauteries aswell actuall, as potentiall, or with the powders of Aloes, Gentian, *Ariſtolochia*, centaury, *cortex pini*, as,

The ſignes of fouleneſſe of the bone.

Corrupt bones are ſometimes hard.

℞ *radic. Ireos, Flor. ariſtolochiæ an.* ʒj. *centaur.* ʒij. *corticis pini* ʒß. *Miſce & fiat pulvis ſubtiliſſimus oſi inſpergendus.* But if it be much corupted, it muſt bee ſcraped forth with your *Scalpra.* And you muſt expect the falling or ſcailing of the corrupt bone from the ſound, and not forcibly procure it; for otherwiſe the ſound bone, which lyes under it, being as yet covered with no fleſh growing over it, would be corrupted by the appulſe, or touch of the ayre. Yet you ſhall by little and little gently move and ſhake rotten bones with your probe, that ſo they may more eaſily ſcaile and with leſſe trouble to nature. But note by the way, that the ſcailing of the bone which hath environed the Trepan, is commonly performed in the ſpace of fortie or fifty dayes. So long alſo will that cauſed by the unuſuall appulſe or touch of the aire, or application of a Cautery, or the aſperſion of Cephalicke pouders; beſides alſo in the ſame number of dayes broken bones may be united and joyned together by a *Callus*, which is to them as a ſcarre, yet ſometimes ſooner, ſomewhiles latter according to the variety of the ages, tempers and habits of divers men.

The benefit of a valnerary potion.

But if the *Caries* or *Rottennes* can neither by theſe fore mentioned remedies be orecome and amended, neither the looſed continuity agglutinated nor united, you muſt give the patient a vulnerary potion, for hence I have found happy ſucceſſe in many. But ſometimes not onely a certaine portion of the bone, is taken with a *Caries*, but alſo the whole is often ſeazed upon with ſphacell, and all falls out. For in *Hippocrates* opinion, *Lib. de vulneribus capitis*, the bone of the ſcull being broken falls from the ſound more or leſſe, according to the violence of the blow; which alſo is confirmed by experience.

A Hiſtory.

For which purpoſe I thinke good in this place to recite a Hiſtory, whereof I was an eye witneſſe, whilſt I ſerved as Chirurgion in *Piemont* under the Marſhal *de Montejan* (who was the Kings Leiſtenant there.) It happened that a Lackey of Monſieur *de Goulaines* came to me to be cured; he had the *Bregma* bone of the left ſide broken with a ſword, neither yet did the fracture come to the ſecond Table; a few dayes after his recovery the bone being agglutinated and united, it came to paſſe that a company of *Gaſcoine* ſouldiers his countreimen came to *Turin*, with whom one morning he eate plentifully Tripe fryed with Onions and ſpices, & drunke a great quantitie of ſtrong wine. Whereupon he preſently fell into a continuall Feaver, and loſt his ſpeech and underſtanding; his head ſwelled, his eyes looked red and fiery and as though they would have ſtarted out of his head. Which things being conſidered, I let him blood, having firſt (by the Phyſitions advice) given him a Gliſter, and applyed to his head ſuch things as were fit, and alſo I laboured with Frictions and Ligatures of the extreame parts to draw the humors downewards; yet for all this the part of the head which was formerly affected begun to impoſtumate; which being opened, there came forth a great quantity of matter, and at the length the muſculous skinne and *Pericranium* ſincking downe, both the Tables of the ſcull became putrified and rotten, as you might know by their blackneſſe and ſtench. Now to take away this coruption, I applyed at certaine times actuall cauteries, both to amend the corruption and ſeparate that which was altered: but marke, after ſome months ſpace, a great number of wormes came forth by the holes of the rotten bones from underneath the putrified ſcull; which moved me to haſten the ſeparation and falling away of the putrid bones. Which being done, upon the very *Craſſa Meninx*, which is more ſtrange, in that place which nature had covered with fleſh, I obſerved three cavities of the largeneſſe of ones thumbe filled with wormes about the bigneſſe of a points tagge, with blacke heads, diverſly wrapped amongſt themſelves. The bone which nature ſeparated was of the bigneſſe of the palme of ones hand, ſo that it was ſtrange that ſo large a portion of the ſcull ſhould bee caſt off by nature, and yet the patient not dye thereof; for he recovered yet beyond all mens expectation, but after the agglutination of the wound the ſcarre remained very hollow according to the decree of *Hippocrates*. For fleſh doth not eaſily grow upon a *Callus*, becauſe it is a thing ſtrange and ſuppoſititious by nature; beſides, as a ſcarre is a thing more denſe than the skinne, ſo is a *Callus* than the bone, ſo that through the more compact ſubſtance thereof, the blood can neither freely, nor plentifully ſweat through for matter to regenerate fleſh. Hence it is, that whereſoever any portion of the ſcull is wanting, you may there by putting too of your hand perceive and feele the beating of the Braine, wherefore the ſcull muſt needes bee much weaker in that place. Now to helpe this infirmity, I wiſhed this Lackey to weare a Cap made of thicke leather, ſo more eaſily to withſtand externall injuries, and verily thereby he grew much better.

A great falling away of a corrupt bone.

Aph. 45. Sect. 6

The covetous craft of impoſtors.

Now I thinke good in this place to lay open the deceite and craft of ſome Impoſtors falſly ſtiling themſelves Chirurgions, who when they are called to cure wounds of the head, wherein any part of the ſcull is loſt, perſwade the patient and his friends, that they muſt put a plate of gold in the place of the ſcull which is wanting. Wherefore they hammer it, in the preſence of the patient, and turne it divers wayes and apply it to the part, the better to fit it; but preſently after they ſliely convey it into their purſes, and ſo leave the patient thus coſened. Others bragge that they are able to put the dryed rinde of a gourd into the place of the loſt bone, and faſten it on to defend the part; and thus they groſſely abuſe thoſe which are ignorant in the Art. For this is ſo farre from being done that nature will not ſuffer nor endure ſo much as an haire, or any other ſmall body to be ſhut up in a wound when it is cicatrized; neither is the reaſon alike of a leaden bullet which ſhot into the body lyes there for many yeeres without any harme to the patient; for although lead have a certaine familiarity with mans body, yet is it at length (unleſſe the denſity of the oppoſed fleſh, ligament, tendon, or ſome other ſuch like ſubſtance hinder) thruſt forth by nature impatient of all ſtrange bodies. And thus much of the rottenneſſe and corruption of fractured bones; now muſt we ſpeake of the diſcommodities which befall the *Meninges* by wounds whereby the ſcull is broken.

Chap. XXI.

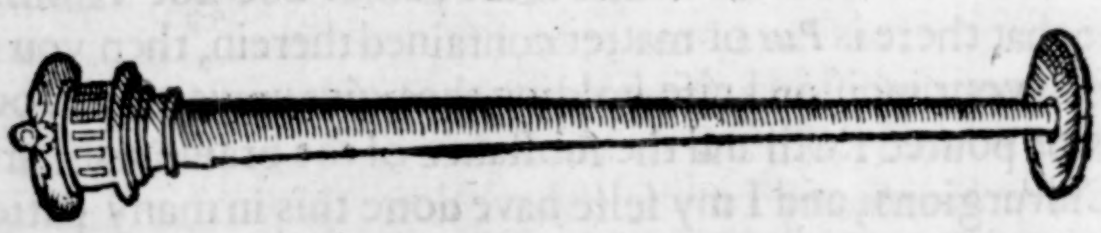
Of the diſcommodities which happen to the Craſſa Meninx *by fractures of the ſcull.*

Many diſcommodities chieſely happen to the *Craſſa Meninx* by a fracture of the ſcull and raſh Trepaning thereof; for it ſometimes chances to bee cut and torne. Agglutination is a remedy for this diſeaſe, which *Hippocrates* wiſhes to be procured with the juice of *Nepeta* [that is, of that calamint, which ſmells like Penny-royall] mixed with barly floure. In ſteed whereof this following powder having the like faculty may take place.

Remedies for the lacerated *Meninx*.

℞ *Colophon.* ℥iij. *Myrrha, aloes, maſtiches, ſanguinis Dracon. an.* ʒj. *croci, ſarcocollæ an.* ʒß. *miſce & fiat pulvis ſubtilis.* But to purge the blood and matter which is gathered and lyes betweene the *Craſſa Meninx* and ſcull, you ſhall put in a Tent made of a ragge twined up ſome foure or five double, and ſteeped in ſyrupe of Roſes or wormewood and a little *aqua vitæ*; for thus you ſhall preſſe downe both the *Craſſa Meninx*, leſt lifted up by the accuſtomed and native pulſation of the braine, it ſhould be hurt by the edges of the ſcull yet rough by reaſon of the ſharpe ſplinters of the bone lately Trepaned, and give freer paſſage forth for the matter there contained. But as oft as you ſhall dreſſe the patient, you ſhall renue the forementioned Tent, untill all the matter be purged forth. And ſo often alſo you ſhall preſſe downe with the following inſtrument the *Dura Mater*, and bid the patient to ſtrive to put forth his breath, ſtopping his mouth and noſe, that ſo the matter may more eaſily be evacuated. This Inſtument wherewith you ſhall hold downe the *Dura Mater*, muſt have the end round, poliſht and ſmooth as it is here expreſt.

A fit Inſtrument to preſſe and hold downe the Dura Mater, *ſo to make way for the paſſage forth of the* Sanies *or* Matter.



And let there be layd upon the *Dura Mater* ſtrewed over with the formerly mentioned powder, a ſpunge moyſtened and wrung forth of a drying decoction made of aromaticke and cephalicke things, ſuch as this which followes.

℞, *Fol. ſalviæ, majoran. betonicæ, roſar. rub. abſinth. Myrtil. florum chamæm. melil. ſtæchad. utriuſque an. M.* iij. ß. *rad. cyperi, calam. aromat. ireos, caryophyllatæ; angelicæ, an.* ʒß. *bulliant omnia ſecundum artem cum aqua fabrorum & vino rubro, fiat decoctio ad uſum dictum.* And in ſtead hereof you may uſe claret with a little *aqua vitæ*, that ſo the conteyned matter may bee evacuated and dryed up. A ſpunge is fitter for this purpoſe to draw than a linnen ragge or any other thing, both becauſe it is good of its ſelfe to draw forth the humidity, as alſo for that by its ſoftneſſe it

A ſpunge fit to foment withall.

Lib. de Vuln. cap.

yeelds to the pulſation of the Braine. Then apply to the wound and all the adjoyning parts, an emplaſter of *Diacalcitheos* diſſolved with vinegar, or wine, or oyle of Roſes, that ſo the plaſter may be the more cold and ſoft. For in *Hippocrates* opinion, nothing which is any thing heavie or hard muſt be applyed to wounds of the head, neither muſt it be bound with too ſtraite, or hard a ligature, for feare of paine and inflammation.

Lib. de faſceijs.

The diſcommodities of too ſtraite binding of the head.

For *Galen* tells (as he had it from *Mantias*) that a certaine man loſt his eyes by inflammation and impoſtumation ariſing, for that an Apothecarie had uſed too ſtraite a ligature to his head and face; for this ſtraite ligature ſo preſſed the ſutures, that the fuliginous vapoures, which uſed to paſſe through them and the pores of the ſcull, were ſtopped from paſſing that way; beſides, the beating of the Arteries was intercepted and hindred; by which meanes the paine and inflammation ſo encreaſed, that his eyes were rent and broke in ſunder and fell forth of their orbe.

What cloathes we muſt uſe.

How the patient muſt lye in his bed.

Wherefore *Hippocrates* rightly commends an indifferent ligature, alſo hee fitly wiſheth us to let the emplaiſters bee ſoft which are applyed to the head, as alſo the cloathes wherewith it is bound up, to bee of ſoft and thinne linnen, or of Cotton, or wooll. When the patient is in dreſſing, if there come much matter out of the wound, you ſhall wiſh him if hee can, to lye upon the wound, and now and then by fits to ſtrive to breathe, ſtopping his mouth and noſe, that ſo the braine lifted and ſwollne upwards, the matter may bee the more readily caſt forth; otherwiſe ſuffer him to lye ſo in his bed, as he ſhall beſt like of, and ſhal be leaſt troubleſome to him.

You may with good ſucceſſe put upon the *Craſſa Meninx* oyle of Turpentine with a ſmall quantity of *aqua vitæ* and a little Aloes and Saffron finely powdred, to clenſe or draw forth the *Sanies*, or matter. Or elſe,

℞. *Mellis roſar.* ℥ij. *farinæ hord. pulver. aloes, Maſtich. & Ireos Florent. an.* ʒß. *aqua vitæ parum*; let them be incorporated together and make a deterſive medicine for the foreſayd uſe.

Paræus lib. 6. cap. 90.

Sometimes alſo the *Craſſa Meninx* is inflamed after Trepaning, and ſwolne by a *Phlegmon*, that impatient of its place, it riſes out of the hole made by the Trepan, and lifts its ſelfe much higher than the ſcull, whence greevous ſymptomes follow. Wherefore to prevent death, of which then wee ought to bee afraid, wee muſt inlarge the former hole with our cutting mullets, that the matter contained under the ſcull, by reaſon of whoſe quantity the membraine ſwells, may the more freely breathe and paſſe forth; and then we muſt goe about by the preſcript of the Phiſition to let him bleed againe, to purge and diet him. The inflammation ſhall bee reſiſted by the application of contrary remedies, as this following fomentation.

Remedies for the inflammation of the *Craſſa Meninx.*

℞ *Sem. lini, althææ, fœn. pſillij, roſ. rub. an.* ℥j. *ſolani, plantag. an. M.* j. *bulliant in aqua tepida communi, ex qua fiat fotus.* Anodyne and repelling medicines ſhall bee dropped into his eares; when it is exceedingly ſwolne, that the tumor may ſubſide, you ſhall caſt upon it the meale or floure of lentills, or vine leaves beaten with Gooſe greaſe. With all which remedies if the tumor doe not vaniſh, and withall you conjecture that there is *Pus* or matter contained therein, then you muſt open the *Dura Mater* with your inciſion knife, holding the point upwards and outwards, for ſo the matter will be poured forth and the ſubſtance of the braine not hurt nor touched. Many other Chirurgions, and I my ſelfe have done this in many patients with various ſucceſſe.

How we muſt open the *Craſſa Meninx* when it is impoſtumate

For it is better in deſperate cauſes to try a doubtfull remedy than none at all; alſo it oft times happens whither by the violence of the contuſion and blow, or concretion or clotting of the blood which is ſhed, or the appulſe of the cold ayre, or the raſh application of medicines agreeing neither in temper nor complexion with the *Craſſa Meninx*, or alſo by the putrifaction of the proper ſubſtance, that the *Dura Mater* it ſelfe becomes blacke. Of which ſymptome the Chirurgion muſt have a great and ſpeciall care.

The cauſes and remedies of the blackeneſſe of the *Dura Mater.*

Remedies for contuſion.

Therefore that thou mayſt take away the blackneſſe, cauſed by the vehemencie of the contuſion, you ſhall put upon it oyle of egges with a little *Aqua Vitæ*, and a ſmall quantity of Saffron and Orris roots in fine powder; you ſhall alſo make a fomentation of diſcuſſing and aromaticke things boiled in water and wine; and *Vigoes* Cerat formerly deſcribed ſhall bee applyed. But if the harme come from congealed blood, you ſhall withſtand it with this following remedie.

For congealed blood.

℞ *Aquæ Vitæ* ℥ij. *granor. tinctorum in tenuem pulverem tritorum* ʒiiß. *croci*, ℈I. *Mellis roſat.* ʒjß. *ſarcocol.* ʒiij. *Leviter & ſimul bulliant omnia, & de colatura infundatur, quouſque nigrities fuerit obliterata.* If this affect come by the touch of the ayre, it ſhall bee helped with this following remedie.

For the hurt received by the ayre.

℞ *Tereb. ven.* ℥iij, *Mellis roſ.* ℥ij. *Vitellum ovi unum, farin. hordei* ʒiij. *croci* ℈j. *ſarcocol.* ʒij. *aq. vitæ* ʒij. *Incorporentur ſimul, & bulliant paululum.* This remedy ſhall be uſed untill the blackneſſe be taken away, and the membrane recover its priſtine colour.

What medicines make the *Craſſa Meninx* blacke.

But if this affect proceedes from the raſh uſe of medicines, it muſt bee helped by application of things contrary. For thus the offence cauſed by the too long uſe of moyſt and oyly medicines, may be amended by uſing catagmaticke & cephalick powders; but the heate and biting of acride medicines, ſhal be mitigated by the contrary uſe of gentle things; for both humide and acride things ſomewhat long uſed make the part looke blacke; that truely by generating and heaping up filth, but this by the burning and hardening heate. But when ſuch blackneſſe proceedes from putrifaction, *Iohn de Vigo* commends the following remedie.

Medicines against the putrefaction of the *Meninx*.

℞ *aquæ vitæ* ℥ij *mellis roſat.* ℥ß. But if the affect be growne ſo contumacious that it will not yeeld to this gentle remedy, then this following will bee convenient.

℞ *Aq vitæ* ℥iij. *mellis roſ.* ℥j *pulver. Mercur.* ʒij. *unica ebullitione bulliant ſimul ad uſum dictum.* Or ℞ *aquæ vit.* ℥iß. *ſyrup. abſinth & mellis roſat. an.* ʒij. *unguenti ægyptiaci* ʒijß. *ſarcocol. myrrhæ, aloes, an.* ʒj. *vini albi boni & odoriferi,* ℥j. *bulliant leviter omnia ſimul, colentur ad uſum dictum.* But if the force of the putrefaction be ſo ſtubborne, that it will not yeeld to theſe remedies, it will be helped with *Ægyptiacum* (made with plantaine water in ſteed of Vinegar) uſed alone by its ſelfe, or with the powder of Mercury alone by it ſelfe, or mixt with the powder of Alome. Neither muſt we bee afraid to uſe ſuch remedies eſpecially in this extreame diſeaſe of the *Dura Mater*; for in *Galens* opinion the *Craſſa Meninx* after the ſcull is Trepaned delights in medicines that are acride, that is, ſtrong and very drying, eſpecially if it have no *Phlegmon*; and this for two reaſons; the firſt is, for that hard and dry bodies, ſuch as membranous bodies are, be not eaſily affected unleſſe by ſtrong medicines; the other is, which muſt be the chiefe and prime care of the Phyſition, to preſerve and reſtore the native temper of the part by things of like temper to it. But if the auditory paſſage not onely reaching to the hard membranes of the Braine, but alſo touching the Nerve which deſcends into it from the braine, ſuffer moſt vehement medicines, though it be placed ſo neere; certainely the *Craſſa Meninx* will endure them farre more eaſily and without harme.

Why the *Craſſa Meninx* eaſily endures acrid medicines.

But if by theſe meanes the putrifaction be not reſtrained, and the tumor bee encreaſed ſo much, that the *Dura Mater* riſing farre above the ſcull, remaines unmoveable, blacke and dry, and the patients eyes looke fiery, ſtand forth of his head and rowle up and downe with unquietneſſe and a phrenſie, and theſe ſo many ill accidents be not fugitive, but conſtant; then know that death is at hand, both by reaſon of the corruption of the gangræne of a noble part, as alſo by extinction of the natiue heate.

Signes of death at hand.

CHAP. XXII.

Of the cure of the Braine being ſhaken, or moved.

What the concuſſion of the braine is.

WEe have formerly declared the cauſes, ſignes and ſymptomes of the concuſſion, or ſhaking of the Braine, without any wound of the muſculous skinne, or fracture of the bone; wherefore for the preſent I will treate of the cure.

Therefore in this caſe, for that there is feare that ſome veſſell is broken under the ſcull, it is fit preſently to open the cephalicke veine. And let bloud bee plentifully taken according to the ſtrength of the patient, as alſo reſpectively to the diſeaſe both which is preſent, and like to enſue, taking the advice of a Phyſition.

Then when you have ſhaven away the haire, you ſhall apply to the whole head and often renue the forementioned cataplaſme, *Ex farinis, oleo roſaceo, oxymelite,* and other like cold and moyſt repelling medicines. But you muſt eſchew dry, and too aſtringent medicines muſt bee ſhunned, ſuch as are *Vnguentum de bolo* and the like; for they obſtruct too vehemently, and hinder the paſſage forth of the vapours both by the ſutures and the hidden pores of the ſcull. Wherefore they doe not onely not hinder the inflammation, but fetch it when it is abſent, or encreaſe it, when preſent. The belly ſhall bee looſed with a gliſter, and the acride vapours drawne from the head; for which purpoſe alſo it will bee good, to make frictions from above downewards, to make ſtraight ligatures on the extreame parts, to faſten large cupping-glaſſes with much flame to the ſhoulders and the originall of the ſpinall marrow, that ſo the revulſion of the blood running violently upwards to the braine, and ready to cauſe a phlegmon, may be the greater. The following day it will be convenient to open the *Vena Puppis,* which is ſeated upon the Lambdall ſuture, by reaſon of the community it hath with the veines of the braine, and ſhutting the mouth and noſe to ſtrive powerfully to breathe. For thus the membranes ſwell up, and the blood gathered betweene them and the ſcull is thruſt forth; but not that which is ſhut up in the braine and membranes, of which if there be any great quantity, the caſe is almoſt deſperate, unleſſe nature aſſiſted with ſtronger force, caſt it forth turned into *Pus.* But alſo after a few dayes the *vena frontis* or forehead veine may be opened, as alſo the Temporall Arteries and Veines under the tongue, that the conjunct matter may bee drawne forth by ſo many open paſſages.

The opening of the *Vena Puppis.*

In the meane ſpare the Patient muſt keepe a ſpare diet, and abſtaine from wine, eſpecially untill the fourteenth day, for that untill that time the fearefull ſymptomes commonly reigne. But repelling medicines muſt be uſed untill the fourteenth day be paſt, then we muſt come to diſcuſſing medicines, beginning with the more milde, ſuch as is this following decoction.

A diſcuſſing fomentation.

℞. *rad. Alth.* ℥vj. *ireos, cyperi, calami arom. an.* ʒij. *fol. ſalviæ, Majoran, betonic. flor. chamæm. melil. roſ. rub. ſtæchad. an. M.* ß. *ſalis com.* ℥iij. *bulliant omnia ſimul ſecundum artem cum vino rub. & aqua fabrorum, fiat decoctio.* Let the head bee waſhed therewith twiſe a day with a ſpunge. But yet when you doe this, ſee that the head bee not to much heated by ſuch a fomentation, or any ſuch like thing, for feare of paine and inflammation.

A caution in fomenting the head.

Then you ſhall apply the cerate of *Vigo* which hath power to diſcuſſe indifferently, to dry, and draw forth the humors which are under the ſcull, and by its aromaticke force and power to confirme and ſtrengthen the braine; it is thus deſcribed.

A deſcription of *Vigoes* Cerate.

℞. *Furfuris bene triturati* ℥iij. *farin. lentium* ℥ij. *roſ. myrtillor. foliorum & granorum ejus, an.* ℥j. *calam. aromat.* ℥iß. *chamæmel. melil. an. M.* ß. *nuces cupreſſi num.* vj. *olei roſacei, & chamæm. an.* ℥iij. *ceræ albæ* ℥iiß, *thuris, maſtichis, an.* ʒiij. *myrrhæ* ʒij. *In pulverem quæ redigi debent redactis, & liquefactis oleis cum cera,* *omnia miſceantur ſimul, & fiat mixtura, quæ erit inter formam emplaſtri & ceroti.*

A Hiſtory.

Vigo ſaith, that one of the Duke of *Vrbins* Gentlemen found the virtue hereof to his great good. Hee fell from his horſe with his head downewards upon hard Marble, he lay as if hee had beene dead, the blood guſht out of his noſe, mouth and eares, and all his face was ſwollen and of a livide colour; hee remained dumbe twenty dayes, taking no meat but diſſolved gellies, and Chicken, and Capon broths with ſugar; yet he recovered, but loſt his memorie, and faultered in his ſpeech all his life after. To which purpoſe is that Aphoriſme of *Hippocrates*; Thoſe which have their Braine ſhaken by what cauſe ſoever, muſt of neceſſity become dumbe; yea alſo, as *Galen* obſerves in his commentary, looſe both their ſenſe and motion. That Cerat is not of ſmall efficacie, but of marvellous and admirable force, which could hinder the generating of an abſceſſe, which was incident to the braine by reaſon of the fall.

Aph.58.ſect.7.

That there may be an abſceſſe in the braine.

Yet there be many men ſo farre from yeelding to reaſon, that they ſtifly denie, that any impoſtumation can be in the braine, and augmenting this errour with another, they deny that any who have a portion of the braine cut off can recover, or riſe againe; but the authority of ancient writers and experience doe abundantly refell the vanitie of the reaſons whereon they relye. Now for the firſt in the opinion of *Hippocrates*; If thoſe which have great paine in their heads have either *pus*, water or blood flowing from their Noſe, mouth or eares, it helpes their diſeaſe.

Aph.10.ſect.6.

Gal.lib.de inæqual. intemp. Rhaſ.cap.4. continent. Avicen.cap.de exit. fen.3.lib.4.cap.20.

But *Galen*, *Rhaſis* and *Avicen* affirme that *Sanies* generated in the braine diſburdens its ſelfe by the noſe, mouth or eares; and I my ſelfe have obſerved many who had the like happen to them.

A Hiſtory.

I was told by *Prothais Coulen* Chirurgion to Monſieur *de Langey*, that he ſaw a certaine young man in the towne of *Mans*, who often uſed to ring a great bell; hee once hanging in ſport upon the rope, was ſnatch up therewith and fell with his head full upon the pavement: he lay mute, was deprived of his ſenſes and underſtanding, and was beſides hard bound in his belly. Wherefore preſently a feaver and *delirium* with other horrid ſymptomes aſſayled him, for he was not Trepaned becauſe there appeared no ſigne of fracture in the ſcull: on the ſeaventh day hee fell into a great ſweate with often ſneeſing, by the violence whereof a great quantity of matter and *Pus* flowed forth of his eares, mouth and noſe, then hee was eaſed of all his ſymptomes, and recovered his health.

Lib.8.de. uſu part. & com. ad aph.18. ſect.6.

Now for the ſecond, *Galen* affirmes that he ſaw a Boy in *Smirna* of *Ionia* that recovered of a great wound of the braine, but yet ſuch an one as did not penetrate to any of the ventricles.

But *Guido* of *Cauliac* ſaith, he ſaw one which lived and recovered after a great portion of the braine fell out by reaſon of a wound received on the hind part of his head.

In the yeare of our Lord 1538, while I was Chirurgion to the Marſhall of *Monteſjan* at *Turin*, I had one of his Pages in cure, who playing at quoites received a wound with a ſtone upon the right *Bregma* with a fracture, and ſo great an effracture of the bone, that the quantity of halfe a haſell Nut of the braine came forth thereat. Which I obſerving, preſently pronounced the wound to bee deadly; a Phyſition which was preſent contradicted my opinion, affirming that ſubſtance was no portion of the braine, but a certaine fatty body. But I with reaſon and experience in preſence of a great company of Gentlemen, convinced the pertinacie of the Man; with reaſon; for that fat cannot be generated under the ſcull, for although the parts there contained be cold, yet becauſe they are heated by the abundance of the moſt hot and ſubtle animall ſpirits, and the heate of vapours riſing thither from all the body, they doe not ſuffer fat to concreate about them. But with experience, for that in the diſſecting of dead bodies, there was never any fat obſerved there; beſides alſo fat will ſwimme on the top of water; but this ſubſtance as marrowie, caſt into the water preſently ſunke to the bottome.

Why fat cannot be generated under the ſcull.

Signes of a fatty ſubſtance.

Laſtly, fat put to the fire becomes liquide and melts; but this ſubſtance being layd upon a hot Iron, became dry, ſhrunke up and contracted it ſelfe like a peece of leather; but diſſolved not at all. Wherefore all thoſe which were preſent cryed out, that my judgement was right of that ſubſtance that came forth of the ſcull. Yet though it was cut away, Page recovered perfectly, but that he continued deafe all his life after.

CHAP. XXIII.

Of the wounds of the face.

Why we treat in particular of wounds of the face.

HAving treated of the wounds of the head by their cauſes, ſignes and cure, it followes that we now ſpeake of the wounds of the face, if but for this, that when they are careleſſely handled, they leave deformed ſcarres in the moſt ſpecious and beautifull part of the body. The cauſes are the ſame which are incident to the ſcull, that is, externall. But this may bee added to the kindes and differences of the wounds, that the life may be out of danger though any one whole part of the face, (as the eare, eye, noſe, lippe) may bee cut away by a wound, but not ſo in the head or ſcull. Wherefore beginning at the wounds of the eye browes, wee will proſecute in order the wounds of the other parts of the face.

A thing to be obſerved in wounds of the eyebrows.

This is chiefely to bee obſerved in wounds of the eye-browes, that they are oft times cut ſo overtwhart, that the muſcles, and fleſhy pannicle which moove and lift them up, are wholy rent and torne. In which caſe the eye liddes cannot be opened, and the eyes remaine covered, and as it were ſhut up in the caſes of their lids; ſo that even after the agglutination of the wound, if the patient would looke upon any thing, he is forc'd to hold up the eye-lids with his hand; with which infirmity I have ſeene many troubled, yet oft times not ſo much by the violence of the wound, as by the unskilfulneſſe of the Chirurgion who cured them; that is, by the negligent application of boulſters, an unfit ligature and more unfit ſuture. In this caſe the skilfull Chirurgion which is called to the patient ſhall cut off as much of the skinne and fleſhy pannicle as ſhall ſerve the eyelids, that ſo they may by their owne ſtrength holde and keepe open, without the helpe of the hand: then he ſhall ſow the wound as is fit, with ſuch a ſtitch as the Furriers, and Glovers uſe; and then he ſhall poure thereon ſome of the balſome of my deſcription, and ſhall lay ſuch a medicine to the neighbouring parts.

R *Olei roſar.* ℥ß. *album. ovor. nu.* ij. *boli armeni, ſanguinis Dracon. Maſtich. an* ʒj. *agitentur ſimul, fiat medicamentum.* Then let the part be bound with a fitting ligature. Afterwards you ſhall uſe *Emplaſt. de gratia Dei, Empl. de Betonica, Diacalcitheos,* or ſome other like, untill the wound be cicatrized. But ſuch like and all other wounds of the face may be eaſily healed, unleſſe they either bee aſſociated with ſome maligne ſymptomes, or the patient body be repleate with ill humors.

Lagophthalmia **is a quite contrary to the falling downe of the eye-lids.**

There ſometimes happens a quite contrary accident in wounds of the eye-browes, that is, when the eye-lids ſtand ſo up that the patient is forc'd to ſleepe with his eyes open, wherefore thoſe which are ſo affected are called by the Greeks *Lagophthalmi.* The cauſe of this affect is often internall, as a carbuncle or other kinde of abſceſſe, as a blow or ſtroake. It ſhall be cured by a crooked or ſemicircular inciſion made above the eye-liddes, but ſo that the extreames of the ſemicircle bend downewards, that they may be preſſed downe and ioyned as much as is needefull to amend the ſtifneſſe of the eye-lidde. But you muſt not violate the griſtle with your Inſtrument, for ſo they could no more be lifted up; the reſidue of the cure muſt bee performed as is fit.

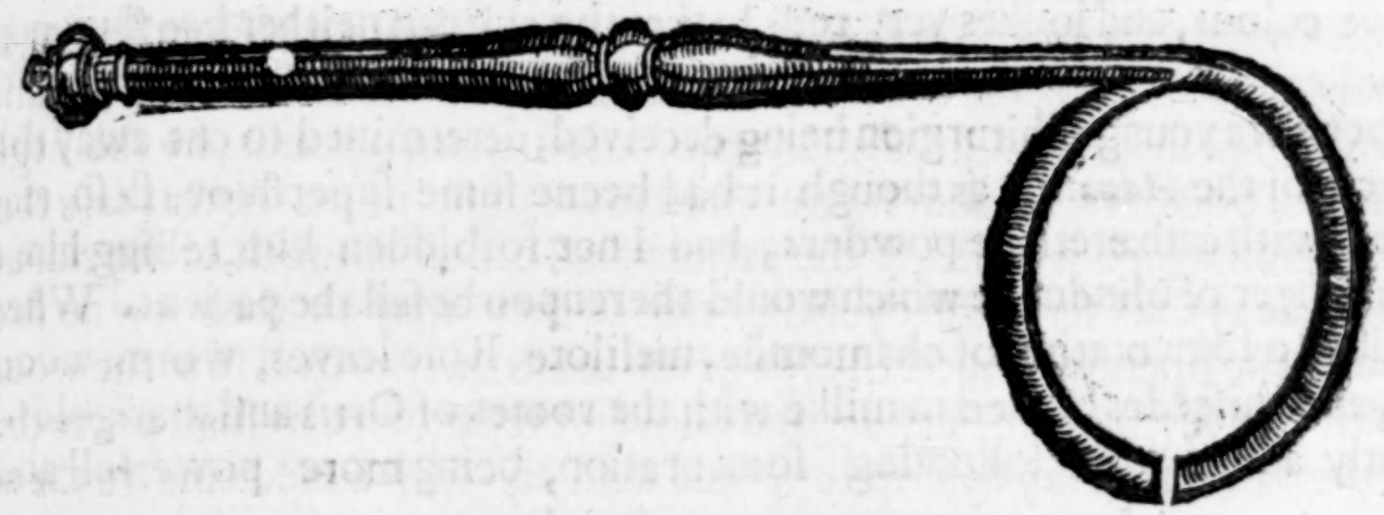
CAHP.

CHAP. XXIIII.

Of the wounds of the eyes.

WOunds of the eyes are made by the violence of things prickings cutting, bruiſing, or otherwiſe looſing the continuity. But the cure muſt alwayes be varied according to the variety of the cauſes and differences. The firſt head of the cure is, that if any ſtrange and heterogeneous body ſhall be fallen into the eyes, let it be taken forth as ſoone as you can, lifting and turning up the eyelid with the end of a *ſpatula*. But if you cannot diſcerne this moate or little body, then put three or foure ſeedes of *Clary*, or *Oculus Chriſti* into the pained eye. For theſe ſeedes are thought to have a faculty to clenſe the eyes and take out the moats, which are not faſtned deepe in, nor doe too ſtubbornely adhere to the membranes. For in this caſe, you ſhall uſe this following inſtrument, for heerewith wee open the eyelids the further, putting it betweene them and the eye, and alſo keepe the eye ſteddy by gently preſſing it, that ſo with our mullets wee may pull out the extraneous body; this is the figure of ſuch an Inſtrument.

The delineation of a Speculum oculi, fit to dilate and hold aſunder the eyelids, and keepe the eye ſteddy; it is ſo made, that it may be dilated and contracted according to the greatneſſe of the eyes.



A repercuſſive to be put into the eye.

All ſtrange bodies taken out, let this medicine be put into the eye. Take the ſtraines of a dozen egges, let them be beaten in a lead Mortar with a little Roſe water, and ſo put into the eye; but let this repercuſſive be layd upon the eye and the neighbouing parts. ℞. *albumin. ovor. nu.* iiij. *pulver. aluminis rochæ combuſti* ʒij. *ſanguinis Draconis* ʒj. *aquæ roſar. & plantag. an.* ℥ij. *agitentur ſimul*, make a repercuſſive, which you may frequently uſe. Or elſe apply cheeſe curds well wrung, mixed with Roſewater, the white of an Egge, and as much *acacia* as ſhall ſuffice. This which followeth doth more powerfully ſtay the flowing humor. ℞. *gum arab & tragac. an.* ʒij *pſilij, cydon. ſemin. portul. plant. ſumach. an.* ʒij *fiat mucag. cum aqua plantag. (olan. & roſar. concinnetur collyrium*, of which you may drop ſome both within and about the eye.

Divers repercuſſives to be applyed to the eye.

Things actually cold are hurtfull to the eyes.

But note, that all ſuch remedies muſt be applyed warme, both that they may the better penetrate by their moderate heate, as alſo for that all actuall cold things are hurtfull to the eyes and ſight, becauſe they dull the ſight by incruſtating the viſive ſpirits. For I have knowne many who have become dull of ſight by the frequent uſing of medicines actually cold to the eyes.

I have on the contrary ſeene not a few, who have recovered with the fit uſe of ſuch like medicines, who have had any part of their eye (ſo it were not the *pupilla* or Apple of the eye) ſo pricked with a needle or bodkin, that much of the watriſh humour ran forth thereat.

Anodyne medicines for the eyes.

The milke of a woman which ſuckles a girle (for that is reputed the cooler) mitigates paine and clenſes, if it bee milked out of the Dug into the eye; to which purpoſe alſo the blood of Turtles, Pidgeons or Chickens much conduces, being dropt into the eye by opening a veine under their wings. Alſo this following cataplaſme aſſwageth paine and inflammation, and hinders defluxion, being applyed to the eye and the adjacent parts. ℞ *Carnis pomorum ſub cinere calido decoctorum* ℥v. *vitellos ovorum num.* iij, *caſsiæ fiſtulæ recenter extractæ* ℥ß, *mucaginis pſilij, altheæ & cydon. an.* ℥j. *farin. hordei parum, incorporentur omnia ſimul, fiat cataplaſma.*

Narcotickes.

Alſo ſheepes lungs boyled in milke and applyed warme, and changed as they grow cold, are good to aſwage paine. But if the too violent heate and paine ſhall not yeeld to ſuch medicines, but require more vehement, then *Foliorum Hyoſcyami, m.* j. *ſub cineribus coquatur, atque in mortario cum mucagine ſeminis pſilij, & cydonior, extract. in aquis ſolani & plantag. piſtetur:* then let this medicine be wrapped in a linnen cloath and applyed to the eyes and temples. The mucilages of *Pſilium,* or Flea-wort, and Quince ſeedes extracted in a decoction of Poppy heads and mixed with a little *Opium* and Roſe water, are uſed for the ſame purpoſe. But when there is neede of detergent and ſarcoticke medicines, then ℞ *ſyrup. roſar. ſiccar.* ℥j. *aq. fænic. & rutæ an.* ʒij, *aloes lotæ, olibani an.* ℥ß. mixe them for the foreſayd uſe. The galls of Scates, Hares, and Partridges diſſolved in eye-bright and fennell water, are fit for clenſing ſuch wounds; as alſo this following *Collyrium.*

Detergent medicines.

℞ *Aquæ hordei* ℥j. *mellis deſpumati* ʒiij. *aloes ter lotæ in aqua plantaginis* and *ſacchari cand. an* ʒj. *fiat collyrium.* Alſo this enſuing medicine is very ſarcoticke.

A ſarcoticke medicine for the eyes.

℞ *mucagin. gummi olibani, arabici, tragacanth. & ſarcocol. in aq. hordei extract. an.* ʒiij, *aloes ter lotæ in aq. roſarum* ʒj. *ceruſ. uſtæ & lotæ, tutiæ præpar. an.* ʒß *fiat collyrium.*

But here you muſt note, that the coate *Adnata* often ſwells ſo much by reaſon of a wound or ſome other injurie, and ſtands ſo forth by the falling downe of humores, acceſſe and mixture of flatulencies, that it hides the whole *Pupilla,* and hangs forth of the eye-lids, like as if it were an unnaturall fleſhy excreſcence, and it looſes the native colour, and lookes very red; ſo that the eye can neither bee ſhut nor opened.

Wherewith a young Chirurgion being deceived, determined to cut away this protuberancie of the *Adnata,* as though it had beene ſome ſuperfluous fleſh, and then to waſte it with cathæreticke powders, had I not forbidden him, telling him of the certaine danger of blindneſſe which would thereupon befall the patient. Wherefore I preſcribed a fomentation of chamomile, melilote, Roſe leaves, wormewood, rue, fennell, and aniſeedes boyled in milke with the rootes of Orris and marigolds. Then I preſently added this following fomentation, being more powerfull and drying.

A drying fomentation.

℞ *Nucis cupreſsi, gallar. balauſt. an.* ℥j. *plantag. abſinth. hippuris, flo. chamæm. roſ. rub. an. M.* ß. *bulliant ſimul cum aqua fabrorum, & fiat decoctum pro fotu cum ſpongia.*

Beſides alſo you may apply a cataplaſme made of barly and beane flowre, the powders of Maſticke, Mirrhe, and Aloes, and ſome of the laſt deſcribed decoction. The tumor beginning to decline; I dropt the flowing liquor into the eye, which hath a very aſtringent, drying and ſtrengthening faculty.

Roaſt a new layd egge in Embers untill it be hard, then pill off the ſhell, take forth the yolke, and in place thereof put a ſcruple of Roman Vitrioll in fine powder, then put it in a linnen cloath and wring it hard forth into ſome cleane thing, and droppe thereof for ſome dayes into the eye, with a little ſmithes water wherein Sumach and Roſe leaves have beene boyled. I have found by experience the certaine force of this remedy; but if notwithſtanding there be a true fleſhy excreſcence upon the coate *Adnata,* it may be taken away by this following powder.

A medicine to conſume a fleſhy excreſcence without biting.

℞ *Oſsis ſepiæ, & teſtæ ovorum calcinatæ an.* ʒj, *fiat pulvis.* Calcined Vitriole, burnt Alome and the like may bee commodiouſly uſed to this purpoſe. Yet you muſt warily make uſe of all ſuch things, and alwayes lay repercuſſives about the eye, that no harme enſue thereof.

For diverſe times acride humors fall downe into the eye with ſuch violence, that they breake the Horny coate, whereupon the humors of the eye are poured out. Remember alſo, that in diſeaſes of the eyes, the Patient lye with his head ſomewhat high, and that he keepe ſhut not only the pained, but alſo the ſound eye, becauſe reſt is alwayes neceſſary for the grieved part. But one eye cannot bee moved without ſome motion of the other by reaſon of the connexion they have by their opticke and moving nerves, both the *Meninges,* the *Pericranium,* Veines, and Arteries; which is the cauſe that when the one ſuffers, the other in ſome ſort partakes therewith.

A Seton a good remedy againſt inveterate defluxions into the eyes.

But if we cannot prevaile by all theſe formerly preſcribed medicines fit to ſtay the defluxion, then it remaines, that wee apply a Seton to the necke; for it is a ſingular remedy againſt inveterate defluxions into the eyes. For we know by dayly experience, that many who have had their ſight dulled by a long and great defluxion, ſo that they were almoſt blinde, have by little and little recovered their former ſplendour and ſharpeneſſe of ſight, when matter once begun to bee evacuated by the Seton.

A Hiſtory.

The truth hereof appeared in *Paul* the Italian Goldſmith, who dwelt neere the Auſtine Friers. For he having uſed many medicines of diverſe Phyſitions, and Chirurgions in vaine, when he was almoſt blinde, he applying a Seton, by mine advice, began by little and little to ſee better according to the quantity of the matter which was evacuated, untill at length he perfectly recovered his ſight. But at laſt growing wearie of the Seton which he had worne for a yeere (although matter came dayly forth thereof) yet he would have it taken forth, and healed up; but this way of evacuation being ſhut up, and the humor againe beginning to flow into his eyes, ſo that he was in danger to become blinde, hee called me and made me againe to apply the Seton in his necke. Whereby recovering his former ſoundneſſe and perfection of ſight, he yet weares the Seton.

A Seton good againſt the falling ſickeneſſe.

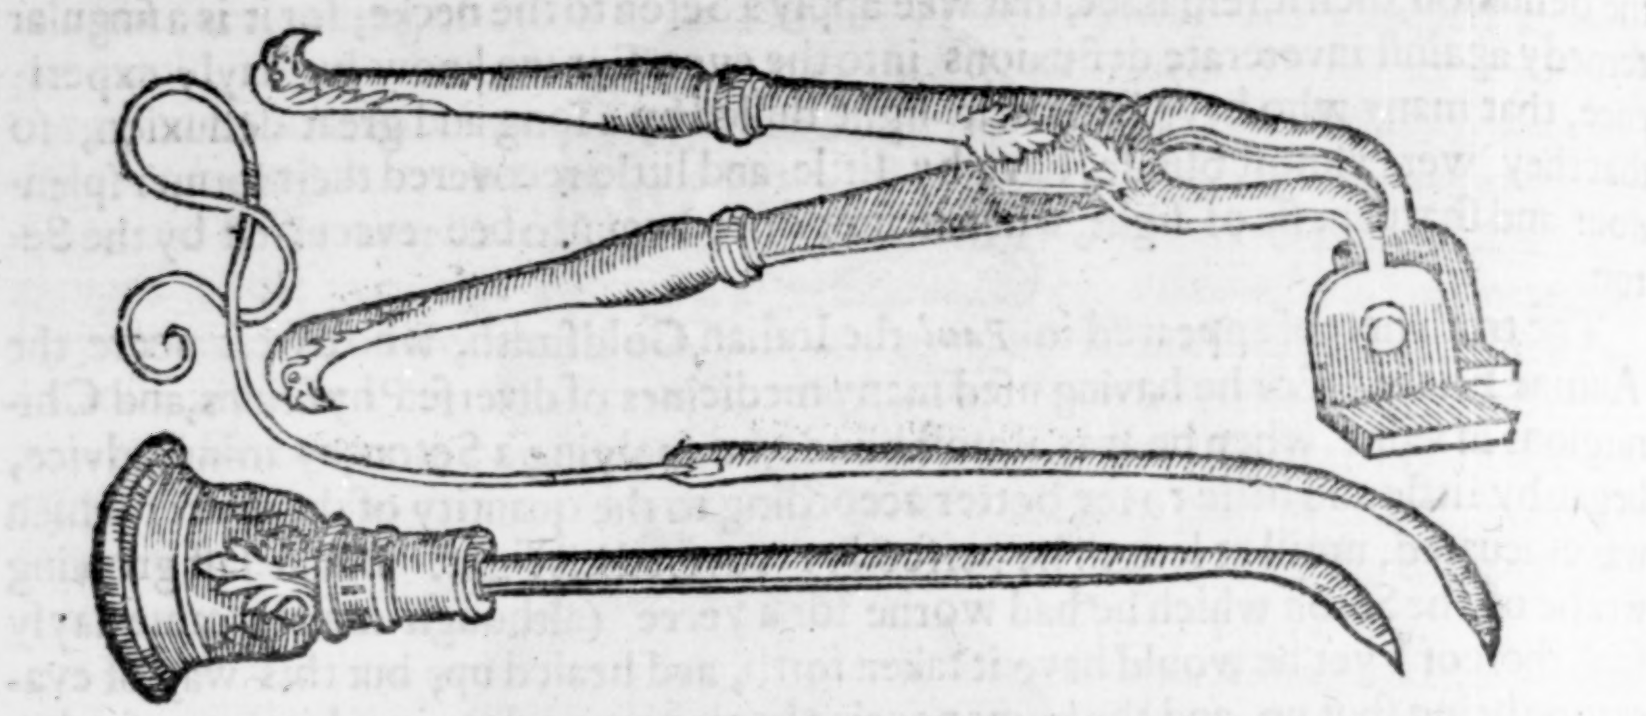
I alſo once freed by this kinde of remedy, by the appointment of the moſt learned Phyſition *Hellerius*, a certaine young man of twenty yeeres old, from the falling ſickeneſſe, who before had many fits thereof; the Ichorous humors the feeders of this diſeaſe being by this meanes, as it is moſt probable, drawne away and evacuated.

The manner of making a Seton.

Wherefore ſeeing a Seton is of this uſe, I have thought good in this place to ſet downe in writing and by figure, the manner of making thereof, for the behoofe of young practitioners. Wiſh the patient to ſit on a low ſtoole, and to bend downe his head, that ſo the ſkinne and fleſhy pannicle may be relaxed; then muſt you with your fingers plucke up and ſever the ſkinne from the muſcles, and take hold of as much hereof as you can with your pincers, not touching the muſcles of the necke for feare of a convulſion and other ſymptomes; you ſhall then twitch the ſkinne which is held in the pincers, moſt hard, when you ſhall thruſt the hot Iron through the holes made in the midſt of them; that alſo the nerves being ſo twitched, the dolorificke ſenſe may the leſſe come to the part. The wound muſt be made or burnt in long wayes and not twharting, that ſo the matters may be the better evacuated by the ſtraight fibers. But the cautery or hot Iron muſt have a three or elſe a foure-ſquare point and that ſharpe, that ſo it may the more eaſily and ſpeedily enter. Then keeping the pincers immoveable, let him draw through the paſſage made by the cautery a needle thred with a three or foure doubled threed of Cotton [or rather a skeane of ſilke] moiſtned in the white of an egge and oyle of Roſes; then after you have applyed pledgets dipped in the ſame medicine, binde up the part with a convenient ligature. The day following the necke muſt be annointed with oyle of Roſes, and the pledgets dipped in the former medicine applyed for ſome dayes after. But it will bee convenient to moiſten the Seton with a digeſtive made of the yolke of an Egge and oyle of Roſes, untill the ulcer caſt forth much matter; then you ſhall annoint the Cotton thred with this following remedie. ℞ *terebinthinæ ven.* ℥iiij. *ſyrupi roſat. & abſinthij an.* ℥ß. *pulveris Ireos, diacrydij, agarici trochiſcati, & Rhei, an.* ℥ß. *incorporentur omnia ſimul & fiat medicamentum.* Which you ſhall uſe ſo long, as you intend to keepe open the ulcer. For it hath a facultie to draw the humors from the face, and clenſe without biting.

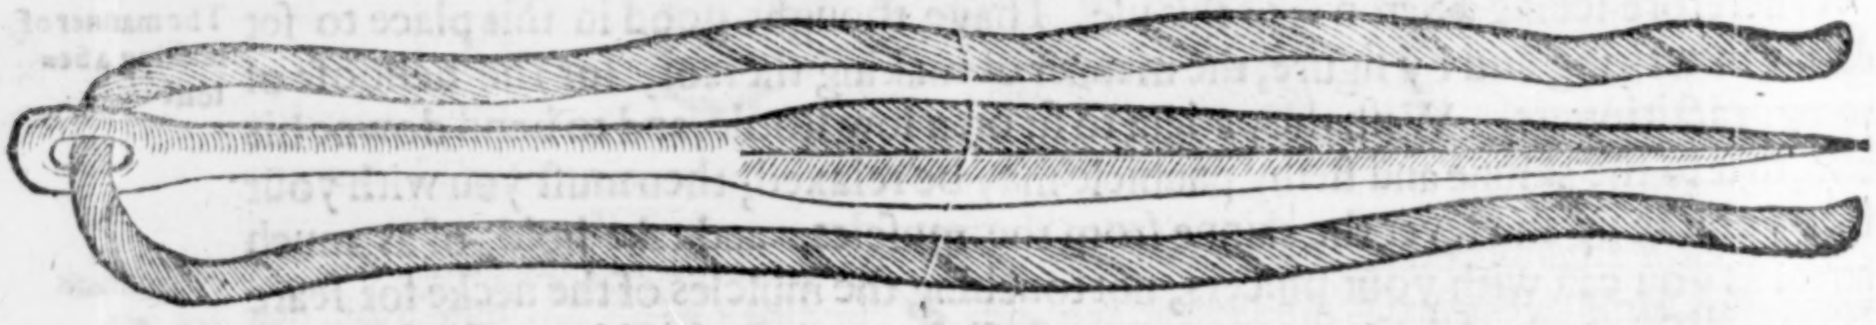
A

A figure of the Pincers, actuall Cautery and Needle uſed in making a Seton.



I have found not long ſince by experience, that the apertion made with a long thicke Triangular needle of a good length like to a large Pack-needle, is leſſe painefull, than that which is performed with the actuall cautery, which I formerly mentioned. Wherefore I would adviſe the young Chirurgion, that hee no more uſe the foreſayd actuall cauterie. I have here given you the figure of the Needle.

The Figure of a Triangular Needle.



CHAP. XXV.

Of Wounds of the Cheeke.

The uſe of a dry ſuture.

SEeing a wound of the cheeke ſeemes to require a ſuture, it muſt have a dry ſuture (as they terme it) leaſt that the ſcarre ſhould become deformed. For that deformity is very greevous to many, as to women who are highly pleaſed with their beauties. Therefore you ſhall ſpread two peeces of new cloath of an indifferent fineneſſe, and proportionable bigneſſe with this enſuing medicine.

How to make a dry ſuture.

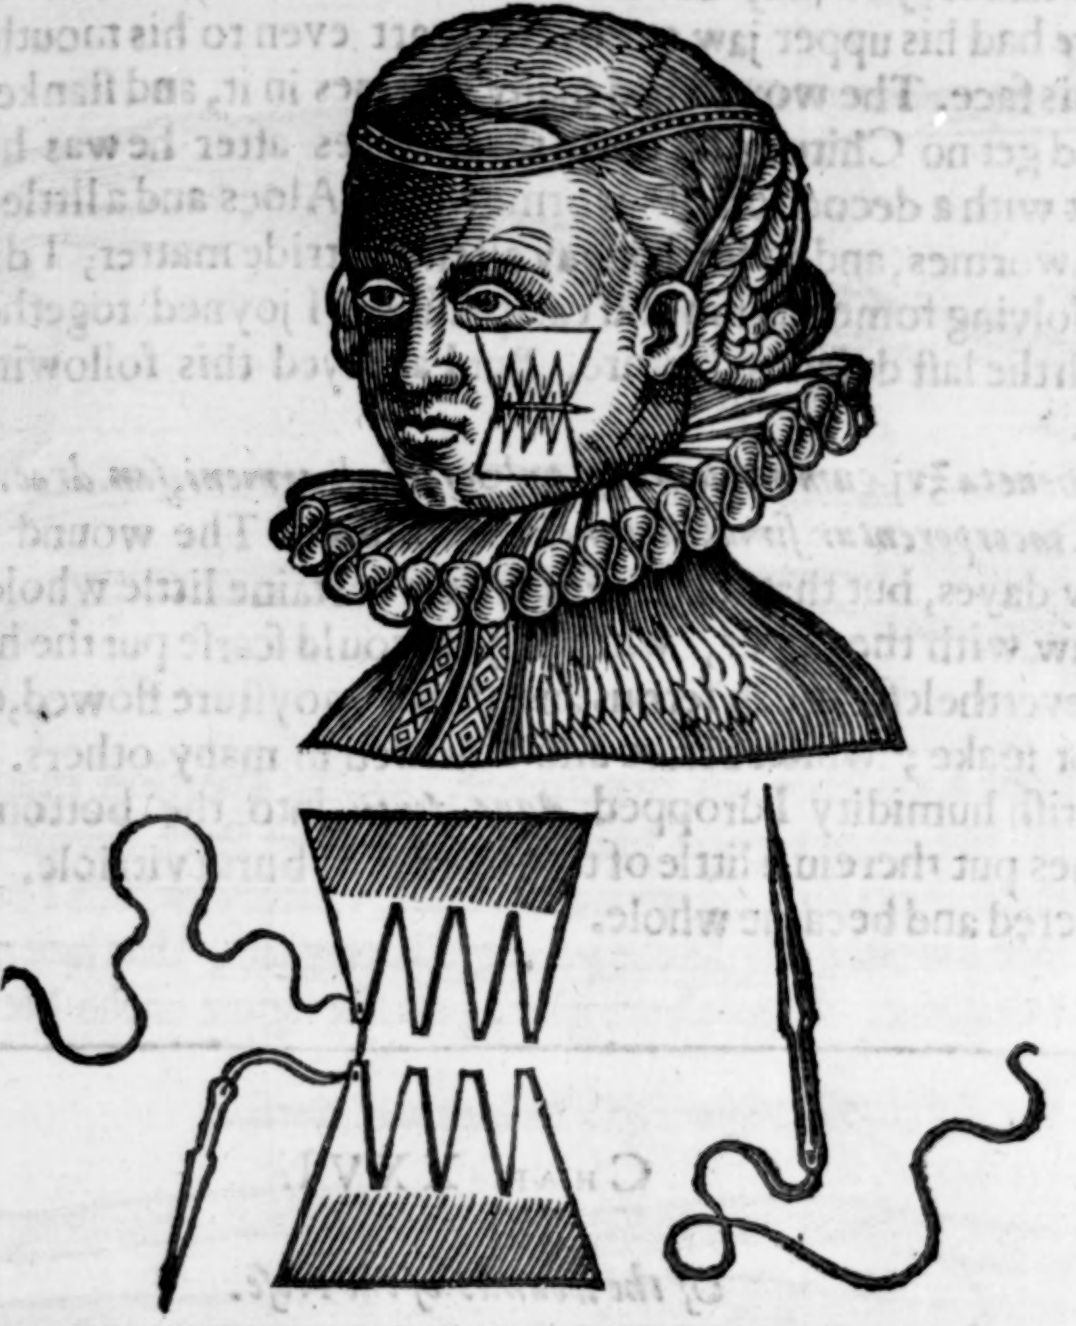
℞ *pulveris maſtichini, ſanguinis Draconis, thuris, farinæ volatilis, tragacanthæ contuſæ, gypſi, picis, ſarcocollæ an.* ʒij. *picis nigræ* ʒiß. *albumina ovorum quæ ſufficiant, fiat medicamentum.* Apply the peices of cloath ſpread with this on each ſide of the wound one, ſome fingers breadth aſunder, and let it alone till it be hard dryed to the skinne. Then you ſhall ſo draw them together with your needle and thred, that the fleſh by their ſticking may alſo follow, and bee mutually adjoyned, as you may ſee it here expreſt. The wound ſhall be agglutinated by this meanes, together with the uſe of fit medicines, pledgers, ligatures. But all the ligatures and ſtayes which ſhall be uſed for that purpoſe muſt be faſtened to the patients night-lappe.

A Suture fit for hare-lips.

The manner thereof.

But when the wound is great and deep, and the lips thereof are much diſtant the on from the other, there can be no uſe of ſuch a dry ſuture. Wherefore you muſt uſe a three or foure ſquare needle (that ſo it may the more readily and eaſily enter into the fleſh) being thred with a waxed thred; and with this you muſt thruſt through the lips of the wound, and leave the needle ſticking in the wound, and then wrappe the thred to and againe over the ends thereof eight or ten times, juſt after that manner which women uſe to faſten a needle with thred in it, upon their ſleeves, or Tailors to their hatts or capps, that they may not loſe them.

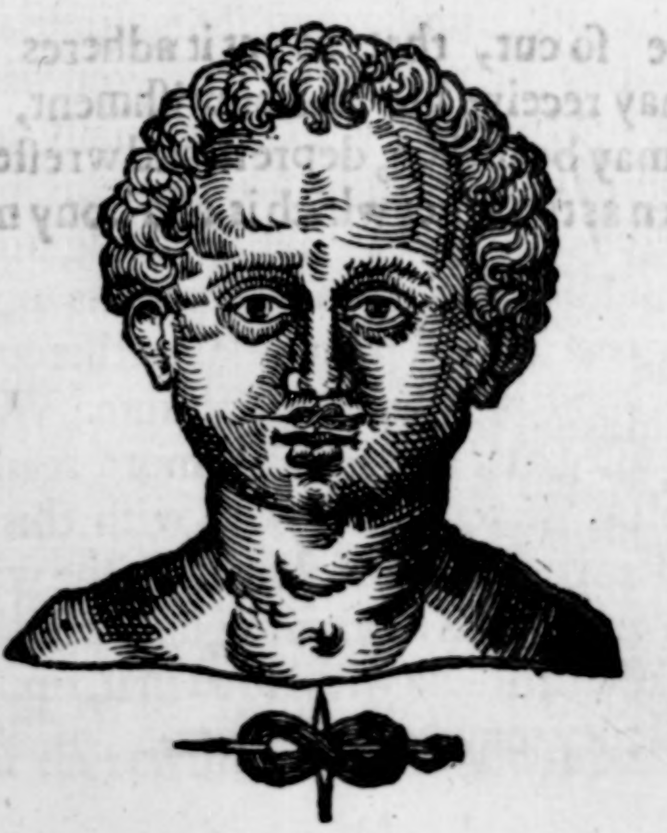
The



The needle thus faſtened, ſhall bee there untill the perfect agglutination of the wound; this kind of ſuture is uſed in the wounds of the lips, as alſo in hare-lips, for ſo we commonly call lips which are cleft from the firſt conformation in the wombe by the error of the forming faculty. But ſuch a ſuture will helpe nothing to agglutination, if there lye or remaine any skin betweene the lips of the wound; Wherefore you ſhall cut away whatſoever thereof ſhall be there, other-wiſe you muſt expect no union. Other kinde of ſutures are of no great uſe in wounds of theſe parts, for out of the neceſſity of eating and ſpeaking, they are in perpetuall motion; wherefore a thrid would cut the fleſh; for which reaſon you ſhall take up much fleſh with ſuch Needles mentioned in this laſt deſcribed kinde of Suture, as this following figure ſhewes.

What hare lips are

The figure of the ſuture fit for cloven or Hare lips, as alſo the dilineation of the Needle about whoſe ends the thrid is wrapped over and under, to and againe.



To

A Hiſtory.

A decoction good to waſh away putrefaction.

To this purpoſe I will recite a hiſtory, to the end, that if any ſuch thing happen to come to your hands, you may doe the like. A certaine Gaſcoine in the battell at Saint *Laurence* had his upper jaw cut overthwart even to his mouth, to the great disfiguring of his face. The wound had many wormes in it, and ſtanke exceedingly, becauſe he could get no Chirurgion untill three dayes after he was hurt. Wherefore I waſhed it with a decoction of wormewood, Aloes and a little *Ægyptiacum*, both to kill the wormes, and to fetch away all the putride matter; I diſcuſſed the tumor with a diſſolving fomentation and cataplaſime, I joyned together the lippes of the wound with the laſt deſcribed ſuture. But I applyed this following medicine to the whole part.

A ſmall hole remaining after the cure of great wounds.

℞ *Terebinth. venetæ* ℥vj. *gummi elemi.* ℥ij. *pulveris boli armeni, ſan. drac. Maſtickes, myrrhæ, aloes an.* ʒß. *incorporentur ſimul, fiat medicamentum.* The wound was agglutinated within a few dayes, but that there remained a certaine little whole at the joyning of the lower jaw with the upper, wherein you could ſcarſe put the head of a pinne; out whereof neverthеleſſe much ſerous and thinne moyſture flowed, eſpecially when he either eate or ſpake; which I have alſo obſerved in many others. But for ſtaying of this watriſh humidity I dropped *Aqua fortis* into the bottome of the ulcer, and divers times put therein a little of the powder of burnt vitriole. Thus by Gods grace he recovered and became whole.

Chap. XXVI.

Of the wounds of the Noſe.

How many wayes the noſe may be hurt.

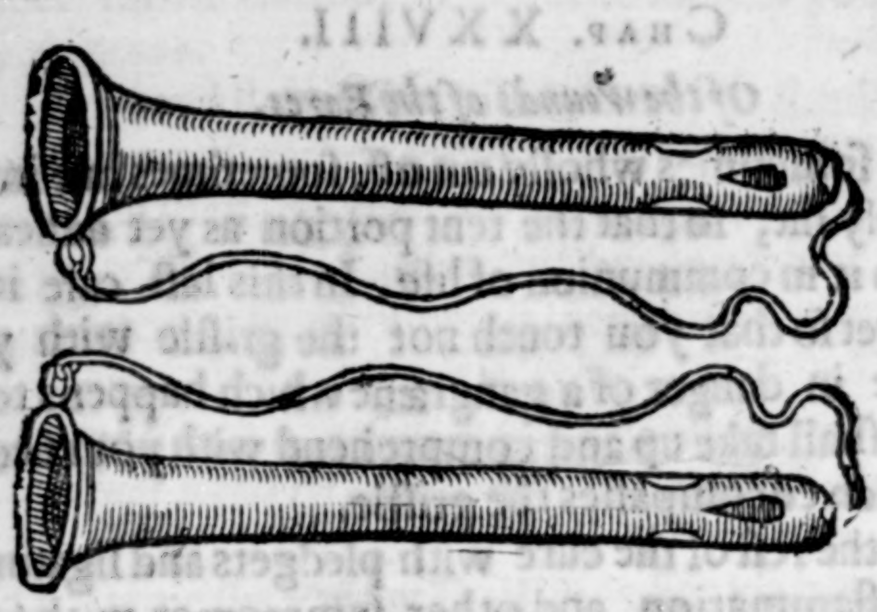
The cure of a broken noſe.

The uſe of pipes in broken noſes

THe Noſe many wayes ſuffers ſolution of continuity; as by a wound, fracture and contuſion, and it is ſometimes battered and broken on the upper part; which when it happens, you ſhall reſtore the depreſt bones to their native ſeat and figure, with the end of a *ſpatula* or fit ſticke wrapped about with towe, cotton or a linnen ragge. Then with pledgets dipped in an aſtringent medicine compoſed *ex albumine ovi, maſtich, bolo armeno, ſanguine drac. & Alumine uſto*, and applyed to the ſide of the noſe, hee ſhall labour to ſtrengthen the reſtored bones, and then binde them with a convenient ligature, which may not preſſe them too much, leſt the noſe ſhould become flat, as it happens to many through the unskilfulneſſe of Chirurgions. Then muſt you put little pipes into the noſe-thrills, and theſe not exactly round, but ſomewhat flat and depreſt, tyed to the night-cappe on each ſide with a thred, leaſt they ſhould fall out. By the helpe of theſe pipes the bones of the noſe will be kept in their place, and there will be paſſage forth for the matter, and for inſpiration and exſpiration. But if all the noſe, or ſome portion thereof ſhall bee wholy cut off, wee muſt not hope to reſtore it.

But if the Noſe bee ſo cut, that as yet it adheres to much of the adjacent fleſh, from whence it may receive life and nouriſhment, then ſow it up. For the lower part of the noſe it may be ſhaken, depreſt and wreſted aſide, ſeeing it is griſtly; but it cannot be broken as the other which is of a bony nature.

The Figure of pipes to be put into the Noſe-thrills.



CHAP. XXVII.

Of the Wounds of the tongue.

THe tongue may bee ſo wounded, that either it may bee wholely cut off and deprived of ſome portion of the ſubſtance, or onely ſlit long wayes or atwhart. The loſſe of the ſubſtance cannot bee repaired, becauſe every part ſeparated and pluckt from the living body, from whence it had life, ſpirit and blood, preſently dyes. For as the Philoſophers ſay, *A privatione ad habitum non eſt regreſſus.* But when it is cut or ſlit longwayes or ſidewayes, it is eaſily reſtored by ſuture, if ſo bee that the cloven part yet adhere to the living body from whence it may draw both matter and forme of life. Therefore a carefull ſervant ſhall ſtraitly hold with a ſoft and cleane linnen cloth the body of the tongue, leaſt it ſhould ſlip away by reaſon of its ſlipperineſſe, whilſt the Chirurgion ſtitch it above and below; when he thinkes hee hath ſufficiently ſowed it, let him cut off the threed as neere to the knot as he can, leaſt being left too long it might bee tangled with the teeth as hee eates, and ſo cauſe a hurtfull laceration or rending of the ſowed parts. In the meane time let the patient eate barly creames, almond milkes, Gelleyes, culliſſes and broathes, and the yolkes of egges; and let him often hold in his mouth Sugar of Roſes and ſyrupe of Quinces; for ſuch things beſides their nouriſhing faculty, performe the part of an agglutinating and detergent medicine.

How many wayes the continuity of the tongue may be looſed.

The cure of a cloven tongue.

I have learned theſe things I have here ſet downe, neither from my Maſters whom I have heard with attention, nor by reading of bookes, but they have beene ſuch as I have tryed with happy ſucceſſe in many; as in the ſonne of Monſieur *de Marigny* preſident of the Inquiſition, in *Iohn Piet* a Carpenter dwelling in the ſuburbs of Saint *German*.

But moſt apparently in a child of three yeeres old, the ſonne of the great Lawyer Monſier *Couet*, who fell with his chin upon a ſtone, and ſo cut off a large peece of the end of his tongue, which chanced to be betweene his teeth, it hung but at a very ſmall fiber of fleſh, ſo that I had very little or no hope to agglutinate and unite it, which thing almoſt made me to plucke it quit away; yet I changed that determination by conſidering the loſſe of the moſt noble action of ſpeaking, which would thereupon enſue, and weighing the providence of nature often working wonders and ſuch things as exceed the expectation of the phyſition in curing diſeaſes.

A Hiſtory.

I alſo thought thus with my ſelfe, the fleſh of the tongue is ſoft, looſe, fungous and ſpungie, neither is it altogether obvious to the externall injuries of the ayre; wherefore after that I had once or twiſe thruſt through the needle and thred upwards and downewards, and for the reſt ordered the child to be uſed and dieted after the man-

Nature oft doth ſtrange things in the cures of diſeaſes.

manner I lately mentioned, he grew well within a ſhort time, and yet remaines ſo, ſpeaking well and diſtinctly.

Chap. XXVIII.

Of the Wounds of the Eares.

How many wayes the unity of eares may be violated.

How to ſow a wounded Eare.

THe eares are ſometimes wholly cut off, ſometimes but in part, otherwhiles they are onely ſlit, ſo that the rent portion as yet adhearing to the reſt, is joyned with it in communion of life. In this laſt caſe it is fit to uſe a ſuture; but yet ſo that you touch not the griſtle with your needle; for thence there would be in danger of a gangræne which happens to many by fooliſh curing; therefore you ſhall take up and comprehend with your needle only the skin, and that little fleſh which encompaſſes the griſtle.

You ſhall performe the reſt of the cure with pledgets and ligatures artificially fitted, and ſhall reſiſt inflammation and other ſymptomes with fit medicines. But you muſt take ſpeciall care that no ſuperfluous fleſh grow in the auditory paſſage, which may hinder the hearing; wherefore you ſhall keepe that paſſage free by ſtopping it with a peece of ſpunge. But you ſhall procure agglutination and conſolidation of the griſtly part (and therefore next to a bone moſt dry) with dry medicines. But thoſe who have their eares quite cut off, can doe nothing but hide the deformity of their miſſe-hap with a cap, ſtuffed with Cotton on that ſide.

Chap. XXIX.

Of the Wounds of the necke and throate.

The differences of wounds of the necke and throate.

THe Wounds of the necke and throate are ſomewhiles ſimple, as thoſe which onely uſe the continuity of the muſcles; other whiles compound, ſuch as thoſe which have conjoyned with them a fracture of the bones, as of the *Vertebræ*, or hurt of the internall and externall jugular Veines, or ſleepy Arteries; ſometimes the *Trachea Arteria*, or Weazon, and the *æſophagus* or gullet are wounded; ſometimes wholy cut off, whence preſent death enſues. Wherefore let not the Chirurgion meddle with ſuch wounds, unleſſe he firſt foretell the danger of death, or the loſſe of ſome motion to thoſe that are preſent. For it often happens that ſome notable nerve or tendon is violated by a wound in the necke, whence a palſie enſues, and that abſolutely incureable, if the wound ſhall penetrate to the ſpinall marrow, alſo hurt therewith. Wounds of the gullet and Weazon are difficultly cured becauſe they are in perpetuall motion; and chiefely of the latter by reaſon it is griſly and without blood. The wounds of the gullet are knowne, by ſpitting of blood, by the breaking forth of meate and drinke by the wound; but if the gullet be quite cut aſunder, the patient cannot ſwallow at all. For the cut parts are both contracted in themſelves, the one upwards, and the other downewards. But we know the weazon is hurt, by caſting up blood at the mouth with a continuall cough, and by the comming forth of the breath or winde by the Wound. The Wounds of the jugular Veines and ſleepy Arteryes, if they be great, are uſually deadly, becauſe they cannot bee ſtraitely bound up; for you cannot binde the throate hard without danger of choaking or ſtrangling the patient. But for defect of a ſtraite ligature in this caſe the fluxe of blood prooves deadly. If the recurrent Nerve of either ſide be cut, it makes the voyce hoarſe; if cut on both ſides, it takes away the uſe of ſpeech, by hurting theſe inſtruments which impart motion to the muſcles of the *Larinx*. For the cure if the wound be ſmall, & not aſſociated with the hurt of any notable veſſell, nor of the Weazon and gullet, it is ſpeedily and eaſily cured; and if there ſhall be neede you ſhall uſe a ſuture, then you ſhall put therein a ſufficient quantity of Venice Turpentine mixed with bole-Armenicke; or elſe ſome of my Balſame of which this is the receipt. ℞. *Terebinth. venetæ* ℔ *ſſ. gum. elemi* ℥iiij. *olei hypericonis* ℥iij. *boli armeni, & ſang. draconis an.* ℥j. *aquæ vitæ* ℥ij. *liquefiant ſimul omnia lento igne, & fiat Balſamum ut artis eſt, addendo pulveris ireos Florent. aloes, Maſtiches, myrrhæ, an.* ʒj. I have done wonders with this Balſame in the agglutination of ſimple wounds, wherein no ſtrange body hath beene.

The palſie followes upon wounds of the necke.

Signes that the gullet is wounded.

The wounds of the iugular veines and ſleepy Arteries are deadly by accident.

By hurting the recurrent Nerve the voyce is hurt.

The deſcription of the Authors Balſame.

Now

The faculty of *Diacalcitheos*.

Now when you have put it in, lay upon it a plaiſter of *Diacalcitheos* diſſolved in oyle of Roſes and vinegar, as that which hath power to repreſſe the flowing downe of humors, and hinder inflammation, or in ſteede thereof you may apply *Emp. de Gratia, Dei*, or *Emp. de Ianua*.

The cure of the wounded Weazon and gullet.

But if the jugular veines and ſleepy Arteries bee cut, let the bleeding bee ſtayed, as we have ſhewed in a chapter, treating thereof. When the Weazon or Gullet are wounded, the Chirurgion ſhall ſow them up as neatly as hee can; and the patient ſhall not endeavour to ſwallow any hard thing, but be content to bee fed with gellyes and brothes. When a gargariſme is needfull, this following is very good.

A gargariſme.

R. *hordei M.* j. *florum roſar. p.* j. *paſſul. mund. jujubarum an.* ʒß, *glycyrhizæ* ℥j. *bulliant omnia ſimul, addendo mellis roſ. & Iulep. roſ. an.* ℥ij. *fiat gargariſma, ut artis eſt.*

The manifold uſe thereof.

With which being warme the Patient ſhall moyſten his mouth, and throate, for it will mittigate the harſhneſſe of the part, aſwage paine, cleanſe and agglutinate, and make him breathe more freely. But that the Chirurgion may not deſpaire of, or leave any thing unattempted in ſuch like wounds, I have thought good to demonſtrate by ſome examples, how wonderfull the workes of nature are, if they be aſſiſted by Art.

A Hiſtory.

A certaine ſervant of Monſieur *de Champaigne*, a gentleman of *Anjou*, was wounded in the throat with a ſword, whereby one of the jugular veines was cut together with his Weazon. Hee bled much and could not ſpeake, and theſe ſymptomes remained, untill ſuch time as the wound was ſowed up, and covered with medicines, But if the medicines at any time were more liquid, hee as it were ſucked them by the wound and ſpaces betweene the ſtitches, and preſently put forth at his mouth that which he had ſucked or drawne in. Wherefore more exactly conſidering with my ſelfe, the greatneſſe of the Wound, the ſpermaticke, and therefore dry and bloodleſſe nature unapt to agglutination, of the affected part, but cheefely of the Weazon & jugular veine; as alſo for that the rough Artery is obnoxious to theſe motions which the gullet performes in ſwallowing, by reaſon of the inner coate, which is continued to the coate of the gullet, by which meanes theſe parts mutually ſerve each other with a reciprocall motion, even as the ropes which runne to the wheele of a pulley; furthermore weighing that the Artery was neceſſary for the breathing, and tempering the heate of the heart, as the jugular veines ſerved for the nouriſhment of the upper parts; and laſtly weighing with my ſelfe the great quantity of blood he had loſt, which is as it were the treaſure of nature, I told thoſe which were preſent, that death was neere and certainely at hand. And yet beyond expectation, rather by divine favour than our Art, he recovered his health.

A ſtrange Hiſtory.

Equally admirable is this hiſtory following. Two Engliſhmen walked out of the Citty of *Paris* for their recreation to the wood of *Vincenne*; but one of them lying in waite to rob the other of his money and a maſſie chaine of gold which hee wore, ſet upon him at unawares, cut his throate and robbed him, and ſo left him amongſt the Vines which were in the way, ſuppoſing he had kill'd him having with his dagger cut the Weaſon and gullet.

This murderer came backe to the citty; the other halfe dead, crawled with much adoe to a certaine Peaſants houſe, and being dreſſed with ſuch medicines as were preſent and at hand, he was brought to the Citty, and by his acquaintance committed to my cure to be cured.

I at the firſt, as diligently as I could, ſowed up the Weaſon which was cut quite aſunder, and put the lips of the wound as cloſe together as I could; I could not get hold of the gullet becauſe it was fallen downe into the ſtomacke, then I bound up the wound with medicines, pledgets and fit ligatures. After he was thus dreſt he begun to ſpeake, and tell the name of the villaine the author of this fact, ſo that hee was taken and faſtened to the wheele, and having his limbes broken loſt his wretched life, for the life of the innocent wounded man who dyed the fourth day after he was hurt.

Another Hiſtory.

The like hurt befell a certaine Germane; who laye at the houſe of one *Perot* in the ſtreete of Nuts; he being franticke in the night cut his throate with a ſword. I being called in the morning by his friends who went to ſee him, dreſt him juſt after the ſame manner as I dreſſed the Engliſhman. Wherefore he preſently recovering his ſpeech, which before could not utter one ſillable, freed from ſuſpition of the crime and priſon the ſervant, who lying in the ſame chamber with him, was upon ſuſpition committed to priſon, and confeſſing the thing as it was done, lived foure dayes after the wound, being nouriſhed with broathes put into his fundament like clyſters, and with the gratefull vapour of comfortable things, as bread newly drawne out of the Oven and ſoked in ſtrong wine.

Having thus by the Art of Chirurgery made the dumbe ſpeake for the ſpace of foure dayes.

CHAP. XXX.

Of the Wounds of the Cheſt.

The differences of wounds of the Cheſt.

SOme wounds of the Cheſt are on the fore ſide, ſome behinde, ſome penetrate more deepe, others enter not into the capacity thereof, other ſome peirce even to the parts contained therein, as the *Mediaſtinum*, Lungs, heart, midriffe, hollow veine, and aſcendent artery; Other ſome paſſe quite through the body; whereby it happens that ſome are deadly, ſome not.

The ſignes.

You ſhall thus know that the wound penetrates into the capacity of the Cheſt, if that when the patients mouth and noſe be ſhut, the breath, or winde breakes through the wound with noyſe, ſo that it may diſſipate, or blow out a lighted candle being held neere it. If the patient can ſcarſe either draw, or put forth his breath, which alſo is a ſigne that there is ſome blood fallen downe upon the *Diaphragma*.

Signes that the heart is wounded.

By theſe ſignes you may know that the heart is wounded: If a great quantity of blood guſh out, if a trembling poſſeſſe all the members of the body; if the pulſe bee little and faint, if the colour become pale, if a cold ſweate and frequent ſowning aſſayle him, and the extreame parts become cold, then death's at hand.

A Hiſtory.

Yet when I was at *Turin* I ſaw a certaine Gentleman who fighting a Duell with another, received a wound under his left breſt which pierced into the ſubſtance of his heart, yet for all that he ſtrucke ſome blowes afterwards, and followed his flying Enemie, ſome two hundred paces untill hee fell downe dead upon the ground; having opened his body, I found a wound in the ſubſtance of the heart, ſo large as would containe ones finger; there was onely much blood poured forth upon the midriffe.

Signes that the Lungs are wounded.

Theſe are the ſignes that the Lungs are wounded, for the blood comes foamie or frothy out of the wounds the patient is troubled with a cough, hee is alſo troubled with a great difficulty of breathing and a paine in his ſide, which hee formerly had not; he lyes moſt at eaſe when he lyes upon the wound, and ſometimes it comes ſo to paſſe, that lying ſo he ſpeakes more freely and eaſily, but turned on the contrary ſide, he preſently cannot ſpeake.

Signes that the midriffe is wounded.

When the *Diphragma* or midriffe is wounded, the party affected is troubled with a weight or heavineſſe in that place, hee is taken with a *Delirium*, or raving by reaſon of the ſympathy of the Nerves of the ſixth conjugation which are ſpread over the midriffe; difficulty of breathing, a cough and ſharpe paine trouble the patient, the Guts are drawne upwards; ſo that it ſometimes happens by the vehemency of breathing, that the ſtomacke and gutts are drawne through the wound in to the capacity of the Cheſt; which thing I obſerved in two.

A Hiſtory.

The one of theſe was a Maſon, who was thruſt though the midſt of the midriffe, where it is Nervous, and dyed the third day following. I opening his lower belly, and not finding his ſtomacke, thought it a monſtrous thing; but at length ſearching diligently, I found it was drawne into the Cheſt, though the wound which was ſcarce an inch broade. But the ſtomacke was full of winde, but little humidity in it.

Another Hiſtory.

The other was called captaine *Francis d'Alon* a Native of *Xintoigne*, who before *Rochell* was ſhot with a musket bullet, entring by the breaſt-bone neere to the ſword-like Griſtle and paſſing through the fleſhy part of the midriffe, went out at the ſpace betweene the fifth and ſixth baſtard ribbes. The wound was healed up on the out ſide, yet for all that there remained a weakeneſſe of the ſtomacke, whereupon a paine of the guttes like to the colicke tooke him eſpecially in the Evening, and on the night; for which cauſe he durſt not ſup but very ſparingly. But on the eighth month after, the paine raging more violently in his belly than it was accuſtomed, hee dyed; though for the mitigating of the vehemency thereof *Simon Malmedy* and *Anthony du Val* both learned Phyſitions omitted no kinde of remedy. The body of the diſeaſed was opened by the skilfull Chirurgion, *Iames Guillemeau*, who found a great portion of the collicke gut ſwelled with much wind gotten into the Cheſt, through the wound of the *Diaphragma*, for all it was ſo ſmall that you could ſcarſe put your little finger in thereat. But now let us returne from whence we digreſſed.

Signes that there is blood poured into the capacity of the Cheſt.

We underſtand that there is blood poured forth into the capacity of the Cheſt by the difficulty of breathing, the vehemency of the encreaſing feaver, the ſtinking of the breath, the caſting up of blood at the mouth, and other ſymptomes which uſually happen to theſe who have putrified and clotted blood poured out of the veſſells into the belly, infecting with the filthy vapour of the corrupt ſubſtance, the parts to which it ſhall come.

But alſo, unleſſe the patient cannot lye upon his backe, he is troubled with a deſire to vomite, and covets now and then to riſe, whence hee often falls into a ſwond, the vitall faculty which ſuſteines the body being broken and debilitated both by reaſon of the wound, and concreate or clotted blood; for ſo putting on the quality of poyſon, it greatly diſſipates and diſſolves the ſtrength of the heart.

Signes that the ſpine is wounded.

It is a ſigne the ſpinall marrow is hurt, when a convulſion or Palſie, that is, a ſuddaine loſſe of ſenſe and motion in the parts thereunder, an unvoluntary excretion of the Vrine and other excrements, or a totall ſuppreſſion of them, ſeazes upon the Patient.

When the hollow veine and great Artery are wounded, the patient will dye in a ſhort time, by reaſon of the ſuddaine and aboundant effuſion of the blood and ſpirits, which intercepts the motion of the lungs and heart, whence the party dyes ſuffocated.

Chap. XXX.

Of the cure of the Wounds of the Cheſt.

Vigo tract. de vuln. thorac. cap. 10.

WE have read in *Iohn de Vigo*, that it is diſputed amongſt Chirurgions concerning the conſolidation of wounds of the Cheſt. For ſome thinke that ſuch wounds muſt bee cloſed up, and cicatrized with all poſſible ſpeed, leaſt the cold ayre come to the heart, and the vitall ſpirits flye away and bee diſſipated. Others on the contrary thinke that ſuch wounds ought to be long kept open; and alſo' if they be not ſufficiently large of themſelves, that then they muſt be enlarged by Chirurgery, that ſo the blood powred forth into the capacity of the Cheſt may have paſſage forth, which otherwiſe by delay would putrefie, whence wound enſue an increaſe of the feaver, a fiſtulous ulcer, and other pernicious accidents.

The firſt opinion is grounded upon reaſon and truth, if ſo bee that there is little or no blood poured forth into the capacity of the Cheſt; But the latter takes place where there is much more blood contained in the empty ſpaces of the Cheſt. Which leaſt I may ſeeme raſhly to determine, I thinke it not amiſſe to ratifie each opinion with a hiſtory thereto agreeable.

A Hiſtory.

Whileſt I was at *Turin*, Chirurgion to the Marſhall of *Montejan*, the King of France his Generall, I had in cure a ſouldier of *Paris*, whoſe name was *L'eveſque*, he ſerved under captaine *Renouart*. He had three wounds, but one more greevous than the reſt, went under the right breſt, ſomewhat deepe into the capacity of the Cheſt, whence much blood was poured forth upon the midriffe, which cauſed ſuch difficulty of breathing, that it even tooke away the liberty of his ſpeech; beſides, though this occaſion he had a vehement feaver, coughed up blood, and a ſharpe paine on the wounded ſide. The Chirurgion which firſt dreſt him, had ſo bound up the wound with a ſtraite and thicke ſuture, that nothing could flow out thereat. But I being called the day after, and weighing the preſent ſymptomes which threatned ſpeedy death, judged that the ſowing of the wound muſt ſtraight be looſed; which being done, there inſtantly appeared a clot of blood at the orifice thereof; which made mee to cauſe the patient to lye halfe out of his bed, with his head downewards, and to ſtay his hands on a ſettle which was lower than the bed, and keeping himſelfe in this poſture, to ſhut his mouth and noſe that ſo his lungs ſhould ſwell; the midriffe be ſtretched forth, and the intercoſtall muſcles and thoſe of the *Abdomen* ſhould be compreſſed, that the blood powred into the Cheſt might be evacuated by the wound; but alſo that this excreſcion might ſucceede more happily, I thruſt my finger ſomewhat deepe into the wound, that ſo I might open the Orifice thereof being ſtopped up with the congealed blood; and certainely I drew out ſome ſeaven or eight ounces of putrified and ſtinking blood by this meanes. When he was layd in his bed, I cauſed frequent injections to be made into the wound of a decoction of Barly with honey of Roſes and red Sugar, which being injected I wiſht him to turne firſt on the one, and then on the other ſide and then, againe to lye out of his bed as before; for thus he evacuated ſmall, but very many clots of blood, together with the liquor lately injected; which being done, the ſymptomes were mittigated, and left him by little and little. The next day I made another more detergent injection, adding thereto wormewood, centaury, and Aloes; but ſuch a bitterneſſe did riſe up to his mouth together with a deſire to caſt, that he could not longer endure it. Then it came into my mind that formerly I had obſerved the like effect of the like remedy in the Hoſpitall of *Paris*, in one who had a fiſtulous ulcer in his Cheſt. Therefore when I had conſidered with my ſelfe that ſuch bitter things may eaſily paſſe into the Lungs, and ſo may from thence riſe into the Weazon and mouth, I determined that thence forwards I would never uſe ſuch bitter things to my patients, for the uſe of them is much more troubleſome than any way good and advantagious. But at the length this patient by this and the like meanes recovered his health beyond my expectation.

Why bitter things muſt not be caſt in to the Cheſt.

Reade the Hiſtory of *Maryllus* in *Galen, lib. 7. de Anatom. adminiſtra.*

But on the contrary, I was called on a time to a certaine *Germaine* gentleman who was runne with a ſword into the capacity of his Cheſt; the neighbouring Chirurgion had put a great tent into the wound at the firſt dreſſing, which I made to bee taken forth, for that I certainly underſtood there was no blood powred forth into the capacity of the Cheſt becauſe the patient had no feaver, no weight upon the *diaphragma*, nor ſpitted forth any blood. Wherefore I cured him in few dayes by onely dropping in ſome of my balſame and laying a plaſter of *Diacalcitheos* upon the wound.

What harme enſues the too long uſe of tents.

The like cure I have happily performed in many others. To conclude, this I dare boldly affirme, that wounds of the Cheſt by the too long uſe of tents degenerate into Fiſtula's.

Wherefore if you at any time ſhall undertake the cure of wounds] which penetrate in the to capacity of the Cheſt, you ſhall not preſently ſhut them up at the firſt dreſſing, but keep them open for two or three dayes; but when you ſhal finde that the patient is troubled with no or very little paine, and that the midriffe is preſſed downe with no weight, and that he breathes freely, then let the tent be taken forth, and the wound healed up as ſpeedily as you can by covering it onely with lint dipped in ſome balſame which hath a glutinative faculty, and layd ſomewhat broader than the wound; never apply liniments to wounds of this kinde, leſt the patient by breathing draw them into the capacity of the Cheſt. Whereſore alſo you muſt have

No liniments muſt be uſed in wounds of the Cheſt.

a care that the tent put into thoſe kindes of wounds may be faſtened to the Pledgets, and alſo have ſomewhat a large head, leſt they ſhould be drawne as we ſayd into the capacity of the Cheſt, for if they fall in, they will cauſe putrifaction and death.

Let *Emplaſt. Diacalcitheos* or ſome ſuch like bee applyed to the wound. But if, on the contrary, you know by proper, and certaine ſignes, that there is much blood fallen into the ſpaces of the Cheſt, then let the orifice of the wound bee kept open with larger tents, untill all the *Sanies* or bloody matter, wherein the blood hath degenerated, ſhall bee exhauſted. But if it happen at any time, as aſſuredly it ſometimes doth, that notwithſtanding the Art and care of the Phyſition, the wound degenerates into a *Fiſtula*, then the former evill is become much worſe. For *Fiſtula's* of the Cheſt, are ſcarſe cured at any time, and that for divers cauſes. The firſt is, for that the muſcles of the Cheſt are in perpetuall motion; Another is, becauſe they on the contrary inſide are covered onely with the membrane inveſting the ribbes, which is without blood. The third is, for that the wound hath no ſtay, by meanes whereof it may be compreſſed, ſowed, and bound, whereby the lips being joyned together, the wound may at length be repleniſhed with fleſh, and cicatrized.

Wounds of the Cheſt eaſily degenerate into a *Fiſtula*.

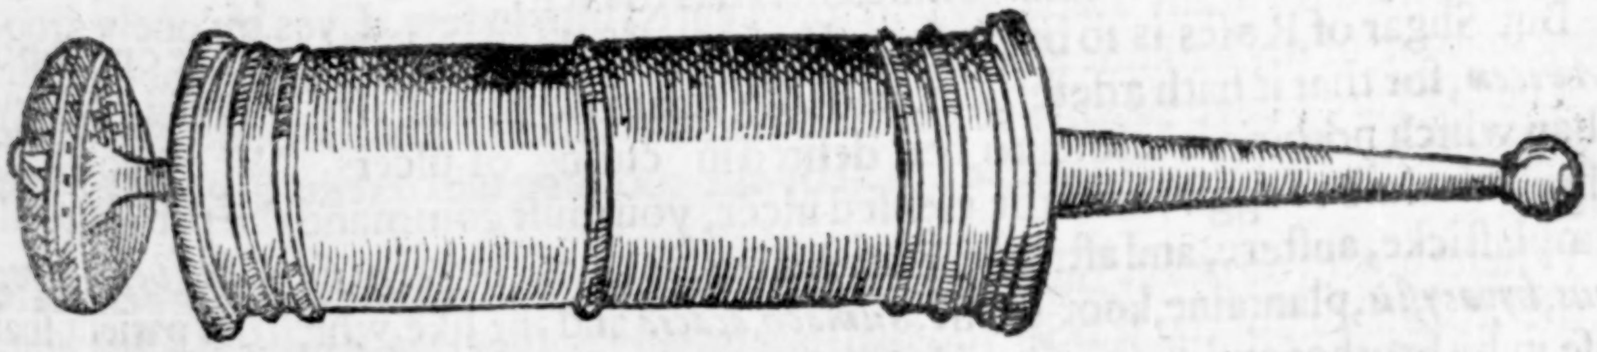
But the reaſon why wounds of the Cheſt doe every day heape up and poure forth ſo great a quantity of matter, ſeemes to be their vicinity to the heart, which being the fountaine of blood, there is a perpetuall effluxe thereof from thence to the part affected. For this is natures care in preſerving the affected parts, that continually and aboundantly without meaſure or meane it ſends all its ſupplyes, that is, blood and ſpirits, to the ayde. Ad hereto, that the affected parts by paine, heate and continuall motion of the Lungs and midriffe, draw and allure much blood to themſelves. Such like blood defiled by the malignity and filth of the wound, is ſpeedily corrupted; whence it is that from the perpetuall affluxe of blood, there is a continuall effluxe of matter or filth, which at the laſt brings a man to a conſumption; becauſe the ulcerated part like a ravenous wolfe conſumes more blood by the paine, heate and motion than can be miniſtred thereto by the heart. Yet if there bee any hope to cure and heale the *Fiſtula*, it ſhall bee performed, (after the uſe of diet, phlebotomie, and according to the preſcript of the Phyſition) by a vulnerary potion, which you ſhall finde deſcribed when we treate of the *Caries* or rottenneſſe of the bones. Wherefore you ſhall make frequent injections therewith into the *Fiſtula*, adding and mixing with it *ſyrupus de roſis ſiccis* and *mel roſarum*. Neither doe I, if the putrefaction bee great, feare to mixe therewith *Ægyptiacum*. But you muſt have a care to remember and obſerve the quantity of the injected liquor, that you may know whether it all come forth againe after it hath performed its detergent office. For if any thereof remaine behinde in the corners and crooked paſſages, it hurts the part, as corrupted with the contagion thereof.

Why there flowes ſuch plenty of matter out of wounds of the Cheſt.

The cure of a *Fiſtula* in the Cheſt.

When *Ægyptiacum* muſt be put into the injections.

The forme of a Syring fit to make injection, when a great quantity of liquor is to be injected into any part.



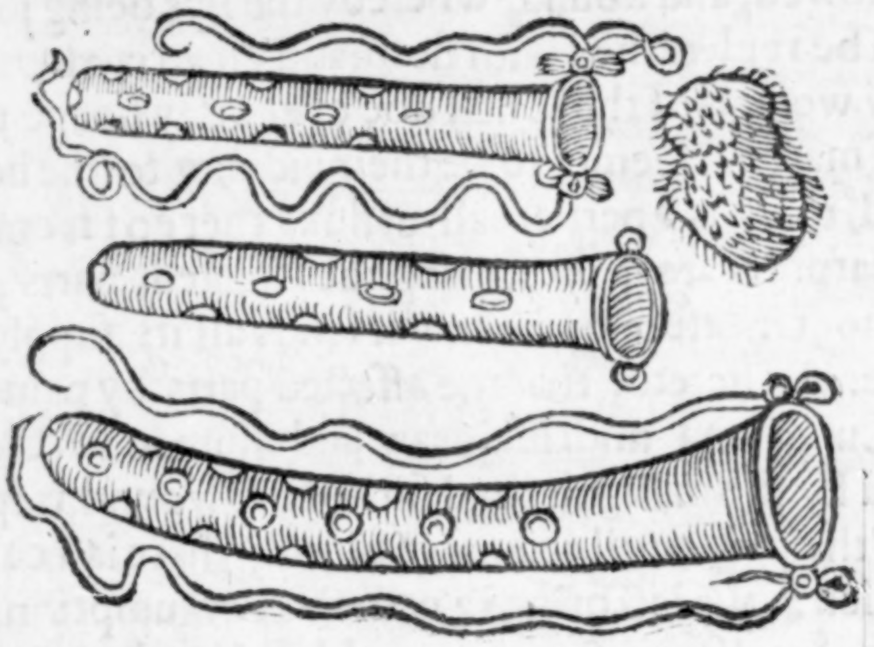
After the injected liquor is come forth, a pipe of gold, ſilver or lead, ſhall bee put into the fiſtulous ulcer; and it muſt have many holes in it, that ſo the filth may paſſe forth at them; it muſt be faſt tyed with ſtrings, that it may not fall into the capacity of the Cheſt.

A great ſpunge ſteeped in *aqua vitæ* and wrung forth againe, ſhall bee layd hot to the end or orifice thereof, both to hinder the entrance of the ayre into the Fiſtulous ulcer, as alſo to draw forth the filth thereof by its gentle heate, the which thing the

Patient ſhall much further if often times both day and night hee hold his breath, ſtopping his mouth and noſe, and lying upon the diſeaſed ſide, that ſo the *Sanies* may bee the more forcibly evacuated; neither muſt wee leave putting in the pipe, before that this fiſtulous ulcer ſhall bee almoſt dry, that is, whole, as when it yeelds little, or no matter at all; then it muſt be cicatrized. But if the orifice of this fiſtulous ulcer being in the upper part hinder the healing thereof, then by a chirurgicall Section a paſſage ſhall be made in the bottome, as we ſayd before in an *Empyema*.

The delineation of the pipes with their ſtrings and ſpunges.

The reader muſt note that the pipes which are fit for this uſe, neede not have ſo many holes as theſe here expreſt; but onely two or three in their ends: for the fleſh growing and getting into the reſt, make them that they cannot be plucked forth without much paine.



What wounds of the Lungs cureable.

A wound made in the Lungs admits cure, unleſſe it bee very large; if it bee without inflammation; if it bee on the skirts of the Lungs, and not on their upper parts; if the patient conteine himſelfe from coughing much, and contentious ſpeaking, and great breathing: for the wound is enlarged by coughing, and thence alſo ariſes inflammation; the *Pus* and *Sanies* whereof, whilſt the lungs againe endeavour to expell by couching, by which meanes they are onely able to expell that which is hurtfull and troubleſome to them, the vulcer is dilated, the inflammation augmented, the Patient waſtes away, and the diſeaſe becomes incureable.

The harme that enſues upon coughing in wounds of the Lungs.

How *Eclegma's* muſt be ſwallowed.

There have beene many *Eclegma's* deſcribed by Phyſitions for to clenſe the ulcer; which when the patient uſeth, he ſhall lye on his backe, to keepe them long in his mouth, ſo to relaxe the muſcles of the *Larinx*; for thus the medicine will fall by little and little alongſt the coates of the Weazon, for if it ſhould fall downe in great quantity, it would be in danger to cauſe coughing. Cowes, Aſſes, or Goates milke with a little honey, leaſt they ſhould corrupt in the ſtomacke, are very fit remedies for this purpoſe; but womans milke exceedes the reſt.

The utility of Sugar of roſes in ulcerated or wounded Lungs.

But Sugar of Roſes is to be preferred before all other medicines, in the opinion of *Avicen*, for that it hath a detergent, and alſo an aſtrictive and ſtrengthening faculty, than which nothing is more to bee deſired in curing of ulcers. When you ſhall thinke it time to agglutinate the clenſed ulcer, you muſt command the patient to uſe emplaſticke, auſtere, and aſtringent medicines, ſuch as are *Terra ſigillata, bolus armenus, hypocyſtis*, plantaine, knot-graſſe, *Sumach, acacia* and the like, which the patient ſhall uſe in his brothes and *Eclegma's*, mixing therewith honey of roſes, which ſerving for a vehicle to the reſt, may carry away the impacted filth which hinders agglutination. But ſeeing an hecticke feaver eaſily follows upon theſe kindes of wounds, and alſo upon the affects of the Cheſt and lungs, it will not be amiſſe to ſet downe ſomewhat concerning the cure thereof, that ſo the Chirurgion may know to adminiſter ſome helpe to his patient, whilſt a Phyſition is ſent for, to overcome this diſeaſe with more powerfull and certaine remedies.

CHAP.

CHAP. XXXII.

Of the differences, cauſes, ſignes and cure of an Hecticke feaver.

The reaſon of the name.

A Hecticke feaver is ſo called; either for that it is ſtubborne and hard to cure and looſe, as things which have contracted a habite; for *Hexis* in Greeke ſignifies a habite; or elſe for that it ſeazes upon the ſolide parts of our bodies called by the Greekes *Hexeis*; both which the Latine word *Habitus* doth ſignifie.

The differences thereof.

There are three kindes, or rather degreees of this feaver. The firſt is when the hecticke heate conſumes the humidity of the ſolide parts. The ſecond is, when it feeds upon the fleſhy ſubſtance. The third and uncureable is, when it deſtroyes the ſolide parts themſelves. For thus the flame of a lampe firſt waſtes the oyle, then the proper moyſture of the weeke. Which being done there is no hope of lighting it againe what ſtore of oyle ſoever you poure upon it. This feaver very ſeldome breeds of its ſelfe, but commonly followes after ſome other.

The cauſes.

Wherefore the cauſes of a hecticke feaver are, ſharpe and burning feavers not well cured, eſpecially if their heate were not repreſſed with cooling epithemes applyed to the heart and *Hypochondria*. If cold water was not fitly drunke. It may alſo ſucceede a Diary feaver which hath bin cauſed and begun by ſome long, great and vehement greef or anger, or ſome too violent labour, which any of a ſlender and dry body hath performed in the hot ſunne. It is alſo oft times cauſed by an ulcer or inflammation of the Lungs, an *empyema* of the Cheſt, by any great and long continuing *Phlegmon* of the liver, ſtomacke, meſentery, wombe, kidneyes, Bladder, of the guts *Iejunum* and *Colon*, and alſo of the other Guts, of if the *Phlegmon* ſucceed ſome long *Diarrhœa*, *Lienteria* or bloody flix; whence a conſumption of the whole body, and at laſt a hecticke feaver, the heate becomming more acride, the moyſture of the body being conſumed.

The ſignes.

This kinde of feaver as it is moſt eaſely to bee knowne, ſo is it moſt difficult to cure; the pulſe in this feaver is hard, by reaſon of the dryneſſe of the Artery which is a ſolide part; and it is weake by reaſon of the debility of the vitall faculty, the ſubſtance of the heart being aſſaulted. But it is little and frequent becauſe of the diſtemper and heate of the heart, which for that it cannot by reaſon of its weakeneſſe cauſe a great pulſe to coole its ſelfe, it labours by the oftenneſſe to ſupply that defect.

Why in hecticks the heate is more acride after meate.

But for the pulſe, it is a proper ſigne of this feaver, that one or two houres after meate the pulſe feeles ſtronger than uſuall; and then alſo there is a more acride heate over all the patients body. The heate of this flame laſts untill the nouriſhment bee diſtributed over all the patients body; in which time the dryneſſe of the heart in ſome ſort tempered and recreated by the appulſe of moyſt nouriſhment, the heate increaſes no otherwiſe than lime which a little before ſeemed cold to the touch, but ſprinkled and moyſtned with water growes ſo hot, as it ſmoakes and boyles up. At other times there is a perpetuall equallity of heate and pulſe in ſmalneſſe, faintneſſe, obſcurity, frequency, and hardneſſe, without any excerbation, ſo that the patient cannot thinke himſelfe to have a feaver, yea hee cannot complaine of any thing, hee feeles no paine, which is another proper ſigne of an hecticke feaver.

The ſignes of a hecticke ioyned with a putride feaver.

The cauſe that the heate doth not ſhew its ſelfe is, it doth not poſſeſſe the ſurface of the body, that is, the ſpirits and humors, but lyes as buried in the earthy groſſeneſſe of the ſolide parts. Yet if you hold your hand ſomewhat long, you ſhall at laſt perceive the heate more acride and biting, the way being opened thereto by the ſkinne rarifyed by the gentle touch of the warme and temperate hand. Wherefore if at any time in theſe kinde of feavers the Patient feele any paine, and perceive himſelfe troubled with an inequality and exceſſe of heate, it is a ſigne that the hecticke feaver is not ſimple, but conjoyned with a putride feaver, which cauſeth ſuch inequality, as the heate doth more or leſſe ſeaze upon matter ſubject to putrefaction; for a hecticke feaver of its ſelfe is void of all equality, unleſſe it proceede from ſome externall cauſe, as from meate; Certainely if an Hippocratique face may be found in any diſeaſe, it may in this, by reaſon of the colliquation, or waſting away the triple ſubſtance.

The cure.

In the cure of this diſeaſe, you muſt diligently obſerve with what affects it is entangled, and whence it was cauſed. Wherefore firſt you muſt know whether this feaver be a diſeaſe; or elſe a ſymptome. For if it be ſymptomaticall it cannot be cured; as long as the diſeaſe the cauſe thereof, remaines uncured; as if an ulcer of the guts occaſioned by a bloody flixe ſhall have cauſed it, or elſe a fiſtulous ulcer in the Cheſt cauſed by ſome wound received on that part, it will never admit of cure, unleſſe firſt the fiſtulous or dyſenterick ulcer ſhall be cured; becauſe the diſeaſe feedes the ſymptomes, as the cauſe the effect. But if it be a ſimple and eſſentiall hecticke feaver, for that it hath its eſſence conſiſting in an hot and dry diſtemper, which is not fixed in the humors, but in the ſolide parts, all the counſell of the Phyſition muſt be to renue the body, but not to purge it; for onely the humors require purging, and not the defaults of the ſolide parts. Therefore the ſolide parts muſt bee refrigerated and humected; which wee may doe by medicines taken inwardly and applyed outwardly.

A ſymptomaticall hecticke.

An eſſentiall hecticke.

Things to bee taken inwardly.

The things which may with good ſucceſſe bee taken inwardly into the body for this purpoſe, are medicinall nouriſhments. For hence we ſhall finde more certaine and manifeſt good, than from altering medicines, that is, wholly refrigerating and humecting without any manner of nouriſhment.

The benefit of medicinall nouriſhments.

For by reaſon of that portion fit for nutriment which is therewith mixed, they are drawne and carried more powerfully to the parts, and alſo converted into their ſubſtance: whereby it comes to paſſe that they doe not humect and coole them lightly and ſuperficially, like the medicines which have onely power to alter and change the body, but they carry their qualities more throughly even into the innermoſt ſubſtance.

Of theſe things ſome are herbes, as violets, purſlaine, bugloſſe, endive, duckſ-meat, or water lentill, mallowes, eſpecially when the belly ſhall be bound. Some are fruits, as gourds, cowcumbers, apples, prunes, raiſons, ſweete almonds, and freſh or new pine-apple kernells. In the number of ſeedes are the foure greater and leſſer cold ſeedes, and theſe new, for their native humidity, the ſeedes of poppyes, berberries, quinces. The floures of bugloſſe, violets, water lillies, are alſo convenient; of all theſe things let broth be made with a chicken, to bee taken in the morning for eight or nine dayes, after the firſt concoction.

The choyce of meates.

For meates; in the beginning of the diſeaſe, when the faculties are not too much debilitated, hee ſhall uſe ſuch as nouriſh much and long, though of hard digeſtion; ſuch as the extreame parts of beaſts, as the feete of Calves, Hoggs feete not ſalted, the fleſh of a Tortois, which hath lived ſo long in a garden, as may ſuffice to digeſt the excrementitious humidity; the fleſh of white Snailes, and ſuch as have beene gathered in a vineyard, of frogs, river Crabs, Eeles taken in cleere waters and; wel cooked, hard egges eaten with the juice of Sorrell without ſpices; Whitings and ſtockfiſh. For al ſuch things becauſe they have a tough and glutinous juice, are eaſily put & glutinated to the parts of our body, neither are they ſo eaſily diſſipated by the feaveriſh heat. But when the patient languiſheth of a long hectick, he muſt feede upon meats of eaſiy digeſtion, and theſe boyled rather than roaſted; for boyled meats humect more, and roaſted more eaſily turne into choler. Wherefore hee may uſe to eate Veale, Kid, Capon, Pullet, boyled with refrigerating and humecting hearbes; hee may alſo uſe Barly creames, Almond milkes, as alſo bread crummed and moyſtened with roſe water and boyled in a decoction of the foure cold ſeedes with ſugar of roſes; for ſuch a Panada cooles the liver, and the habite of the whole body, and nouriſheth withall.

The Teſticles, wings, and livers of young cockes, as alſo figges and raiſons. But if the patient at length begin to loathe and grow weary of boyled meates, then let him uſe roaſt, but ſo that he cut away the burnt and dryed part thereof, and feed onely on the inner part thereof, and that moyſtned in roſe water, the juice of Citrons, Oranges or Pomegranats. Let him abſtaine from ſalt and dry fiſhes, and chuſe ſuch fiſhes as live in ſtony waters, for the exerciſe they are forc'd to undergoe in ſhunning the

rockes

How Aſſes milke muſt be uſed in a hectick.

rockes beaten upon by the waves. Aſſes milke newly milked and ſeaſoned with a little ſalt, ſugar, honey, or fennell, that it may not corrupt, nor grow ſowre in the ſtomacke; or womans milke ſucked from the dug by the patient, to the quantity of halfe a pint is much commended; verily womans milke is the more wholſome, as that which is more ſweet and familiar to our ſubſtance, if ſo be that the nurſe be of a good temper and habite of body. For ſo it is very good againſt the gnawings of the ſtomacke, and ulcers of the Lungs, from whence a Conſumption often proceeds. Let your milch Aſſe be fed with barly, oates, oake leaves; but if the patient chance to bee troubled with the fluxe of the belly, you ſhall make the milke ſomewhat aſtringent, by gently boyling it, and quenching therein pebble ſtones heated red hot. But for that all natures cannot away with Aſſes milke, ſuch ſhall abſtaine from it, as it makes to have acrid belchings, difficulty of breathing, a heate and rumbling in the *Hypochondria*, and paine of the head. Let the patient temper his wine with a little of the waters of Lettuce, purſlaine and water-lillies, but with much bugloſſe water, both for that it moyſtens very much; as alſo for that it hath a ſpecificke power to recreate the heart, whoſe ſolide ſubſtance in this kinde of diſeaſe is greivouſly afflicted. And thus much of things to be taken inwardly.

Womans milk more wholſome than Aſſes.

Things to be outwardly applyed.

Theſe things which are to be outwardly applyed, are inunctious, bathes, epithemes, clyſters. Inunctions are divers, according to the various indication of the parts whereto they are applyed. For *Galen* annoints all the ſpine with cooling & moderate aſtringent things, as which may ſuffice to ſtrengthen the parts, and hinder their waſting, and not let the tranſpiration; for if it ſhould bee letted, the heate would become more acride, by ſuppreſſing the vapours. Oyle of roſes, water lillies, Quinces, the mucilages of Gumme tragacanth and arabicke extracted in water of nitghſhade, with ſome ſmall quantity of camphire, and a little waxe if neede require; but on the contrary, the parts of the breaſt muſt be annoynted with refrigerating and relaxing things; by refrigerating I meane things which moderately coole, for cold is hurtfull to the breaſt. But aſtringent things would hinder the motion of the muſcles of the cheſt, and cauſe a difficulty of breathing. Such inunctions may be made of oyle of Violets, willowes, of the ſeeds of lettuce, poppyes, water-lillyes, mixing with them the oyle of ſweete almonds to temper the aſtriction which they may have by their coldneſſe. But you muſt have great care that the Apothecarie for covetouſneſſe in ſteed of theſe oiles newly made give you not old, rancide and ſalted oiles, for ſo in ſteed of refrigerating, you ſhall heate the part; for wine, honey and oyle acquire more heate by age; in defect of convenient oyles, we may uſe butter well waſhed in violet and nightſhade water. The uſe of ſuch inunctions, is to coole, humect and comfort the parts whereto they are uſed; they muſt be uſed evening and morning, chiefely after a bath.

A caution in the choyſe of Oyles.

The differences of bathes.

Now for Bathes, we preſcribe them either onely to moyſten, and then plaine warme water wherein the flowres of Violets and water lillyes, willow leaves and barly have beene boyled, will be ſufficient; or elſe not onely to moyſten, but alſo to acquire them a fairer and fuller habite, and then you may adde to your bath the decoction of a ſheepes head and Gather, with ſome butter. But the patient ſhall not enter into the bath faſting, but after the firſt concoction of the ſtomack, that ſo the nouriſhment may be drawne by the warmeneſſe of the bath into the whole habite of the body, for otherwiſe he which is ſicke of a conſumption and ſhall enter the bath with his ſtomacke empty, ſhall ſuffer a greater diſſipation of the triple ſubſtance, by the heate of the bath, than his ſtrength is well able to endure. Wherefore it is fit thus to prepare the body, before you put it into the bath. The day before in the morning let him take an emollient clyſter, to evacuate the excrements baked in the guts by the hecticke dryneſſe; then let him eate to his dinner ſome ſolide meats about nine of the clocke; and let him about foure of the clocke eate ſomewhat ſparingly, meates of eaſie digeſtion to his ſupper. A little after midnight let him ſup of ſome chicken broth or barly creame, or elſe two reare egges tempered with ſome roſe water and ſugar of roſes in ſteed of ſalt. Some 4. or 5. hours after, let him enter into the bath, theſe things which I have ſet downe, being obſerved. When he comes out of the bath, let him be dryed and gently rubbed, with ſoft linnen cloathes, and annointed as I formerly

Why the patients muſt not enter the Bath faſting.

How to prepare the body for the Bath.

Things ſtrengthening the ventricle.

Epithemes.

ly preſcribed, then let him ſleepe if he can for two or three houres in his bed: when he wakes let him take ſome Ptiſan, or ſome ſuch like thing, and then repeate his bath after the foreſayd manner. He ſhall uſe this bath thrice in ten dayes; But if the patient be ſubject to crudities of the ſtomacke, ſo that hee cannot ſit in the bath without feare of ſowning and ſuch ſymptomes, his ſtomacke muſt be ſtrengthened with oyle of Quinces, Wormewood and Maſtich, or elſe with a cruſt of bread toſted, and ſteeped in muskedine, and ſtrewed over with the powders of Roſes, Sanders, and ſo layd to the ſtomacke, or behinde neare to the thirteenth *vertebra* of the backe, under which place, Anatomie teaches, that the mouth of the ſtomacke lyes. Epithemes ſhall be applyed to the liver and heart, to temper the too acride heate of theſe parts, and correct the immoderate dryneſſe by their moderate humidity.

What a fluxe happening in a hecticke feaver indicates.

How children be cured,

Now they ſhall be made of refrigerating and humecting things, but chiefely humecting; for too great coldneſſe would hinder the penetration of the humidity into the part lying within. The waters of Bugloſſe, and Violets, of each a quarterne with a little white wine is convenient for this purpoſe. But that which is made of French barly, the ſeedes of gourds, pompions, or Cowcumbers of each three drams in the decoction, and mixed with much tempering with oyle of Violets, or of ſweete almonds, is moſt excellent of all other. Let clothes be dipped and ſteeped in ſuch epithemes, and layd upon the part, and renued as oft as they become hot by the heate of the part. And becauſe in hecticke bodies, by reaſon of the weakeneſſe of the digeſtive facultie, many excrements are uſually heaped up, and dryed in the guts, it will be convenient, all the time of the diſeaſe to uſe frequently gliſters made of the decoction of cooling and humecting hearbes, flowres, and ſeedes wherein you ſhall diſſolve *Caſsia* with ſugar and oyle of Violets, or water-lillies. But becauſe there often happen very dangerous fluxes in a confirmed hecticke feaver, which ſhew the decay of all the faculties of the body, and waſting of the corporaell ſubſtance, you ſhall reſiſt them with refrigerating and aſiſting medicines; and meates of groſſer nouriſhment, as Rice, and Cicers; and application of aſtringent and ſtrengthening remedies; and uſing the decoction of Oates or parched barly for drinke. Let the patient be kept quiet and ſleeping as much as may be, eſpecially if he be a child.

For this feaver frequently invades children by anger, great and long feare, or the too hot milke of the nurſe, overheating in the Sunne, the uſe of wine and other ſuch like cauſes; they ſhall be kept in a hot and moyſt ayre, have another Nurſe, and bee anoynted with oyle of violets; to conclude, you ſhall apply medicines which are contrary to the morbificke cauſe.

Chap. XXXIII.

Of the wounds of the Epigaſtrium *and of the whole lower belly.*

Their differences.

Signes of a wounded liver.

THe wounds of the lowerbelly are ſometimes before, ſometimes behind, ſome onely touch the ſurface thereof, others enter in; ſome paſſe quite through the body, ſo that they often leave the weapon therein, ſome happen without hurting the conteined parts; others grievouſly offend theſe parts, the liver, ſpleene, ſtomacke, guts, kidneyes, wombe, bladder, ureters, and great veſſells, ſo that oft times a great portion of the Kall falls forth. We know the Liver is wounded, when a great quantity of blood comes forth of the wound, when a pricking paine reaches even to the ſwordlike griſtle, to which the Liver adheares. Oft times more choler is caſt up by vomit, and the patient lyes on his belly with more eaſe, and content.

Signes that the ſtomacke and ſmaller guts are wounded.

Signes to know when the greater guts are wounded,

When the ſtomacke or any of the ſmall guts are wounded, the meate and drinke break out at the wound, the *Ilia* or flankes ſwell and become hard, the hicket troubles the patient, and oft times he caſts up more choler, and greevous paine wrings his belly, and hee is taken with cold ſweates, and his extreme parts waxe cold.

If any of the greater gutts ſhall bee hurt, the excrements come forth at the wound:

When the Spleene is wounded, there flowes out thicke and blacke blood, the patient is oppreſſed with thirſt, and there are alſo the other ſignes, which wee ſayd uſe to accompany the wounded Liver. A difficulty of making water troubles the patient whoſe reines are wounded, blood is piſſed forth with the Vrine, and he hath a paine ſtretched to his groines and the regions of the Bladder and Teſticles.

Signes that the Kidneyes are hurt.

Signes that the Bladder is wounded.

The Bladder or Vreters being wounded, the flankes are pained, and there is a Tenſion of the *Pecten* or ſhare, blood is made in ſtead of vrine, or elſe the vrine is very bloody, which alſo divers times comes forth at the wound. When the wombe is wounded, the blood breakes forth by the privities, and the Symptomes are like thoſe of the Bladder.

Signes that the wombe is wounded.

Prognoſticks.

The wounds of the liver are deadly, for this part is the worke houſe of the blood, wherefore neceſſarie for life; beſides by wounds of the liver the branches of the Gate or Hollow veines are cut, whence enſues a great flux of blood not onely inwardly, but alſo outwardly, and conſequently a diſſipation of the ſpirits and ſtrength.

But the blood which is ſhed inwardly amongſt the bowels putrefies and corrupts, whence followes paine, a feaver, inflammation, and laſtly death. Yet *Paulus Ægineta* writes, that the lobe of the Liver may be cut away without neceſſary conſequence of death. Alſo the wounds of the Ventricle and of the ſmall Guts, but chiefely of the *Iejunum* are deadly; for many veſſells runne to the *Iejunum* or empty Gut, and it is of a very nervous and ſlender ſubſtance, and beſides it receives the cholericke humour from the bladder of the Gall. So alſo the wounds of the Spleene, Kidneyes, Vreters, Bladder, Womb and Gall, are commonly deadly, but alwayes ill, for that the actions of ſuch parts are neceſſary for life; beſides, divers of theſe are without blood and nervous, others of them receive the moiſt excrements of the whole body, and lie in the innermoſt part of the body, ſo that they doe not eaſily admit of medicines. Furthermore, all wounds which penetrate into the capacitie of the belly, are judged very dangerous, though they doe not touch the conteined bowells; for the encompaſſing and new ayre entring in amongſt the bowells, greatly hurts them, as never uſed to the feeling thereof; adde hereto the diſſipation of the ſpirits which much weakens the ſtrength. Neither can the filth of ſuch wounds be waſted away according to the minde of the Chirurgion, whereby it happens, they divers times turne into Fiſtula's, as we ſaide of wounds of the Cheſt, and ſo at length by collection of matter cauſe death. Yet I have dreſſed many who by Gods aſſiſtance and favour have recovered of wounds paſſing quite through their bodies.

Lib.6.cap.88.

A Hiſtorie.

I can bring as a witneſſe the ſteward of the Portingall Embaſſadour, whom I cured at *Melun*, of a wound made with a ſword ſo running through his body, that a great quantity of excrements came forth of the wounded Guts, as he was a dreſſing, yet he recovered.

Another Hiſtorie.

Not long agone *Giles le Maiſtre* a Gentleman of *Paris* was runne quite through the body with a Rapier, ſo that he voyded much blood at his mouth and fundament divers dayes together, whereby you know the Guts were wounded; and yet he was healed in twenty dayes. In like ſort the wounds of the greater veſſells are mortall, by reaſon of the great effuſion of blood and ſpirits which enſues thereupon.

Chap. XXXIIII.

The cure of wounds of the lower belly.

The firſt cogitation in curing of theſe wounds ought to be whether they pierce into the capacitie of the Belly; for thoſe which paſſe no further than to the *Peritonæum* ſhall be cured like ſimple wounds which onely requre union. But thoſe which enter into the capacity muſt be cured after another manner. For oft times the Kall or Guts, or both fall forth at them.

The cure of a wounded Gut.

A gut which is wounded muſt be ſowed up with ſuch a ſeame as Furriers or Glovers uſe, as we formerly told you; and then you muſt put upon it a pouder made of

Maſtich, Myrrhe, Aloes and Bole. Being ſowed up, it muſt not bee put up boyſterouſly together and at once into its place, but by little and little, the Patient lying on the ſide oppoſite to the wound. As for example, the right ſide of the Guts being wounded and falling out by the wound, the Patient ſhall lye on his left ſide, for the more eaſy reſtoring of the fallne downe Gut, and ſo on the contrary. If the lower part of the Guts being wounded ſlide through the wound, then the Patient ſhall lye with his head low downe, and his buttocks raiſed up by putting a pillow under them; If the upper part be hurt, then muſt he lye quite contrary, that the Guts falling downewards by ſuch a ſite, may give way to theſe which are fallne out through the wound. But often in this caſe, the Guts having taken cold by the encompaſſing aire, ſwell up & are diſtended with winde, the which you muſt diſcuſſe before you put them into their place, with a fomentation of the decoction of camomill, melilote, aniſeeds and fennell applyed with a ſpunge, or contained in a bladder; or elſe with chickens, or whelpes cut alive in the midſt and layd upon the ſwelling; for thus they doe not onely diſcuſſe the flatulency, but alſo comfort the afflicted part. But if the inflation cannot thus be diſcuſſed, the wound ſhall be dilated, that ſo the Guts may returne the more freely to their place.

The cure when the Kall falls out.

Hip. Aph. 58. ſect. 6.

If the Kall ſhall fall out, it muſt be ſpeedily reſtored to its place, for it is very ſubject to putrifie; for the fat, whereof for the moſt part it conſiſts, being expoſed to the aire, eaſily looſes its native heate, which is ſmall and weake, whence a mortification enſues. Hence is that of *Hippocrates*; If the Kall fall out, it neceſſarily putrifies. The Chirurgion ſhall know whether it putrifie, or not, by the blackneſſe and the coldneſſe you may perceive by touching it; neither muſt you when it putrifies preſently reſtore it to its place, for ſo the contagion of the putrifaction would ſpread to the reſt of the parts: but what ſoever thereof is putrefied ſhall be twitched and bound hard with a ſtring and ſo cut off, and the reſt reſtored to his proper place: but its good after cutting of it away to leave the ſtring ſtill hanging thereat, that ſo you may plucke and draw forth whatſoever thereof may by being too ſtraight bound fall away into the capacity of the belly. Some thinke it to be better to let the Kall thus bound to hang forth untill that portion thereof which is putrified fall away of it ſelfe, and not to cut it off. But they are much deceived, for it hanging thus would not cover the guts, which is the proper place. The Guts and Kall being put up, if the wound be great and worth ſpeaking of, it muſt be ſowed with that ſuture which is termed *Gaſtroraphia*; but this kind of ſuture is thus made. The needle at the firſt putting in muſt onely take hold of the *peritonæum*, & then on the oppoſite ſide onely of the fleſh, letting the *peritonæum* alone, and ſo goe along putting the needle from without inwards, and from within outwards, but ſo that you onely take the muſculous fleſh and ſkinne over it, and then onely the *peritonæum*, untill you have ſowed up all the wound. Hee which doth otherwiſe ſhall undergoe this danger, that whereas the coate *peritonæum* is of it ſelfe without blood, it being devided, or wounded cannot of it ſelfe be united to it ſelfe, therefore it requires an intercourſe of fleſh: otherwiſe unleſſe it be thus united by the benefit of the fleſh intermixed therewith, there would remaine an uncurable Tumour after the wound is cicatrized on the outſide.

Lib. 6. Meth. cap. 4.

But that which wee ſayd before according to *Galens* minde, that all the wounds muſt be ſowed, it is not ſo to be taken as if that the wound muſt be ſowed up to the very end; for in the lower part of the wound there muſt be left a certaine ſmall vent by which the quitture may paſſe forth, which being wholly clenſed and exhauſted, the wound muſt be quite healed up. But the wounds which ſhall penetrate into the ſubſtance of the liver, ſpleene, ventricles, and other bowells, the Chirurgion ſhall not ſuffer them to be without medicines as if they were deſperate, but here ſhall ſpare neither labour nor care to dreſſe them diligently. For doubtfull hope is better than certaine deſpaire. The bladder, wombe, and right gut being wounded, detergent and agglutinative injections ſhall be put up by their proper paſſages. I have read nothing as yet in any author of the wounds of the Fat, for all of them referre the cure thereof to the wounds of the Muſcles.

The cure of the wounded fat.

Yet I will ſay this by the way, that wounds of the fat how deepe ſoever they be, if they be onely ſimple, may be dreſſed without putting in of any Tent, but onely dropping in ſome of my balſame, and then laying upon it a plaiſter of *Gratia Dei*, or ſome ſuch like, for ſo they will heale in a ſhort time.

CHAP.

Chap. XXXV.

Of the wounds of the Groines, Yard and Teſticles.

WHen the Groines and neighbouring parts are wounded, we muſt firſt conſider whether they pierce to within: and if they doe penetrate, to what inward parts the come, whether to the bladder, the wombe, or right gut: for theſe parts are ſuch neare neighbours that oft times they are all wounded with one blow. But for the wounds of the Teſticles, and genitall parts, becauſe they are neceſſary inſtruments for the preſerving the *ſpecies* by generation, or a ſucceſſion of individualls, and to keepe all things quiet at home, therefore the Chirurgion ought to be very diligent and carefull for their preſervation. Wherefore if they ſhould chance at any time to be wounded, they ſhall be dreſſed as we have formerly delivered, the medicines being varyed according to the ſtate of the wound, and the appearing and happening ſymptomes; for it would be a thing of immenſe labour to handle all things in particular.

Chap. XXXVI.

Of the Wounds of the Thighes and Legges.

Why wounds of the inſide of the Thigh are oft times deadly.

WOunds which have beene received on the inſide of the Thighes, have often cauſed ſuddaine death, if they have come to the veine *Saphena*, or the great Artery, or the Nerves the aſſociates of theſe veſſells. But when they are ſimple, there is nothing which may alter the uſuall manner of cure. Yet the patient muſt be carefull to lye in his bed: for the vulgar Italian proverbe is true. *La mano al petto, la gamba al letto,* [that is, the hand on the breaſt, and the legge on the bed.] But when they penetrate more deepely into the ſubſtance of the part, they bring horrid and fearefull ſymptomes, as an inflammation, an abſceſſe, from whence oft times ſuch aboundance of matter iſſues forth, that the Patient falls into an *Atrophia* and conſumption. Wherefore ſuch wounds and ulcers require a carefull and induſtrious Chirurgion, who may fitly make inciſions neceſſary for the corrupt parts, and calloſity of the fiſtulous ulcer. Some Chirurgions have beene ſo bold as to ſowe together the end of the Tendons of the Ham, and of other joynts, when they have beene quite cut aſunder. But I durſt never attempt it for feare of paine, convulſions and the like horrid ſymptomes. For the wounds of that large Tendon which is compoſed in the calfe of the Legge by the concourſe of three muſcles, and goes to the heele, I have obſerved that when it hath beene cut with a ſword, that the wounds have beene long and hard to cure; and beſides when at the laſt they have beene healed, as ſoone as the Patient hath got out of his bed, and endeavoured to goe, they have growne ill and broke open againe. Wherefore in ſuch like wounds let the Patient have a care that he begin not to goe, or too boldly to uſe his hurt leg before it be perfectly cicatrized and the ſcarre growne hard. Therefore that the patient may be in more ſafety, I judge it altogether neceſſary, that he uſe to goe with Crutches, for a good while after the wound is perfectly healed up.

The large Tendon of the heele hard to conſolidate.

Chap. XXXVII.

Of the wounds of the Nerves, and nervous parts.

Differences drawne from things wounding.

THe continuity of the nervous parts is divers wayes looſed by the violent incurſion of externall things; as by things which contuſe, batter and grinde in ſunder, as by the blow of a ſtone, cudgell, hammer, lance, bullet out of a gun, or croſſebow; by the biting of greater teeth; or the pricking of ſome ſharpe thing, as a needle, bodkin, penknife, arrow, ſplinter; or the puncture of ſome venemous thing, as of a Sea Dragon; or the edge of ſome cutting thing, as a ſword or Rapier; or of ſtretching things which violently teare aſunder the nervous bodies. Hence therefore it is, that of ſuch wounds ſome are ſimple, others compound, and the compound, ſome more compound than other. For of theſe ſome are ſuperficiary

Their ſymptomes.

Why a puncture of a nerve is deadly.

perficiary and ſhort,others deepe and long; ſome runne alongſt the nervous body, others runne broadwayes; ſome cut the part quite aſunder, others onely a portion thereof. The ſymptomes which follow upon ſuch wounds are,vehement paine, and defluxion,inflammation,abſceſſe, feaver, *delirium*, ſowning, convulſion, gangrene, ſphacell; whence often death enſues by reaſon of that ſympathy, which all the nervous parts have with the braine. Amongſt all the wounds of the nervous parts, there is none more to be feared than a puncture, or pricke, nor any which cauſeth more cruell and dangerous ſymptomes. For by reaſon of the ſtraitneſſe of the wound, medicines can neyther be put in, nor the ſanious matter paſſe forth:now the ſanious matter by long ſtay acquires virulencie, whereby the nervous parts are tainted and ſwollne,ſuffer paine,inflammation,convulſions and infinite other ſymptomes;of theſe the wounds are moſt dangerous, by which the nervous and membranous bodies are but halfe cut aſunder.For the portion whereof which remaines whole,by its drawing and contracting its ſelfe towards the originall,cauſeth great paine and convulſion by ſympathy.The truth hereof is evident in wounds of the head,as when the *pericranium* is halfe cut, or when it is cut to apply a Trepan. For the cutting thereof infers farre greater paine,than when it is cut quite aſunder. Wherefore it is ſafer,to have the nervous body cut quite off, for ſo it hath no cōmunity, nor conſent with the upper parts, neither doth it labour,or ſtrive to reſiſt the contraction of its ſelfe; now this contrariety,and as it were fight,is the cauſe of paine;yet there ariſes another miſery from ſuch a wound,for the part whereinto the nerve which is thus cut inſunder paſſes,thence forwards looſeth its action.

Chap. XXXVIII.

Of the cure of wounds of the nervous parts.

A wound of the nervous parts indicates contrary to the generall cure of wounds.

IT is the ancient doctrine of the ancient Phiſitions,that the wounds of the nervous parts ſhould not preſently be agglutinated(which notwithſtanding the generall and firſt indication uſually taken from the ſolution of continuity requires)but rather,chiefely if they be too ſtraite,that the punctures ſhould be dilated, by cutting the parts which are above them,and let them be kept long open that the filth may paſſe freely forth and the medicine enter well in. Yet I in many cures have not followed this counſell,but rather that which the common indication requires.

A Hiſtorie.

That cure is in freſh memory which I performed upon Monſieur *le Cocq*, a Procter of the ſpirituall court,who dwelt in our Ladies ſtreete; he gathering and binding up ſome looſe papers,run a penknife which was hid amongſt them, through his hand. Alſo one of his neighbours who went to ſpit a piece of beefe,thruſt the ſpit through the midſt of his hand; But I preſently agglutinated both their wounds, without any danger,dropping preſently in at the firſt dreſſing a little of my balſame warme,&putting about it a repelling & aſtringent medicine,& by this meanes they were both of them healed in a ſhort time,no ſymptome thereupon happening. Yet I would not have the young Chirurgion to run this hazard,for firſt he muſt be well practiſed and accuſtomed to know the tempers and habits of men; for this manner of curing would not doe well in a plethoricke body,or in a body replete with ill humours,or endued with exquiſite ſenſe. Therefore in ſuch a caſe it will be ſafer to follow the courſe here ſet downe. For wounds of the nerves doe not onely differ from other wounds, but alſo among themſelves in manner of curing. For although all medicines which draw from farre,and waſte ſanious humors, may be reputed good for the wounds of the nerves; yet thoſe which muſt be applyed to punctures and to thoſe nerves which are not wholly laid open,ought to be far more powerfull,ſharpe and drying, yet ſo that they be not without biting,that ſo penetrating more deepe they may draw forth the matter,or elſe conſume and diſcuſſe that which eyther lies about the nerves, or moiſtens their ſubſtance. On the contrary when the ſinewes are bared from fleſh and the adjoyning particles, they ſtand in neede but of medicines, which may onely dry. Here you may furniſh your ſelves with ſufficient ſtore of medicins good for the nerves howſoever pricked. As ℞. *Terebinth.ven.& olei veteris an.*℥j.*aquæ vitæ parum.* Or ℞.*olei Terebinth.*℥j.*aquæ vitæ* ʒj.*euphorb.* ʒß. Or ℞.*radices Dracontiæ, Brioniæ, valerianæ, & gentianæ exſiccatas, & in pulverem redactas, miſce cum decocto centaurij,*

Medecines fit for wounds of the nerves.

aut oleo, aut exungia veteri; drop hereof warme into the wound as much as ſhall ſuffice. Or elſe put ſome Hogges, Gooſe, Capons, or Beares greaſe, old oile, oile of Lillyes or the like, to *Galbanum*, pure Rozin, *opopanax* diſſolved in *aqua vitæ* and ſtrong vinegar. Or ℞.*olei hypericonis, ſambuci, & de euphorbio an.* ℥j.*ſulphuris vivi ſubtiliter pulveriſati* ℥ß *gummi ammoniaci, bdellij, an.* ʒij.*aceti boni* ℥ij. *vermium terreſt. præparat.*℥j.*bulliant omnia ſimul ad conſumptionem aceti.* Let as much hereof as ſhall ſuffice be dropped into the wound; then apply this following cerate, which drawes very powerfully. ℞.*olei ſuprà ſcripti* ℥j.*terebinth. venet.* ℥ß.*diachylonis albi cum gummi,* ʒx.*ammoniac bdellij in aceto diſſolutorum an.* ʒij.*reſin. pini, gum. elemi, picis navalis an.* ʒv; *ceræ quod ſufficit, fiat ceratum ſatis molle.* We muſt uſe ſomewhiles one, ſomewhiles another of theſe medicines in punctures of the Nerves with choiſe and judgement, according to their conditions, manner, depth, and the temperaments and habit of the wounded bodies. But if the paine yeeld not to ſuch remedies, but rather increaſe, with the inflammation of the affected part, a ſwelling of the lips of the wound, and ſweating forth of a ſerous, thinne and virulent matter or filth, then you ſhall poure into it ſcalding oyle, and ſhall touch three or foure times not onely the ſurface of the wound but the bottome thereof with a ragge dipped therein and tyed to the end of a *ſpatula*. For this will take away the ſenſe from the Nerve, Tendon, or Membrane, like as if they were burnt with a cautery, and ſo the paine will be eaſed. So in the moſt grievous paines of rotten teeth, the thruſting of an hot iron into their roots, or ſtopping them with cotten dipped in oyle of Vitrioll, or *aqua vitæ*, gives moſt certaine eaſe; for by burning the Nerve which is inſerted into their roots, the ſenſe and ſo conſequently the paine is taken away. So alſo in malignant, gnawing, eating, and ſpreading ulcers, which are alwayes aſſociated with much paine, the paine ceaſes by applying an Eſcharoticke, as the pouder of Alume, or Mercury, or *ægyptiacum* made ſomewhat more ſtrong than uſuall. That the yong Chirurgion may be more ready for this practiſe and the uſe of the former remedies, I have thought good to inſert the following Hiſtory both for the lateneſſe of the thing and the pleaſing memory of the moſt laudible Prince.

What wounds of the Nerves muſt be burnt.

A certaine Anodyne in paine of the teeth.

Why Eſcharoticks muſt be uſed to ſpreading ulcers.

A famous hiſtorie.

Charles the ninth the French King being ſicke of a feaver, Monſieur *Chapellan* and *Caſtellan* his Phiſitions thought it fit hee ſhould be let blood; for the performance whereof, there was called a Chirurgion wondrous famous for that buſineſſe; but when as he by chance had pricked a nerve in ſtead of a veine, the King cryed out, that he felt a mighty paine in that place. Then I bid, that the ligature ſhould ſtraightwayes be looſed, otherwiſe the arme would preſently be much ſwelled. But he going ſlowly about it, behold the arme begun to ſwell with ſuch contraction, that he could not bend it, nor put it forth, and cruell paine moleſted not onely the pricked particle, but all the whole member beſids. I forthwith laid upon the wound a plaiſter of *Baſilicō*, to hinder the agglutination thereof, & then I wrapped all the arme in a double linnen cloth dipped in oxycrate, putting upon it an expulſive ligature, which beginning at the wriſt & ending at the top of the ſhoulder, might keepe the blood and ſpirits from feare of defluxion and inflammation. This being thus performed, we went aſide to conſult what was neceſſary to be done, both to aſſwage the paine, as alſo to divert the other ſymptomes, which uſually happen upon punctures of the nerves. I being deſired, thus delivered my opinion, that in my minde, there were nothing better, than preſently to drop into the wound ſome oyle of Turpentine warmed and mixed with a little *aqua vitæ*. And then all the arme ſhould be covered with a plaiſter of *Diacalcitheos* diſſolved in vinegar and oyle of Roſes, bound over and beſides with the expulſive ligature, which we formerly mentioned. For the oyle and *aqua vitæ* have a faculty to penetrate into the bottome of the wound, & to exhauſt and dry up, the ſerous and virulent humour, which ſweats from the ſubſtance of the pricked nerve; and alſo to mitigate the paine by its actuall heate. Furthermore the emplaſter *Diacalcitheos* hath a faculty to diſſolve the humour which hath already fallen downe into the arme, and to hinder the entrance and defluxion of any new matter. And the ligature is ſuch as by its moderate aſtriction would ſerve to ſtrengthen the muſcles, and to preſſe out and repell the humours which were fallen downe into the upper part, and to prohibite that which is ready to fall downe. Mine advice being approved of the Phyſitions both in word and deede, the paine was mitigated. But the humour ſtayed in the part, for the diſſolving and drying whereof, this following remedy was uſed.

A diſcuſsing and drying cataplaſme.

℞ *far. hordei & orobi, an.* ʒij. *flor. chamæm. & melilot. an.* p. ij *butyr. recentis ſine ſale* ℥jß. *lixivij barbitonſoris quod ſufficit, fiat cataplaſma ad formam pultis.* By theſe remedies the King at the laſt after three months ſpace was perfectly healed, ſo that there remained no ſigne of the depraved action in the part. But if at any time there ſhall be ſo great contumacie, that it will not yeeld to theſe meanes, but that there is imminent danger of a convulſion; it will bee better to cut it in ſunder whether Nerve, Tendon or Membrane, than to expoſe the patient to the danger of a deadly convulſion; for thus indeede the peculiar action of that part will be loſt, but the whole body preſerved thereby; for ſo we had determined by common conſent, that if the paine which afflicted the King would not yeeld to the preſcribed remedies, eyther to poure in ſcalding oyle, or elſe to cut the ſinew quite aſunder.

A Hiſtorie.

For the late and ſad memory of Miſtris *Courtin* dwelling in the ſtreete of the holy-Croſſe was in our mindes, who of a veine not well opened in her arme fell into a Gangræne and totall mortification of that whole part, of which ſhee died, becauſe ſhee was not dreſſed with the formerly mentioned medicines. Yet wee muſt abſteine from theſe too powerfull remedies, when the pricked nerve ſhall lye bare, for elſe the paine would be encreaſed, and more grievous ſymptomes follow. Wherefore as I have formerly wiſhed, more milde medicines muſt be applyed, which may dry up the ſerous humour without biting or acrimonye, as ℞. *terebinth. venet. in aq. roſ. lotæ* ℥ij. *boli armen. ſubtiliter pulveriſati,* ʒij. *incorporentur ſimul.* Our Balſame alſo is excellent in this caſe, and this of *Vigoes* which followes.

An anodyne and Sarcotick Balſame.

℞. *olei. roſar. omphacini* ℥jß. *olei de terebinth.* ʒiij. *ſucci plantag.* ℥ß. *ſemin. hypericonis aliquantulū contriti. m.* ß. *tutiæ præpar.* ʒiij. *calcis decies lotæ cum aqua plantagin.* ʒij. *antimonij* ʒi. *ſevi hircini, & vitulini, an* ʒv. *vermium terreſtrium cum vino lotorum* ℥jß. *bulliant omnia ſimul dempta tutia in cyatho decoctionis hordei, ad conſumptionem aquæ & vini, colentur, rurſumq; igni admoveantur, addendo tutiam, & fiat linimentum cum cera alba, &* ʒß. *croci.* This liniment aſſwages paines, and covers the bared nerves with fleſh. This cure of punctured nerves, may with choiſe and judgement and obſerving the proportion of the parts be transferred to the pricked Tendons and membranes. But take this as a generall and common rule, that all nervous bodies howſoever hurt, are to bee comforted by anointing them with hot oyles, ſuch as the oiles of Bayes, Lillies, of Wormes, Sage, or ſome other ſuch like remedy being applyed to their originalls and more notable paſſages; as to the originall of the ſpinall marrow, the armepits and groines. Neither doe I thinke it fit in this place to omit an affect which ſometimes happens to the large Tendon of the heele, of which we formerly made mention. For it oft times is rent or torne by a ſmall occaſion without any ſigne of injury or ſolution of continuity apparent on the outſide as by a little jumpe, the ſlipping aſide of the foote, the too nimble getting on horſeback, or the ſlipping of the foote out of the ſtirrop in mounting into the ſadlde. When this chance happens it will give a cracke like a Coachmans whip; above the heele, where the tendon is broken, the depreſſed cavity may be felt with your finger, there is great paine in the part, & the party is not able to goe. This miſchance may be amended by long lying and reſting in bed, and repelling medicines applied to the part affected in the beginning of the diſeaſe, for feare of more grievous ſymptomes; & then applying the Blacke plaiſter, or *Diacalcitheos* or ſome other ſuch, as neede ſhall require; neither muſt we hereupon promiſe to our ſelves or the patient certaine or abſolute health. But on the contrary at the beginning of the diſeaſe we muſt foretell, that it wil never be ſo cured but that ſome reliques may remaine, as the depreſſion of the part affected and depravation of the action and going; for the ends of this broken or relaxed Tendon by reaſon of its thickeneſſe and contumacie cannot eaſily be adjoyned, nor being adjoyned, united.

A generall rule for all wounds of all Nervous parts.

CHAP.

CHAP. XXXIX.

Of the wounds of the joynts.

Why wounds of the joynts are malignant.

BEcauſe the wounds of the joynts have ſomething proper and peculiar to themſelves, beſides the common nature of wounds of the Nerves, therefore I intend to treat of them in particular. Indeede they are alwayes very dangerous, and for the moſt part deadly, by reaſon of the nervous productions and membranous Tendons wherewith they are bound and engirt, and into which the Nerves are inſerted: whereby it comes to paſſe, that the exquiſite ſenſe of ſuch like parts will eaſily bring maligne ſymptomes, eſpecially if the wound poſſeſſe an internall, or as they terme it, a domeſtique part of them; as for example, the armepits, the bending of the arme, the inner part of the wriſt, and ham, by reaſon of the notable Veines, Arteries and Nerves of theſe parts, the looſed continuity of all which brings a great flux of blood, ſharpe paine and other malignant ſymptomes; all which we muſt reſiſt according to their nature and condition, as a flux of blood with things ſtaying bleeding, paine with anodynes. If the wound be large and wide, the ſevered parts ſhall be joyned with a ſuture, leaving an orifice in the lower part, by which the quitture may paſſe forth. This following pouder of *Vigoes* deſcription muſt be ſtrewed upon the ſuture.

The cure.

℞. *thuris, ſang. draconis, boli armen. terræ ſigill. an.* ʒij. *aloes, maſtich. an.* ʒj. *fiat pulvis ſubtilis.* And then the joynt muſt bee wrapped about with a repercuſſive medicine compoſed of the whites of egges, a little oyle of Roſes, Bole, Maſtich, and barly floure. If it be needefull to uſe a Tent, let it be ſhort and according to the wound thicke, leſt it cauſe paine: and moreover let it bee annointed with the yolke of an egge, oyle of Roſes, waſhed turpenetine and a little ſaffron. But if the wound bee more ſhort and narrow, it ſhall be dilated, if there be occaſion, that ſo the humour may paſſe away more freely. You muſt reſt the part, and beware of uſing cold, relaxing mollifying, humecting, and unctuous medicines, unleſſe peradventure the ſharpeneſſe of the paine muſt be mitigated. For on the contrary, aſtringent and deſiccant medicines are good, as this following cataplaſme.

An aſtringent and drying cataplaſme.

℞. *furfur. macri, farin. hordei, & fabarum. an.* ℥iiij. *florum chamæ. & melil. an* m. ß. *terebinth.* ℥iij. *mellis communis* ℥ij. *ol. myrtini* ℥j. *oxymelitis, vel oxycrat. vel lixivij com. quantum ſufficit, fiat cataplaſma ad formam pultis.* Or you may compoſe one of the Lees of wine, Wheate branne, the pouder of Oaken barke, cypreſſe nuts, galls and Turpentine and ſuch like, that have an aſtringent, ſtrengthning and drying qualitie, and thereby aſſwaging paine, and hindering the defluxion of humours. This following medicine is aſtringent and agglutinative.

℞. *Terebinth. venet.* ℥ij. *aq, vitæ parum, pulveris maſtich. aloes, myrrha, boli armen. an.* ℈ij. And alſo our balſame will be good in this caſe, if ſo be that, you adde hereto ſo much pouder which dryes without acrimonie as occaſion ſhall ſerve. I admoniſhed you before to take heede of cold, and now againe; for it is hurtfull to all wounds and ulcers, but eſpecially to theſe of the nervous parts; hence it is that many dye of ſmall wounds in the winter, who might recover of the ſame wounds though greater in the Summer. For cold according to *Hippocrates* is nipping to ulcers, hardens the skin, and hinders them from ſuppuration, extinguiſheth naturall heate, cauſes blackeneſſe, cold aguiſh fits, convulſions and diſtentions. Now divers excrements are caſt forth of wounds of the joynts, but chiefely albugineous, that is, reſembling the white of an egge, and mucous, and ſometime a very thinne water, all which ſavour of the nature of that humour which nouriſheth theſe parts. For to every part there is appropriate for his nouriſhment and conſervation, a peculiar Balſame, which by the wound flowes out of the ſame part, as out of the branches of the Vine when they are pruned, their radicall moiſture or juice flowes; whence alſo a *Callus* proceeds in broken bones. Now this ſame mucous and albugineous humour, ſlow and as it were frozen flowing from the wounded joynts, ſhewes the cold diſtemper of the parts, which cauſes paine, not to be orecome by medicines onely potentially hot. Wherefore to correct

Aphor. 20. ſect. 5.

What matter uſually flowes from wounds of the joynts.

Why things actually hot muſt be applyed to the wounded ioynts.

Of the ſite and poſture of wounded ioynts.

correct that, we muſt apply things actually hot, as beaſts and ſwines bladders halfe full of a diſcuſſing decoction, or hot bricks quenched in wine. Such actuall heate helps nature to concoct and diſcuſſe the ſuperfluous humour impact in the joynts, and ſtrengthens them; both which are very neceſſary, becauſe the naturall heate of the joynts is ſo infirme that it can ſcarſe actuate the medicine unleſſe it be helped with medicines actually hot. Neither muſt the Chirurgion have the leaſt care of the figure and poſture of the part, for a vicious poſture increaſes ill ſymptomes, uſes to bring to the very part though the wound be cured, diſtortion, numnes, incurable contraction; which fault leaſt he ſhould runne into, let him obſerve what I ſhall now ſay; If the forepart of the ſhoulder be wounded, a great boulſter muſt be under the armepit, and you muſt carry your arme in a ſcarſe, ſo that it may beare up the lower part of the arme, that ſo the top of the ſhoulder may be elevated ſomewhat higher, and that ſo it may be thereby more ſpeedily and happily agglutinated and conſolidated. If the lower part be wounded, when fleſh begins to be generated and the lips of the wound to meete, you muſt bid the patient to moove and ſtirre his armes divers wayes ever and anon, for if that be omitted or negligently done, when it is cicatrized then it wil be more ſtiffe and leſſe pliable to every motion; and yet there is a further danger leaſt the arme ſhould totally looſe its motion. If the wound be upon the joynt of the elbow, the arme ſhall be placed and ſwathed in a middle poſture, that is, which neither too ſtraitly bowes it, nor holds it too ſtiffly out; for otherwiſe when it is cicatrized, there will be an impediment either in the contraction or extenſion. When the wound is in the wriſt, or joynts of the fingers either externally or internally, the hand muſt be kept halfe ſhut, continually mooving a ball therein. For if the fingers be held ſtraight ſtretched forth, after it is cicatrized, they will be unapt to take up or hold any thing, which is their proper faculty. But if after it is healed, it remaine halfe ſhut, no great inconvenience will follow thereon; for ſo hee may uſe his hand divers wayes to his ſword, pike, bridle and in any thing elſe. If the joynts of the Hip be wounded, you muſt ſo place the patient that the thigh bone may be kept in the cavity of the hucklebone, & may not part a haires breadth therefrom, which ſhal be done with linnen boulſters and ligatures applyed as is fitting, and lying full upon his backe. When the wound ſhal begin to cicatrize, the patient ſhall uſe to moove his thigh every way, leaſt the head of the Thigh-bone ſticke in the cavity of the huckle-bone without motion. In a wound of the knee, the legge muſt be placed ſtraight out, if the patient deſire not to be lame. When the joynts of the feete and toes are wounded, theſe parts ſhall neither be bended in nor out, for otherwiſe he will not be able to goe.

To conclude, the ſite of the foote and legge, is quite contrary to that of the arme and hand.

Chap. XL.

Of the wounds of the Ligaments.

Ligaments more dry than Nerves, and without ſenſe.

THe wounds of the Ligaments, beſides the common manner of curing theſe of the Nerves, have nothing peculiar, but that they require more powerfull medicines, for their agglutination, deſiccation and conſolidating, both becauſe the Ligamentall parts are harder, and dryer, and alſo for that they are voyd of ſence. Therefore the foreſaid cure of Nerves and joynts may be uſed for theſe wounds: for the medicines in both are of the ſame kinde, but here they ought to be ſtronger and more powerfully drying. The Theorie and cure of all the ſymptomes which ſhall happen thereupon have beene expreſſed in the Chapter of curing the wounds of the nervous parts, ſo that heere we ſhall neede to ſpeake nothing of them, for there you may finde as much as you will. Wherefore here let us make an end of wounds, and give thankes to God the author and giver of all good for the happy proceſſe of our labours, and let us pray that, that which remaines may be brought to a happy end, and ſecure for the health and ſafety of good people.

The end of the tenth Booke.

OF VVOUNDS MADE BY GVNSHOT, OTHER FIERIE ENGEINES, AND ALL SORTS OF WEAPONS.

The Eleventh Booke.

The Preface.

I Have thought good here to premiſe my opinion of the originall, encreaſe, and hurt of fiery Engines, for that, I hope it will be an ornament and grace to this my whole treatiſe: as alſo to intice my Reader, as it were with theſe junckets, to our following Banquet ſo much ſavouring of Gunpouder. For thus it ſhall bee knowne to all whence Guns had their originall, and how many habits and ſhapes they have acquired from poore and obſcure beginnings; and laſtly how hurtfull to mankind the uſe of them is.

Polydore Virgill writes that a Germane of obſcure birth and condition was the inventor of this new engine which we terme a Gun, being induced thereto by this occaſion. He kept in a mortar covered with a tyle, or ſlate, for ſome other certaine uſes a pouder (which ſince that time for its chiefe and new knowne faculty, is named Gunpouder.) Now it chanced as hee ſtrucke fire with a ſteele and flint, a ſparke thereof by accident fell into the mortar, whereupon the pouder ſuddainly catching fire, caſts the ſtone or tyle which covered the mortar, up on high; he ſtood amazed at the novelty and ſtrange effect of the thing, and withall obſerved the formerly unknowne faculty of the pouder; ſo that he thought good to make experiment thereof in a ſmall Iron trunke framed for that purpoſe according to the intention of his minde. When all things were correſpondent to his expectation, he firſt ſhewed the uſe of his engine to the Venetians, when they warred with the Genoveſes about *Foſſa Clodia*, in the yeare of our Lord 1380. Yet in the opinion of *Peter Meſsias*, their invention muſt have beene of greater antiquity; for it is read in the Chronicles of *Alphonſus* the eleaventh King of *Caſtile*, who ſubdued the Iſles *Argezires*, that when he beſeiged the cheefe Towne in the yeare of our Lord 1343. the beſeiged Moores ſhot as it were thunder againſt the aſſailants, out of Iron mortars. But we have read in the Chronicles written by *Peter* Biſhop of *Leons*, of that *Alphonſus* who conquered *Toledo*, that in a certaine ſea fight fought by the King of *Tunis*, againſt the Mooriſh King of *Sivill*, whoſe part King *Alphonſus* favoured, the *Tunetans* caſt lightning out of certaine hollow Engines or Trunkes with much noiſe. Which could be no other, than our Guns, though not attained to that perfection of art and execution which they now have.

Lib. 2. de invent. rerum.

Cap. 8. prim. par. Var. lect.

I thinke the deviſer of this deadly Engine hath this for his recompence, that his name ſhould be hidden by the darkeneſſe of perpetuall ignorance, as not meriting for this his moſt pernicious invention, any mention from poſterity. Yet *Andrew Thevet* in his Coſmography publiſhed ſome few yeares agone, when hee comes to treate of the *Suevi*, the inhabitants of Germany, brings upon the authority & credite of a certaine old Manuſcript, that the Germane the inventer of this warlike Engine was by profeſſion a monke and Philoſopher or Alchymiſt, borne at *Friburge*, and named *Conſtantine Anclzen.* Howſoever it was, this kind of Engine was called *Bombarda* (*i*) a Gun, from that noiſe it makes, which the Greekes and Latines according to the ſound call *Bombus*; then in the following ages, time, art and mans maliciouſneſſe added much to this rude and unpoliſht invention. For firſt for the matter, Braſſe and Copper, mettalls farre more tractable, fuſible and leſſe ſubject to ruſt, came as ſupplies to Iron. Then for the forme, that rude and undigeſted barrell, or mortar-like maſſe, hath undergone many formes and faſhions, even ſo farre as it is gotten upon wheeles, that ſo it might run not onely from the higher ground, but alſo with more rapide violence to the ruine of mankinde; when as the firſt and rude mortars ſeemed not to bee ſo nimbly traverſed, nor ſufficiently cruell for our deſtruction by the onely caſting forth of Iron & fire. Hence ſprung theſe horrible monſters of Canons, double Canons, Baſtards, Muſquits, feild peices; hence theſe cruell and furious beaſts, Culverines, Serpentines, Baſiliſques, Sackers, Falcons, Falconets, and divers other names not onely drawne from their figure and making, but alſo from the effects of their cruelty. Wherefore certainly I cannot ſufficiently admire the wiſedome of our Anceſtors, who have ſo rightly accommodated them with names agreeable to their natures; as thoſe who have not onely taken them from the ſwifteſt birds of prey, as Falcons; but alſo from things moſt harmefull and hatefull to mankinde, ſuch as Serpents, Snakes, and Baſiliſks. That ſo wee might clearely diſcerne, that theſe engines were made for no other purpoſe, nor with other intent, but onely to be imployed for the ſpeedy and cruell ſlaughter of men; and that by onely hearing them named we might deteſt and abhorre them, as pernicious enemies of our lives. I let paſſe other engines of this ofspring, being for their quantitie ſmall, but ſo much the more pernicious and harmefull, for that they nearer aſſaile our lives, and may trayterouſly and forthwith ſeaze upon us not thinking nor fearing any ſuch thing; ſo that we can ſcarſe have any meanes of eſcape; ſuch are Piſtolls and other ſmall hand-guns, which for ſhortneſſe you may carry in your pocket, and ſo privily and ſuddainly taking them forth oppreſſe the careleſſe and ſecure. Fowling peices which men uſually carry upon their ſhoulders, are of the middle ranke of theſe engines, as alſo Muskets and Caleevers, which you cannot well diſcharge unleſſe lying upon a Reſt, which therefore may be called Breaſt-guns for that they are not laid to the cheeke, but againſt the Breaſt by reaſon of their weight and ſhortneſſe; All which have beene invented for the commodity of footemen, and light horſemen. This middle ſort of engine we call in Latine by a generall name *Sclopus*, in imitation of the ſound, and the Italians who terme it *Sclopetere*; the French call it *Harquebuſe*, a word likewiſe borrowed from the Italians, by reaſon of the touch-hole by which you give fire to the peice, for the Italians call a hole *Buzio.* It is tearmed, *Arcus* (*i*) a Bow, for that at this preſent it holds the ſame place in martiall affaires, as the Bow did of old; and as the Archers formerly, ſo at this day the Muſquetiers are placed in front. From the ſame wretched ſhoppe and magazine of cruelty, are all ſorts of Mines, Countermines, pots of fire, traines, fiery Arrowes, Lances, Croſſebowes, barrells, balls of fire, burning faggots, Granats, and all ſuch fiery engines and Inventions, which cloſely ſtuffed with fewell and matter for fire, and caſt by the defendants upon the bodies and Tents of the aſſailants, eaſily take fire by the violence of their motion. Certainely a moſt miſerable and pernicious kinde of invention, whereby we often ſee a thouſand of heedeleſſe men blowne up with a mine by the force of gunpouder; otherwhiles in the very heate of the conflict you may ſee the ſtouteſt ſouldiers ſeazed upon with ſome of theſe fiery Engines, to burne in their harneſſe, no waters being ſufficiently powerfull to reſtraine and quench the raging and waſting violence of ſuch fire cruelly ſpreading over the body and bowells. So it was not ſufficient to have

Who the inventor of Guns.

The reaſon of the name.

The danger of Piſtolls.

armes, Iron and fire to mans deſtruction, unleſſe alſo that the ſtroake might be more ſpeedy, we had furniſhed them, as it were with wings, ſo to fly more haſtily to our owne perdition, furniſhing ſithe-bearing death with wings ſo more ſpeedily to oppreſſe man, for whoſe preſervation, all things conteined in the world were created by God. Verily when I conſider with my ſelfe all the ſorts of warlike Engines, which the ancients uſed, whether in the field in ſet battells, as Bowes, Darts, Croſſebowes, Slings; or in the aſſault of Citties, and ſhaking or overturning their walls, as Rammes, Horſes, wooddon towres, ſlings and ſuch like; they ſeeme to me certaine childiſh ſports and games made onely in imitation of the former. For theſe moderne inventions are ſuch as eaſily exceede all the beſt appointed and cruell Engines which can bee mentioned or thought upon, in the ſhape, cruelty and appearance of their operations. For what in the world is thought more horrid or fearefull than thunder and lightning? and yet the hurtfulneſſe of thunder is almoſt nothing to the cruelty of theſe infernall Engines; which may eaſily appeare by comparing together both their effects. Man alone of all creatures is not alwayes killed by being touched with thunder; but it immediatly killeth all other things which are ſubject to bee toucht therewith.

A compariſon of the ancient weapons with the moderne.

Plini. Lib. 2. Cap. 54.

Nature beſtowing this honour upon him, ſeeing ſo many creatures exceede him in ſtrength: For all things ly contrary to man; and man, unleſſe hee bee overthrowne with it, doth not dye thereof. But theſe fire-ſpitting Engines doe no more ſpare man, than they doe other creatures, and kill without difference from whence ſoever they come, whither ſoever they are carried, and howſoever they touch. There are many, but more are ſaid to be the remedies againſt thunder; for beſide the charmes whereby the ancient Romans did ſuppoſe they might be driven away, they never penetrate deeper into ground than five foote, therefore ſuch as were fearefull thought the deeper Caves moſt ſafe. Of thoſe things which grow out of the earth they doe not touch the Bay tree, and that was the cauſe that it was counted a ſigne of victory both in ancient and moderne times. Wherefore *Tiberius Cæſar* otherwiſe a contemner of God and religion, as hee who indued with the Mathematicall ſciences thought all things governed by fate, yet becauſe hee exceedingly feared thunder, hee alwayes carried a Lawrell wreath about his necke when the aire was troubled, for that this kind of leafe is reported not to be touched by thunder. Some report that he made him tents of Seales ſkinnes, becauſe it toucheth not this kinde of creature of all theſe things that live in the Sea, as neither the Eagle amongſt birds, which for that is fained to be *Ioves* ſquire. But on the contrary, charmes, the victorious Bay, the Seale or Sea-calfe, the Eagle or any ſuch thing profits nothing againſt the violence of theſe fiery Engines: no not a wall of tenne foote thicke will advantage. Laſtly, this argues the immenſe violence of braſen Cannons above thunder, for that thunder may be diſperſed and driven away with the noyſe and ringing of Bells, the ſounding of Trumpets, the tinkling of braſen kettles, yea alſo by the ſhooting of ſuch great Ordinance; to wit, the clouds, by whoſe colliſion and fight the Thunder is cauſed, being diſperſed by this violent agitation of the ayre, or elſe driven further to more remote parts of the skies. But their fury once provoked, is ſtayed by no oppoſition, appeaſed by no remedy. As there are certaine ſeaſons of the yeare, ſo alſo there are certaine Regions of the earth, wherein Thunder is ſeldome or never heard. Thunders are rare in Winter and Summer, and that for contrary cauſes; for that in Winter the denſe aire is thickned with a thicker coate of clouds, and the froſty and cold exhalation of the earth extinguiſheth what fiery vapours ſoever it receives; which thing keepes *Scythia* and the cold countries about it free from Thunder. And on the contrary, too much heate preſerves Egypt. For hot and dry exhalations of the earth are condenſed into very thinne, ſubtile and weake clouds. But as the invention, ſo alſo the harme and tempeſt of great Ordinance, like a contagious peſtilence is ſpread and rages over all the earth, and the skies at all times ſound againe with their reports. The Thunder and Lightning commonly gives but one blow, or ſtroke, and that commonly ſtrikes but one man of a multitude; But one great Cannon at one ſhot may ſpoyle and kill an hundred men. Thunder, as a thing naturall falls by chance, one while upon an high oake, another while upon the top of a mountaine,

Plin. Lib. 2. Cap. 55.

Sueton. in Tyberio.

The wonderous force of great Ordinance.

Plin. Lib. 2. Cap. 50.

taine, and ſomewhiles on ſome lofty towre, but ſeldome upon man. But this helliſh Engine tempered by the malice and guidance of man, aſſailes man onely, and takes him for his onely marke, and directs his bullets againſt him. The Thunder by its noyſe as a meſſenger ſent before, foretells the ſtorme at hand; but, which is the chiefe miſchiefe, this infernall Engine roares as it ſtrikes, and ſtrikes as it roares, ſending at one and the ſame time the deadly bullet into the breaſt, and the horrible noyſe into the eare. Wherefore we all of us rightfully curſe the author of ſo pernicious an Engine; on the contrary praiſe thoſe to the skies, who endeavour by words and pious exhortations to dehort Kings from their uſe, or elſe labour by writing and operation to apply fit medicines to wounds made by theſe Engines. Which hath moved me, that I have written hereof almoſt with the firſt of the French. But before I ſhall doe this, it ſeemeth not amiſſe, ſo to facilitate the way to the treatiſe I intend to write of wounds made by Gunſhot, to premiſe two Diſcourſes, by which I may confute and take away certaine erronious opinions which have poſſeſſed the mindes of divers; for that unleſſe theſe be taken away, the eſſence and nature of the whole diſeaſe cannot be underſtood, nor a fitting remedy applyed by him which is ignorant of the diſeaſe.

The arguments of the following diſcourſes.

The firſt Diſcourſe which is dedicated to the Reader, refells and condemnes by reaſons and examples the method of curing preſcribed by *Iohn de Vigo*, whereby he cauterizes the wounds made by Gunſhot, ſuppoſing them venenate; and on the contrary proves that order of curing with is performed by ſuppuratives, to be ſo ſalutary and gentle, as that preſcribed by *Vigo* is full of errour and cruelty.

The ſecond dedicated to the King, teaches that the ſame wounds, are of themſelves voyd of all poiſon, and therefore that all their malignity depends upon the fault of the aire, and ill humours predominant in the bodies of the patients.

THE FIRST DISCOVRSE, VVHEREIN VVOVNDS MADE BY GVNSHOT, ARE FREED FROM BEING BVRNT, OR CAVTERIZED ACCORDING to *Vigoes* Methode.

IN the yeare of our Lord 1536. *Francis* the French King, for his acts in warre and peace ſtiled the Great, ſent a puiſſant Army beyond the Alpes, under the governement and leading of *Annas* of Mommorancie high Conſtable of France, both that he might releeve *Turin* with victualls, ſouldiers, and all things needefull, as alſo to recover the Citties of that Province taken by the Marquis of *Guaſt* Generall of the Emperours forces. I was in the Kings Army the Chirurgion of Monſieur of *Montejan* Generall of the foote. The Imperialiſts had taken the ſtraits of *Suze*, the Caſtle of *Villane*, and all the other paſſages; ſo that the Kings army was not able to drive them from their fortifications but by fight. In this conflict there were many wounded on both ſides with all ſorts of weapons, but cheefely with bullets. I will tell the truth, I was not very expert at that time in matters of Chirurgery; neither was I uſed to dreſſe wounds made by Gunſhot. Now I had read in *Iohn de Vigo* that wounds made by Gunſhot were venenate or poiſoned, and that by reaſon of the Gunpouder; Wherefore for their cure, it was expedient to burne or cauterize them with oyle of Elders ſcalding hot, with a little Treacle mixed there-

Lib. 1. de Vulner. Cap. 8.

with. But for that I gave no great credite neither to the author, nor remedy, becauſe I knew that cauſtickes could not be powred into wounds, without exceſſive paine; I, before I would runne a hazard, determined to ſee whether the Chirurgions, who went with me in the army, uſed any other manner of dreſſing to theſe wounds. I obſerved and ſaw that all of them uſed that Method of dreſſing which *Vigo* preſcribes; and that they filled as full as they could, the wounds made by Gunſhot with Tents and pledgets dipped in this ſcalding Oyle, at the firſt dreſſings; which encouraged me to doe the like to thoſe, who came to be dreſſed of me. It chanced on a time, that by reaſon of the multitude that were hurt, I wanted this Oyle. Now becauſe there were ſome few left to be dreſſed, I was forced, that I might ſeeme to want nothing, and that I might not leave them undreſt, to apply a digeſtive made of the yolke of an egge, oyle of Roſes, and Turpentine. I could not ſleepe all that night, for I was troubled in minde, and the dreſſing of the precedent day (which I judged unfit) troubled my thoughts; and I feared that the next day I ſhould finde them dead, or at the point of death by the poyſon of the wound, whom I had not dreſſed with the ſcalding oyle. Therefore I roſe early in the morning, I viſited my patients, and beyound expectation, I found ſuch as I had dreſſed with a digeſtive onely, free from vehemencie of paine to have had goood reſt, and that their wounds were not inflamed, nor tumifyed; but on the contrary the others that were burnt with the ſcalding oyle were feaveriſh, tormented with much paine, and the parts about their wounds were ſwolne. When I had many times tryed this in divers others, I thought thus much, that neither I nor any other ſhould ever cauterize any wounded with Gun-ſhot. When wee firſt came to *Turin*, there was there a Chirurgion farre more famous than all the reſt in artificially and happily curing wounds made by Gun-ſhot; wherefore I laboured withall diligence for two yeeres time to gaine his favour and love, that ſo at the length, I might learne of him, what kinde of Medicine that was, which he honoured with the glorious tittle of Balſame, which was ſo highly eſteemed by him, and ſo happy and ſucceſfull to his patients; yet could I not obtaine it. It fell out a ſmall while after that the Marſhall of *Montejan* the Kings Leiſtenant, Generall there in *Piemont* dyed, wherefore I went unto my Chirurgion, and told him that I could take no pleaſure in living there, the favourer and *Mecenas* of my ſtudies being taken away; and that I intended forthwith to returne to *Paris*, and that it would neither hinder, nor diſcredit him to teach his remedy to me, who ſhould be ſo farre remote from him. When he heard this, he made no delay, but preſently wiſhed mee to provide two Whelpes, 1 pound of earthwormes, 2 pounds of oyle of Lillyes, ſixe ounces of Venice Turpentine, and one ounce of *aqua vitæ*. In my preſence he boyled the Whelpes put alive into that oyle, untill the fleſh came from the bones, then preſently he put in the Wormes, which he had firſt killed in white wine, that they might ſo be cleanſed from the earthy droſſe wherewith they are uſually repleate, and then hee boyled them in the ſame oyle ſo long, till they became dry, and had ſpent all their juyce therein: then hee ſtrayned it through a towell without much preſſing; and added the Turpentine to it, and laſtly the *aqua vitæ*. Calling God to witneſſe, that he had no other Balſame, wherewith to cure wounds made with Gunſhot, and bring them to ſuppuration. Thus he ſent me away as rewarded with a moſt pretious gift, requeſting me to keepe it as a great ſecret, and not to reveale it to any.

What chance may doe in finding out of remedies.

The deſcription of oyle of Whelpes.

When I came to *Paris*, I went to viſite *Silvius* the Kings profeſſor of Phyſicke well knowne by name to all ſchollers for his great learning; he kept me long that ſo I might dine with him, and diligently enquires of me, if I had obſerved any new Method of curing wounds made by Gun-ſhot, and combuſtions occaſioned by Gunpowder. Then I affirmed to him that Gun-pouder did not participate any thing of poyſon, for that none of theſe things, whereof it is compounded are poyſonous; which reaſon ought to free the whole compoſition from ſuſpicion of poyſon. And that experience confirmed this reaſon, for I had ſeene many ſoldiers, who would drinke a great quantity of this powder with wine, becauſe they were perſwaded, that this drinke would free them from maligne ſymptomes when they were wounded, yet I give no credit to this perſwaſion; and laſtly for that many with-

Gun-pouder not poiſonous.

out any harme, ſtrew this pouder upon rebellious ulcers. For the Bullets, I affirme, that they cannot conceive ſuch heate, as to become cauſticke. For if you ſhoot them out of a Gun againſt a hard ſtone, yet you may preſently take them up without any harme in your hands, though by ſtriking upon the ſtone, they ſhould become more hot. For the combuſtions cauſed by Gunpouder, I obſerved no ſpeciall nor peculiar remedy, which might make their cure different from other combuſtions. To which purpoſe I related this enſuing hiſtory.

Bullets ſhot out of a Gun doe not burne.

A Hiſtorie.

One of the Marſhall of *Montejan* his Kitchin boyes, fell by chance into a Caldron of Oyle being even almoſt boyling hot; I being called to dreſſe him, went to the next Apothecaries to fetch refrigerating medicines commonly uſed in this caſe: there was preſent by chance a certaine old countrey woman, who hearing that I deſired medicines for a burne, perſwaded mee at the firſt dreſſing, that I ſhould lay to raw Onions beaten with a little ſalt; for ſo I ſhould hinder the breaking out of bliſters or puſtules, as ſhee had found by certaine and frequent experience. Wherefore I thought good to try the force of her Medicine upon this greaſy ſcullion. I the next day found thoſe places of his body whereto the Onions lay, to bee free from bliſters, but the other parts which they had not touched, to be all bliſtered.

A medicine hindering bliſtring in burnes, or ſcalds.

A Hiſtorie.

It fell out a while after, that a German of *Montejan* his guard had his flaſque full of Gunpouder ſet on fire, whereby his hands and face were grievouſly burnt: I being called, laid the Onions beaten as I formerly told you, to the middle of his face, and to the reſt I laid medicines uſually applyed to burnes. At the ſecond dreſſing I obſerved the part dreſſed with the Onions quite free from bliſters and excoriation, the other being troubled with both; whereby I gave credit to the Medicine. Beſides alſo, I laſtly told him this, that I had obſerved, that that was the readieſt to draw forth bullets ſhot into the body, which ſets the patients in the ſame poſture and ſite, as hee was when hee received his hurt. Which things when I had told him, together with many other handled at large in this worke, the good old man requeſted mee to publiſh in print my opinions concerning theſe things, that ſo the erronious and hurtfull opinion of *Vigo* might bee taken out of mens minds. To whoſe earneſt entreaty when I had aſſented, I firſt of all cauſed to be drawne and carved many Inſtruments fit to draw forth Bullets and other ſtrange bodies; then a ſhort while after I firſt publiſhed this worke in the yeare of our Lord 1545. which when I found to bee well liked and approved by many, I thought good to ſet it forth the ſecond time ſomewhat amended in the yeare 1552. And the third time augmented in many particulars in the yeare 1564. For I having followed many warres, and deteined as Chirurgion in beſeiged Citties, as *Mets* and *Heſdin*, had obſerved many things under five Kings, whom I ſerved with diligence and content. I had learnt many things from moſt expert Chirurgions, but more from all learned Phyſitions, whoſe familiarity and favour for that purpoſe I alwayes laboured to acquire with all diligence and honeſt Arts; that ſo I might become more learned and ſkillfull by their familiarity and diſcourſe, if there was any thing eſpecially in this matter and kind of wounds, which was hid from me, or whereof I was not well aſſured. Of which number I have knowne very few, who any thing ſeene in this kind of operation eyther by ſtudy, or experience in Warres, who have not thought that wounds made by Gunſhot ought to be dreſſed at the firſt with ſuppurative medicines, and not with ſcalding and Cauſticke Oyle.

Wounds made by Gunſhot muſt be dreſſed with ſuppuratives.

For this I affirme, which then alſo I teſtified to this good man, that I have found very many wounds made in the fleſhy parts by Gunſhot, as eaſily cured as other wounds, which bee made by contuſing things. But in the parts of the body where the bullet meets with bones and nervous particles, both becauſe it teares and rends into ſmall peeces thoſe things which reſiſt, not onely where it touches, but further alſo, through the violence of the blow, therefore it cauſeth many and greevous ſymptomes, which are ſtubborne and difficult, and oft times impoſſible to cure, eſpecially in bodies replete with ill humors, in an ill conſtitution of the heaven and ayre, ſuch as is hot, moyſt and foggy weather,

The cauſes of difficultie in this cure.

ther, which therefore is ſubject to putrifaction; and in like manner a freezing and cold ſeaſon, which uſes to mortifie the wounded parts not onely of thoſe that are hurt with Bullets, but in like ſort with any other weapon; nor onely in bony and nervous particles, but alſo in muſculous. Whereby you may underſtand, that the difficulty of curing proceeds not from the venenate quality of the wounds, nor the combuſtion made by the Gunpouder, but the foulneſſe of the patients bodies, and the unſeaſonableneſſe of the aire.

A Hiſtorie.

For proofe whereof, I will ſet downe, that which I not long agone obſerved in a Scottiſh Nobleman the Earle of *Gordon*, Lord of *Achindon*, whom I cured at the appointment of the Queene Mother. He was ſhot through both his thighes with a Piſtoll, the bone being not hurt nor touched; and yet the 32. day after the wound he was perfectly healed, ſo that hee had neither feaver nor any other ſymptome which came upon the wound. Whereof there are worthy witneſſes, the Archbiſhop of *Glaſco*, the Scottiſh Embaſſadour, *Francis Brigart* and *Iohn Altine*, Doctors of Phyſicke, as alſo *Iames Guillemeau* the Kings Chirurgion, and *Giles Buzet* a Scottiſh Chirurgion, who all of them wondred that this Gentleman was ſo ſoone healed, no acride medicine being applyed. This I have thought good to recite and ſet downe, that the Readers may underſtand, that I for 30. yeares agoe had found the way to cure wounds made by Gunſhot, without ſcalding oyle or any other, more acrid medicine; unleſſe by accident the illneſſe of the patients bodies and of the aire cauſed any maligne ſymptomes, which might require ſuch remedies beſides the regular and ordinary way of curing, which ſhall bee more amply treated of in the following diſcourſe.

What makes Chirurgions ſometimes uſe cauſticks in curing wounds made by Gunſhot.

ANOTHER DISCOURSE OF THESE THINGS, WHICH KING CHARLES THE NINTH, REturning from the expedition and taking of *Rouën*, enquired of me concerning wounds made by Gunſhot.

The occaſion of writing this diſcourſe.

FOr that it pleaſed your Majeſtie one day, together with the Queene Mother, the Prince of the *Rocke upon Ton*, and many other Noble-men and Gentlemen, to enquire of mee, what was the cauſe that the farre greater part of the Gentlemen and common Souldiers which were wounded with Guns, and other warlike Engines, all remedies uſed in vaine, either dyed, or ſcarſe and that with much difficultie recovered of their hurts, though in appearance they were not very great, and though the Chirurgions diligently performed all things requiſite in their Art; I have made bold to premiſe this Diſcourſe to that Tractate which I determine to publiſh concerning wounds made by Gunſhot; both to ſatisfie the deſires of the Princes and of many Gentlemen, as alſo the expectation they have of mee, as being the Kings chiefe Chirurgion, (which place being given me by *Henry* the ſecond, *Charles* the ninth, a ſonne moſt worthy of ſuch a father, had confirmed) neither make I any queſtion, but that many who too much inſiſt upon their owne judgement, and not throughly conſider the things themſelves, will marvaile, and thinke it farre from reaſon; that I departing from the ſteps of my anceſtors, and diſſenting wholly from the formerly received opinions, am farre from their Tenents, who lay the cauſe of the malignitie of wounds made by Gunſhot, upon the poyſon brought into the body by the Gunpouder, or mixed with the Bullets whilſt they are tempered or caſt. Yet for all this, if they will courteouſly and patiently weigh my reaſons, they ſhall eyther thinke as I doe, or at leaſt ſhall judge this my endeavour and paines taken for the publike good, not to be condemned nor contemned.

The argument of this diſcourſe.

For I ſhall make it evident by moſt ſtrong reaſons drawne out of the writings of the Ancient both Philoſophers and Phyſitions, and alſo by certaine experiments of mine owne, and other Chirurgions, that the malignitie and contumacie which we frequently meete withall in curing wounds made by Gunſhot, is not to be attributed eyther to the poyſon carryed into the body by the Gunpouder or Bullet, nor to burning imprinted in the wounded part by the Gunpouder. Wherefore to come to our purpoſe, that opinion muſt firſt bee confuted, which accuſeth wounds made by Gunſhot of poyſon; and wee muſt teach, that there is neither any venenate ſubſtance, nor qualitie in Gunpouder, neyther if there ſhould bee any, could it empoyſon the bodies of ſuch as are wounded. Which that wee may the more eaſily performe, wee muſt examine the compoſition of ſuch pouder, and make a particular enquiry of each of the ſimples, whereof this compoſition conſiſts, what eſſence they have, what ſtrength and faculties, and laſtly what effects they may produce. For thus by knowing the ſimples, the whole nature of the compoſition conſiſting of them, will bee apparently manifeſt.

Gunpouder is not poyſonous.

Of what it is made.

The ſimples which enter the compoſition of Gunpouder are onely three, Charcoales of Sallow or Willow, or of Hempe ſtalkes, Brimſtone, and ſalt Peter, and ſometimes a little *aqua vitæ*. You ſhall finde each of theſe, if conſidered in particular, voide of all poyſon and venenate quality. For firſt, in the Char-coale you ſhall obſerve nothing but dryneſſe, and a certaine ſubtlety of ſubſtance, by meanes whereof it fires ſo ſuddainly, even as Tinder. *Sulphur* or Brimſtone is hot and dry, but not in the higheſt degree, it is of an oyly and viſcide ſubſtance, yet ſo that it doth not ſo ſpeedily catch fire as the coale, though it reteine it longer being once kindled, neither may it be ſo ſpeedily extinguiſhed. Salt Peter is ſuch, that many uſe it for Salt, whereby it is evidently apparent that the nature of ſuch ſimples is abſolutely free from all poyſon; but chiefly the Brimſtone, (which notwithſtanding is more ſuſpected than the reſt.) For *Dioſcorides* gives Brimſtone to be drunke, or ſupped out of a reare Egge to ſuch as are Aſthmaticke, troubled with the Cough, (ſpit up purulent matter, and are troubled with the yellow Iaundiſe.) But *Galen* applies it outwardly to ſuch as are bitten by venemous Beaſts, to ſcabs, teaters, and leproſyes. For the *aqua vitæ*, it is of ſo tenuious a ſubſtance that it preſently vaniſheth into aire, and alſo very many drinke it, and it is without any harme uſed in frictions of the exteriour parts of the body. Whence you may gather, that this pouder is free from all manner of poyſon, ſeeing theſe things whereof it conſiſts and is compoſed, want all ſuſpition thereof.

Lib. 5. Cap. 73. Lib. 9. ſimpl. Cap 36.

Therefore the Germane horſemen, when they are wounded with ſhot, feare not to drinke off cheerefully halfe an ounce of Gunpouder diſſolved in wine; hence perſwading themſelves freed from ſuch maligne ſymptomes as uſually happen upon ſuch wounds; wherein whether they doe right or wrong I doe not here determine; the ſame thing many French Souldiers forced by no neceſſity, but onely to ſhew themſelves more couragious, alſo doe without any harme; but divers with good ſucceſſe uſe to ſtrew it upon ulcers, ſo to dry them. Now to come to theſe, who thinke that the venenate quality of wounds made by Gunſhot, ſprings not from the pouder, but from the Bullet wherewith ſome poyſon hath beene commixt or joyned, or which hath beene tempered or ſteeped in ſome poyſonous liquor.

Bullets cannot be poyſoned.

This may ſufficiently ſerve for a reply; that the fire is aboundantly powerfull to diſſipate all the ſtrength of the Poyſon, if any ſhould bee poured upon or added to the Bullet. This much confirmes mine opinion, which every one knowes; The Bullets which the Kings ſouldiers uſed to ſhoote againſt the Townſemen in the ſeige of Rouën, were free from all poyſon, and yet for all that they of the Towne thought that they were all poyſoned, when they found the wounds made by them, to be uncurable and deadly. Now on the other ſide the Townſemen were falſly ſuſpected guilty of the ſame crime by the Kings Army, when as they perceived all the Chirurgions labour in curing the wounds made by the Bullets ſhot from Rouën, to be fruſtrated by their contumacy and maligne nature; each ſide judging of the magnitude and malignitie of the cauſe from the unhappy ſucceſſe of the effect in curing. Even as amongſt Phyſitions according to ***Hippocrates***, all diſeaſes are termed peſtilent, which ariſing from whatſoever common cauſe, kill many people; ſo alſo wounds made by Gunſhot, may in ſome reſpect be called peſtilent, for that they are more refractory, and difficult to cure than others, and not becauſe they partake of any poyſonous qualitie, but by default of ſome common cauſe, as the ill complexions of the patients, the infection of the aire, and the corruption of meats and drinkes. For by theſe cauſes wounds acquire an evill nature and become leſſe yeelding to medicines. Now we have by theſe reaſons convinced of errour that opinion which held wounds made by Gunſhot for poiſonous; let us now come to overthrow that which is held concerning their combuſtion.

As *Galen* notes *ad ſent.* 20. *et* 21. *ſect.* 3. *lib.* 3. *Epid.*

Firſt it can ſcarce be underſtood how bullets which are commonly made of Lead, can attaine to ſuch heate, but that they muſt be melted; and yet they are ſo far from melting, that being ſhot out of a Musket they will peirce through an armour and the whole body beſides, yet remaine whole, or but a little diminiſht. Beſides alſo if you ſhoote them againſt a ſtone wall, you may preſently take them up in your hand without any harme, and alſo without any manifeſt ſence of heate; though their heate by the ſtriking upon the ſtone ſhould bee rather encreaſed, if they had any.

Wounds made by Gunſhot are not burnt

Furthermore, a Bullet ſhot into a barrell of Gunpouder, would preſently ſet it all on fire, if the Bullet ſhould acquire ſuch heate by the ſhooting, but it is not ſo. For if at any time the pouder be fired by ſuch an accident, wee muſt not imagine that it is done by the bullet bringing fire with it, but by the ſtriking and colliſion thereof againſt ſome Iron, or ſtone that oppoſes or meets therewith, whence ſparkes of fire proceeding as from a flint, the pouder is fired in a moment. The like opinion wee have of thatched houſes, for they are not fiered by the bullet which is ſhot, but rather by ſome other thing as linnen ragges, browne paper, and the like, which rogues and wicked perſons faſten to their Bullets. There is another thing which more confirmes mee in this opinion, which is; take a bullet of Waxe, and keepe it from the fire, for otherwiſe it would melt, and ſhoote it againſt an inch board, and it will goe through it; whereby you may underſtand that Bullets cannot become ſo hot by ſhooting, to burne like a cautery. But the Orifices (may ſome ſay) of ſuch wounds are alwayes blacke. This indeede is true, but it is not from the effect of heate brought thither by the Bullet, but the force of the contuſion.

The reaſon why wounds made by Gunſhot looke blacke.

Now the contuſion is exceeding great, both becauſe the Bullet is round, and enters the body with incredible violence. Of which thoſe that are wounded will give you ſufficient teſtimony, for there is none of them, which thinkes not preſently upon the blow, that as it were ſome poſt, or thing of the like weight, falls upon the affected member, whence great paine and ſtupiditie poſſeſſe the part, whereby the native heate and ſpirits are ſo much diſſipated, that a Gangreen may follow.

But for the Eſchar which they affirme is made by the blow, and falls away afterwards, they are much miſtaken. For certaine particles of the membranes and fleſh contuſed and torne by the violence of the Bullet beguiles them; which preſently putrifying are ſevered from the ſound parts by the power of nature and the ſeparating heate, which thing uſually happens in all great Contuſions. But for all that theſe ſo many and weighty reaſons may free the Pouder from all ſuſpition of Poiſon, and the Bullet from all thought of burning;

yet there are many who inſiſting upon Philoſophicall arguments, raiſe new ſtirrs. For (ſay they) the diſcharging a peice of Ordinance is abſolutely like Thunder and Lightning, which the rent and torne clouds caſt from the middle region, upon the earth; wherefore the Iron bullet which is ſhot out of the Cannon muſt needs have a venenate and burning faculty.

The reaſons of our adverſaries refelled.

I am not ignorant that Lightnings generated of a groſſe and viſcous exhalation, breaking the cloud wherewith it is encompaſſed, never falls upon the earth, but brings fire with it, one while more ſubtile, another while more groſſe, according to the various condition of the matter whence the exhalation hath ariſen.

Quaſt. nat. lib. 2. cap. 49.

For *Seneca* writes that there are three ſeverall kinds of Lightning differing in burning, condition and plenty. One of them penetrates or rather perforates by the tenuity of the matter of the objects which it touches. The other with a violent impetuoſity breakes inſunder and diſſipates the objects, by reaſon it hath a more denſe, compact and forcible matter, like as Whirlewinds have. The third, for that it conſiſts of a more terreſtriall matter, burnes what it touches, leaving behind it the impreſſion of the burning.

The ſtinking ſmell of lightning.

Alſo I know that Lightning is of a peſtilent and ſtinking nature, occaſioned by the groſſeneſſe and viſcidity of the matter whereof it is; which matter taking fire ſends forth ſo lothſome and odious a ſmell that the very wilde-beaſts cannot endure it; but leave their Dennes, if they chance to be touched with ſuch a lightening. Beſides alſo, we have read in the northerne hiſtory of *Olaus Magnus*, that in ſome places after a Lightning, you ſhall finde a whole plaine ſpred over with Brimſtone, which Brimſtone notwithſtanding is extinguiſhed, unprofitable & of no efficacie. But grant theſe things be thus, yet muſt we not therefore conclude, that the Bullets of the great Ordinance carry poyſon and fire with them into the wounds. For though there be many things like in Lightning and diſcharging great Ordinance, yet they have no ſimilitude either in matter or ſubſtance, but onely in effects whereby they ſhake, breake inſunder and diſperſe the bodies which withſtand them; For Lightning and Thunder doe it by meanes of fire, and oft times of a ſtone generated in them, which is therefore tearmed, a Thunderbolt; But Ordinance by the bullet carried by the force of the aire, more violently driving and forcing it forwards; Neither if any ſhould by more powerfull arguments force me to yeeld that the matter of Lightning and ſhooting of Ordinance are like, yet will I not therefore be forced to confeſſe that wounds made by Gunſhot are combuſt.

Lib. 2. cap. 51.

For according to *Pliny*, there are ſome Lightnings which conſiſting of a moſt dry matter, doe ſhatter in ſunder all that withſtands them, but doe not burne at all; others which are of ſomewhat a more humid nature, burne no more than the former, but onely blacke ſuch things as they touch; Laſtly others ſome of a more ſubtile and tenuous matter, whoſe nature (as *Seneca* ſaith) wee muſt not doubt to be divine, if but for this reaſon, that they will melt gold and ſilver, not harming the purſe; a ſword, not hurting the ſcabbard; the head of a Lance, not burning the wood, and ſhed wine not breaking the veſſell.

The wonderfull nature of ſome lightning.

According to which decree I can grant, that theſe Lightnings which breake in ſunder, melte and diſſipate, and performe other effects ſo full of admiration, are like in ſubſtance to the ſhot of great Ordinance; but not theſe which carry with them fire and flame.

A Hiſtorie.

In proofe whereof there comes into my minde the hiſtorie of a certaine Souldier, out of whoſe thigh I remember I drew forth a Bullet wrapped in the taffety of his breeches, which had not any ſigne of tearing or burning. Beſides, I have ſeene many who not wounded, nor ſo much as touched, yet notwithſtanding have with the very report & winde of a Cannon bullet, ſliding cloſe by their eares, fallne downe for dead, ſo that their members becomming livid & black, they have dyed by a Gangrene enſuing thereupon. Theſe and ſuch effects are like the effects of Lightnings which wee lately mentioned, and yet they beare no ſigne nor marke of poyſon. From whence I dare now boldly conclude, that wounds made by Gunſhot are neither poyſoned, nor burnt.

Why the wounds made by Gunſhot ſome few yeares agone were ſo deadly.

But ſeeing the danger of ſuch wounds in theſe laſt civill warres hath beene ſo great, univerſall and deadly to ſo many worthy perſonages and valiant men, what then may have beene the cauſe thereof, if it were neither combuſtion, nor the venenate qualitie of the wound? This muſt wee therefore now inſiſt upon and ſomewhat hardily explaine.

Thoſe who have ſpent all their time in the learning and ſearching out the myſteries of Naturall Philoſophie, would have all men thinke and beleeve, that the foure Elements have ſuch mutuall ſympathy, that they may bee changed each into other; ſo that they not onely undergoe the alterations of the firſt qualities which are heate, coldneſſe, dryneſſe and moiſture, but alſo the mutation of their proper ſubſtances by rarefaction and condenſation. For thus the fire is frequently changed into ayre, the ayre into water, the water into aire, and the water into earth; and on the contrary, the earth into water, the water into aire, the aire into fire; becauſe theſe 4. firſt bodies have in their common matter enjoyed the contrary and fighting, yet firſt and principall qualities of all.

The cauſe of the tranſmutation of the Elements.

Whereof we have an example in the *Ball-bellowes brought out of Germany, w^{ch} are made of braſſe, hollow and round; and have a very ſmall hole in them, whereby the water is put in, and ſo put to the fire; the water by the action thereof is rarified into aire, and ſo they ſend forth winde with a great noyſe, and blow ſtrongly as ſoone as they grow throughly hot. You may try the ſame with Cheſnuts, which caſt whole and undivided into the fire, preſently fly aſunder with a great cracke; becauſe the watry and innate humidity turned into winde by the force of the fire, forcibly breakes his paſſage forth. For the aire or winde raiſed from the water by rarifaction, requires a larger place, neither can it now bee conteined in the narrow filmes, or ſkinnes of the Cheſnut, wherein it was formerly kept. Iuſt after the ſame manner Gunpouder being fiered, turnes into a farre greater proportion of ayre, according to the truth of that Philoſophicall propoſition, which ſaith, Of one part of earth, there are made ten of water; of one of water, ten of aire; and of one of aire are made ten of fire. Now this fire not poſſible to be pent in the narrow ſpace of the peice, wherein the pouder was formerly conteined, endeavours to force its paſſage with violence, and ſo caſts forth the Bullet lying in the way, yet ſo that it preſently vaniſhes into aire, and doth not accompany the Bullet to the marke, or object, which it batters, ſpoiles and breakes aſunder. Yet the Bullet may drive the obvious aire with ſuch violence, that men are often ſooner touched therewith than with the bullet, and dye by having their bones ſhattered and broken without any hurt on the fleſh which covers them; which as wee formerly noted, it hath common with Lightning. We finde the like in Mines, when the pouder is once fiered, it remooves and ſhakes even mountaines of earth.

* Theſe bellowes here mentioned by the Author, are Bals made of Braſſe in forme of a peare, with a very ſmall hole in their leſſer ends: when you would fill them with water you muſt heate them very hot, and ſo the aire which is conteined in them will be exceedingly rarified, which by putting them preſently into water will be condenſate as much, and ſo will draw in the water to ſupply the place, *ne detur Vacuum*. Then put them into the fire, and it againe rarifying the water into aire will make them yeelde a ſtrong continued and forcible blaſt.

The cauſe of the report and blow of a Cannon.

In the yeare of our Lord 1562 a quantity of this pouder which was not very great, taking fire by accident in the Arcenall of Paris, cauſed ſuch a tempeſt, that the whole Citty ſhoke therewith, but it quite overturned divers of the neighbouring houſes, and ſhooke off the tyles and broke the windowes of thoſe which were further off; and to conclude, like a ſtorme of Lightning it laid many here and there for dead, ſome loſt their ſight, others their hearing, and otherſome had their limbes torne aſunder, as if they had beene rent with wilde horſes; and all this was done by the onely agitation of the aire into which the fired Gunpouder was turned; Iuſt after the ſame manner as windes pent up in hollow places of the earth which want vents. For in ſeeking paſſage forth, they vehemently ſhake the ſides of the Earth, and raging with a great noiſe about the cavities, they make all the ſurface thereof to tremble; ſo that by the various agitation one while up, another downe, it overturnes or carries it to another place. For thus we have read that *Megara* and *Ægina* anciently moſt famous Citties of Greece, were ſwallowed up and quite overturned by an earthquake; I omit the great bluſterings of the windes ſtriving in the cavities of the earth, which repreſent to ſuch as heare them at ſome diſtance, the fierce aſſailing of Citties, the bellowing of Bulles, the horrid roarings of Lions, neither are they much unlike to the roaring reports of Cannons. Theſe things being thus premiſed let us come to the thing we have in hand.

A Hiſtorie.

The cauſe of an Earthquake.

Amongſt things neceſſary for life, there is none cauſes greater changes in us than the aire; which is continually drawne into the Bowells appointed by nature, and whether we ſleepe, wake, or what elſe ſoever we doe, we continually draw in, and breath it out. Through which occaſion *Hippocrates* calls it Divine, for that breathing through this mundane Orbe, it embraces, nouriſhes, defends and keepes in quiet peace all things contained therein, friendly conſpiring with the ſtarres from whom a divine vertue is infuſed therein. For the aire diverſly changed and affected by the ſtarres, doth in like manner produce various changes in theſe lower mundane bodies. And hence it is that Philoſophers and Phyſitions doe ſo ſeriouſly wiſh us to behold and conſider the culture and habite of places, and conſtitution of the aire, when they treate of preſerving of health, or curing diſeaſes. For in theſe the great power and dominion of the aire is very apparent, as you may gather by the foure ſeaſons of the yeare; for in ſummer the aire being hot and dry, heats and dries our bodies; but in winter it produceth in us the effects of winters qualities, that is, of cold and moiſture; yet by ſuch order and providence of nature, that although according to the varieties of ſeaſons our bodies may be variouſly altered, yet ſhall they receive no detriment thereby, if ſo be that the ſeaſons reteine their ſeaſonableneſſe; from whence if they happen to digreſſe, they raiſe and ſtirre up great perturbations both in our bodies and mindes; whoſe malice we can ſcarſe ſhunne, becauſe they encompaſſe us on every hand, and by the law of nature enter together with the aire into the ſecret cabinets of our bodies both by occult and manifeſt paſſages. For who is he, that doth not by experience finde both for the commodity and diſcommodity of his health, the various effects of winds, (wherewith the aire is commixt) according as they blow from this or that Region, or Quarter of the world. Wherefore ſeeing that the South winde is hot and moiſt; the North wind cold and dry; the Eaſt wind cleare and freſh; the Weſt winde cloudy; it is no doubt but that the aire which we draw in by inſpiration carries together therewith into the bowells the qualities of that winde which is then prevalent. When wee reade in *Hippocrates*, that changes of times, whether they happen by different windes, or viciſſitude of ſeaſons, chiefly bring diſeaſes; For northerly winds doe condenſe, and ſtrengthen our bodies, and makes them active, well coloured and daring, by reſuſcitating and vigorating the native heate. But ſoutherne windes reſolve and moiſten our bodies, make us heavy-headed, dull the hearing, cauſe giddineſſe, and make the eyes and body leſſe agile; as the Inhabitants of *Narbon* finde to their great harme, who are otherwiſe ranked among the moſt active people of France. But if wee would make a compariſon of the ſeaſons and conſtitutions of a yeare, by *Hippocrates* decree Droughts are more wholeſome and leſſe deadly than Raines; I judge for that too much humiditie is the mother of putrifaction, as you learne by theſe countries which are blowne upon by a winde from Sea: For in theſe fleſh which is kept for foode, putrefies in the ſpace of an houre; and ſuch ulcers as in other places are eaſily and quickly healed, doe there by the conflux and collection of matter become inveterate and contumacious. Therefore as when the ſeaſons of the yeare ſucceſſively fall out agreeable to their nature, and when each ſeaſon is ſeaſonable, then either we are not ſicke at all, or aſſuredly with leſſe danger. So on the contrary the perfect conſtitution and health of our bodies becomes worſe and decaies, when the ſeaſons of the yeare are depraved and perverted in time and temper.

How the aire becomes hurtfull,

Aphor. 17. ſect. 3.

Fleſh quickly putrifies in maritime places.

Now ſeeing that theſe many yeares the foure ſeaſons of the yeare have wanted their ſeaſonableneſſe, the ſummer wanting his uſuall heate, and the winter its cold, and all things by moiſture and the dominion of the ſoutherne windes have beene humid and languide, I thinke there is none ſo ignorant in naturall Philoſophie and Aſtrologie, who will not thinke that the cauſes of the malignitie and contumacie of thoſe deſeaſes which have ſo long afflicted all France, are not to bee attributed to the aire and Heavens. For otherwiſe, whence have ſo many peſtilent and contagious diſeaſes tirannized over ſo many people of every age, ſex and condition? whence have ſo many catarrhes, coughs and heavineſſes of the head, ſo many pleuriſies, tumors, ſmall poxes, meazells, and Itches not admitting of digeſtion and remedies preſcribed by Art? Whence have we had ſo many venemous creatures, as Toades, Graſhoppers, Caterpillers, Spiders, Waſpes, Hornets, Beetles, Snailes, Vipers, Snakes, Lizards Scorpions and Efts or Nutes, unleſſe from exceſſive putrefaction which the humidity of the aire, our native heate being liquid and dull, hath cauſed in us, and the whole kingdome of France? Hence alſo proceedes the infirmity of our native heate, and the corruption of the blood and humors whereof we conſiſt, which the rainy Southwind hath cauſed with its ſultry heate. Wherefore in theſe laſt yeares I have drawne little blood, which hath not preſently ſhewed the corruption of its ſubſtance by the blacke or greeniſh colour, as I have diligently obſerved in all ſuch as I have bled, by the direction of Phyſitions, either for prevention of future, or cure of preſent diſeaſes. Whence it comes to paſſe that the fleſhy ſubſtance of our bodies could not but be faulty both in temper and conſiſtence; ſeeing that the blood whence it is generated had drawne the ſeeds of corruption from the defiled aire. Whence it fell out, that the wounds which happened with loſſe of ſubſtance, could be ſcarſe healed or united, becauſe of the depraved nature of the blood. For ſo the wounds and ulcers of theſe which are troubled with the Dropſie, whoſe blood is more cold or wholly wateriſh; ſo of Leprous perſons, whoſe blood is corrupt, and laſtly of all ſuch as have their bodies replete with ill juice, or elſe are Cachecticke, will not eaſily admit of cure. Yea aſſuredly if but the very part which is hurt ſwerve from its native temper, the wound will not eaſily bee cured.

In what bodies ulcers and wounds are not eaſily cured.

Therefore ſeeing all theſe things, both the putrefaction of the Aire, and depraved humors of the body, and alſo the diſtemper of the affected parts conſpired together to the deſtruction of the wounded, what marvaile was it, if in theſe late civill warres, the wounds which were for their quantity ſmall, for the condition of the wounded parts but little, have cauſed ſo many and grievous accidents and laſtly death it ſelfe? Eſpecially, ſeeing that the Aire which encompaſſeth us, tainted with putrefaction corrupts and defiles the wounds by inſpiration and expiration, the body and humours being already diſpoſed, or inclined to putrefaction.

Now there came ſuch a ſtincke, which is a moſt aſſured ſigne of putrefaction, from theſe wounds when they were dreſſed, that ſuch as ſtood by could ſcarſe endure it, neither could this ſtinke bee attributed to the want of dreſſing, or fault of the Chirurgion; for the wounds of the Princes and Nobility ſtunke as ill as theſe of the common Souldiers. And the corruption was ſuch, that if any chanced to bee undreſt for one day, which ſometimes happened amongſt ſuch a multitude of wounded perſons, the next day the wound would be full of wormes. Beſides alſo, which furthermore argues a great putrifaction of humors, many had Abſceſſes in parts oppoſite to their wounds, as in the left knee, when as the right ſhoulder was wounded; in the left arme, when as the right Leg was hurt. Which I remember befell the King of *Navarre*, the Duke of *Nevers*, the Lord *Rendan* and divers others. For all men had nature ſo overcharged with abundance of vicious humors, that if it expelled not part thereof by impoſtumes to the habite of the body, it certainly otherwiſe diſpoſed of it amongſt the inner parts of the body; for in diſſecting dead bodies, wee obſerved that the Spleene, Liver, Lungs, and other Bowells were purulent, and hence it was that the patients by reaſon of vapours ſent from them to the heart were troubled with continuall feavers. But the Liver and all the veinous parts being polluted, and ſo the generation of the laudible blood hindred, they languiſhed for want of fitting nouriſhment. But when the Braine by vapours was drawne in to ſympathize with the reſt, they were moleſted with Ravings and Convulſions. Wherefore if any thing ſucceeded unproſperouſly in ſo great malignancie of wounds, the Chirurgion was not to be blamed, for that it were a crime to fight againſt God and the Aire, wherein the hidden ſcourges of the divine juſtice lye hid. Therefore, if according to the minde of the great ***Hippocrates***, who commands to bring all contuſed wounds to ſuppuration, that ſo they may be healed, wee endeavoured to cure with ſuch medicines wounds made with Gunſhot, and therefore contuſed; who can rightly be angry with us, if we performed it not ſo well, by reaſon of theſe putrifactions, gangreens and mortifications which proceeded from the corrupt Aire, for all that we uſed not onely ſuppuratives, but were oft times forced to uſe other medicines, ſo long turning aſide from the cure of the diſeaſe, untill we had orecome the ſymptomes which much endanger the patient and cuſtomarily happen upon ſuch wounds, as alſo upon thoſe which are made with a ſword or any other kind of weapon; As ſhall plainly appeare in the following treatiſe, to which it now ſeemes high time that we betake our ſelves.

An argument of great putrifaction of the humors.

All contuſed wounds muſt bee brought to ſuppuration.

CHAP.

CHAP. I.

A diviſion of wounds drawne from the variety of the wounded parts, and the Bullets which wound.

A diviſion of wounds from the variety of the wounded parts.

From the difference of Bullets.

Wounds made by Gunſhot are uſually round.

ALl wounds which are made in mans body by Gunſhot, whether ſimple or compound, are accompanied with contuſion, dilaceration, diſtemper and ſwelling. I ſay, all theſe poſſeſſe eyther the noble parts, or ignoble, the fleſhy, nervous or bony, ſome whiles with rending and tearing aſunder the larger veſſells, ſometimes without harming them. Now theſe wounds are onely ſuperficiary, or elſe peirce deepe and paſſe quite through the body. But there is alſo another diviſion of theſe wounds taken from the variety of the Bullets wherewith they are made. For ſome bullets are bigger, ſome leſſe, ſome betweene both, they are uſually made of Lead, yet ſometimes of Steele, Iron, Braſſe, Tinne, ſcarſe any of Silver, much leſſe of Gold. There ariſes no difference from their figure; for almoſt all kinds of wounds of this nature are round. From theſe differences, the Chirurgion muſt take his Indications what to doe, and what medicines to apply. The firſt care muſt be, that he thinke not theſe horrid and maligne ſymptomes, which uſually happen upon theſe kinds of wounds, to ariſe from combuſtion, or poyſon carried with the Bullet into the wounded part, and that for theſe reaſons we have formerly handled at large. But rather let him judge they proceede from the vehemencie of the contuſion, dilaceration and fracture, cauſed by the Bullets too violent entry into the nervous and bony bodies. For if at any time the bullet ſhall onely light upon the fleſhy parts, the wounds will be as eaſily cured, as any other wound uſually is, which is made with a contuſing and round kind of weapon, as I have often found by frequent experience, whileſt I have followed the warres, and performed the part of a Chirurgion to many Noble-men and common Souldiers, according to the counſell of ſuch Phyſitions as were there overſeers of the cure.

CHAP. II.

Of the ſignes of wounds made by Gunſhot.

Signes of wounds from their figure.

From their colour.

From the feeling the blow.

From the bleeding.

From the heate of the wound.

WOunds made by Gunſhot are knowne by their figure, which is uſually round; by their colour, as when the native colour of the part decayes, and in ſtead thereof a livid, greeniſh, violet or other colour ſucceeds; by the feeling or ſenſe of the ſtroke, when in the very inſtant of the receiving thereof, hee feeles a heavy ſenſe as if ſome great ſtone, or peice of Timber, or ſome ſuch other weightything had falne upon it; by the ſmall quantity of blood which iſſues out thereat, for when the parts are contuſed, within ſome ſmall while after the ſtroake they ſwell up, ſo that they will ſcarſe admit a Tent, whence it is that the blood is ſtopped, which otherwiſe would flow forth of the orifice of the wound; by heate, which happens eyther by the violentneſſe of the motion, or the vehement impulſion of the aire, or the attrition of the contuſed parts, as the fleſh and nerves.

Whence theſe wounds are ſo much contuſed.

Alſo you may conjecture that the wounds have beene made by Gunſhot, if the bones ſhall be broken, and the ſplinters thereof by pricking the neighbouring bodies cauſe defluxion and inflammation. But the cauſe that the Bullet makes ſo great a contuſion is, for that it enters the body not with any points or corners, but with its round and ſphericall body, which cannot penetrate but with mighty force; whence it commeth to paſſe that the wound lookes blacke, and the adjacent parts livid. Hence alſo proceede ſo many grievous ſymptomes, as paine, Defluxion, Inflammation, Apoſtumation, Convulſion, Phrenſie, Palſie, Gangreen and mortification, whence laſtly death enſues. Now the wounds doe often caſt forth virulent and very much ſtincking filth, by reaſon of the great contuſion, and the rending and tearing of the neighbouring particles. A great aboundance of humors flow from the whole body, and fall downe upon the affected parts, which the native heate thereof being diminiſhed forſakes, and preſently an unnaturall heate ſeazes upon it. Hither alſo tend an univerſall or particular repletion of ill humours, chiefely if the wounds poſſeſſe the nervous parts as the joynts. Verily neither a Stagge with his horne, nor a flint out of a ſling can give ſo great a blow, or make ſo large a wound, as a Leaden or Iron Bullet ſhot out of a Gun, as that which going with mighty violence, peirces the body like a Thunderbolt.

CHAP. III.

How theſe wouuds muſt be ordered at the firſt dreſſing.

Strange bodies muſt firſt be pulled forth.

THe wound muſt forthwith be enlarged, unleſſe the condition of the part reſiſt, that ſo there may be free paſſage forth both for the *Sanies*, or matter, as alſo for ſuch things as are farced, or otherwiſe contained therein; ſuch as are peices of their cloathes, bombaſt, linnen, paper, peices of Maile or Armour, Bullets, Haile-ſhot, ſplinters of bones, bruiſed fleſh and the like, all which muſt be plucked forth with as muſt celerity and gentleneſſe as may bee. For preſently after the receiving of the wound the paine and inflammation are not ſo great, as they will be within a ſhort time after. This is the principall thing in performance of this worke, that you place the patient juſt in ſuch a poſture as he was in at the receiving of the wound; for otherwiſe the various motion and turning of the Muſcles will eyther hinder or ſtraiten the paſſage forth of the conteined bodies. You ſhall if it be poſſible, ſearch for theſe bodies with your finger, that ſo you may the more certainly and exactly perceive them. Yet if the Bullet bee entred ſomewhat deepe in, then you ſhall ſearch for it with a round and blunt probe, leſt you put the patient to paine; yet often times you ſhall ſcarce by this meanes finde the Bullet. As it happened to the Marſhall of *Briſſac* in the ſeige of *Parpignan*, who was wounded in his right ſhoulder with a Bullet, which the Chirurgions thought to have entred into the capacitie of his body. But I, wiſhing the patient to ſtand juſt in the ſame manner as hee did when hee received the wound, found at length the place where the Bullet lay, by gently preſſing with my fingers, the parts neare the wound, and the reſt which I ſuſpected; as alſo by the ſwelling, hardneſſe, paine and blackneſſe of the part, which was in the lower part of the ſhoulder neare unto the eight or ninth ſpondill of the backe. Wherefore the bullet being taken forth by making inciſion in the place, the wound was quickly healed and the Gentleman recovered. You ſhall well obſerve this, and rather beleeve the judgement of your fingers, than of your probe.

The manner how to draw them forth.

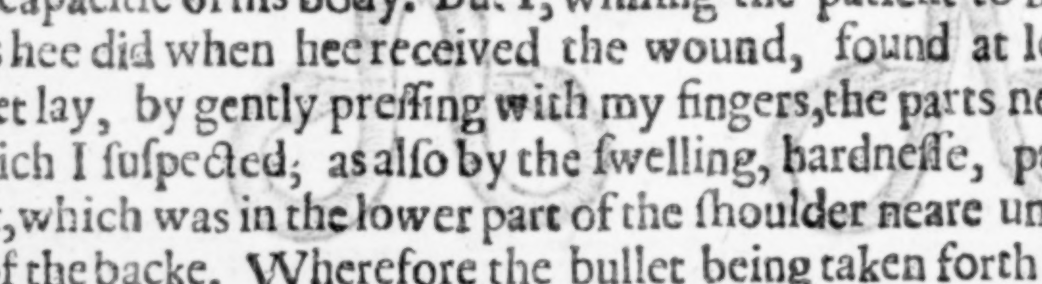
CHAP. IIII.

A deſcription of fit Inſtruments to draw forth Bullets and other ſtrange bodies.

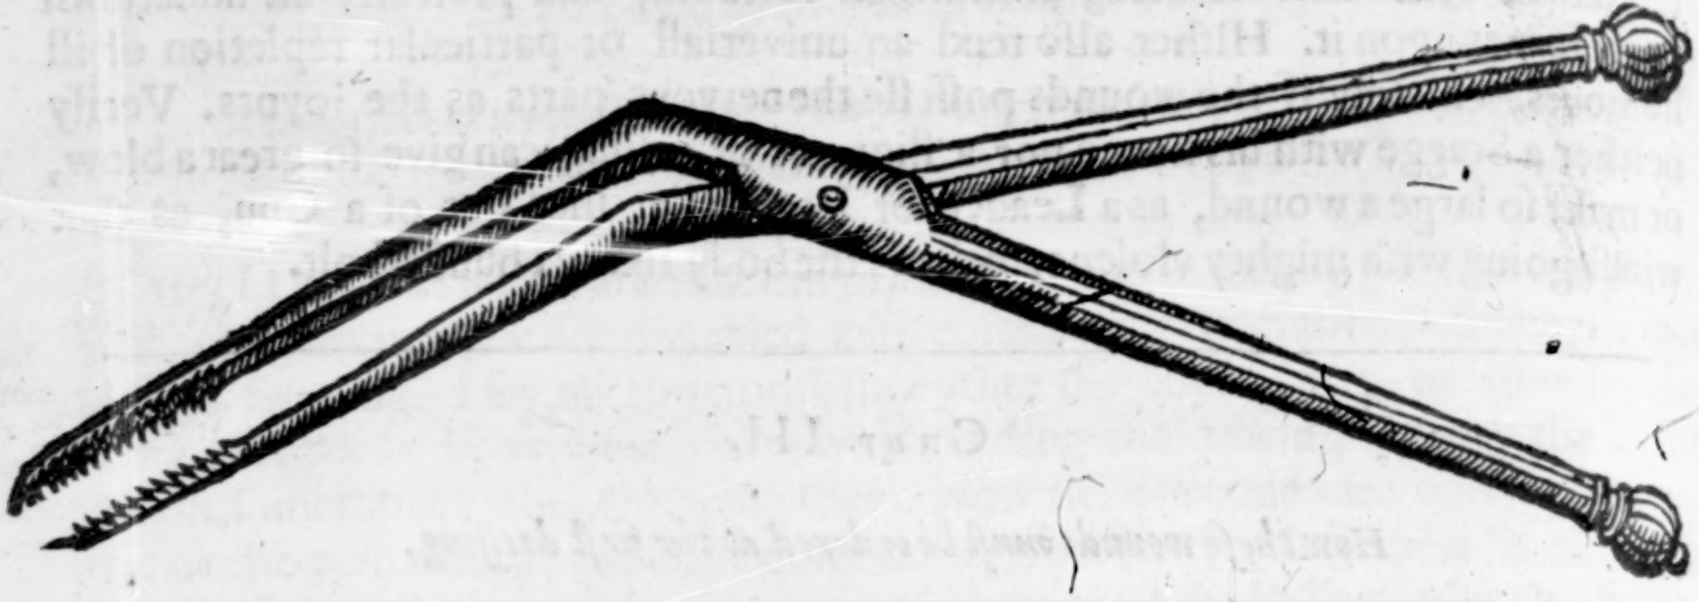
BOth the magnitude and figure of Inſtruments fit for drawing forth of Bullets and other ſtrange bodies, are various according to the diverſity of the incident occaſions. For ſome are toothed, others ſmooth, others of another figure and bignes; of all which ſorts the Chirurgion muſt have divers in a readineſſe, that he may fit them to the bodies and wound, and not the wounds and bodies to his Inſtruments.

The Deliniation of ſuch like Inſtruments.

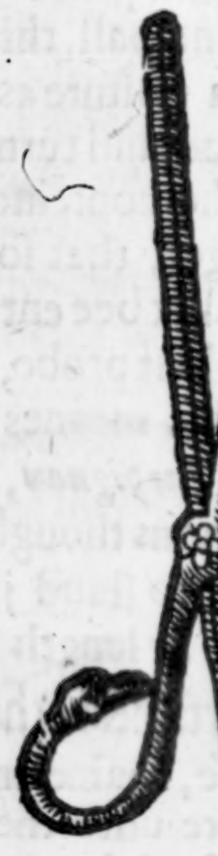
A toothed Crowes-Bill.



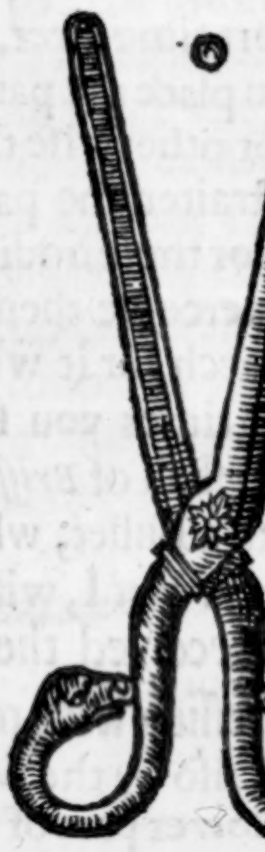
The crooked Cranes-bill, with teeth like a Saw.



The ſtraight Cranes-bill being alſo toothed, fit for drawing forth haile-ſhot, pieces of armour, ſplinters of bones, and ſuch things as lye deepe within.

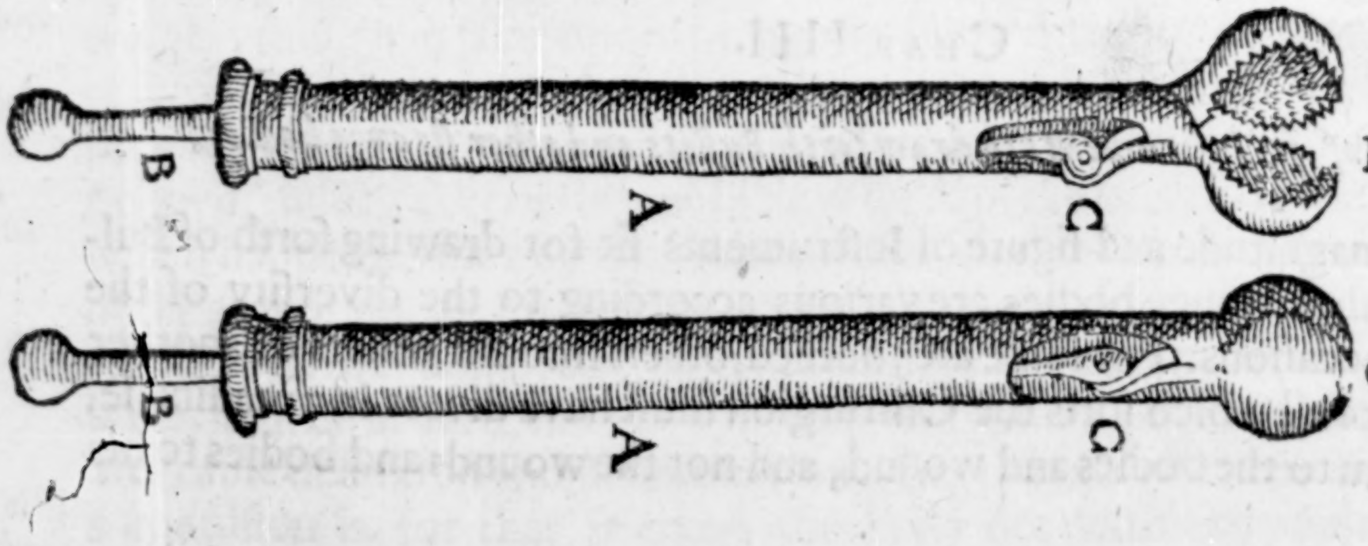


The Ducks-bill.



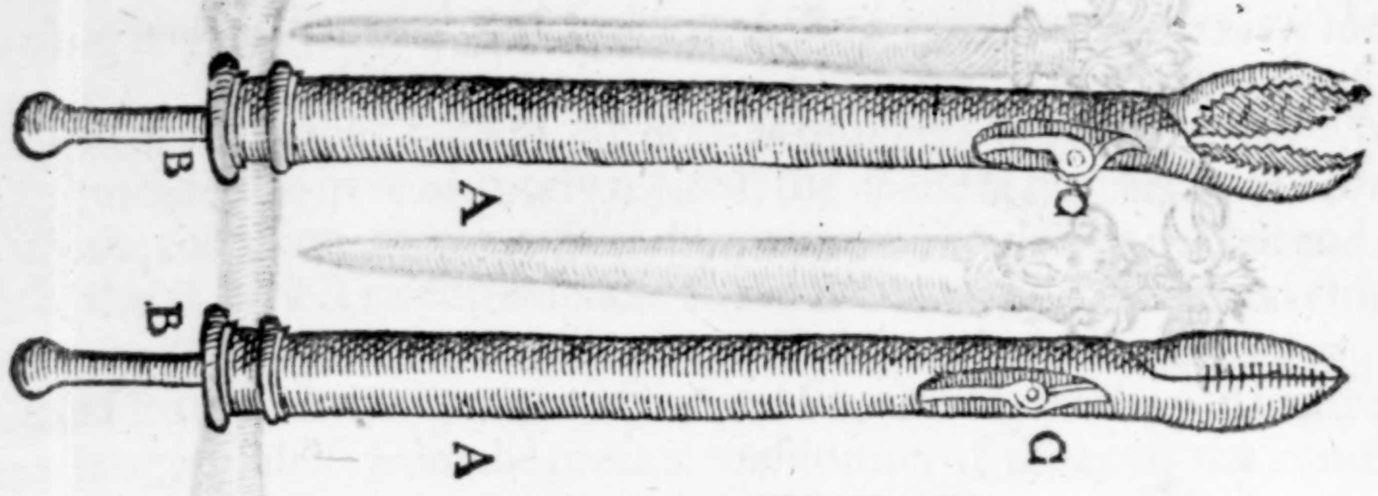
This Ducks bill hath a large round and toothed cavitie in the end, for ſo it more eaſily taketh hold of the Bullet when it lies amongſt much Fleſh.

Another Inſtrument fit for drawing forth of Bullets, which may be termed, a Catch-bullet.

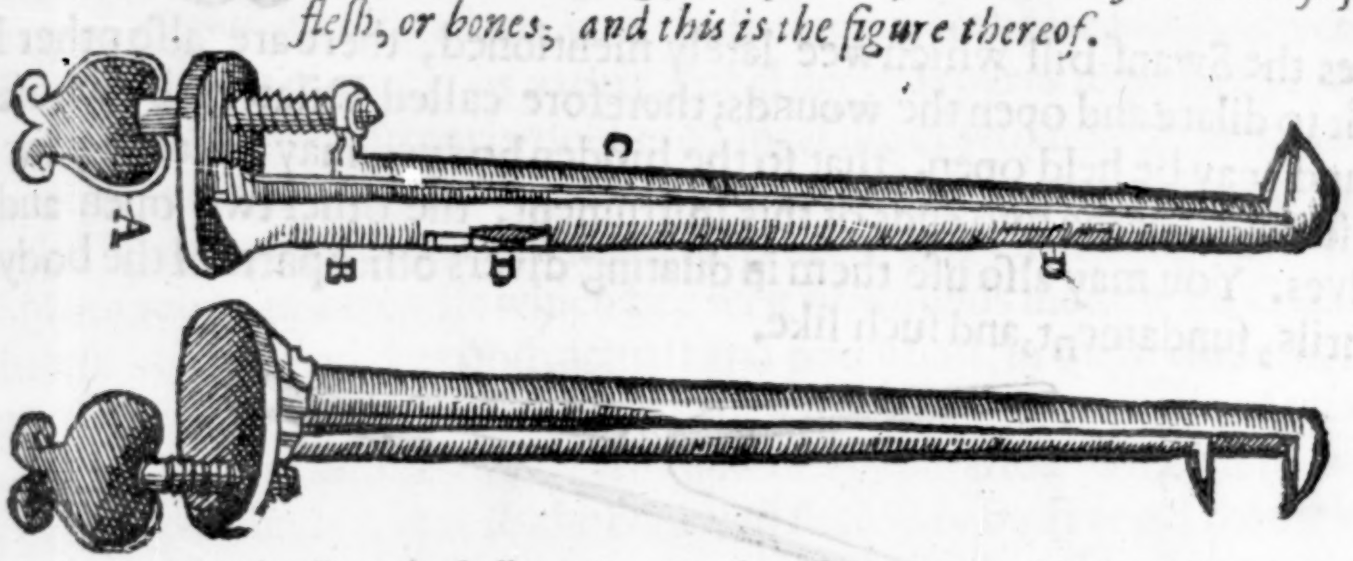


A. *Shewes the Trunke.*
B. *Shewes the rod, or ſtring, which opens & ſhuts the joynt.*
C. *The joynt.*

Another Catch-bullet called a Lizards-noſe, made for drawing out of bullets which are ſomewhat flatted, by ſtriking upon a bone.

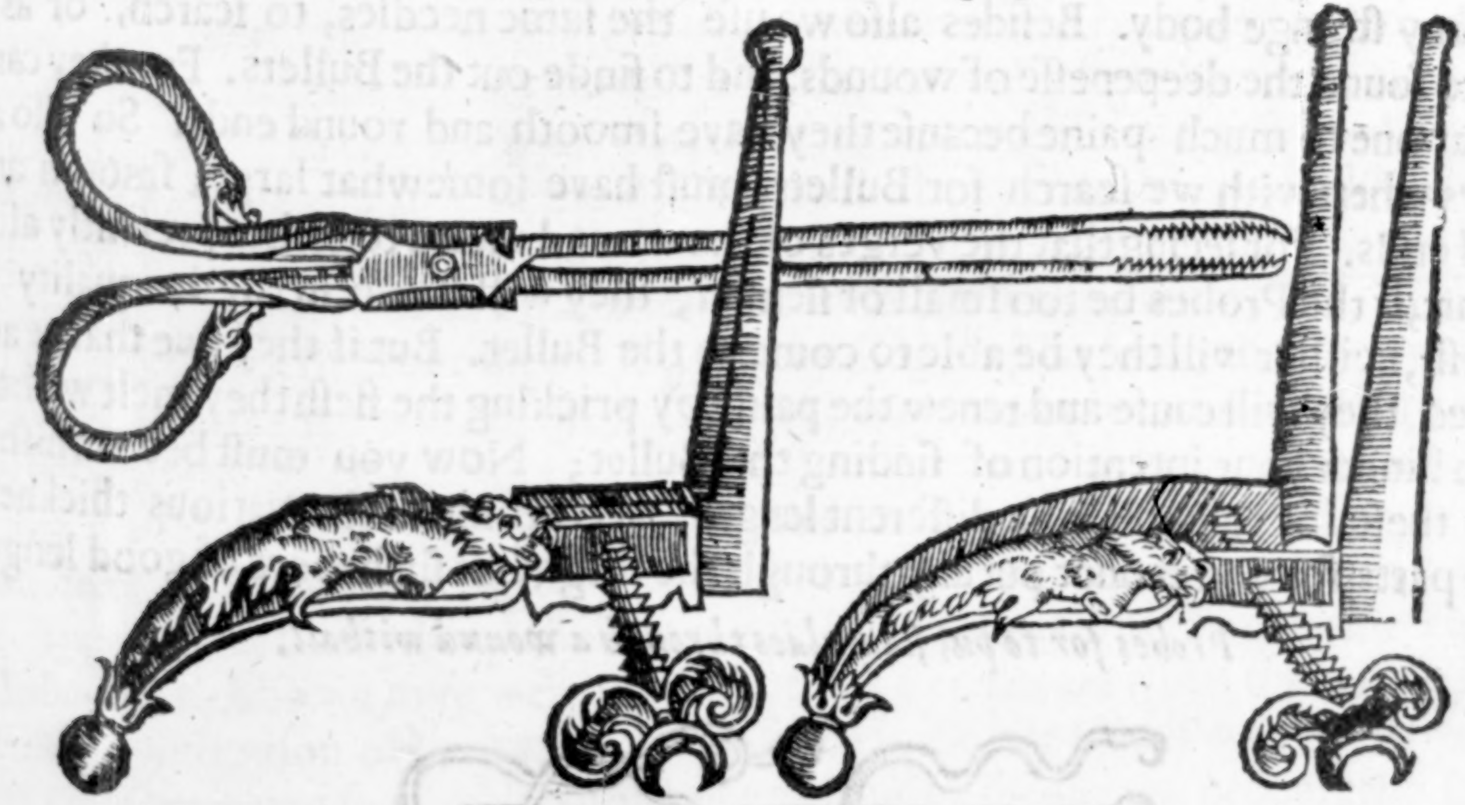


The Parrots-beake is made for drawing forth peices of maile thruſt into the fleſh, fleſh, or bones; and this is the figure thereof.



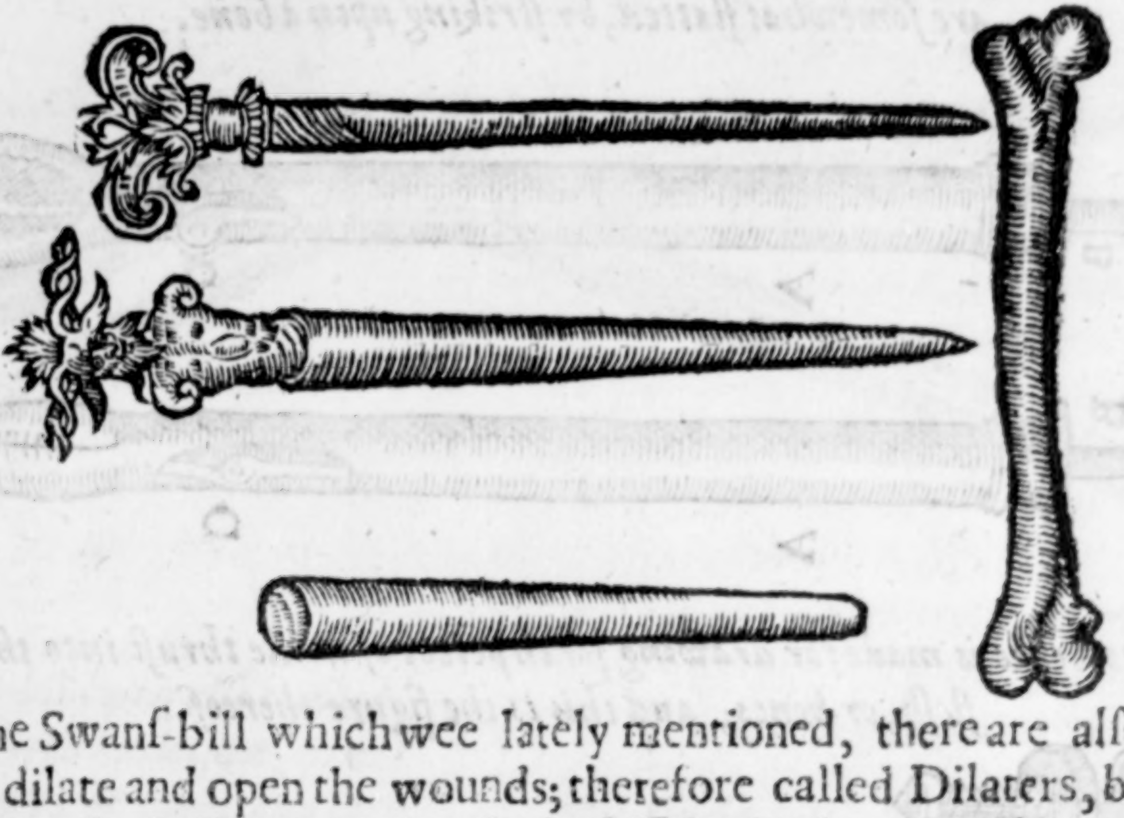
A. Shewes the ſcrew pin. B *The hollowed part which receives, the round part noted with.* C. *which is opened and ſhut by the ſcrew.* D. D. *falls, or ſtayes, which governe the running branch.*

The Swannes bill opens with a ſcrew: you may with this dilate the wounds, and ſo put in a ſtreight Cranes-bill, as pincers to plucke forth ſtrange bodyes. The figure of both are heere expreſt.

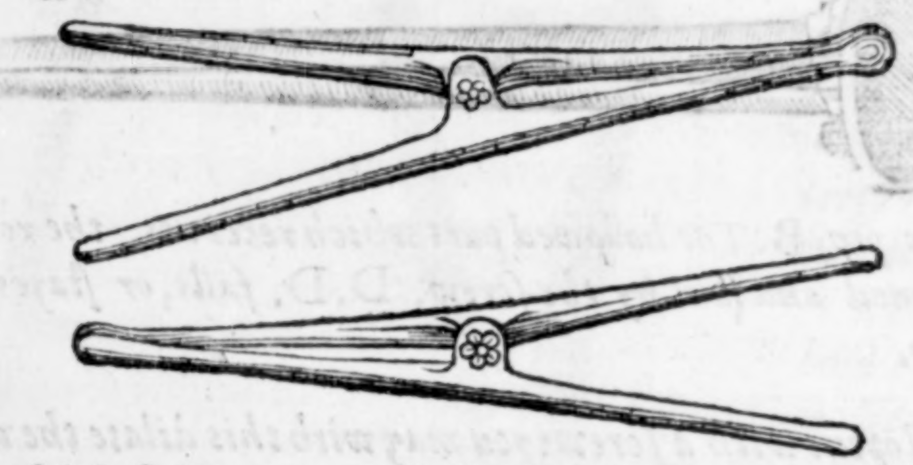


But if theſe ſtrange bodyes, eſpecially bullets and haileſhot, be not too deepe in the wound, they may be taken forth with your Levatorie, or elſe by the helpe of theſe Gimblets. Theſe Gimblets are ſcrewed into their pipes, or canes, and enter with their ſcrewed points into the Bullets, if that they be of Lead or Tin, and of no harder mettall; and ſo being faſtened in them, bring them out with them.

The figure of the Gimblet with his pipe, or cane.



Beſides the Swanſ-bill which wee lately mentioned, there are alſo other Inſtruments fit to dilate and open the wounds; therefore called Dilaters, by whoſe helpe the wound may be held open, that ſo the hidden bodyes may be ſeene; for when you preſſe together the two ends of this Inſtrument, the other two open and dilate themſelves. You may alſo uſe them in dilating divers other parts of the body, as the Noſe-thrils, fundament, and ſuch like.

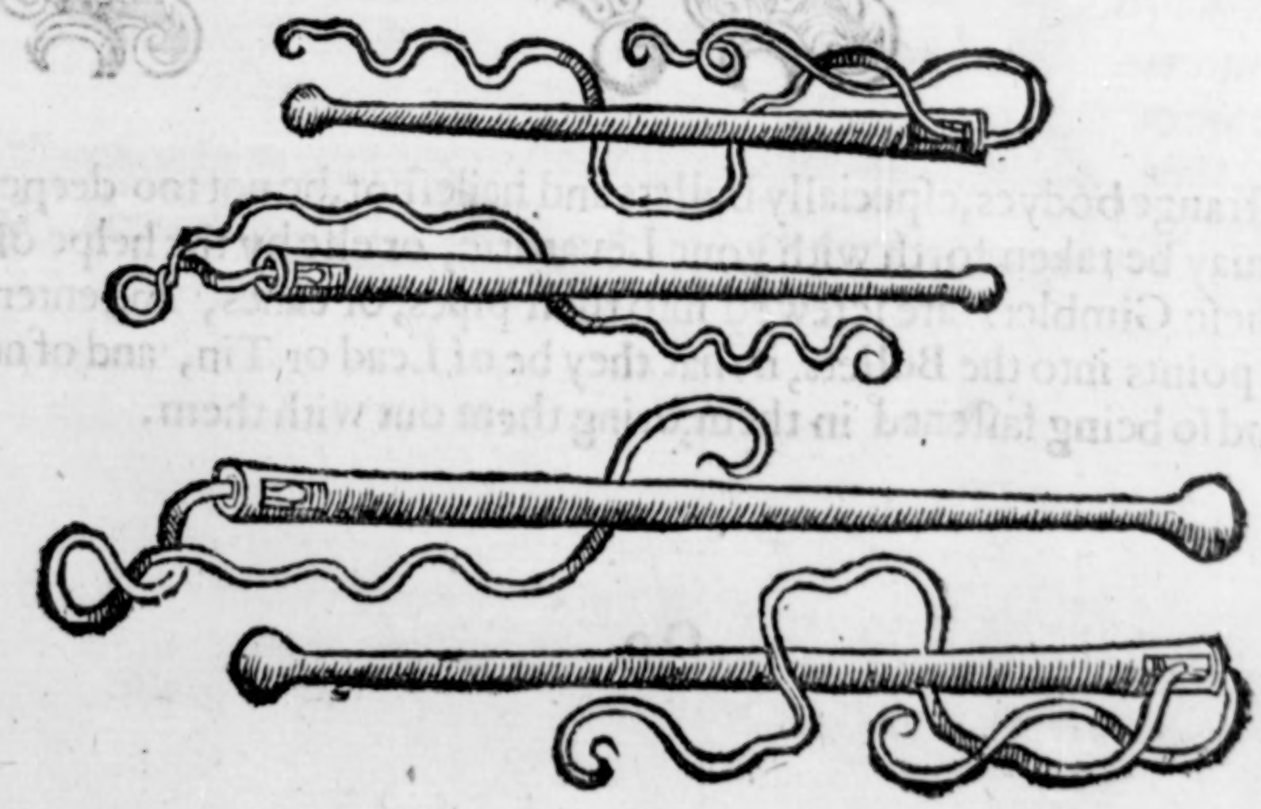


Dilaters.

The Inſtruments which follow are called Seton needles, or Probes; whoſe uſe is, to draw through a flamula, ſo to keepe the wound open, that you may the better take forth any ſtrange body. Beſides alſo we uſe the ſame needles, to ſearch, or as it were to ſound the deepeneſſe of wounds, and to finde out the Bullets. For they cannot put one to much paine becauſe they have ſmooth and round ends. So alſo all Probes wherewith we ſearch for Bullets, muſt have ſomewhat large, ſmooth and round ends. For ſeeing that the verges of the wound meete together preſently after the hurt, if the Probes be too ſmall or ſlender, they will ſticke in the inequality of the fleſh, neither will they be able to come to the Bullet. But if they bee ſharpe and pointed they will cauſe and renew the paine by pricking the fleſh they melt withall, and ſo hinder your intention of finding the Bullet; Now you muſt bee furniſhed with theſe Inſtruments of a different length, according to the various thickneſſe of the parts; for you cannot put any through the thigh but ſuch as are of good length.

What probes fit to ſearch theſe wounds.

Probes for to put ſlamulaes through a wound withall.



CHAP. IX.

what dreſsing muſt firſt be uſed, after the ſtrange bodies are pluckt or drawn out of the wound.

WHen the ſtrange bodyes are drawne or pluckt out of the wound, by theſe meanes we have formerly recited, the chieſe of the cure muſt be to heale the contuſion, and amend the diſtemper of the aire if it bee hot and moyſt, that is, ſubject to putrefaction. This ſhal be don by medicins taken inwardly, applied outwardly, and put into the wound. Things to be inwardly uſed in dyet and Pharmacie I leave to the judgement of learned Phyſitions; for the particular and topicke medicines, (unleſſe from the preſent conſtitution of the ayre, the condition of the wounded part, or from ſome other cauſe there be danger of a Gangreene) you muſt uſe ſuppuratives, as you uſually doe in contuſions; ſuch as are oyle of Whelpes and that which we call a digeſtive; you muſt chiefely forbeare ſuppuratives, when as the wounded part is of a nervous nature. For al nervous parts require dryer medicines than fleſhy, as we have formerly delivered ſpeaking of wounds of the joynts; wherefore in wounds of the joynts and nervous parts you ſhall uſe more venice Turpentine than oyle. *Laurentius Iobertus* the Kings Phyſition and Chancellour of the Vniverſity of Mompelier, in a treatiſe which hee writ of wounds made with Gunſhot, forbids the uſe of Eſcharotickes both actuall and potentiall, in theſe wounds, if ſimple; for that they induce paine, inflammation, a feaver, Gangræne and other deadly ſymptomes. Beſides alſo an eſchar will hinder ſuppuration, which is to bee deſired in this kinde of woundes, that ſo the contuſed fleſh may be ſevered from the ſound, leaſt it be drawne to putrefaction by contagion. Which eaſily happens when an Eſchar is drawne, as a barre over it, for then the excrementitious humor remaines longer in the part, and the putridinous vapours hindred from paſſing forth, are encreaſed, and carryed from the leſſer veſſells to the bigger, and ſo over all the body. Wherefore, when you ſuſpect putrefaction, letting alone ſuppuratives, uſe in the firſt place ſuch things as reſiſt putrefaction, as this following oyntment. ℞. *pulver. alumin. rocha, viridis æris, Vitrioli romani, mellis roſat. an.* ℥ij. *aceti boni quantum ſufficit, bulliant omnia ſimul ſecundum artem, & fiat medicamentum ad formam mellis*. This by reaſon of the heate and ſubtlety of the ſubſtance, hath a faculty to induce and attenuate the humors, as alſo to call forth the native heate drawne in and diſſipated by the violent and forcible entrance of the Bullet into the body; furthermore alſo it corrects the venemous contagion of the virulent humor. Now this medicine ſhall be uſed, diſſolved in Venegar or *aqua vitæ*, and be put into the wound with tents, or pledgets. The tents which ſhall bee uſed at the firſt dreſſing muſt be ſomewhat long and thicke, that by dilating the wound, they may make way for applycation of other remedies; otherwiſe you may make injection with a ſyring, that ſo it may penetrate the more powerfully. But this deſcribed *Egyptiacum* ſhall be tempered according to the condition of the affected parts, for the nervous parts will bee offended with it as being too acride; but it may be qualified by admixture of oyle of Turpentine and Saint Iohn-wort. Alſo we may well be without this *Egyptiacum* when there is no ſuch peſtilent conſtitution of the ayre, as was ſeene in the late Civill warres. After the uſe of *Egyptiacum* you ſhall with emollient and lenitive medicines procure the falling away of the Eſchar, and ſuch a medicine is this following oyle, being ſomewhat more than warme.

A Caution in the uſe of ſuppuratives.

Why Eſcharotickes muſt be eſchewed in theſe kinds, if they be ſimple.

How an Eſchar may cauſe putrefaction.

The deſcription of an *Egyptiacum*.

How and when to temper this *Egyptiacum*.

℞. *Olei violati lib.* iiij. *in quibus coquantur catelli duo nuper nati, uſque ad diſſolutionem oſsium, addendo vermium terreſtrium, ut decet præparatorum,* ℔. j. *coquantur ſimul lento igne, deinde fiat expreſsio ad uſum, addendo terebinth. venet.* ℥iij. *aquæ vitæ* ℥j. This oyle hath a wonderful force to aſſwage paine, to bring the wound to ſuppuration, & cauſe the falling away of the Eſchar. This enſuing oyle is made more eaſily. ℞. *olei ſeminis lini, & lilior. an.* ℥iij. *unguent. baſilic.* ℥j. *liquefiant ſimul & fiat medicamentum*, put of this a ſufficent quality into the wound; for this being applyed indifferent hot, hath power to aſſwage pain, to ſoften and humect the orifice of the wound, and help forwards ſuppuration, which is the true manner of curing theſe kinde of wounds, according to

The oyle of Whelpes a digeſtive, anodyne, and fit medicine to procure the falling away of an Eſchar.

Lib. de ulcer.

the rule of *Hippocrates*, which wiſhes every contuſed wound to bee preſently brought to ſuppuration, for ſo it will be leſſe ſubject to a Phlegmon; and beſides, all the rent and bruiſed fleſh muſt putrifie, diſſolve and turne to quitture, that new and good fleſh may be generated in ſteed thereof.

The faculties of the powder of Mercury.

The force of calcined vitrioll.

How wounds made by Gunſhot may be combuſt.

Scarification.

Laurentius Ioubertus much commends this following medicine, of whoſe efficacie, as yet, I have made no triall. ℞. *pulver. mercur. bis calcinati*, ℥j, *adipis porci recentis, vel butyri recentis*, ℥viij. *Camphora in aqua vita diſſolutæ*, ʒij. *miſce omnia ſimul, addendo tantillum olei liliorum, aut lini*. Experience taught him, and reaſon alſo ſhewes, that this kinde of remedy is very commendable; for the powder of Mercury, if mixed with a groſſe and humecting matter, doth in a ſhort ſpace turne the bruiſed fleſh into *pus*, without cauſing any great paine. For the Camphire, whether it be hot or cold, in temper, it much conduces to that purpoſe, by reaſon of the ſubtlety of the parts, whereof it conſiſts. For by meanes of this quality the medicines enter with more facility into the affected bodyes, and performe their parts; beſides alſo Camphire reſiſts putrifaction. Some droppe into the wound *aqua vita*, wherein they have diſſolved ſome calcined vitrioll. Which kind of remedy is not ſuppurative, but yet much reſiſts putrefaction, ſo that we may uſe it with good ſucceſſe, when the weather is hot, moyſt, and foggie. But when the wound is made very neere at hand, it cannot but be burnt by the flame of the powder; in which remedies uſed for burnes, will be uſefull, not omitting ſuch as are fit for contuſions. But for theſe parts which lye next the wound, you ſhall not, unleſſe at the firſt dreſſing apply, refrigerating and aſtringent things, but rather emollient and ſuppurative. For thoſe things which have a refrigerating faculty, weaken the part, and hinder ſuppuration. For aſtringents conſtipate the skin, which is the cauſe, that the putride vapours ſhut up and hindred from tranſpiration and paſſage forth, a gangrene and mortification eaſily ſeaze upon the part. But if the contuſion be great and diffuſe it ſelfe more largely over the fleſh; the part muſt be much ſcarified; that ſo the contuſed and concreat blood, and therefore ſubject to putrefaction, may be evacuated. But for theſe parts, which ſomewhat further diſtant from the wound encompaſſe the contuſed fleſh, they require refrigerating and ſtrengthening medicines, ſo to hinder the falling downe and ſetling of the humor in that part; ſuch is this enſuing medicine. ℞. *Pul. boli. armen. ſanguin. Dracon. Myrrhæ. an.* ℥j *ſucci ſolan. ſempervivi, portulac. an.* ℥iß. *album* iiij. *ovorum. oxyrhodin. quantum ſufficit; fiat linimentum, ut decet*. You may uſe this, and the like untill the ſuſpected ſymptome, be paſt feare. Neither muſt you have leſſe care, of binding up and rolling the part, than of your medicines; for it doth not a little conduce to the cure, to binde it ſo fitly up as it may be without paine. The wound at the beginning of the cure, muſt be dreſſed but once in 24. houres, that is, untill the wound come to ſuppuration; but when the quitture begins to flow from it, and conſequently the paine and feaver are encreaſed, it ſhall be dreſt twiſe a day, that is every twelve houres. And when the quitture flowes more abundantly than uſuall, ſo that the collection thereof is very troubleſome to the Patient, it will be requiſite to dreſſe it every 8 houres; that is thriſe a day. Now when as this aboundant effluxe is ſomewhat ſlaked, and begins to decreaſe, it will ſuffice to dreſſe it twiſe a day. But when the ulcer is filled with fleſh, and conſequently caſts forth but little matter, it will ſerve to dreſſe it once a day, as you did at the firſt.

An Aſtringent repelling medicine.

The binding up.

How oft the wound muſt be dreſt in a day.

Chap. VI.

How you ſhall order it at the ſecond dreſſing.

Why wounds made by Gunſhot are ſo long before they come to ſuppuration.

AT the ſecond and following dreſſings, unleſſe you ſuſpect putrifaction, and a Gangrene, you ſhall onely put into the wound ſome of the oyles formerly deſcribed, adding to them the yolkes of ſome egges and a little ſaffron; and uſe this medicine, untill the wound come to perfect ſuppuration. Here you muſt note this, that theſe kindes of wounds are longer before they come to ſuppuration, than other wounds made by any other ſort of weapon; both for that the bullet, as alſo the ayre which it violently carries before it, by much bruiſing the fleſh, on every ſide, diſſipates the native heate, and exhauſts the ſpirits of the part. Which things hinder digeſtion, and often cauſe the matter to ſtinke, as alſo many other pernitious ſymptomes. Yet moſt uſually *pus* or quitture appeares within three or foure dayes, ſooner and later according to the various complexion, and temperament of the patients bodyes, and the condition of the ambient ayre in heate and cold. Then by little and little you muſt come to deterſives, adding to the former medicine ſome Turpentine waſhed in Roſe, Barly, or ſome other ſuch like water, which may waſh away the biting thereof. If the encompaſſing ayre be very cold, you may to good purpoſe adde ſome *aqua vitæ*; for by *Galens* preſcript, we muſt uſe hot medicines in winter, and leſſe hot in ſummer. Then in the next place uſe deterſives, as ℞. *aquæ decoctionis hordei quantum ſufficit, ſucci plantaginis, appij, agrimon. centaurei minoris, an.* ℥j, *bulliant omnia ſimul; in fine decoctionis adde terebinthinæ venetæ* ℥iij. *mellis roſat.* ℥ij. *farin. hordei.* ʒiij. *croci* ℈j. Let them be all well mixed together and make a Mundificative of an indifferent conſiſtence. Or ℞. *ſucci clymeni, plantag. abſinth. appij, an.* ℥ij. *tereb. venet.* ℥4. *ſyrup. abſinth. & mellis roſ. an.* ℥ij. *bulliant omnia ſecundum artem, poſtea colentur, in colatura adde pulver. aloes, maſtiches, ireos Florent. far. hord. an.* ʒj. *fiat Mundificatiuum ad uſum dictum.* Or elſe ℞. *terebinth. venet. lotæ in aq. roſ.* ℥v. *olei roſ.* ℥j. *mellis roſ.* ℥iij. *myrrhæ, aloes, maſtich. ariſtoloch. rotundæ, an.* ʒſs. *far. hord,* ʒiij. *miſce.* Make a Mundificative, which you may put into the wound with tents, but ſuch as are neither too long, nor thicke, leſt they hinder the evacuation of the quitture and vapours, whence the wounded part will bee troubled with eroſion, paine, defluxion, inflammation, abſceſſe, putrefaction; all which ſeverally of themſelves, as alſo by infecting the noble parts, are troubleſome both to the part affected, as alſo to the whole body beſides. Wherefore you ſhall put into the wound no tents, unleſſe ſmall ones, and of an indifferent conſiſtence; leſt (as I ſayd) you hinder the paſſing forth of the matter, or by their hard preſſing of the part, cauſe paine, and ſo draw on maligne ſymptomes. But ſeeing tents are uſed both to keepe open a wound ſo long, untill all the ſtrange bodyes be taken forth, as alſo to carry the medicines, wherewithall they are annointed: even to the bottome of the wound. Now if the wound be ſinuous and deepe, that ſo the medicine cannot by that meanes arrive at the bottome and all the parts thereof, you muſt doe you buſineſſe by injections made of the following decoction. ℞. *aq. hord.* lib. 4. *agrimon. centaur. minor. pimpinellæ, abſinth. plantag. an. M.*ſs. *rad. ariſtoloch. rotund.* ʒſs. *fiat decoctio ad lib.* j. *in colatura expreſſa diſſolve aloes hepaticæ* ʒiij. *mellis roſ.* ℥ij. *bulliant modicum.* Inject ſome of this decoction, three or foure times into the wound, as often as you dreſſe the patient; and if this ſhall not be ſufficient to clenſe the filth, and waſte the ſpongious, putride and dead fleſh, you ſhall diſſolve therein as much *Ægyptiacum* as you ſhall thinke fit for the preſent neceſſity; but commonly you ſhall diſſolve an ounce of *Ægyptiacum* in a pint of the decoction. Verily *Ægyptiacum* doth powerfully conſume the proud fleſh which lyes in the capacity of the wound; beſides alſo it only workes upon ſuch kind of fleſh. For this purpoſe, I have alſo made triall of the powder of Mercury, and burnt Alome equally mixed together, and found them very powerfull, even almoſt as ſublimate, or Arſenicke, (but that theſe cauſe not ſuch paine in their operation.) I certainely much wonder at the largeneſſe of the Eſchar which ariſes by the aſperſiō of theſe powders. Many Practitioners would have a great quantity of the injection to be left in the cavityes of ſinuous ulcers, or wounds; which thing I could never allow of. For this contained humor cauſeth an unnaturall tenſion in theſe parts, and taints them with ſuperfluous moyſture, whereby the regeneration of fleſh is hindered; for that every ulcer as it is an ulcer, requires to be dryed, in *Hippocrates* opinion. Many alſo offend in the too frequent uſe of Tents; for as they change thē every houre, they touch the ſides of the wound, cauſe pain, & renew other maligne ſymptomes; wherefore ſuch ulcers as caſt forth more abundance of matter, I could wiſh rather to be dreſſed with hollow tents, like thoſe I formerly deſcribed to be put into wounds of the Cheſt. You ſhall alſo preſſe a linnen boulſter to the bottome of the wound, that ſo the parts themſelves may be mutually condenſed by that preſſure and the quitture thruſt forth; neither will it be amiſſe to let this boulſter have a large hole fitted to the orifice of the wound & end of the hollow tent and pipe, that ſo you may apply a ſpunge for to receive the quitture, for ſo the matter wil be more ſpeedily evacua-

evacuated and ſpent, eſpecially if it be bound up with an expulſive ligature, beginning at the bottome of the ulcer, and ſo wrapping it up to the toppe. All the boulſters and rowlers, which ſhall be applyed to theſe kindes of wounds, ſhall be dipped in Oxycrate, or red wine, ſo to ſtrengthen the part, and hinder defluxion. But you muſt have a ſpeciall care, that you doe not binde the wound too hard, for hence will ariſe paine, hindring the paſſage forth of the putredinous vapours and excrements, which the contuſed fleſh caſts forth; and alſo feare of an *Atrophia*, or want of nouriſhment, the alimentary juyces being hindred from comming to the part.

CHAP. VII.

By what meanes ſtrange bodyes, left in at the firſt dreſsing, may be drawne forth.

Two cauſes that make ſtrange bodies hard to be taken forth.

IT divers times happens, that certaine ſplinters of bones, broken and ſhattered aſunder by the violence of the ſtroake, cannot be pulled forth at the firſt dreſſing, for that they either doe not yeeld or fall away, or elſe cannot be found by the formerly deſcribed inſtruments. For which purpoſe this is an approved medicine to draw forth that which is left behind.

℞. *radic. Ireos Florent. panac. & cappar. an.* ʒiij. *ariſtoloch. rotund. mannæ, thuris. an.* ʒj. *in pollinem redacta incorporentur cum melle roſar. & terebinth. venet. an.* ℥ij. or ℞. *reſin. pini ſiccæ* ℥iij. *pumicis combuſti & extincti in vino albo, radic. Ireos, ariſtolochiæ, an.* ʒß. *thuris* ʒj. *ſquamæ æris*, ʒij. *in pollinem redigantur, incorporentur cum melle roſato, fiat medicamentum.*

CHAP. VIII.

Of Indications to be obſerved in this kinde of wounds.

THe ulcer being clenſed and purged, and all ſtrange bodyes taken forth; natures endeavours to regenerate fleſh, and cicatrize it, muſt be helped forwards with convenient remedies, both taken inwardly, and applyed outwardly. To which things we may be eaſily and ſafely carryed by indications drawne, firſt from the eſſence of the diſeaſe, then from the cauſe; if as yet preſent it nouriſh the diſeaſe. For that which *Galen* ſayes, *Lib. 3. Meth.* that no indication may bee taken from the primitive cauſe and time; muſt bee underſtood of the time paſt, and the cauſe which is abſent. And then from the principall times of the diſeaſe, the beginning, encreaſe, ſtate, and declination; for each of theſe foure require their remedies. Others are taken from the temperament of the patient, ſo that no Chirurgion neede doubt, that ſome medicines are fit for cholericke, otherſome for phlegmaticke bodyes. Hither referre the indication taken from the age of the patient; alſo it is drawn from his dyet, for no man muſt preſcribe any ſlender diet to one who is alwayes feeding, as to him who is accuſtomed to eate but once, or twiſe a day. Hence it is that a dyet conſiſting onely of *Panada's* is more fit for Italians, than for French men; for we muſt give ſomewhat to cuſtome, which is as it were another nature. Vocations and dayly exerciſes, are referred to dyet, for other things beſt husbandmen and laboures, whoſe fleſh is denſe and skin hardened by much labour, than idle and delicate perſons. But of all other, have diligent regard of that indication which is drawne from the ſtrength of the patient; for we muſt preſently, (all elſe being neglected) ſuccour the fainting, or decaying ſtrength; wherefore if it be needfull to cut off a member that is putrified, the operation muſt bee deferred if the ſtrength of the patient be ſo dejected, that hee cannot have it performed without manifeſt danger of his life. Alſo indication may be drawne from the encompaſſing ayre, under which alſo is comprehended that, which is taken from the ſeaſon of the yeere, region, the ſtate of the ayre and ſoyle, and the particular condition of the preſent and lately by-paſt time. Hence it is we reade in *Guido*, that wounds of the head are cured

Why wounds of the head at *Paris*, and of the legges at *Avignion* are hard to be cured.

with farre more difficulty at *Paris*, than at *Avignion*; where notwithſtanding on the contrary, the wounds of the legges are cured with more trouble, than at *Paris*; The cauſe is, the ayre is cold and moyſt at *Paris*; which conſtitution ſeeing it is hurtfull to the braine and head, it cannot, but muſt be offenſive to the wounds of theſe parts. But the heate of the ambient ayre at *Avignion*, attenuates and diſſolves the humors, and makes them flow from above downewards. But if any object that experience contradicts this opinion of *Guido*, & ſay, that wounds of the head are more frequently deadly in hot countries; let him underſtand that this muſt not be attributed to the manifeſt & naturall heate of the ayre, but to a certaine maligne & venenate humor, or vapour diſperſed through the ayre, and rayſed out of the Seas; as you may eaſily obſerve in thoſe places of France & Italy which border upon the Mediterranean Sea. An indication may alſo be drawne from the peculiar temper of the wounded parts, for the muſculous parts muſt be dreſſed after one, and the bony parts after another manner. The different ſenſe of the parts, indicates and requires the like variety of remedies; for you ſhall not apply ſo acride medicines to the Nerves and Tendons, as to the ligaments which are deſtitute of ſenſe. The like reaſon alſo, for the dignity and function of the parts needefull for the preſervation of life; for oft times wounds of the braine, or of ſome other of the naturall and vitall parts, for this very reaſon that they are defixed in theſe parts, divert the whole manner of the cure, which is uſually and generally performed in wounds. Neither that without good cauſe, for oft times from the condition of the parts, we may certainely pronounce the whole ſucceſſe of the diſeaſe; for wounds which penetrate into the ventricles of the braine, into the heart, the large veſſells, the cheſt, the nervous part of the midriffe, the Liver, ventricle, ſmall guts, bladder, if ſomewhat large are deadly; as alſo theſe which light upon a joynt in a body repleate with ill humors, as we have formerly noted. Neither muſt you neglect that indication which is drawne from the ſituation of the part, and the commerce it hath with the adjacent parts, or from the figure thereof; ſeeing that *Galen* himſelfe would not have it neglected. But wee muſt conſider in taking theſe forementioned Indications, whether there bee a compoſition, or complication of the diſeaſes; for as there is one and that a ſimple indication, of one & that a ſimple diſeaſe, ſo muſt the indication be various of a compound and complicate diſeaſe. But there is obſerved to be a triple compoſition, or complication of affects beſides nature; for either a diſeaſe is compounded with a diſeaſe, as a wound, or a phlegmon with a fracture of a bone; or a diſeaſe with a cauſe, as an ulcer with a defluxion; or a diſeaſe with a ſymptome, as a wound with paine, or bleeding. It ſometimes comes to paſſe, that theſe three, the diſeaſe, cauſe, and ſymptome, concurre in one caſe or affect. In artificially handling of which, we muſt follow *Galens* counſell, who wiſhes in complicated and compounded affects, that we reſiſt the more urgent; then let us withſtand the cauſe of the diſeaſe, and laſtly that affect, without which the reſt cannot be cured. Which counſell muſt well be obſerved; for in this compoſure of affects, which diſtracts the Empericke; But on the contrary the rationall Phyſition hath a way preſcribed in a few and theſe excellent words, which if hee follow in his order of cure, hee can ſcarſe miſſe to heale the patient. Symptomes truely as they are ſymptomes, yeeld no indication of curing, neither change the order of the cure; for when the diſeaſe is healed, the ſymptome vaniſhes, as that which followes the diſeaſe, as a ſhadow followes the body. But ſymptomes doe often times ſo urge and preſſe, that perverting the whole order of the cure, we are forced to reſiſt them in the firſt place, as thoſe which would otherwiſe encreaſe the diſeaſe. Now all the formerly mentioned indications may be drawne to two heads; the firſt is, to reſtore the part to its native temper; the other is that the blood offend not either in quantity or quality; for when thoſe two are preſent, there is nothing which may hinder the repletion, nor union of wounds or Vlcers.

An indication to be drawne from the quicke and dull ſenſe of the wounded parts.

Gal. lib. 7. Meth. et 2. ad Glauc.

Gal. lib. 7. Meth.

How and when we muſt take indication of curing from a ſymptome.

Chap.

CHAP. IX.

what remaines for the Chirurgion to doe in this kinde of wounds.

THe Chirurgion muſt firſt of all be skilfull and labour to aſſwage paine, hinder defluxions, preſcribe a dyet in theſe ſixe things we call Not naturall, forbidding the uſe of hot and acrid things, as alſo of wine; for ſuch attenuate the humors and make them more apt for defluxion. Therefore at the firſt let his dyet be ſlender, that ſo the courſe of the humors may bee diverted from the affected part; for the ſtomacke being empty and not well filled, drawes from the parts about it, whereby it conſequently followes, that the utmoſt and remoteſt parts are at the length evacuated; which is the cauſe, that ſuch as are wounded, muſt keepe ſo ſpare a dyet for the next dayes following. Venery is very pernitious, for that it inflames the ſpirits and humors farre beyond other motions; whereby it happens that the humors waxing hot, are too plentifully carryed to the wounded and overheated part. The bleeding muſt not bee ſtanched preſently upon the receiving of the wound, for by the more plentifull effluxe thereof the part is freed from danger of inflammation and fulneſſe. Wherefore if the wound bleede not ſufficiently at the firſt, you ſhall the next day open a veine, and take blood according to the ſtrength and plenitude of the patient; for there uſually flowes no great ſtore of blood from wounds of this nature; for that by the greatneſſe of the contuſion and vehemencie of the mooved ayre, the ſpirits are forced in, as alſo I have obſerved in thoſe who have one of their limbes taken away with a Cannon bullet. For in the time when the wound is received, there flowes no great quantity of blood, although there be large veines and arteries torne in ſunder thereby. But on the 4, 5, 6. or ſome more dayes after, the blood flowes in greater abundance, and with more violence, the native heate and ſpirits returning into the part. The belly muſt be ſo qualified, that he may have at the leaſt one ſtoole a day, either by nature, or Art; and if by Art, then rather with a gliſter than purging medicines taken by the mouth, for that the agitation of humors, chiefely in the firſt dayes of the diſeaſe, is to be ſuſpected, leaſt we increaſe the defluxion falling downe upon the wounded part. Yet *Galen* writes that both the evacuations are heere needefull, that is, blood-letting and purging, though the Patient bee neither phethoricke, nor repleate with ill humors. But the care hereof muſt be committed to the judgement of the learned Phyſition. Paine if ioyned with inflammation ſhall be mitigated, by anointing the parts neere unto the wound with ***Vnguent. nutritum***, compoſed with the juyce of Plantaine, Houſleeke, Nightſhade and the like. ***Vnguentum Diacalcitheos*** deſcribed by *Galen* diſſolved with vinegar, oyle of Poppyes and Roſes is of no leſſe efficacy; nor ***unguent. de bolo***, nor divers other things of the ſame faculty, though properly no anodynes, as thoſe which are not hot and moyſt in the firſt degree, but rather cold, but yet not ſo as to have any narcoticke faculty. Now theſe forementioned things aſſwage paine for that they correct the hot diſtemper, and ſtay the acride and chollericke defluxions, whoſe violence is more than cold. After the uſe of repercuſſives, it will be good to apply this following cataplaſme. ℞ ***Micæ panis infuſæ in lacte vaccino*** ℔ j.ß. ***bulliant parum addendo olei violacei, & roſar. an.*** ℥iij. ***vitellos ovorum nu.*** iiij. ***pulver. roſar. rub. flor. chamæm. & meliloti, an.*** ℥ij. ***farin. fabar. & hordei, an.*** ℥j. ***miſce. fiat cataplaſma ſecundum artem.*** Alſo in this caſe you may eaſily make a medicine, of bread crummes boyled in Oxycrate and oyle of Roſes. The cure of Tumors, if any aſſociate the wound, may be found in their proper place. Natures motion, whether to ſuppuration, or any ſuch thing, muſt ſtill be obſerved, and helped by the Phyſition and Chirurgion, as the miniſters or ſervants thereof.

Why ſuch as are wounded muſt keepe a ſlender Diet,

Why we muſt open a veine in ſuch as are wounded by Gunſhot.

Gal. Lib. 4. Meth, cap. 6.

Gal. Lib. 1 de comp. Med, ſecund. gen. c. 6.

An Anodyne and ripening Cataplaſme

CHAP. X.

Of Bullets which remaine in the body, for a long time after the wound is healed up.

Leaden Bullets lye in ſome parts of the body ſome whiles ſeaven, eight or more yeares, ſo that they neither hinder the agglutination of the wound, neither doth any other ſymptome happen thereupon, as I have diverſe times obſerved; untill at length by the ſtrength of nature forcing them, and their proper weightines bearing them downewards, they ſhew themſelves in ſome lower part, by their ſwelling or bunching forth, and ſo muſt be taken forth by the hand of the Chirurgion. For they ſay Lead hath a certaine ſympathy and familiarity with mans body, chiefely the fleſhy parts thereof. Wherefore it neither putrifies its ſelfe, nor cauſeth the fleſh to putrifie; beſides it hath an excellent faculty in cicatrizing old ulcers. But bullets of ſtone, Iron and of any other mettall, are of another nature, for they cannot remaine any long time in the body without hurt; for Iron will grow ruſty, and ſo corrode the neighbouring bodyes, and bring other maligne ſymptomes. Yet a Leaden bullet cannot remaine any long time in nervous, or noble parts without danger.

Why Leaden Bullets lye in the body ſo many yeeres without doing any harme.

CHAP. XI.

How to correct the conſtitution of the ayre, ſo that the noble parts may be ſtrengthened, and the whole body beſides.

But becauſe as we have formerly told you, there are ſome times wherein even ſmall wounds made by Gunſhot prove deadly, not by their owne fault, but the fault of the ayre; therefore alſo the Chirurgion muſt have this care, that he correct the ayre with all diligence, and reduce it to a certaine quality and moderation of ſubſtance, and ſtrengthen the noble parts and whole body beſides, which may be performed, by the following medicines, which are to be taken inwardly and applyed outwardly. In the morning three houres before meate let the Patient take ſome certaine quantity as the Phyſition ſhall thinke fit of the electuary *Diarbodon Abbatis, or Aromaticum roſatum, triaſantalon, biamoſchum, lætificans Galeni,* or ſome ſuch other like. And you ſhall apply ſome ſuch Epitheme as is heere deſcribed to the heart and Liver. ℞ *aquæ roſar.* ℥iiij, *aquæ bugloſſæ, aceti boni, an.* ℥ij. *coriandri præparati* ℥ß. *caryophill. cortic. citri, an* ʒj. *ſant. rub.* ʒß. *coralli utriuſque* ʒß. *camphoræ* ℈j. *croci* ℈ß. *pulver. diarhod. Abbat.* ʒij *theriacæ & Mithridatij an.* ℥ß. *pul. flo. chamæm & melil. an.* ʒiij. *miſce, fiat epithema.* Let it be applyed warme by dipping a ſcarlet cloath therein. You ſhall frequently put odoriferous and refrigerating things to the patients noſe, to ſtrengthen the animall faculty, as, ℞. *aquæ roſar. & aceti boni. an.* ℥iij. *caryophyllorum, nucis moſchat, cinamomi conquaſſatorum, & Theriacæ Galeni, an.* ʒj. Let a linnen ragge dipped herein, be now and then put to the patients noſe; for the ſame purpoſe he ſhall carry a Pomander about him, and often ſmell thereto. As ℞ *roſ. rub. violar. an* ʒiij. *baccarum myrti, juniperi, ſantal. rub. an.* ʒijß. *ſtyracis calamit.* ʒij. *aq. roſarum, quantum ſatis eſt: liquefiat ſimul cum ceræ albæ quod ſufficit, fiat ceratum ad comprehendendos ſupradictos pulvers cum piſtillo calido, & ducatur in pomum.* Or, ℞. *rad. For the rottenneſſe and corruption of bones we will treate thereof hereafter in its due place.

A ſweete water.

Perfumes to burne.

CHAP. XII.

Certaine memorable Hiſtories.

HEre I thinke good for the benefit of young practitioners, to illuſtrate by examples the formerly preſcribed Methode of curing wounds made by Gunſhot. The famous and moſt valiant Count of Mansfelt, Governour of the Dutchy of *Luxembourge*, Knight of the order of Burgundy, comming to the ayde of the French King, was at the battell of Moncontour, where in the conflict, he received ſo great a wound at the joynt of the left arme with a Piſtoll bullet, that the bones were ſhivered and broken in ſo many peeces, as if they had bin layd upon an Anvill and ſtruck with an hammer: hence proceeded many maligne ſymptomes, as cruel & tormenting paine, inflammation, a feaver, an œdematous and flatulent tumor of the whole arme even to the fingers end, and a certaine inclination to a Gangræne: which to reſiſt, *Nicolas Lambert*, & *Richard Hubert* the Kings Chirurgions, had made many and deepe ſcarifications. But when I came to viſite and dreſſe him, by the Kings appointment, and had obſerved the great ſtinch, and putrifaction, I wiſhed that they would uſe lotions of *Ægyptiacum* made ſomewhat ſtronger than ordinary, & diſſolved in venegar & *aqua vitæ*, and do other things more largely ſpoken of in the chapter of a Gangreene. For the patient had alſo a *Diarrhæa* or fluxe, whereby he evacuated the purulent, and ſtinking filth which flowed from his wound. Which how it might come to paſſe wee will ſhow at large when we come to treate of the ſuppreſſion of the Vrine. For this ſeemed very abſurd to many, becauſe that if this purulent humor flowed out of the arme into the belly, it muſt needs flow backe into the veines, bee mixed with the blood, and by its pernitious and contagious paſſage through the heart and liver, cauſe exceeding ill ſymptomes, and laſtly death. Indeed he often ſwounded by the aſcent of the filthy vapours raiſed from the ulcers to the noble parts; which to reſiſt, I wiſhed him to take a ſpoonefull of *aqua vitæ* with ſome Treacle diſſolved therein. I endeavoured to repreſſe the œdematous and flatulent Tumor poſſeſſing all the arme with ſtoups dipped in oxycrate, to which was put a little ſalt and *aqua vitæ*, theſe ſtoups I ſtayed & held to the part with double clothes, ſowed as ſtrait as I could. Such a compreſſion held the broken bones in their places, preſſed their *Sanies* from the ulcers, and forced backe the humors flowing to the part into the center of the body. If at any time I omitted this compreſſion, the tumor was ſo encreaſed, that I was in a great deale of feare, leaſt the native heate of the part ſhould bee ſuffocated. Neither could I otherwiſe binde up the arme by reaſon of the exceſſive paine which moleſted the patient upon the leaſt ſtirring of the Arme. There were alſo many Abſceſſes

The maligne ſymptomes which uſually happens upon wounds made by Gunſhot.

Matter may flow from the wounded limbes into the belly.

about his elbow and over all his arme beſides. For the letting forth of whoſe matter I was forced, to make new inciſions; which he endured very ſtoutly. At length I cured him with uſing a vulnerary potion, and by cleanſing the ulcers, and correcting the putrifaction with *Ægyptiacum* diſſolved in wine or honey of roſes, and ſo poured into the ulcers, and repreſſing the growth of proud fleſh, with the pouder of burnt Alome, drying it after the deterſion with liniments. Now this I can truely affirme and profeſſe, that during the time of the cure, I tooke out above threeſcore ſplinters of bones, and thoſe neceſſarily, amongſt which there was one of the length of ones finger; yet by Gods aſſiſtance at length he became ſound in all things, but that hee could not put forth, or draw in his arme.

A breefe recitall of the manner of the cure.

Not long after by the Kings command I went to ſee *Charles Philip* of Croy, Lord of Auret, the Duke of Aſchos brother, not farre from Mounts a City of Henalt. He kept his bed ſeaven monthes by reaſon of a wound made by a Bullet the ſpace of three fingers above his knee. When I came to him, hee was afflicted with theſe ſymptomes, intollerable paine, a continuall feaver, cold ſweats, watchings, excoriation of the hippes by reaſon of his long lying upon them, his appetite dejected with much thirſt. He oft ſunke downe as if he had the falling ſickneſſe, had a deſire to vomit, and a continuall trembing or ſhaking ſo that he could not put one hand to his mouth without the aſſiſtance of the other: he ſwounded frequently by reaſon of the vapours aſcending to the noble parts. For the thighbone was broken long wayes and ſidewayes with many ſplinters of bones, whereof ſome were plucked out and others remained ſticking faſt in. He beſides alſo had an ulcer in his groine which reached to the midſt of his thigh, and many other ſinuous ulcers about his knee. All the muſcles of his thigh and legge were ſwolne with a flegmaticke, cold and flatulent humor, ſo that almoſt all the native heate of thoſe parts ſeemed extinct. All which things being conſidered, I had ſcarſe any hope to recover him, ſo that I repented my comming thither. Yet at length putting ſome confidence in his ſtrength, and prime of youth, I began to have better hopes. Therefore with his good liking, firſt of all I make two inciſions, ſo to let forth the matter, which lying about the bone did humect the ſubſtance of the muſcles. This had happy ſucceſſe, and drew out a great quantity of matter; then I with a ſyring injected much *Ægyptiacum* diſſolved in wine, and a little *aqua vitæ* into theſe inciſions, ſo to reſtraine and amend the putrifaction, repreſſe the ſpongie, looſe and ſoft fleſh, reſolve the œdematous and flatulent tumor, aſſwage the paine, and ſtirre up and ſtrengthen the native heate almoſt oppreſt by the aboundance of excrementitious humors, ſo that it could ſcarſely aſſimulate any nouriſhment and adjoyne it to the parts. Then I fomented the affected part with Sage, Roſe-mary, Time, Lavander, Chamomile and Melilot flowres and red-roſe leaves boyled in white wine, and lye made of Oake-aſhes, adding thereto as much ſalt and vineger as I judged requiſite. This fomentation did attenuate and draw forth the morbificke humour. Now we uſed them long and often, ſo to waſte the humour more by drying up and breathing thorow the paſſages of the ſkinne, more thereof than fell into the part. For this ſame purpoſe, we ordained that he ſhould uſe frictions with hot linnen clothes, and that theſe ſhould be made from above downwards, from below upwards, and ſo on every ſide, and ſomewhat long withall: For a ſhort friction drawes more humour into the part than it can reſolve: I wiſhed that each other day they ſhould lay bricks heated hot in the fire about his leg, thigh, & ſoale of his foot; but they were to be ſomewhat quenched, & ſprinkeld with wine and vineger, with a ſmall quantity of *aqua vitæ*. Much watriſh moiſture by this moiſt heat, did ſweat out of theſe parts, the tumour was leſſened, and the native heat by little and little reſtored. Then ſhoupes dipped in lye made of Oake-aſhes, wherein Sage, Roſmarie, Lavender, ſalt, and cloaves, were boyled, ſome *aqua vitæ* added, were applyed thereto; but the rowlers were ſo gently, and artificially wrapped about, that he did eaſily endure them without any paine, and that with ſuch happy ſucceſſe, that if they were omitted but for one day, the tumor became very great. But thicke linnen boulſters were layd upon the lower cavities of the ulcers; that ſo the *ſanies* or filth might be more eaſily preſſed forth. But I had alwayes a ſpeciall care that the orifices of the ulcers ſhould be kept open with hollow Tents or pipes put therein;

Horride ſymptomes occaſioned by a wound made by Gun-ſhot.

Inciſions wherefore made.

Wherefore I uſed fomentations.

Mixed or round frictions, as they terme them.

A medicated Lye.

A diſcuſſing Cataplaſme.

and ſometimes this following cataplaſme was applyed to reſolve the tumor. ℞. *Far. hord. fabar. & orobi, an* ℥vj. *mellis com. & tereb. an.* ℥ij. *flo. chamam. melil. & roſ. rub. an.* ℥ß. *pulv. rad. Ireos, Flor. cyper. Maſt. an.* ʒiij. *oxymel. ſimp. quantum ſufficit; fiat cataplaſma ad formam pultis ſatis liquida.* And *Emplaſtrum de Vigo* without mercury was applyed thereto, whereby the paine was much aſſwaged, and the tumor leſſened; yet were they not applyed before the parts were throughly heated by the fomentation, frictions, and evaporations; for otherwayes this Emplaſter could never have beene activated, by reaſon of the exceſſive coldneſſe of the affected parts. Neither did we omit catagmaticke powders, fit for the taking, and drawing forth of broken bones. He uſed a vulnerary potion for 15, dayes. Alſo beſides the particular frictions of the affected parts, I appointed other generall frictions of the whole body, which was become very leane; for by theſe, blood together with the ſpirit was drawne to the parts, and the acride, and fuliginous vapours were breathed forth.

To conclude, his feaver and paines being aſſwaged, his appetite reſtored, by feeding plentifully upon good meates according to his ſtrength, he in a ſhort time became more luſty; and laſtly by the ſingular mercy of God, recovered his health perfectly, but that he could not very well bend his knee. I thought good to recite theſe things, not to glory or bragge of the happy ſucceſſe of thoſe patients, which have recovered by my meanes, and the favour of God; but that thus I may more fully and perfectly by familiar examples inſtruct young practitioners in the operations of Chirurgery.

CHAP. XIII.

An Apologie concerning Wounds made by Gunſhot.

The occaſion of writing this Apologie.

THere lately came to my hands a booke written by a certaine Phyſition, whereby he endeavours to diſproove and overthrow, that which I have hitherto writ, of the cure of wounds made by Gunſhot. Aſſuredly if there were no other harme, but the loſſe of my credit enſuing thereon, I would willingly hold my peace, and ſtoppe his mouth by modeſt ſilence. But ſeeing the ſafety of ſo many men, lyes upon the judgement of this point, I have thought good to withſtand this error, leaſt it, to the great deſtruction of mankind, ſpread and diffuſe it ſelfe any further. The uſe (ſaith he) of ſuppurative medicines, have killed many who have beene but lightly wounded with Gunſhot, but acride medicines, as *Ægyptiacum* have killed more. Neither is the counſell of *Hippocrates* to be obſerved in curing this ſort of wounds, who bids that every contuſed wound be brought to ſuppuration. For ſeeing this is a new kinde of wound, it requires new, and not anciently uſed medicines. Now the temper of the ayre changed from the naturall conſtitution ought not to indicate change of medicines; but much leſſe muſt thunder and lightening bee compared to the ſhooting of Great Ordinance. Theſe are the chiefe heads of this his booke, which becauſe they diſſent from the truth, & theſe things I have formerly delivered, I have thought good heere to confute.

The chiefe heads of our adverſaries Treatiſe.

All wounds made by Gunſhot are contuſed.

First, ſeeing Leaden bullets which are uſually ſhot out of Guns are round, obtuſe and weighty, they cannot wound the body without contuſion and attrition; Now no contuſion can be cured without ſuppuration, not onely according to the opinion of *Hippocrates*, but alſo of *Galen* and all others who have written of Phyſicke. Neither muſt we invent new remedies, for theſe new kindes of wounds; for the lawes of the ſacred and divine Art of Phyſicke are nor obnoxious to change, nor ſubject to the humor of men or times, as the decrees of Kings and Emperours are. For theſe are ſtabliſhed with immutable neceſſitie, which conſtancie neither conſuming time, nor age, nor tyranny can pervert. Wherefore neither theſe who with great prayſe are Phyſitions to Kings and Princes, I meane *Ioubert* and *Botallus*, think it lawfull for them to depart from the rule of *Hippocrates*. And this they not only doe and follow in curing and doing the workes of Art, but much and highly commend, confirme and propound to be diligently obſerved by all, in their bookes which they have publiſhed concerning the cure of theſe kinds of wounds. And yet theſe Phyſitions are ſuch, as daily converſant in Armies and Kings houſes have healed and daily cure as many wounded by Gunſhot as this Phyſition our Antagoniſt hath ſeene in all his life. Neither onely doe theſe whom I have named thus cure theſe wounds, but almoſt all that dreſſe ſuch kind of wounds doe the like, ſo that if there bee nothing which may hinder, or indicate to the contrarie they preſently apply ſuppuratives. And I wonder that hee hath not obſerved how his neighbour ***Doublet*** the Empericke cures deſperate wounds of this nature, with no other than a ſuppurative medicine, compoſed of Lard, the yolke of an Egge, Turpentine and a little Saffron.

A ſuppurative medicine of tryed efficacy.

In the yeare 1538. There was at ***Turin*** whileſt I was Chirurgion there to the Marſhall of ***Montjan*** the Kings Leifetenant Generall in ***Piemont***, a certaine Chirurgion wondrous famous for curing theſe wounds, and yet hee uſed nothing elſe but the oyle of Whelpes, (the deſcription whereof I at length obtained of him with much intreaty and expence) and hee uſed it not ſcalding hot, as ſome have imagined, but powred it ſcarſe warme into their wounds, and ſo did mitigate their paine, and happily bring them to ſuppuration. Which afterwards almoſt all Chirurgions, after they had got the deſcription heereof, when I firſt publiſhed this Worke, have uſed and daily doe uſe with happy ſucceſſe.

The force of *Ægyptiacum* againſt putrefaction.

But in contemning and condemning *Ægyptiacum*, I thinke hee hath no partaker; ſeeing there as yet hath beene found no medicine more ſpeedy and powerfull to hinder putrifaction, if beginning; or correct it if preſent. Now theſe wounds often degenerate into virulent, eating, ſpreading, and maligne ulcers, which caſt forth a ſtincking and carion-like filth, whence the part Gangrenates, unleſſe you withſtand them with *Ægyptiacum* and other acrid medicines, being greatly approved by the formerly named Phyſitions and all Chirurgions. But (ſaith hee) this unguent is poyſonous, and therefore hath beene the death of many who have beene wounded by Gunſhot. Verily if any diligently enquire into the compoſition of this oyntment, and conſider the nature of all and every the ingredients thereof, hee ſhall underſtand that this kind of Vnguent is ſo farre from poyſon, that on the contrary it directly oppoſes and reſiſts all poyſon and putrifaction which may happen to a fleſhy part, through occaſion of any wound.

The force of the ayre in breeding and augmenting diſeaſes.

It is moſt falſe and diſſonant from the doctrine of *Hippocrates* to affirme, that the ſeaſons of the yeare ſwerving from the Law of nature, and the aire, not truly the ſimple and elementary, but that which is defiled and polluted by the various mixture of putrid and peſtilent vapours, eyther raiſed from the earth, or ſent from above, make not wounds more maligne and hard to cure at ſome times than they are at otherſome.

For the ayre eyther very hot, or cold, drawne into the body by inſpiration or tranſpiration, generates a condition in us like its qualities. Therefore why may it not, when defiled with the putredinous vapours of bodies lying unburied after great battailes, and ſhipwracks of great Armadoes, infect with the like qualitie our bodies and wounds?

A Hiſtory.

In the yeare 1562. when the civill warres concerning Religion firſt begun in France, at ***Pene*** a Caſtle lying upon the River ***Lot***, many ſlaine bodies were caſt into a Well, ſome hundred Cubits deepe, ſo ſtinking and peſtilent a vapour aroſe from hence ſome two moneteh after, that many thouſand of people dyed all over the Provence of ***Agenois***, as if the Plague had beene amongſt them, the pernitious contagion being ſpred twenty miles in compaſſe; which none ought to thinke ſtrange, eſpecially ſeeing the putride exhalations by the force of the windes may be driven and carried into divers and moſt remote regions, diſperſed like the ſeeds of the Peſtilence; whence proceeds a deadly corruption of the ſpirits, humors and wounds, not to be attributed to the proper malignitie, or perverſe cure of wounds, but to be the fault of the aire.

Therefore ***Francis Daleſchampe*** in his French Chirurgery, in reckoning up theſe things which hinder the healing of Vlcers, hath not omitted

Hip. Aph. 1. ſect. 3.

that common cauſe which proceeds from the ayre defiled or tainted with the ſeedes of the peſtilence. For he had learnt from his Maſter ***Hippocrates*** that the mutations of times chiefely bring diſeaſes, and he had read in ***Guido***, that this was the chiefe occaſion, that wounds of the head at *Paris*, and of the legges at *Avignion*, were more difficultly healed. Laſtly even Barbers and ſuch as have leaſt skill in Chirurgery know, that wounds eaſily turne into a Gangreene in hot and moyſt conſtitutions of the ayre.

In our ſecond diſcourſe.

The power of the ſtarres upon the Aire and our bodies.

Apho. 20. ſect. 5.

Wherefore when the winde is ſoutherly, the Butchers will kill no more fleſh than to ſerve them for one day. I have formerly declared the malignity of the wounds occaſioned by the ayre in the ſeige of *Roüen*, which ſpared none, no not the Princes of the blood, who had all things which were requiſite for their health. Which cauſed me, made at length more skilfull by experience, to uſe *Vnguentum Ægyptiacum* and medicines of the like faculty in ſteed of ſuppuratives, to wounds during all that ſeaſon, that ſo I might withſtand the putrefaction and Gangreene which ſo commonly aſſayled them. But if the various motion of the ſtarres, can by their influxe ſend a Plague into the aire, why then may it not by depravation of their qualityes infect, and as by poyſoning corrupt both wounds and wounded bodies obnoxious to their changes and that of the ayre? Wee learnt long ſince by experience, that all paines but principally of wounds, grow worſe in a rainy and moiſt ſeaſon, ſpecially becauſe in that ſoutherly conſtitution the aire replete with thicke and foggy vapours, cauſes the humors to abound in the body, which forthwith eaſily fall upon the affected parts, and cauſe encreaſe of paine. But (ſaith our Adverſary) in the battell at ***Dreux*** and at S. ***Dennis*** which were fought in winter, there dyed a great number of men who were wounded by Gunſhot: This I confeſſe is true; but yet I deny, that it was occaſioned by applying ſuppuratives, or corroſives, but rather by the vehemencie and largeneſſe of their wounds, and the ſpoile the Bullet made in their members, but above all by reaſon of the cold. For cold is moſt hurtfull to wounds and ulcers (as ***Hippocrates*** teſtifies) it hardens the skinne and cauſes a Gangreene. If this my Gentleman had beene with mee in the ſeige of ***Metz***, he might have ſeene the Legges of many ſouldiers to have rotted, and preſently taken with a Gangreene to have fallne away, by the onely extremitie of cold; If he will not beleeve me, let him make tryall himſelfe; and goe in winter to the Chappell at Mount ***Senis*** one of the Alpine hills, where the bodies of ſuch as were frozen to death in paſſing that way are buried, and hee ſhall learne and feele how true I ſpeake. In the meane time I thinke it fit to confute the laſt point of his reprehenſion.

The ſimilitude betweene Thunder and great Ordinanee, maintained.

He cavills for that I compared Thunder and Lightning with the diſcharging peices of Ordinance. Frſt he cannot denie but that they are alike in effects. For it is certaine that the flame ariſing from Gunpouder ſet on fire, reſembles Lightning; in this alſo that you may ſee it before you heare the cracke or reporr. I judge for that the eye almoſt in a moment perceives its object; but the eare cannot but in ſome certaine ſpace of time, and by diſtinct gradations. But the rumbling noiſe is like in both, and certainly the report of great Ordinance may bee heard ſometimes at forty miles diſtance, whilſt they make any great battry in the beſeiging of Citties.

Beſides alſo, Iron Bullets caſt forth with incredible celerity by the fiered Gunpouder, throw downe all things with a horrid force, and that more ſpeedily and violently by how much they reſiſt the more powerfully by their hardneſſe. They report that Lightning melts the money not hurting the purſe; Now many by the onely violence of the aire agitated and vehemently mooved by ſhooting a peice of Ordinance, as touched with Lightning, have dyed in a moment, their bones beeing ſhivered and broken, no ſigne of hurt appearing in the skinne.

The ſmell of Gunpouder when it is fiered, is hurtfull, firy and ſulphurous, juſt like that which exhales or comes from bodies killed with Lightning. For men doe not onely ſhunne this ſmell, but alſo wilde Beaſts leave their Dennes if touched with Lightnings. Now the cruelty of great Ordinance makes no leſſe ſpoyle amongſt buildings, nor ſlaughter amongſt men and beaſts, than Lightnings doe, as wee have formerly ſhowne by examples, not onely horrid to ſee, but even to heare reported, as of Mines, the Arcenall of *Paris*, the Cittie of *Malignes*. Theſe may ſeeme ſufficient to reach, that Thunder and Lightning have a great ſimilitude with the ſhooting of great Ordinance, which notwithſtanding I would not have alike in all things. For they neither agree in ſubſtance, nor matter, but onely in the manner of violent breaking aſunder the objects.

Our adverſaries method, and manner of cure, reproved.

Now let us ſee and examine what manner of cure of wounds made by Gunſhot our adverſarie ſubſtitutes for ours. For hee would have ſupparatives uſed and applyed, yet ſuch as ſhould not be hot and moiſt in qualitie, or of an Emplaſticke conſiſtence, but hot and dry things. For (ſaith hee) here is not the ſame reaſon as in Abſceſſes, where the Phyſition intends nothing but ſuppuration. But heere becauſe a contuſion is preſent with the wound, this requires to bee ripened with ſuppuratives, but the wound to be dryed.

Gal. lib. 9. ſimpl. 10. Method.

Now to anſwer this objection, I will referre him to *Galen*, who will teach him the nature of ſuppuratives; from whom alſo hee may learne that great regard is to be had of the cauſe and more urgent order in the cure of compound diſeaſes; then would I willingly learne of him, whether he can heale a wound made by Gunſhot, not firſt bringing that which is contuſed to perfect maturitie. If hee affirme hee can, I will be judged by whatſoever Practitioners hee will, to judge how obſcure theſe things are. Whereby you may the better underſtand there is nothing more commodious than our *Baſilicon* and oyle of Whelpes to ripen wounds made by Gunſhot, if ſo bee that putrifaction, corruption, a Gangreen or ſome other thing doe not hinder. Then would hee have *Oxycrate* poured into theſe wounds to ſtay their bleeding, which if it cannot ſo bee ſtayed, hee would have a medicine applyed conſiſting of the white of an Egge, Bole Armenicke, oile of Roſes and ſalt. But I leave it to other mens judgement, whether theſe medicines have power to ſtay bleeding if put into the wound; certainly they will make it bleede the more. For Vinegar ſeeing it is of a tenuious ſubſtance and biting, it is no doubt but that it will cauſe paine, defluxion and inflammation.

Vinegar put into a wound doth not ſtay but cauſes bleeding.

A Hiſtory.

To which purpoſe I remember I put to ſtanch bleeding, for want of another remedie, a medicine wherein was ſome Vinegar, into a wound received by a Moore, an attendant of the Earle of *Roiſſy*, hurt with a Lance, run through his arme before *Bologne* by an Engliſh horſeman. But he comes againe to mee a little after, complaining and crying out that all his arme burnt like fire; wherefore I was glad to dreſſe him againe, and put another medicine into his wound, and layd an aſtringent medicine upon the wound, but poured it not therein.

And then above all other remedies hee extolls his Balſame compoſed of Oyle of Waxe, and Myrrhe beaten together with the white of an Egge; which hee ſaith is equall in operation to the naturall Balſame of *Peru*. For hee affirmes that this hath a facultie to conſume the excrementitious humidity of wounds, and ſo ſtrengthens the parts that no ſymptome afterwards troubles them. Yet hee ſaith, this doth not ſo well heale and agglutinate theſe wounds, as it doth others which are cut. Verily it is ridiculous to thinke that contuſed wounds can bee healed after the ſame manner as ſimple wounds may, which onely require the uniting of the looſed continuitie.

Balmes are fit to heale ſimple but not contuſed wounds.

Therefore neither can theſe Balſames be fit remedies to heale wounds made by Gunſhot, ſeeing by reaſon of their dryneſſe they hinder ſuppuration, which unleſſe it be procured the patient cannot be healed. Wherefore ſuch things ought not to be put into wounds of this nature, before they be ripened, waſhed and clenſed from their filth. Yet can I ſcarſe conceive, where we ſhall be able to finde out ſo many Chymiſts which may furniſh us with theſe things ſufficiently to dreſſe ſo many wounded ſouldiers as uſually are in an Army, or whence the ſouldiers ſhall have ſufficient meanes to beare the charge thereof. Alſo that which he ſaith is abſurd, that theſe Balſames muſt bee put into the wounds without Tents; and preſently forgetting himſelfe, hee ſaith, It will not bee amiſſe, if there bee a little and ſlender Tent put into the wound, which may onely ſerve to hinder the agglu-

Egyptiacum howſoever made is a clenſer not a ſuppurative.

tination thereof. But how can theſe Balſames come to the bottomes of wounds without Tents, when as it is their chiefe propertie to carry medicines even to the innermoſt parts of the wounds, and alwayes keepe open a free paſſage for the evacuation of the quitture? But it is note worthy, that after hee hath rejected *unguentum Ægyptiacum*, hee neverthleſſe bids to apply it, from the beginning untill the contuſion come to perfect maturation, diſſolving it in a decoction of the tops of wormewood, S. *Iohn wurt*, the leſſer Centory and Plantaine, and ſo injecting it into the wound. Beſides alſo a little after hee gives another way of uſing it, which is, to boyle a quantity of Hony of Roſes in plantaine water, carefully ſciming it, untill it bee boiled to the conſiſtence of Hony, and then to adde as much *Ægyptiacum* thereto, and ſo to make an oyntment moſt fit to bring theſe wounds to ſuppuration. But I leave it for any skilfull in Chirurgery to judge, whether ſuch medicines can bee ſuppuratives, or whether they bee not rather deterſives. Laſt of all hee writes, that theſe wounds muſt bee dreſt but every fourth day. And if there bee a fracture of the bone joyned with the wound, then to moove nothing after the firſt dreſſing untill the eighth day after; then preſently in another place hee ſaith, it will bee good, and expedient, to drop ten or twelve droppes of the formerly deſcribed Balſame every day into the wound. Verily ſuch doctrine which neyther agrees with its ſelfe nor the truth, cannot but much puſle a Novice and young Practitioner in Chirurgery, who is not yet verſed in the Art, or the operations thereof.

Chap. XIIII.

Another Apologie, againſt thoſe who have laboured with new reaſons to proove, that wounds made by Gunſhot are poyſoned.

The occaſion of this Apologie.

SOme few monthes agone, I viſited a patient together with ſome learned Phyſitions and skillfull Chirurgions. Now they, as it oft times happens, in way of diſcourſe, begun to argue of the condition and quality of wounds made by Gunſhot, and endeavoured to proove that they might be poyſoned, by five reaſons. Not truly through the occaſion of the Gunpouder, for they all confeſſed that it was free from poyſon, whether you have regard to its eſſence, or to its compoſition; but by the Bullet, into which the poyſon may bee transfuſed and incorporated. The firſt reaſon is, that Lead ſeeing it is of a rare and ſpongious nature, which the eaſineſſe of melting and ſoftneſſe argues, is very fit to drinke and ſoake in what liquors ſo ever you pleaſe. But me thinkes this concluſion is very weake; for in all mixtures made by Art, ſuch as this is whereof wee ſpeake, there are two things to be conſidered; that is to ſay, the matter of the things which enter into the mixture, and the forme: for the matter, ſuch bodies muſt be eyther liquid, or ſoft or friable; and laſtly ſuch as may be broken and divided into ſmall particles, that ſo they may eaſily in all parts concurre and bee conjoyned and united. But for their forme, there ought to be a certaine affinitie, conſent and ſimpathy. You may perceive this by water and oyle; for each of them though of a liquid ſubſtance, and ſuch as may eaſily bee mixed with divers other things, yet cannot they bee mixed the one with the other by reaſon of their antipathy of formes. For thus gold and ſilver are ſo agreeing with Lead, that as oft as they are molten, Lead is mixed with them. But Braſſe ſhuns Lead as much as gold and ſilver fly Tinne and white Lead. If therefore Braſſe and Lead being melted cannot bee mixed together, though conteined under the ſame *Genus*, and common nature of Mettalls; how then can it be commixt with another thing diſtinct in the whole kinde, much more in *ſpecies*, and forme, to wit, poyſon? Their ſecond reaſon is this; Iron, ſay they, which is more denſe, ſolid, and leſſe porous, may receive ſome venenate ſubſtance and quality, as the Arrowes of the Ancients which were dipped in poyſon, teſtifie; therefore muſt Lead

The reaſons of our adverſaries that the Bullets may be poyſoned, ſet downe and confuted.

much more be capable thereof. I anſwer, that the ſurface of Iron may be poyſoned, but not the inner part or ſubſtance by mixture therewith. But heere the queſtion is of union, but not of annointing or inunction.

The third reaſon is thus framed; Though (ſay they) Lead caſts off and purges it ſelfe from the droſſe and unpure parts, yet that is no argument, that it will not commix, or ſoake its ſelfe in ſome ſtrange liquor or body; for thus Steele, being the moſt ſolid Iron, receives the temper which hardens it by the artificiall pouring upon it or quenching it in liquors contrary thereto in their whole kind. I anſwer, that Steele admits into it by that quenching and tempering, none of the juices or liquors wherewith it is watred or quenched. For if that were neceſſary, it might be better and more eaſily performed, when the mettall is firſt caſt, than when it is beaten into plates, or barres; which anſwer ſhall ſerve to confute their fourth reaſon; wherein they ſay, that bullets may be made ſo poyſonous by the commixture of the juices of Muncks-hood, Oleander, Crowe-foote, and other ſuch like things which in their whole ſubſtance are contrary to ours, that the wound which is made with them cannot but be poyſoned.

But I on the contrary affirme, that mixture is onely of theſe things, which may not onely be put, but alſo ſticke thereto, and be mutually united; but how can water, or any other liquid juice ſo much as onely ſticke to Lead, as that which is a ſolid and firme body, it is ſo farre from being united therewith? You may give more certaine judgement hereof by experience, than by reaſon; wherefore let melted Lead be put into the foreſaid juices or the like; then when the lead is cold, weigh each of them ſeverally, and you ſhall finde, that both of them reteine the ſame weight they formerly had. Which is a moſt certaine argument that neither the Lead hath mixed or united it ſelfe with the juices, nor the juices loſt any part of their ſubſtance.

Their fifth reaſon is thus; A Bullet ſhot out of a Gun againſt ſome hard ſtone, growes not ſo hot, but that you may preſently without any harme take it up in your hand. Therefore it is falſe, that the poyſon commixt and united with the Bullet can bee diſſipated by the fire and flaſh of Gunpouder. The anſwer to this objection is eaſily. For when wee ſay, that although the Bullet may bee infected by poyſon perfectly commixt with the Lead, yet all the force of the poyſon would bee diſſipated by the fire; wee would have you thus to underſtand us, that we doe not meane this of that fire which is made by the pouder at the diſcharging of the Peice, but of that by force whereof the molten head is mixed and conjoyned with the venenate juice, ſo to make one of many. For this fire exerciſing its force upon the venenate juices hindred by the intercourſe of no *Medium*, and that for ſome ſpace of time, and not for an inſtant, it may, if not conſume, yet much weaken their ſtrength.

If there be any, who will not bee ſatisfied by theſe reaſons, let him conſult, and reade *Matthiolus*. There are (ſaith hee) ſome of theſe latter times wholly ignorant of things, who (if wee may ſay the truth) have beene ſo madly fooliſh, that they ſaid it was fit and requiſite to put Treacle and Mithidate and ſuch like Antidotes amongſt Gold and Silver that was melted to make Cuppes, that ſo receiving the faculties of the Antidote they might reſiſt poyſon. But how abſurd and ridiculous their opinion is, let them judge (for it needs no clearer reproofe) who have but a little knowledge in naturall things, but chiefely in Mettalls.

In præfat. l. 6. Dioſcor.

Theſe are my reaſons, theſe the authorities of men excelling in learning and judgement, that confirme me in my ancient and former opinion, that wounds made by Gunſhot doe not partake of any venenate qualitie.

CHAP. XV.

How wounds made by Arrowes differ from ſuch as are made by Gunſhot.

Wounds made with Arrowes and ſuch like things, are often without contuſion. But are ofttimes poyſoned.

WOunds made by Arrowes and Bolts ſhot out of Croſſe-bowes and ſuch like things, differ chiefly in two things, from theſe which are made by Gunſhot. The firſt is, for that they are oft times without contuſion, which the other never are. The other is, for that they oft times are poyſoned. In both theſe reſpects, their cure is different from the other. But the cure of theſe wounds made by Arrowes is different in it ſelfe, by reaſon of the variety and divers ſorts of Darts or Arrowes.

CHAP. XVI.

Of the diverſities of Arrowes and Darts.

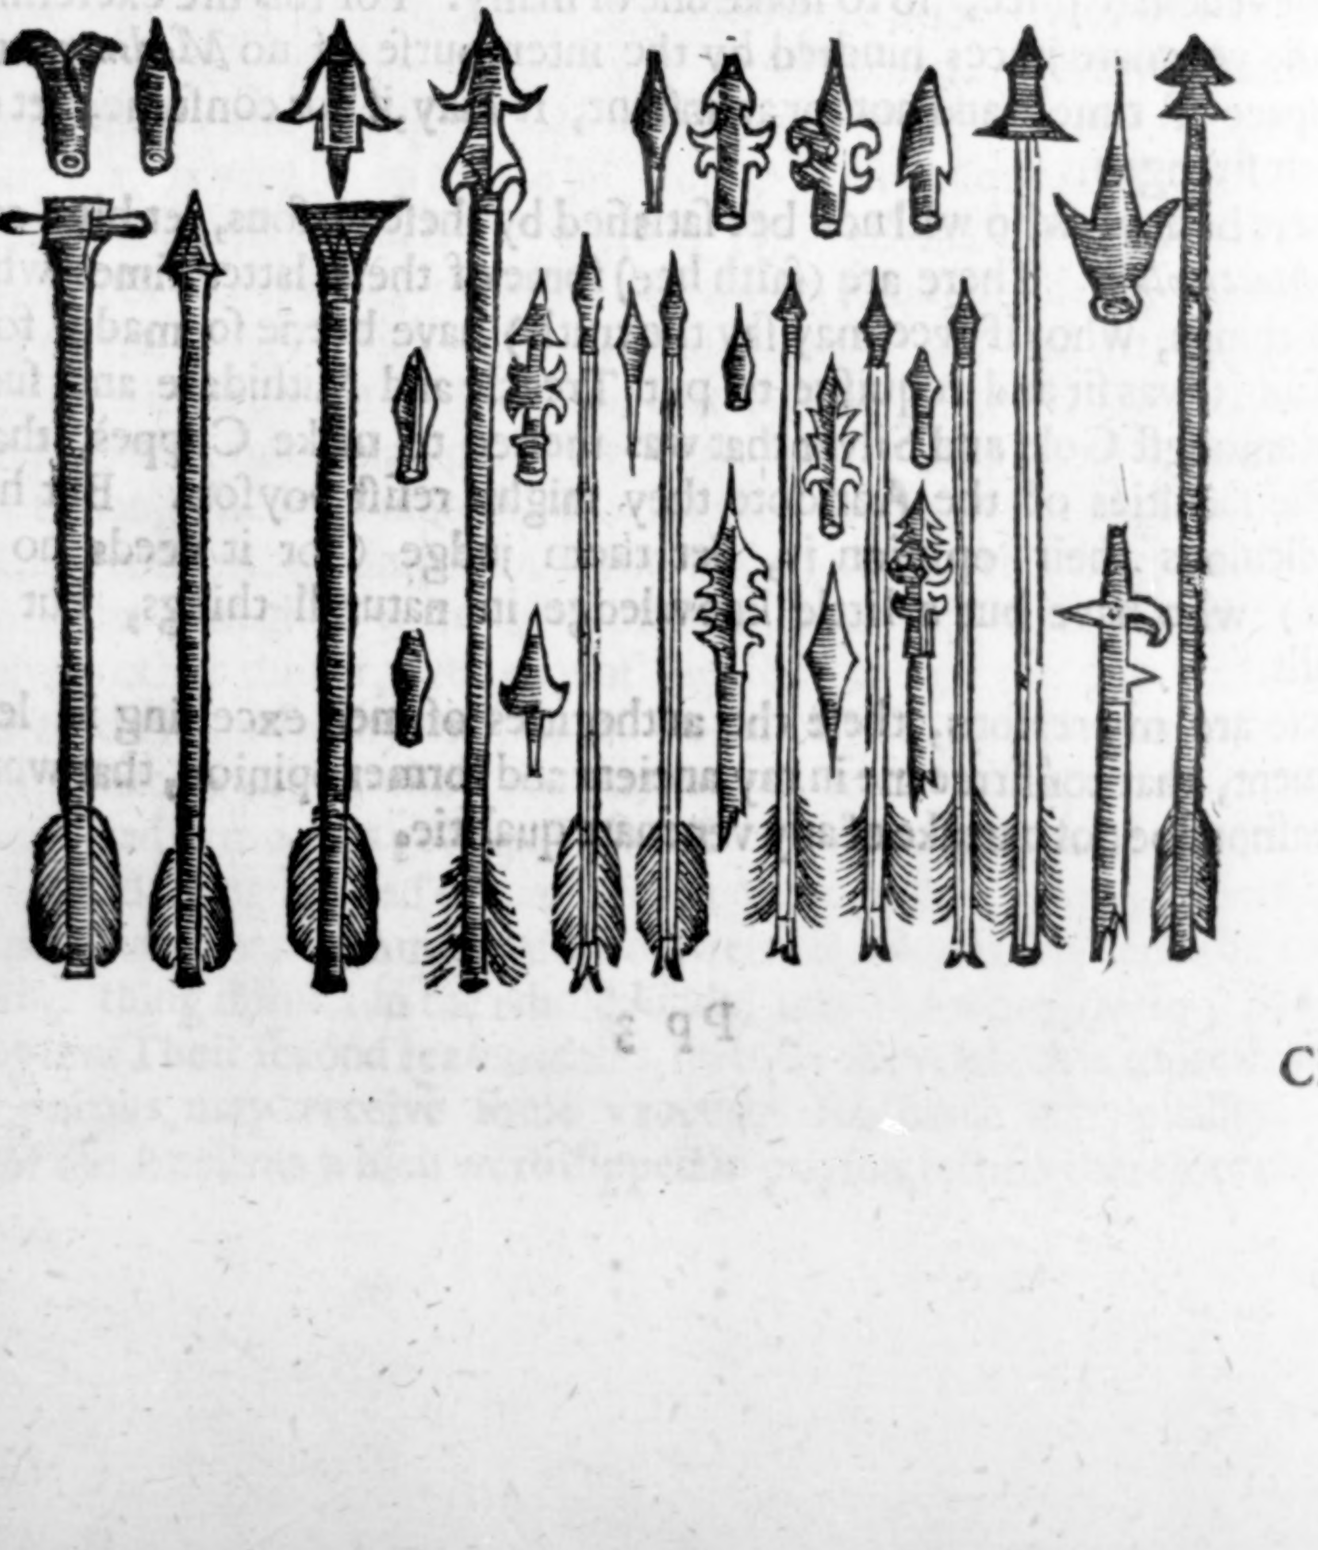
The differences of Arrowes. In matter. In ſigne.

ARrowes and Darts are different amongſt themſelves both in matter and in forme or figure, in number, making, facultie or ſtrength; In matter, for that ſome of them are of wood, ſome of Reeds, ſome are blunt headed, others have piles or heads of Iron, Braſſe, Lead, Tinne, Horne, Glaſſe, Bone. In figure, for that ſome are round, others cornered, ſome are ſharpe pointed, ſome barbed, with the barbs ſtanding either to the point, or ſhafts, or elſe acroſſe, or both wayes; but ſome are broad aad cut like a Chiſſell. For their bigneſſe, ſome are three foote long, ſome leſſe. For their number, they differ in that, becauſe ſome have one head, others more. But they varie in making, for that ſome of them have the ſhaft put into the head, others the head into the ſhaft; ſome have their heads nailed to the ſhaft, others not, but have their heads ſo looſely ſet on, that by gentle plucking the ſhaft, they leave their heads behind them, whence dangerous wounds proceede. But they differ in force, for that ſome hurt by their Iron onely, others beſides that, by poyſon, wherewith they are infected. You may ſee the other various ſhapes here repreſented to you in the following Figure.

In bignes. In number, In making.

In force.

The Figures of divers ſorts of Arrowes.



Chap. XVII.

Of the difference of the wounded parts.

THe Wounded parts are eyther fleſhy or bony; ſome are neare the joynts, others ſeated upon the very joynts; ſome are principall, others ſerve them; ſome are externall, others internall. Now in wounds where deadly ſignes appeare, its fit you give an abſolute judgement to that effect; leaſt you make the Art to be ſcandalled by the ignorant. But it is an inhumane part, and much digreſſing from Art, to leave the Iron in the wound; it is ſometimes difficult to take it out, yet a charitable and artificiall worke. For it is much better to try a doubtfull remedy, than none at all.

You muſt not leave the weapon in the wound.

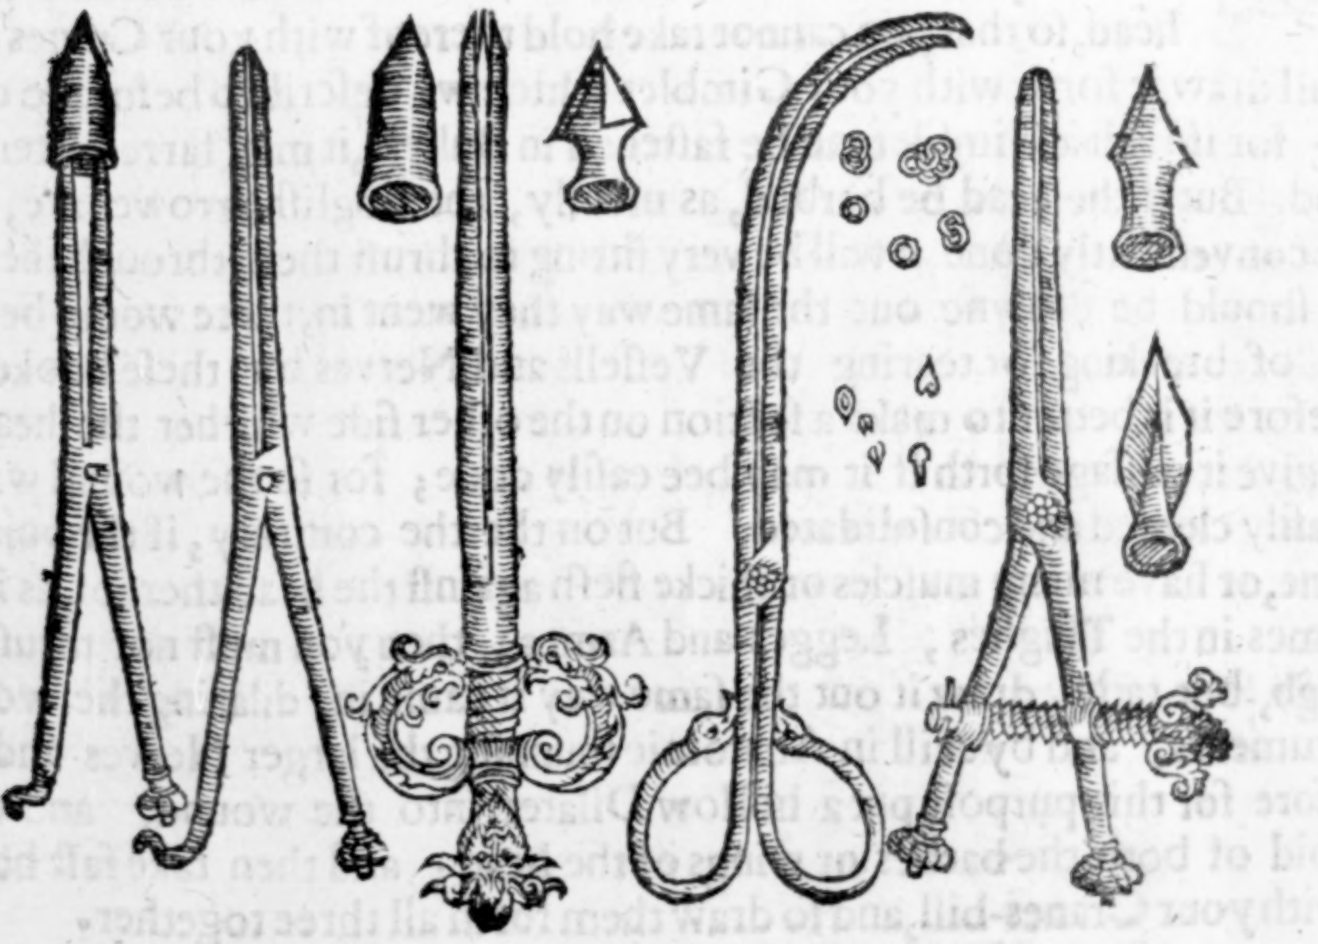
Chap. XVIII.

Of drawing forth Arrowes.

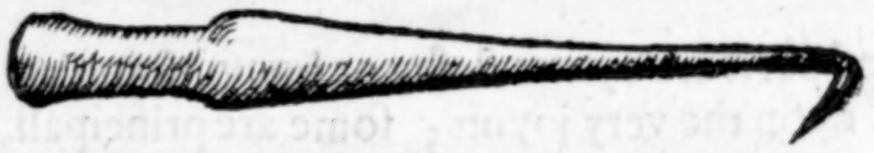
The manner of drawing forth Arrowes and ſuch weapons.

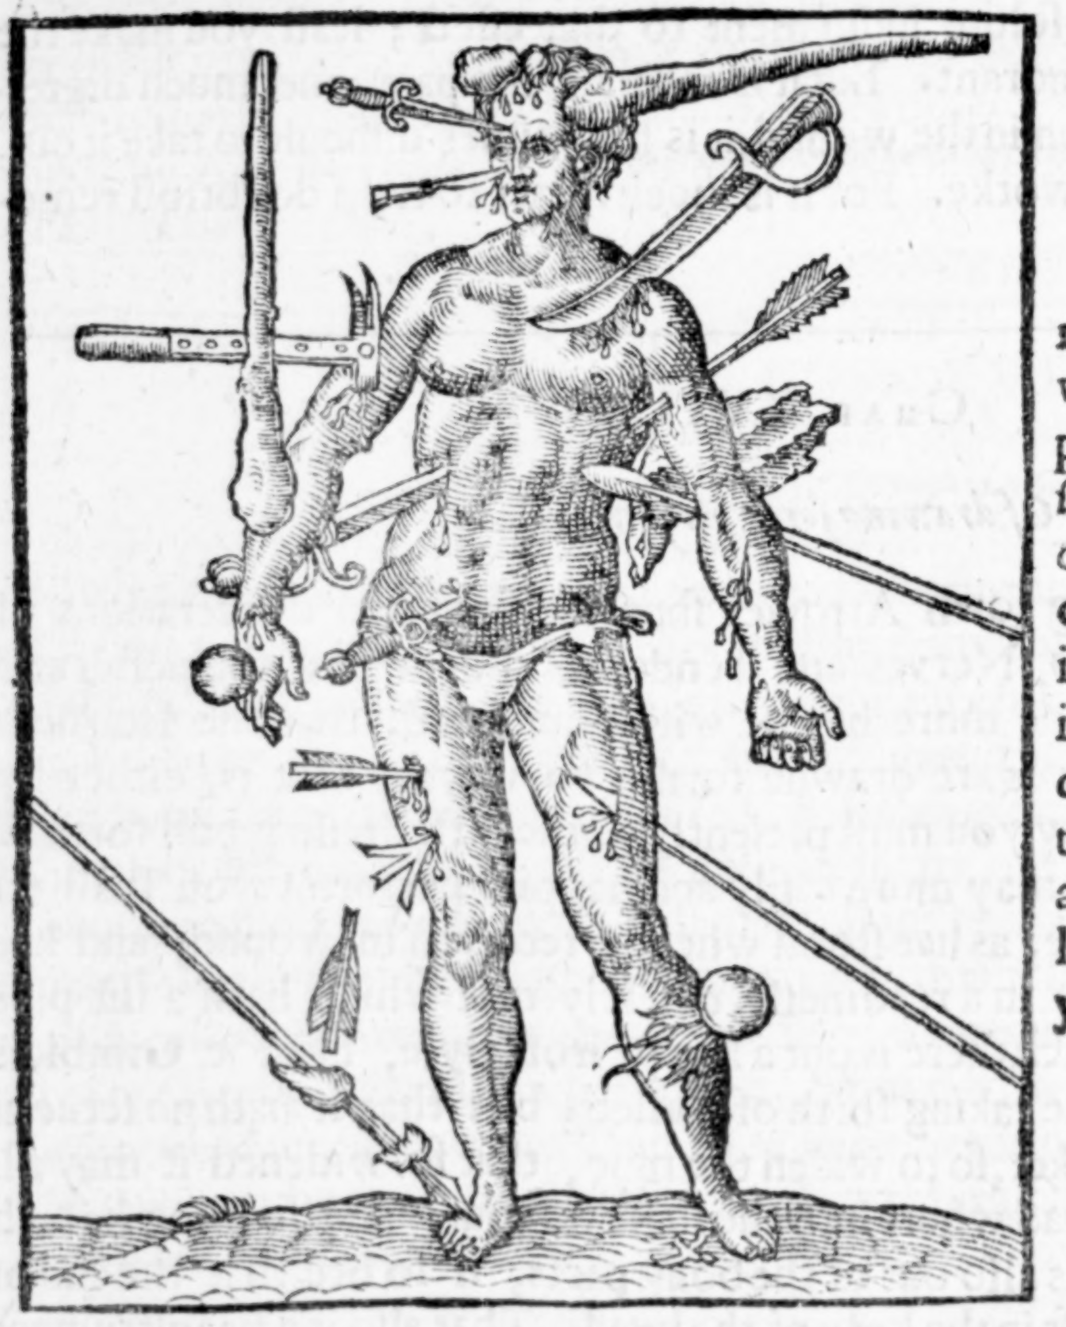
YOu muſt in drawing forth Arrowes ſhun inciſions and dilacerations of Veines and Atteries, Nerves and Tendons. For it is a ſhamefull and bungling part to doe more harme with your hand, than the Iron hath done. Now Arrowes are drawne forth two wayes, that is, either by extraction, or impulſion. Now you muſt preſently at the firſt dreſſing pull forth all ſtrange bodies, which that you may more eaſily and happily performe, you ſhall ſet the Patient in the ſame poſture, as hee ſtood when he received his wound; and hee muſt alſo have his Inſtruments in a readineſſe, chiefely that which hath a ſlit pipe and toothed without, into which there is put a ſharpe iron ſtyle, like the Gimblets we formerly mentioned for the taking forth of Bullets; but that it hath no ſcrue at the end, but is larger and thicker, ſo to widen the pipe, that ſo widened it may fill up the hole of the Arrowes head where into the ſhaft was put, and ſo bring it forth with it, both out of the fleſhy as alſo out of the bony parts, if ſo bee that the end of the ſhaft be not broken, and left in the hole of the head. That alſo is a fit Inſtrument for this purpoſe, which opens the other end toothed on the outſide, by preſſing together of the handle. You ſhall finde the Iron or head that lies hid by theſe ſignes, there will be a certaine roughneſſe and inequalitie obſervable on that part if you feele it up and downe with your hand; the fleſh there will be bruiſed, livid, or blacke, and there is heavineſſe and paine felt by the patient both there and in the wound.

A deliniation of Inſtruments fit to draw forth the heads of Arrowes and Darts, which are left in the wound without their ſhafts.



A hooked Inſtrument fit for to draw forth ſtrange bodies,as peices of Maile, and ſuch other things as it can catch hold of, which may alſo bee uſed in wounds made by Gunſhot.





But if by chance either Arrowes,Darts or Lances,or any winged head of any other weapon, bee run through and left ſticking in any part of the body,as the Thigh, with a portion of the ſhaft or ſtaffe ſlivered in peices,or broken off; then it is fit the Chirurgion with his cutting mullets ſhould cut off the end of the ſtaffe or ſhaft, and then with his other mullets plucke forth the head, as you may ſee by this Figure.

Chap. XIX.

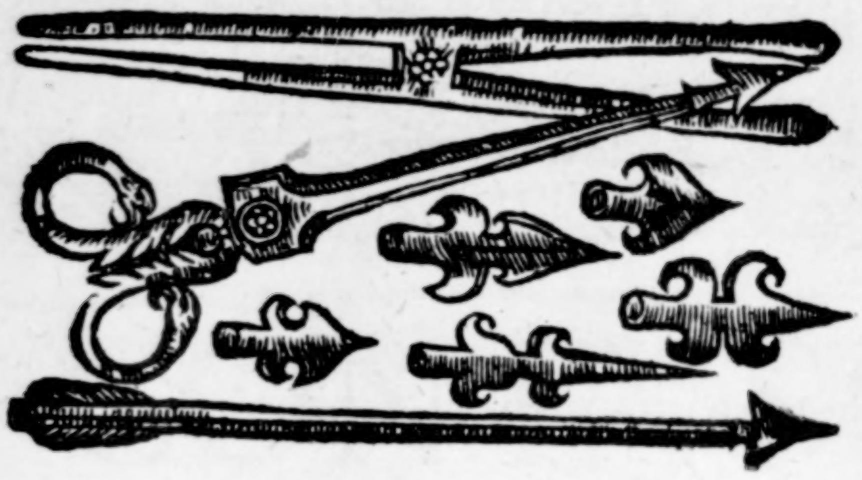
How Arrowes broken in a wound may be drawne forth.

When to draw forth the weapon on the contrary ſide.

But if it chance that the weapon is ſo broken in the wound, that it cannot bee taken hold on by the formerly mentioned Mullets, then muſt you draw,or plucke it out with your Crane,or Crowes bill,and other formerly deſcribed Inſtruments. But if the ſhaft be broken neare the head,ſo that you cannot take hold thereof with your Cranes bill, then you ſhall draw it forth with your Gimblet which we deſcribed before to draw forth bullets; for if ſuch a Gimblet can be faſtened in Bullets,it may farre better take hold of wood. But if the head be barbed, as uſually, the Engliſh arrowes are, then if it may be conveniently done,it will be very fitting to thruſt them through the parts. For if they ſhould be drawne out the ſame way they went in, there would bee no ſmall danger of breaking or tearing the Veſſells and Nerves by theſe hooked barbes. Wherefore it is better to make a ſection on the other ſide whither the head tended, and ſo give it paſſage forth if it may bee eaſily done; for ſo the wound will bee the more eaſily clenſed and conſolidated. But on the the contrary, if the point tend to any bone,or have many muſcles or thicke fleſh againſt the head thereof, as it happens ſometimes in the Thighes, Legges and Armes; then you muſt not thruſt the head thorough, but rather draw it out the ſame way it came in, dilating the wound with fit Inſtruments, and by ſkill in Anatomie ſhunning the larger Nerves and Veſſells. Therefore for this purpoſe put a hollow Dilater into the wound, and therewith take hold of both the barbes or wings of the head; and then take faſt hold of the head with your Cranes-bill,and ſo draw them forth all three together.

When by the ſame way it went in.

A Dilater hollowed on the inſide, with a Cranes-bill to take hold of the barbed head.



Chap. XX.

What to be done, when an Arrow is left faſtned or ſticking in a bone.

But if the weapon be ſo depact and faſtned in a bone that you cannot drive it forth on the other ſide, neither get it forth by any other way than that it entred in by; you muſt firſt gently moove it up and downe, if it ſticke very faſt in, but have a ſpeciall care that you doe not breake it, and ſo leave ſome fragment thereof in the bone; then take it forth with your Crowes bill, or ſome other fit Inſtrument formerly deſcribed. Then preſſe forth the blood, and ſuffer it to bleed ſomewhat largely, yet according to the ſtrength of the Patient and nature of the wounded part. For thus the part ſhall be eaſed of the fulneſſe and illneſſe of humors, and leſſe moleſted with inflammation, putrefaction and other ſymptomes which are cuſtomarily feared. When the weapon is drawne forth, and the wound once dreſſed, handle it, if ſimple, as you doe ſimple wounds; if compound, then according to the condition and manner of the complication of the effects; Certainly the Oyle of Whelpes formerly deſcribed is very good to aſſwage paine. To conclude, you ſhall cure the reſt of the Symptomes according to the method preſcribed in our Treatiſe of wounds in generall, and to that wee have formerly delivered concerning wounds made by Gunſhot.

A Caution.

The benefit of bleeding in wounds.

Chap. XXI.

Of poyſoned wounds.

If theſe wounds at any time proove poyſoned, they have it from their primitive cauſe, to wit, the empoiſoned Arrowes, or Darts of their enemies. You may finde it out both by the propertie of the paine; if that it bee great and pricking, as if continually ſtung with Bees, for ſuch paine uſually enſues in wounds poyſoned with hot poyſon, as Arrowes uſually are; Alſo you ſhall know it by the condition of the wounded fleſh; for it will become pale and grow livid, with ſome ſignes of mortification. To conclude, there happen many and maligne ſymptomes upon wounds which are empoyſoned, being ſuch as happen not in the common nature of uſuall wounds. Therefore preſently after you have plucked forth the ſtrange bodies, encompaſſe the wound with many and deepe ſcarrifications, apply ventoſes with much flame, that ſo the poyſon may bee more powerfully drawne forth; to which purpoſe the ſucking of the wound, performed by one whoſe mouth hath no ſoareneſſe therein, but is filled with oyle, that ſo the poyſon which he ſucks may not ſticke, nor adhere to the part, will much conduce. Laſtly, it muſt be drawne forth by rubefying, veſicatory and cauſtick medicines, and aſſailed by ointments, cataplaſmes, emplaſters, and all ſorts of locall medicines.

The ſignes of poyſoned wounds.

Remedies in poyſoned wounds.

The end of the Eleventh Booke.

OF CONTVSIONS AND GANGRENS.

THE TVVELFTH BOOKE.

CHAP. I.

Gal.Lib.de artis conſtitut.

Sect.2.lib.de fracturis.

Cauſes of Bruiſes and Sugillations.

Sect.2.lib. de fract.

A Contuſion, according to *Galen*, is a ſolution of Continuity in the fleſh or bone, cauſed by the ſtroake of ſome heavy and obtuſe thing, or a fall from an high. The ſymptome of this diſeaſe is by *Hippocrates* called *Pelioſis*, and *Melaſma*, that is to ſay, blackneſſe & blewneſſe; the Latins tearme it *Sugillatum*. There are divers ſorts of theſe Sugillations or blackneſſes, according as the blood is poured forth into the more inward or outward part of the body. The blood is poured forth into the body, when any (for example) falls from an high, or hath any heavy weight falls upon him, as it often happens to ſuch as worke in Mines, or are extreamely racked or tortured; and ſometimes by too loud and forcible exclamation. Beſides alſo by a Bullet ſhot through the body, blood is poured forth into the bellies, and ſo often evacuated by the paſſages of the Guts and bladder. The ſame may happen by the more violent and obtuſe blowes of a hard Trunchion, Club, Stone, and all things which may bruiſe and preſſe the blood out of the veſſells either by extending or breaking them. For which cauſes alſo the exteriour parts are contuſed, or bruiſed ſometimes with a wound, ſometimes without, ſo that the skinne being whole, and as farre as one can diſcerne, untoucht, the blood poures it ſelfe forth into the empty ſpaces of the muſcles, and betweene the skinne and muſcles; which affect the Ancients have tearmed *Ecchymoſis*; *Hippocrates* calls it by a peculiar name *Nauſioſis*, for that in this affect the ſwollne veines ſeeme as it were to vomit, and verily doe vomit or caſt forth the ſuperfluous blood which is conteined in them. From theſe differences of Contuſions are drawne the indications of curing, as ſhall appeare by the enſuing diſcourſe.

CHAP. II.

Of the generall cure of great and enormous Ccontuſions.

THe blood poured forth into the body, muſt bee evacuated by viſible and not viſible evacuation. The viſible evacuation may be performed by bloodletting, Cupping-glaſſes, hornes, ſcarification, horeſeleeches and fit purgative medicines; if ſo bee the patient have not a ſtrong and continuall feaver; The not viſible evacuation is performed by

reſol-

Ad ſentent.62. ſect.3.lib.de Articulis.

A potion to diſſolve and evacuate clotted blood.

A hot ſheeps skinne.

A diſcuſsing oyntment.

A ſudorificke potion to diſſolve congealed blood.

Surups hindering putrifaction and congealing of blood.

reſolving and ſudorificke potions, bath a ſlender diet. Concerning Blood-letting *Galens* opinion is plaine, where he bids, in a fall from an high place, and generally for bruiſes upon what part ſoever they be, to open a veine, though the parties affected are not of a full conſtitution; for that unleſſe you draw blood by opening a veine, there may inflammations ariſe from the concreate blood, from whence without doubt evill accidents may enſue. After you have drawne blood give him foure ounces of Oxycrate to drinke; for that by the tenuity of its ſubſtance hinders the coagulation of the blood in the belly, or in ſtead thereof you may uſe this following potion. ℞. *rad. Gentianæ* ʒiij; *bulliant in Oxycrato; in colatura diſſolve rhei electi* ʒj *fiat potio.* Theſe Medicines diſſolve, and caſt forth by ſpetting and vomite the congealed blood, if any thereof be conteined in the ventricle or lungs; it wil be expedient to wrap the patient preſently in a ſheepes skinne, being hot and newly taken from the ſheepe, and ſprinkled over with a little myrrhe, creſſes and ſalt, and ſo to put him preſently in his bed, and then cover him ſo that he may ſweat plentifully. The next day take away the ſheeps-skinne, and annoint the body with the following anodyne and reſolving unguent. ℞. *unguent. de althæa* ℥vj. *olei Lumbric. chamam. anethi. an* ℥ij. *terebinth. venetæ* ℥iiij. *farinæ fænugræ. roſar. rub. pulveriſat. pul. myrtillorum, an* ℥j. *fiat litus ut dictum eſt.* Then give this potion which is ſudorificke and diſſolves the congealed blood. ℞. *Ligni guaiaci* ℥viij. *radicis enulæ camp. conſolid. majoris, ireos Florent. polypod. querni, ſeminis coriandri, aniſi, an* ℥ß. *glycyrhiz.* ℥ij. *nepetæ, centaureæ, caryophyl. cardui ben. verbenæ, an, m. ſ. aquæ fontanæ lib.* xij. Let them bee all beaten and infuſed for the ſpace of twelve houres, then let them boyle over a gentle fire untill the one halfe bee conſumed; let the patient drinke ſome halfe pinte of this drinke in the morning, and then ſweate ſome houre upon it in his bed, and doe this for ſeaven or eight dayes. If any poore man light upon ſuch a miſchance, who for want of meanes cannot bee at ſuch coſt, it will be good, having wrapped him in a ſheete, to bury him up to the chin in Dung mixed with ſome hay or ſtraw, and there to keepe him, untill he have ſweat ſufficiently. I have done thus to many with very good ſucceſſe. You ſhall alſo give the patient potions made with ſyrups which have power to hinder the coagulation and putrefaction of the blood; ſuch as ſyrupe of Vinegar, or Lemons, of the juice of Citrons and ſuch others to the quantitie of an ounce diſſolved in ſcabious, or *Carduus* water. You may alſo preſently after the fall give this drinke, which hath power to hinder the coagulation of the blood, and ſtrengthen the bowells.

A drinke for the ſame purpoſe.

A pouder for the ſame.

The diſtelled water of greene Walnuts.

Baths.

Lib.3. de vict. acut. & lib.3. de morb.

℞. *Rhei elect. in pul. redacti* ʒj, *aquæ rubiæ majoris, & plantagin. an.* ℥j. *theriacæ* ʒß. *ſyrupi de roſis ſiccis,* ℥ß, *fiat potus.* Let him take it in the morning for foure or five dayes. In ſteed hereof you may make a potion of one dramme of *Sperma ceti* diſſolved in bugloſſe or ſome other of the waters formerly mentioned, and halfe an ounce of ſyrupe of Maiden-haire; if the diſeaſe yeeld not at all to theſe formerly preſcribed medicines, it will be good to give the patient for nine dayes, three or foure houres before meate ſome of the following powder. ℞. *rhei torrefacti, rad. rub. majoris, centaurei, gentianæ, ariſtolo. rotundæ, an.* ℥ß, give ʒj. heereof with ſyrupe of Venegar and *Carduus* water. They ſay that the water of greene Walnuts, diſtilled by an Alembicke, is good to diſſolve congealed and knotted blood. Alſo you may uſe bathes made of the decoction of the rootes or Orris, Elecampane, Sorrell, Fennell, Marſhmallowes, Water-ferne, or Oſmund the waterman, the greater Comfery; the ſeeds of Fænugreeke; the leaves of Sage, Marjerome; the floures of Camæmile, Melilote and the like. For a warme bath hath power to rarifie the skin, to diſſolved the clotted blood, by cutting the tough & mitigating the acride humors, by calling them forth into the ſurface of the body, and relaxing the paſſages thereof, ſo that the rebellious qualities being orecome, there enſues an eaſie evacuation of the matter by vomite, expectoration, if it flote in the ſtomacke, or be conteined in the cheſt; but by ſtoole & Vrine, if it lye in the lower parts; by ſweates and tranſpiration if it lye next under the skin. Wherefore bathes are good for thoſe who have a *Peripneumonia* or inflammation of their Lunges, or a Pleuriſie, according to the minde of *Hippocrates*, if ſo be that they be uſed, when the feaver begins to be aſſwaged; for ſo they mitigate paine, helpe forwards ſuppuration, and haſten the ſpitting up of the purulent matter. But we would not have the patient enter into the bath, unleſſe he have firſt uſed generall remedies, as blood-letting and purging; for otherwiſe there will be no ſmall danger, leaſt the humors diffuſed by the heate of the bath, cauſe a new defluxion into the parts affected. Wherefore doe not thou by any meanes attempt, to uſe this or the like remedy, having not firſt had the advice of a Phyſition.

CHAP. III.

How we muſt handle Contuſions, when they are joyned with a wound.

EVery great Contuſion forthwith requires blood-letting, or purging, or both; and theſe either for evacuation, or revulſion. For thus *Hippocrates* in a contuſion of the Heele, gives a vomitory potion, the ſame day, or elſe the next day after the heele is broken. And then if the Contuſion have a wound aſſociating it, the defluxion muſt be ſtayed at the beginning, with an oyntment made of Bole Armenicke, the whites of egges, and oyle of roſes, and myrtles, with the pouders of red roſes, Allome and maſtich. At the ſecond dreſſing apply a digeſtive made of the yoalke of an egge, oyle of violets and Turpentine. This following Cataplaſme ſhal be appyled to the neare parts to help forwards ſuppuration. ℞. *rad. althæ, & lilio. an.* ℥iiij *fol. malv. violar. ſenecionis, an. M.* ſſ *coquantur complete, & paſſentur per ſetaceum, addendo butyri recentis & olei viol. an.* ℥iij. *farinæ volatilis quant. ſufficit; fiat cataplaſma ad formam pultis liquidæ.* Yet have a care in uſing of Cataplaſmes, that you do not too much exceede; for too frequent and immoderate uſe of them makes wounds plegmonous, ſordide and putride. Wherefore the wound after it is come to ſuppuration muſt be cleanſed, filled with fleſh and cicatrized; unleſſe haply the contuſed fleſh ſhall be very much torne, ſo that the native heate forſake it, for then it muſt be cut away. But if there be any hope to agglutinate it, let it be ſowed, and other things performed according to Art; but the ſtitches muſt not be made ſo cloſe together, as when the wound is ſimple, and without contuſion; for ſuch wounds are eaſily inflamed and ſwell up, which would occaſion either the breaking of the thred or fleſh, or tearing of the ſkinne.

Sect. 2. lib. fract.

A ſuppurative Cataplaſme.

A caution to be obſerved.

How contuſed wounds muſt be ſowed

CHAP. IV.

Of theſe Contuſions which are without a wound.

IF the ſkinne being whole and not hurt, as farre as can be diſcerned, the fleſh which lyes under it be contuſed, and the blood poured forth under the ſkin make an *Ecchymoſis*, then the patient muſt be governed according to Art untill the maligne ſymptomes, which commonly happen, be no more to be feared. Wherfore in the beginning draw blood on the oppoſite ſide, both for evacuation and revulſion. The contuſed part ſhall be ſcarified with equall ſcarifications; then ſhall you apply cupping-glaſſes or hornes, both for evacuation of the blood which cauſes the tumor and Tenſion in the part; as alſo to ventilate and refrigerate the heate of the part, leaſt it turne into an Abſceſſe. Neither muſt we in the meane while omit gentle purging of the belly. The firſt topicke medicines ought to bee aſtrictives which muſt lye ſome ſhort while upon the part, that ſo the Veines, and Arteries may be as it were ſtraitned and cloſed up, and ſo the defluxion hindred; as alſo that the part it ſelfe may be ſtrengthened. This may be the forme of ſuch a remedy, ℞. *Albumina ovorum nu.* iij. *olei myrtini & roſacei, an.* ℥j. *boli armeni, & ſanguin. dracon. an.* ℥ß. *nucum cupreſſ. gallarum, pul. aluminis uſti, an.* ʒij. *incorporentur omnia addendo aceti parum, fiat medicamentum.* Then you ſhall reſolve it with a fomentation, Cataplaſme, and diſcuſſing emplaiſters.

Phlebotomie.

Scarifying. Cupping glaſſes.

Aſtrictives how good in Contuſions.

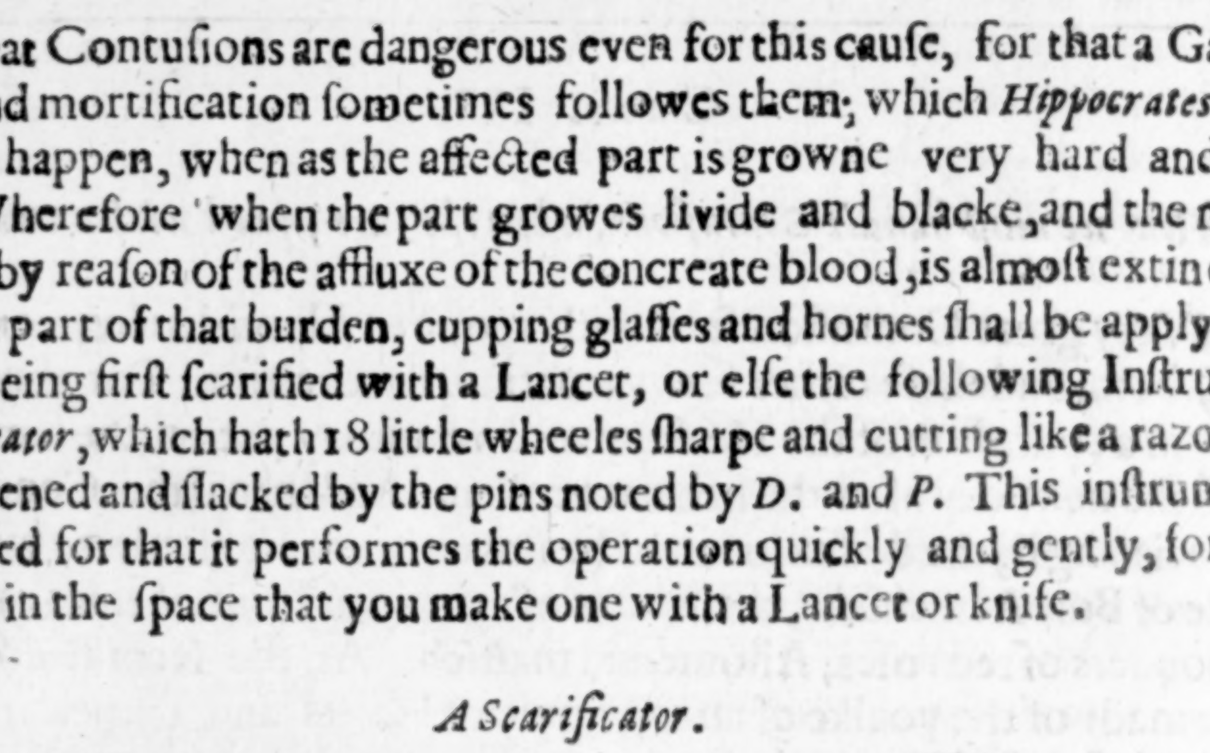
After aſtrictives muſt follow diſcuſſives.

Chap. V.

By what meanes the contuſed part may be freed from the feare and imminent danger of a Gangreene.

Sect. 2. lib. de fract. Great Contuſions are dangerous even for this cauſe, for that a Gangreene and mortification ſometimes followes them; which *Hippocrates* teacheth to happen, when as the affected part is growne very hard and liquide. *The cauſe of a Gangreene.* Wherefore when the part growes livide and blacke, and the native colour thereof, by reaſon of the affluxe of the concreate blood, is almoſt extinct; chiefely, to eaſe the part of that burden, cupping glaſſes and hornes ſhall be applyed to the part it ſelfe being firſt ſcarified with a Lancet, or elſe the following Inſtrument termed a *Scarificator*, *The uſe of a Scarificator.* which hath 18 little wheeles ſharpe and cutting like a razour, which may be ſtraitened and ſlacked by the pins noted by *D.* and *P.* This inſtrument is to be commended for that it performes the operation quickly and gently, for it makes 18 inciſiones in the ſpace that you make one with a Lancet or knife.

A Scarificator.



A. *Shewes the cover.* B. *The Boxe, or Caſe.*

Then ſhall yon foment the part with ſtrong Venegar wherein the roootes of radiſh or of Dragons, Cuckow-pint, *Salomons* Seale, *Auripigmentum* and the like have *A fomentation to diſcuſſe and draw to the skinne.* beene boyled; for ſuch acride things doe powerfully heat, reſolve and draw the concreate blood from the inner part of the body unto the skinne, which by its ſetling in the part affected, prohibits the entrance of the vitall ſpirits, the preſervers of its integrity; yea alſo extinguiſheth the native heate of the ſame part. Now wee muſt not uſe theſe things but with great diſcretion, leaſt ſo we draw not onely that blood which is poured forth of the veſſells, but alſo the other which is contained in the veſſels. Moreover alſo we muſt not uſe them, unleſſe when the defluxion is ſtayed. For ſmall contuſions (which *Galen* judgeth by the ſoftneſſe of the contuſed *In ſect. 2. lib. de fractur.* part) it will bee ſufficient to apply to diſcuſſe them, Virgins waxe diſſolved and mixed with Cummim ſeedes, Cloves, the roote of blacke Briony, (which hath a wonderfull faculty to diſcuſſe all blackeneſſes and ſugillations) for the ſame purpoſe, you may alſo apply wormewood bruſed and ſo warmed in a diſh and ſprinkled over with a little white wine. Alſo fry wormewood with oyle of cammomill, branne, the powder of Cloves, and Nutmegs, adding thereto a little *aqua vita*, then put it all in a linnen cloth and apply it hot to the part. The following emplaſter doth *A diſcuſſing plaiſter.* powerfully diſcuſſe congealed blood. ℞. *Picis nigræ* ℥ij. *Gum. Elemi.* ℥iß. *ſtyracis liquidæ & terebinth. com. an.* ℥ß. *pul. ſulphuris vivi.* ℥j. *Liquefiant ſimul, fiat Emplaſtrum*; and let be ſpred upon leather and ſo applyed.

Chap. VI.

Of that ſtrange kinde of ſymptome which happens upon contuſions of the ribbes.

The fleſh contuſed ſometimes by great violence becomes mucous and ſwolne, or puffed up like Veale, which the butchers blow up, the skinne remaining whole. This is ſeene and happens chiefely in that fleſh which is about the ribs; for this being bruiſed either by a blow, or fall, or renitencie, or any other ſuch like cauſe; if you preſſe it with your hand, a certaine windineſſe goeth out thereof with a ſmall whyzzing, which may be heard, and the print of your finges will remaine as in *œdema's*. Vnleſſe you quickely make fit proviſion againſt this ſymptome, there is gathered in that ſpace which the fleſh departing from the bones, leaves empty, a certaine purulent *ſanies*, which divers times foules and corrupts the ribs. It will be cured, if the mucous tumor be preſently preſſed, and ſtraightly bound with ligatures, yet ſo that you hinder not the breathing, when as the affect happens upon the ribs and parts of the Cheſt. Then apply to the part a plaiſter of *Oxycroceum* or *diachylon Ireatum* with the emplaiſter *de meliloto*; alſo diſcuſſing fomentaions ſhall be uſed.

Hip. ſect. 3. lib. de Art. ſent, 58. & 65.

Remedies for a mucous and flatulent tumor of the ribbes.

The cauſe.

The cauſe of ſuch a tumor is a certaine mucous flegme; ſeeing that nature is ſo weake that it cannot well digeſt the nouriſhment, and aſſimulate it to the part: but leaves ſomething as it were halfe concocted. No otherwiſe than the conjunctive coate of the eye is ſometime ſo lifted up and ſwolne by a ſtroake, that it ſtartes as it were out of the orbe of the eye, leaving ſuch filth or matter as wee ſee thoſe which are bleard eye to be troubled withall; becauſe the force and naturall ſtrength of the eyes is become more weake, either by the fault of the proper diſtemperature, or the aboundance of moyſture which flowes thither, as it happens in thoſe tumors which are againſt nature. For flatulencies are eaſily rayſed from a watriſh and flegmatique humors wrought upon by weake heate, which mixed with the reſt of the humor, the tumor becomes higher.

Chap. VII.

A diſcourſe of Mumia, *or Mummie.*

Peradventure it may ſeeme ſtrange what may be the cauſe, why in this Treatiſe of curing contuſions, or bruiſes, I have made no mention of giving Mummie either in bole, or potion to ſuch as have falne from high places, or have beene otherwiſe bruiſed, eſpecially ſeeing it is ſo common and uſuall, yea the very firſt and laſt medicine of almoſt all our practitioners at this day in ſuch a caſe. But ſeeing I underſtood, and had learnt from learned Phyſitions, that in uſing remedies, the indication muſt alwaies be taken from that which is contrary to the diſeaſe, how could I? how can any other give Mummie in this kinde of diſeaſe, ſeeing we cannot as yet know what Mummie is, or what is the nature and eſſence thereof? So that it cannot certainely be judged, whether it have a certaine property contrary to the nature and effects of contuſions. This how it may have, I have thought good to relate ſomewhat at large; neither doe the Phyſitions who preſcribe Mummie, nor the Authours that have written of it, nor the Apothecaries that ſell it, know any certainty thereof. For if you reade the more ancient, *Serapio*, and *Avicen*, or the moderne *Matthiolus* and *Thevet*, you ſhall finde quite different opinions. Aske the Merchants who bring it to us, aske the Apothecaries who buy it of them, to ſell it to us, and you ſhall heare them ſpeake diverſly heereof, that in ſuch variety of opinions, there is nothing certaine and manifeſt. *Serapio* and *Avicen* have judged Mummie to bee nothing elſe but *Piſſaſphalthum*; now *Piſſaſphaltum* is a certaine froth or foame riſing from the Sea, or Sea waters; this ſame foame as long as it ſwimmes upon the water is ſoft and in ſome ſort

Mummie a frequent and uſuall medicine in contuſions.

The reaſon that the Author makes no mention thereof amongſt his medicines.

The opinion of the *Arabians* concerning it.

liquid: but being driven upon the ſhore by force of tempeſt, and working of the ſea, and ſticking in the cavityes of the rockes; it concreates into ſomewhat a harder ſubſtance than dryed pitch, as *Dioſcorides* ſaith. *Belonius* ſaith, that Mummie is onely knowne to *Ægypt* and *Greece*. Others write that it is mans fleſh, taken from the carcaſes of ſuch as are dead, and covered over in the ſandes in the deſartes of *Arabia*; in which Countrey they ſay the ſands are ſometimes carried and rayſed up with ſuch force and violence of the windes, that they overthrow and ſuffocate ſuch paſſingers as they meete withall; the fleſh of theſe dryed by the ſand and winde they affirme to be Mummy.

Lib.4,cap.84.

Another opinion of Mummie.

Another.

Mathiolus following the more uſuall and common opinion, writes that Mummie is nothing elſe than a liquor flowing from the Aromaticke embalments of dead bodyes, which becomes dry and hard. For underſtanding whereof you muſt know from all manner of antiquity, that the Egyptians have beene moſt ſtudious in burying and embalming their dead; not for that end that they ſhould become medicines for ſuch as live, for they did not ſo much as reſpect or imagine ſo horride a wickedneſſe. But either for that they held an opinion of the generall reſurrection, or that in theſe monuments they might have ſomething, whereby they might keepe their dead friends in perpetuall remembrance.

Thevet not much diſſenting from his owne opinion, writes that the true Mummie is taken from the monuments and ſtony tombes of the anciently dead in Egypt, the chinkes of which tombes were cloſed, and cimented with ſuch diligence; but the encloſed bodyes embalmed with precious ſpices with ſuch art for eternity, that the linnen veſtures which were wrapt about thē preſently after their death, may be ſeene whole even to this day; but the bodies themſelves, are ſo freſh that you would judge them ſcarce to have been three dayes buryed. And yet in thoſe Sepulchers and Vaultes from whence theſe bodyes are taken, there have beene ſome corpes of two thouſand yeeres old. The ſame, or their broken members are brought to Venice from Syria and Egypt, and thence diſperſt over all Chriſtendom. But according to the different condition of men, the matter of their embalments were divers; for the bodyes of the Nobility or Gentry are embalmed with Myrrhe, Aloes, Saffron, and other precious ſpices, and Drugs; but the bodyes of the common ſort whoſe poverty and want of meanes could not undergoe ſuch coſt, were embalmed with *aſphaltum* or *piſſaſphaltum*.

What our Mummie uſually is.

Now *Mathiolus* ſaith that all the Mummie which is brought into theſe parts is of this laſt kinde and condition. For the Noble men and cheefs of the province ſo religiouſly addicted to the monuments of their anceſtors, would never ſuffer the bodyes of their friends, and kindred to be tranſported hither for filthy gaine, and ſuch deteſted uſe, as we ſhall ſhew more at large at the end of this worke.

Which thing ſometimes mooved certaine of our French Apothecaries, men wonderous audacious, and covetous, to ſteale by night the bodyes of ſuch as were hanged, and embalming them with ſalt and Drugges they dryed them in an Oven, ſo to ſell them thus adulterated in ſteed of true Mummie. Wherefore wee are thus compelled both fooliſhly and cruelly to devoure the mangled and putride particles of the carcaſſes of the baſeſt people of Egypt, or of ſuch as are hanged, as though there were no other way to helpe or recover one bruiſed with a fall from a high place, than to bury man by an horrid inſertion in their, that is, in mans guts. Now if this Drugge were any way powerfull for that they require, they might perhaps have ſome pretence, for this their more than barbarous inhumanity.

Mummie is no way good for contuſions,

But the caſe ſtands thus, that this wicked kinde of Drugge, doth nothing helpe the diſeaſed, in that caſe, wherefore and wherein it is adminiſtred, as I have tryed an hundred times, and as *Thevet* witneſſes, he tryed in himſelfe, when as hee tooke ſome thereof by the advice of a certaine Iewiſh Phyſition in Egypt, from whence it is brought; but it alſo inferres many troubleſome ſymptomes, as the paine of the heart or ſtomacke, vomiting and ſtinke of the mouth.

But hurtfull, and how?

I perſwaded by theſe reaſons, doe not onely my ſelfe preſcribe any hereof to my patients, but alſo in conſultations, endeavour what I may, that it bee not preſcribed by others. It is farre better according to *Galens* opinion *in Method. med.* to drinke ſome oxycrate, which by its frigidity reſtraines the flowing blood, and by its tenuity of ſubſtance diſſolves and diſcuſſes the congealed clotts thereof. Many reaſons of learned Phyſitions (from whom I have learned this hiſtory of Mummie) drawne from Philoſophy, whereby they make it apparant, that there can be no uſe of this or that Mummie in contuſions, or againſt flowing or congealed blood, I willingly omit, for that I thinke it not much beneficiall to Chirurgions to inſert them heere. Wherefore I judge it better to beginne to treate of Combuſtions, or Burnes.

The effects of oxycrate in Contuſions.

Chap. VIII.

Of Combuſtions and their differences.

ALL Combuſtions whether occaſioned by Gun-powder, or by ſcalding oyle, water, ſome mettall or what things ſoever elſe, differ onely in magnitude. Theſe firſt cauſe paine in the part, and imprint in it an unnaturall heate. Which ſavouring of the fire, leaves that impreſſion, which the Greekes call *Empyreuma*. There are more or leſſe ſignes of this impreſſion, according to the efficacie of the thing burning, the condition of the part burned, and ſtay upon the ſame. If the Combuſtion be ſuperficiary, the skin riſes into puſtles and bliſters, unleſſe it be ſpeedily prevented. If it be low or deepe in, it is covered with an *Eſchar* or cruſt, the burnt fleſh by the force of the fire turning into that cruſty hardneſſe. The burning force of the fire, upon whatſoever part it falls, leaves a hot diſtemper therein, condenſates, contracts, and thickens the skinne, whence paine proceedes; from paine there comes an attraction of humors, from the adjacent and remote parts. Theſe humors preſently turned into watriſh or ſerous moyſture, whileſt they ſeeke to paſſe forth, and are hindred thereof by the skinne condenſated by the action of the fire, they lift it up higher, and rayſe the bliſters which we ſee. Hence diverſe Indications are drawne, whence proceedes the variety of medicines for burnes. For ſome take away the *Empyreuma*, that is, the heate of the fire (as we terme it) and aſſwage the paine; other hinder the riſing of bliſters; otherſome are fit, to cure the ulcer, firſt to procure the falling away of the *Eſchar*, then to clenſe, generate fleſh and cicatrize it. Remedyes fit to aſſwage paine, and take away the fiery heate, are of two kindes; for ſome doe it by a cooling faculty, by which they extinguiſh the preternaturall heate, and repreſſe or keepe backe the blood and humors, which flow into the parts by reaſon of heat & paine. Others endued with contrary faculties, are hot and attractive; as which by relaxing the skin, and opening the pores, reſolve and diſſipate the ſerous humors, which yeeld both beginning, and matter to the puſtles, and ſo by accident aſſwage the paine and heat. Refrigerating things, are cold water, the water of Plantaine, Night-ſhade, Henbane, Hemlocke; the juyces of cooling hearbes, as Purſelaine, Lettuce, Plantaine, Houſleeke, Poppye, Mandrake and the like. Of theſe ſome may be compounded, as ſome of the fore-named juyces beaten with the white of an egge; Clay beaten and diſſolved in ſtrong Venegar; roch Alome diſſolved in water, with the whites of egges beaten therein; writing inke mixed with Venegar and a little Camphire; *Vnguentum nutritum*, and alſo *Populeon* newly made. Theſe and the like ſhall be now and then renewed chiefely at the firſt, untill the heate and paine be gone. But theſe ſame remedyes muſt be applyed warme, for if they ſhould be layd, or put to cold, they would cauſe paine, and conſequently defluxion; beſides alſo their ſtrength could not paſſe, or enter into the part, or be brought into action; but ſo applyed they aſſwage paine, hinder inflammation and the riſing of bliſters.

The reaſon and ſyptomes of Combuſtions.

The cauſe of the bliſters riſing upon burnes.

Variety of medicines to take away the heate and aſſwage the paine.

CHAP. IX.

Of hot and attractive medicines to be applyed to burnes.

How fire may aſſwage the paine of burning.

Beaten Onions good for burns and how.

Lib. 5. ſimpl.

How often in a day theſe muſt be dreſſed.

Medicines for an *Eſchar*.

AMongſt the hot and attractive things which by rarifying, drawing out, and diſſolving, aſſwage the paine and heate of combuſtions, the fire challenges the firſt place, eſpecially when the burning is but ſmall. For the very common people know and finde by dayly experience, that the heate of the lightly burnt part vaniſhes away, and the paine is aſſwaged, if they hold the part which is burnt ſome prety while to the heate of a lighted candle, or burning coales; for the ſimilitude cauſeth attraction. Thus the externall fire whileſt it drawes forth the fire which is internall and inuſt into the part, is a remedy againſt the diſeaſe it cauſed and bred. It is alſo an eaſily made and approved remedie, if they preſently after the burne apply to the grieved part raw Onions beaten with ſome ſalt. Now you muſt note, that this medicine takes no place, if it be once gone into an ulcer, for it would increaſe the paine and inflammation; but if it bee applyed when the skinne is yet whole and not excoriated, it doth no ſuch thing, but hinders the riſing of puſtles and bliſters. ***Hippocrates*** for this cauſe alſo uſes this kind of remedy in procuring the fall of the *Eſchar*. If any endevour to gaineſay the uſe of this remedy by that principle in Phyſicke, which ſayes, that contraries are cured by contraries, and therefore affirme that Onions according to the authority of *Galen*, being hot in the fourth degree, are not good for combuſtions; let him know that Onions are indeed potentially hot, and actually moyſt, therefore they rarifie by their hot quality, and ſoften the skinne by their actuall moyſture, whereby it comes to paſſe that they attract, draw forth, and diſſipate the imprinted heate, and ſo hinder the breaking forth of puſtles; To conclude, the fire as we formerly noted, is a remedy againſt the fire. But neither are diſeaſes alwayes healed by their contraryes (ſaith *Galen*) but ſometimes by their like; although all healing proceede from the contrary, this word *contrary*, being more largely and ſtricktly taken; for ſo alſo a Phlegmon is often cured by reſolving medicines, which healeth it by diſſipating the matter thereof. Therefore Onions are very profitable for the burnt parts, which are not yet exulcerated or excoriated. But there are alſo many other medicines good to hinder the riſing of bliſters; ſuch is new horſe-dung fryed in oyle of wall-nuts or Roſes, and applied to the parts. In like manner the leaves of Elder or Dane-wort boyled in oyle of nuts, and beaten with a little ſalt. Alſo quinched lime poudered and mixed with *Vnguentum Roſatum*. Or elſe the leaves of Cuckow-pint and Sage beaten together with a little ſalt. Alſo Carpenters Glue diſſolved in water and anoynted upon the part with a feather, is good for the ſame purpoſe. Alſo thicke Verniſh which polliſhers or ſword cutlers uſe, But if the paine be more vehement, theſe medicines muſt be renewed 3 or 4 times in a day and a night, ſo to mittigate the bitternes of this paine. But if ſo be we cannot by theſe remedyes hinder the riſing of bliſters, then we muſt preſently cut them as ſoone as they riſe, for that the humor contayned in them, not having paſſage forth, acquires ſuch acrimonie that it eates the fleſh which lyeth under it, & ſo cauſeth hollow ulcers: So by the multitude of cauſes & increaſe of matter the inflamation groweth greater, not only for nine daies (as the common people prattle) but for farre longer time; alſo ſome whiles for leſſe time, if the body be neither repleat with ill humors, nor plethoricke, and you have ſpeedily reſiſted the paine and heate by fit remedyes. When the combuſtion ſhall be ſo great as to cauſe an *Eſchar*, the falling away muſt be procured by the uſe of emollient and humective medicins, as of greaſes, oyles, butter, with a little *baſilicon*, or the following oyntment.

A deſcription of *Nutritum*.

℞. *Mucagin. pſillij. & cydon. an.* ℥iiij. *gummi, trag.* ℥ij. *extrahantur cum aqua parietariæ, olei lilliorum* ℥iiß. *ceræ novæ q. ſ. fiat unguentum molle.* For ulcers and excoriations you ſhall apply fit remedies, which are thoſe that are without acrimony, ſuch as *unguentum album camphoratum, deſiccativum rubrum, unguentum roſatum*, made without Venegar, or *nutritum* compoſed after this manner. ℞. *lithargyri auri* ℥iiij.

ol. roſat. ℥iij. *ol. de papaver.* ℥iiß. *ung. populeon.* ℥iiij. *camphoræ* ʒj. *fiat unguentum in mortario plumbeo ſecundum artem.* Or oyle of Egges tempered in a Leaden mortar. Alſo unquenched lime many times waſhed and mixed with *unguentum roſatum*, or freſh butter without ſalt, and ſome yolkes of egges hard roaſted. Or. ℞. *Butyri recent. ſine ſale, uſtulati, & colati* ℥vj. *vitell. ovor.* iiij. *ceruſ. lotæ in aqua plantag. vel roſar.* ℥ß. *tutkiæ ſimiliter lotæ*, ʒiij. *plumbi uſti, & loti*, ʒij. *Miſceantur omnia ſimul, fiat linimentum ut decet.* Or elſe, ℞. *cort. ſambuc. viridis, & olei roſat. an. lib.* j. *bulliant ſimul lento igne, poſtea colentur, & adde olei ovorum* ℥iiij. *pul. ceruſſ. & tuthiæ præpar. an.* ℥j. *ceræ albæ quantum ſufficit, fiat unguent. molle ſecundum artem.* But the quantity of drying medicines may alwayes be encreaſed or diminiſhed according as the condition of the ulcer ſhall ſeeme to require. The following remedies, are fit to aſſwage paine, as the mucilages of Line ſeedes, of the ſeedes of *Pſilium*, or Flea-wort, and quinces extracted in roſewater, or faire water, with the addition of a little camphire; and leaſt that it dry too ſpeedily, adde thereto ſome oyle of Roſes. Alſo five or ſixe yoalkes of egges mixed with the mucilages of Line ſeede, the ſeede of *Pſilium*, and quinces often renewed, are very powerfull to aſſwage paine. The women which attend upon the people in the Hoſpitall in *Paris*, doe happily uſe this medicine againſt burnes. ℞. *Lard. conſciſi libram unam*; let it be diſſolved in Roſewater, then ſtrained through a linnen cloath, then waſh it foure times with the water of hen-bane or ſome other of that kinde, then let it be incorporated with eight yolkes of new layd egges, and ſo make an oyntment. If the ſmart be great, as uſually it is in theſe kindes of wounds, the ulcer or ſores ſhall be covered over with a peice of Tiffany, leaſt you hurt them, by wiping them with ſomewhat a courſe cloath, and ſo alſo the matter may eaſily come forth, and the medicines eaſily enter in. Alſo you muſt have a care when the eyelids, lippes, ſides of the fingers, necke, the armepits, hammes, and bending of the elbow are burnt, that you ſuffer not the parts to touch one the other, without the interpoſition of ſome thing; otherwiſe in continuance of time they would grow and ſticke together. Therefore you ſhall provide for this, by fit placing the parts, and putting ſoft linnen ragges betweene them. But you muſt note, that deepe combuſtions, and ſuch as cauſe a thicker *Eſchar*, are leſſe painefull, than ſuch as are but onely ſuperficiary. The truth hereof you may perceive by the example of ſuch as have their limbes cut of, and ſeared or cauteriſed with an hot Iron; for preſently after the cauteriſing is performed they feele little paine. For this great combuſtion takes away the ſenſe, the vehemencie of the ſenſory or thing affecting the ſenſe, depriving the ſenſitive parts of their ſenſe; As wee have formerly noted when we treated of wounds and paines of the Nerves. The falling away of ſuch *Eſchars* ſhall be procured by ſomewhat a deepe ſcarification which may pierce even to the quicke, that ſo the humors which lye under it may enjoy freer perſpiration, and emollient medicines may the freelier enter in, ſo to ſoake, moyſten and ſoften the *Eſchar* that it may at length fall away. The reſt of the cure ſhall be performed by detergent and ſarcoticke medicines, adding to the former oyntments mettalline pouders, when the preſent neceſſitie ſhall ſeeme ſo to requre. But wee cannot juſtly ſay in what proportion and quantity each of theſe may be mixed, by reaſon of that variety which is in the temper and conſiſtence of bodyes, and the ſtubborneſſe and gentleneſſe of diſeaſes. After a burne the ſcarre which remaineth is commonly rough, unequall, and ill favoured: therefore wee will tell you in our treatiſe of the plague how it muſt be ſmoothed, and made even.

A remedy for burnes commonly uſed in the Hoſpitall of *Paris*.

Why deepe combuſtions are leſſe painefull than ſuperficiarie.

I muſt not here omit to tell you, that Gunpowder ſet on fire doth often ſo penetrate into the fleſh, not ulcerating nor taking off the ſkinne, and ſo inſinuate and throughly faſten it ſelfe into the fleſh by its tenuity, that it cannot be taken or drawne out thence by any remedyes, no not by *Phœnigmes* nor veſicatoryes, nor ſcarification, nor ventoſes, nor hornes, ſo that the prints thereof alwayes remaine, no otherwiſe than the markes which the Barbarians burne in their ſlaves which cannot afterwards be taken away or deſtroyed by any Art.

Markes or ſpots made in the face by cornes of Gunpowder cannot be taken away.

Chap. X.

Of a Gangreene and Mortification.

CErtainely the maligne ſymptomes which happen upon wounds, and the ſolutions of Continuity are many, cauſed either by the ignorance or negligence of the Chirurgion; or by the Patient, or ſuch as are about him; or by the malignity and violence of the diſeaſe: but there can happen no greater than a Gangreene, as that which may cauſe the mortification and death of the part, and oft times of the whole body; wherefore I have thought good in this place to treate of a Gangreene, firſt giving you the definition, then ſhewing you the cauſes, ſignes, prognoſtickes, & laſtly the manner of cure. Now a Gangreene is a certaine diſpoſition, and way to the mortification of the part, which it ſeaſeth upon, dying by little and little. For when there is a perfect mortification, it is called by the Greekes *Sphacelos*, by the Latines *Syderatio*, our countrymen terme it the fire of Saint *Anthony* or Saint *Marcellus*.

Gal. 2. ad Glauconem.

Chap. XI.

Of the generall and particular cauſes of a Gangreene.

The generall cauſe of a Gangreene.

THe moſt generall cauſe of a Gangreene is, when by the diſſolution of the harmony and joynt temper of the foure firſt qualities, the part is made unapt to receive the faculties, the Naturall, Vitall, and Animall ſpirits, by which it is nouriſhed, lives, feeles, and mooves. For a part deprived by any chance of theſe, as of the light, languiſhes and preſently dyes. Now the particular cauſes are many; and theſe either primitive, or antecedent. The primitive or externall are combuſtions, cauſed by things either actually or potentially burning; actually as by fire, ſcalding oyle or water, gunpowder fired and the like. But potentially by acride medicines; as Sublimate, vitrioll, potentiall cauteries and other things of the ſame nature: for all theſe cauſe a great inflammation in the part. But the ambient ayre may cauſe great refrigerations, and alſo a Gangreene, which cauſed *Hippocrates lib. de Aer.* to call great refrigerations of the braine *Sphaceliſme*. Therefore the unadviſed and unfit application of cold and narcoticke things, a fracture, luxation and great contuſion, too ſtrait bandages, the biting of beaſts, eſpecially of ſuch as are venemous; a puncture of the Nerves and Tendons, the wounds of the nervous parts and joynts, eſpecially in bodyes which are plethorike and repleate with ill humors, great wounds whereby the veſſels which carry life are much cut, whence an *aneuriſma*, and laſtly many other cauſes, which perturbe that harmony of the foure prime qualities which we formerly mentioned, and ſo inferre a Gangreene.

The perticular cauſes.

Cold cauſeth a Gangreene.

Chap. XII.

Of the Antecedent cauſes of a Gangreene.

How defluxions cauſe a Gangreene.

NOw the antecedent or internall and corporeall cauſes of a Gangreene, are plentifull and abundant defluxions of humors hot or cold, falling into any part. For ſeeing the faculty of the part is unapt and unable to ſuſtaine and governe ſuch plenty of humors, it comes to paſſe that the native heate of the part is ſuffocated and extinct for want of tranſpiration. For the Arteries are hereby ſo ſhut or pent up in a ſtrait, that they cannot performe their motions of contraction and dilatation, by which their native heate is preſerved and tempered. But then the Gangreene is chiefely uncureable when the influxe of humors

An uncureable Gangreene.

Lib. de tumor. præter natur.

Aph. 5. ſect. 6.

mours firſt takes hold of the bones, and inflammation hath its beginning from them. For in the opinion of **Galen**; all theſe kind of affects which may befall the fleſh, are alſo incident to the bones. Neyther onely a Phlegmon or inflammation, but alſo a rottenneſſe and corruption doth oft times firſt invade and beginne at the bones; for thus you may ſee many who are troubled with the Leproſie and French diſeaſe, to have their skinne and fleſh whole and faire to looke on, whoſe bones notwithſtanding are corrupt and rotten, and oft times are much decayed in their proper ſubſtance. This miſchiefe is cauſed by a venemous matter, whoſe occult quality wee can ſcarſe expreſſe by any other name than poyſon inwardly generated. Oft times alſo there is a certaine acrid and ſtinking filth generated in fleſh with a maligne and old ulcer, with which if the bones chance to bee moyſtned they become foule and at length mortified: of which this ſaying of **Hippocrates** is extant, Vlcers of a yeares continuance or longer, muſt neceſſarily foule the bone, and make the ſcarres hollow.

A Gangreene by effluxe of a cold matter.

Whither alſo belongs this ſaying of the ſame party; An *Eryſipelas* is ill in the laying bare of a bone. But this flowing venenate and gangrenous matter is ſomewhiles hot, as in peſtilent Carbuncles, which in the ſpace of foure and twenty houres by cauſing an *eſcharre*, bring the part to mortification: otherwhiles cold, as wee ſee it divers times happens in parts which are poſſeſt with a Gangreene, no paine, tumor, blackneſſe, nor any other precedent ſigne of a Gangreene going before. For *Iohn de Vigo* ſaith, that happened to a certaine gentlewoman of *Genoa* under his cure.

A notable Hiſtory.

I remember the ſame happened to a certaine man in *Paris*, who ſupping merrily and without any ſenſe of paine, went to bed, and ſuddainly on the night time a Gangreene ſeazed on both his legges, cauſed a mortification without tumor, without inflammation; onely his legges were in ſome places ſpred over with livid, blacke and greene ſpots, the reſt of the ſubſtance retaining his native colour; yet the ſence of theſe parts was quite dead, they felt cold to the touch, and if you thruſt your lancet into the skinne no blood came forth.

A Councell of Phyſitions being called, they thought good to cut the skinne, and fleſh lying under it, with many deepe ſcarifications; which when I had done, there came forth a little blacke, thicke and as it were congealed blood; wherefore this remedy as alſo diverſe other, prooved to no purpoſe, for in concluſion a blackiſh colour comming into his face, and the reſt of his body, he dyed franticke. I leave it to the Readers judgement, whether ſo ſpeedy, and ſuddainly cruell a miſchiefe could proceede from any other than a venenate matter; yet the hurt of this venenate matter is not peculiar, or by its ſelfe.

Simple cold may cauſe a Gangreene.

For oft times the force of cold, whether of the encompaſſing ayre, or the too immoderate uſe of Narcoticke medicines, is ſo great, that in a few houres it takes away life from ſome of the members, and diverſe times from the whole body, as we may learne by their example, who travell in great ſnowes, and over mountaines congealed, and horrid with froſt & yce. Hence alſo is the extinction of the native heate and the ſpirits reſiding in the part, and the ſhutting forth of that which is ſent by nature to ayde or defend it. For when as the part is bound with rigide cold, and as it were frozen, they cannot get nor enter therein. Neither if they ſhould enter into the part, can they ſtay long there, becauſe they can there finde no fit habitation, the whole frame and government of nature being ſpoyled, and the harmony of the foure prime qualities deſtroyed, by the offenſive dominion of predominant cold their enimy. whereby it commeth to paſſe, that flying back from whence they firſt came, they leave the part deſtitute and deprived of the benefit of nouriſhment, life, ſenſe and motion.

A Hiſtory.

A certaine Briton an Hoſtler in *Paris*, having drunke ſoundly after ſupper, caſt himſelfe upon a bed; the cold ayre comming in at a window left open, ſo tooke hold upon one of his legges, that when he waked forth of his ſleepe, he could neither ſtand nor goe. Wherefore thinking onely that his leg was numbe, they made him ſtand to the fire; but putting it very nigh, he burnt the ſole of his foote without any ſenſe of paine, ſome fingers thickneſſe, for a mortification had already poſſeſſed more than halfe his legge. Wherefore after he was carried to the Hoſpitall, the Chirurgion who belonged thereto, endeavoured by cutting away of the mortified legge to deliver the reſt of the body from imminent death; but it proved in vaine; for the mortification taking hold upon the upper parts, he dyed within three dayes, with thoubleſome belching and hicketting, raving, cold ſweate, and often ſwounding. Verily all that ſame winter, the cold was ſo vehement that many in the Hoſpitall of *Paris* loſt the wings or ſides of their noſe-thrills, ſeazed upon by a mortification without any putrefaction.

What parts are uſually taken by a Gangreene occaſioned by cold.

But you muſt note, that the Gangreene which is cauſed by cold, doth firſt and principally ſeaze upon the parts moſt diſtant from the heart, the fountaine of heate, to wit, the feete and legges; as alſo ſuch as are cold by nature, as griſtly parts, ſuch as the noſe and eares.

Chap. XIII.

Of the ſignes of a Gangreene.

Sect. 2. lib. de fractur.

THe ſignes of a Gangreene which inflammation or a phlegmon hath cauſed, are paine and pulſation without manifeſt cauſe, the ſudden changing of the fyery and red colour into a livid or blacke, as *Hippocrates* ſhewes where hee ſpeakes of the Gangreene of a broken heele.

What a pulſificke paine is.

I would have you here to underſtand the pulſificke paine not onely to be that which is cauſed by the quicker motion of the Arteries, but that heavy and pricking which the contention of the unaturall heate doth produce by raiſing a thicke cloud of vapours from theſe humours which the Gangreene ſets upon.

Signes of a Gangreene proceeding of cold.

The ſignes of a Gangreene cauſed by cold, are, if ſuddenly a ſharpe pricking and burning paine aſſaileth the part; for *penetrabile frigus adurit* (*i*) peircing cold doth burne: if a ſhining redneſſe as if you had handled ſnow, preſently turne into a livid colour; if in ſtead of the accidentall heate which was in the part, preſently cold and numbeneſſe ſhall poſſeſſe it, as if it were ſhooke with a quartain feaver. Such cold if it ſhall proceede ſo farre as to extinguiſh the native heate, bringeth a mortification upon the Gangreene; alſo oft times convulſions and violent ſhaking of the whole body, wondrous troubleſome to the braine and the fountaines of life.

Signes of Gangreenes proceeding from ſtrait bandages, or ligatures, &c.

But you ſhall know Gangreenes cauſed by too ſtreight bandages, by fracture, luxation, and contuſion, by the hardneſſe which the attraction and flowing downe of the humors hath cauſed; little pimples or bliſters ſpreading or riſing upon the ſkinne by reaſon of the great heate, as in a combuſtion; by the weight of the part occaſioned through the defect of the ſpirits not now ſuſtaining the burden of the member; and laſtly from this, the preſſing of your finger upon the part, it will leave the print thereof as in an *œdema*, and alſo from this, that the ſkinne commeth from the fleſh without any manifeſt cauſe.

Signes of a Gangreene occaſioned by a bite, puncture, &c.

Now you ſhall know Gangreenes ariſing from a bite, puncture, *aneuriſma*, or wound in plethoricke and ill bodies, and in a part indued with moſt exquiſite ſence, almoſt by the ſame ſignes as that which was cauſed by inflammation.

For by theſe and the like cauſes, there is a farre greater defluxion and attraction of the humors than is fit, when the perſpiration being intercepted and the paſſages ſtopt, the native heate is oppreſſed and ſuffocated. But this I would admoniſh the young Chirurgion, that when by the forementioned ſignes hee ſhall finde the Gangreene preſent, that hee doe not deferre the amputation for that hee findes ſome ſenſe, or ſmall motion yet reſiding in the part.

For oft times the affected parts are in this caſe mooved not by the motion of the whole muſcle, but onely by meanes, that the head of the muſcle is not yet taken with the Gangreene: with mooving it ſelfe by its owne ſtrength, alſo mooves its proper and continued tendon and taile though dead already; wherefore it is ill to make any delay in ſuch cauſes.

CHAP. XIIII.

Of the Prognoſtickes in Gangreenes.

HAving given you the ſignes and cauſes to know a Gangreene; it is fit wee alſo give you the prognoſticke. The fearceneſſe and malignity thereof is ſo great, that unleſſe it be moſt ſpeedily withſtood the part it ſelfe will dye, and alſo take hold of the neighbouring parts by the contagion of its mortification: which hath beene the cauſe that a Gangreene by many hath beene termed an *Eſthiomenos.* For ſuch corruption creepes out like poyſon, and like fire eates gnawes and deſtroyes all the neighbouring parts, untill it hath ſpred over the whole body. For as *Hippocrates* writes, *Lib. de vulner. capitis*; *Mortui & viventis nulla eſt proportio* (*i*) There is no proportion betweene the dead and living. Wherefore it is fit preſently to ſeparate the dead from the living; for unleſſe that be done, the living will dye, by the contagion of the dead. In ſuch as are at the point of death a cold ſweat flowes over all their bodyes: they are troubled with ravings, and watchings, belchings, and hicketing moleſt them; and often ſwoundings invade them, by reaſon of the vapours abundantly and continually rayſed from the corruption of the humors and fleſh, and ſo carryed to the bowells and principall parts, by the Veines, Nerves, and Arteries. Wherefore when you have foretold theſe things to the friends of the patient; then make haſte to fall to your worke.

Why a Gangreene is called *Eſthiomenos.*

The quicke impatient of the dead.

CHAP. XV.

Of the generall cure of a Gangreene.

THe Indications of curing Gangreenes are to be drawne from their differences, for the cure muſt bee diverſely inſtituted according to the eſſence and magnitude. For ſome Gangreenes poſſeſſe the whole member; others onely ſome portion thereof; ſome are deepe; otherſome ſuperficiall onely. Alſo you muſt have regard to the temper of the body. For ſoft and delicate bodyes, as of children, women, Eunuches, and idle perſons, require much milder medicines, than thoſe who by nature and cuſtome, or vocation of life, are more ſtrong and hardy, ſuch as husbandmen, labourers, marriners, huntſmen, porters, and men of the like nature who live ſparingly and hardly. Neither muſt you have reſpect to the body in generall, but alſo to the parts affected; for the fleſhy and muſculous parts, are different from the ſolide, as the Nerves and joynts, or more ſolide, as the *Vertebræ.* Now the hot and moyſt parts, as the Privities, mouth, wombe, and fundament, are eaſilyer and ſooner taken hold of by putrifaction; wherefore we muſt uſe more ſpeedy meanes to helpe them. Wherefore if the Gangreene be cheefely occaſioned from an internall cauſe, he muſt have a dyet preſcribed for the decent and fitting uſe of the ſixe things not naturall. If the body be plethoricke, or full of ill humors; you muſt purge, or let blood by the advice of a Phyſition. Againſt the aſcending up of vapours to the noble parts, the heart muſt cheefely be ſtrengthened with Treacle diſſolved in Sorrell, or *Carduus* water; with a bole of Mithridate, the conſerves of Roſes & Bugloſſe; and with Opiates made for the preſent purpoſe according to Art; this following Apozeme ſhall be outwardly applyed to the region of the heart. ℞. *aquæ roſar. & nenuphar. an.* ℥iiij. *aceti ſcillitici* ℥j. *corallorum, ſantalorum alborum & rubrorum, roſar. rub. in pulver. radactarum, & ſpodij, an.* ʒj. *mithrid. & theriacæ, an.* ʒiiß.

Various Indications of curing of a Gangreene.

What parts ſooneſt taken hold of by a Gangreene.

A cordiall Epithema.

ʒijß. *trochiſcorum de Caphura*, ʒij. *flor. cordial. in pollin. redactarum, p.ij croci* ʒj. *ex omnibus in pollinem redactis, fiat epithema.* Which may be applyed upon the region of the heart with a ſcarlet clot or ſpunge. Theſe are uſually ſuch as happen in the cure of every Gangreene.

Chap. XVI.

Of the particular cure of a Gangreene:

The cure of a Gangreene made by inflammation.

The deſcription of an *Egyptiacum.*

Aſtrigents that may be uſed in cure of a Gangreene.

THe cure of a Gangreene, cauſed by the too plentifull and violent defluxion of humors ſuffocating the native heate, by reaſon of great Plegmons, is performed by evacuating and drying up the humors, which putrifie by delay and collection in the part. For this purpoſe ſcarifications and inciſions, great, indifferent, ſmall, deepe and ſuperficiary according to the condition of the Gangreene, are much commended; that ſo the burdened part may enjoy the benefit of perſpiration; and the contained humors, of difflation, or evacuation of their ſooty excrements. Let inciſions be made when the affect is great, deepe in, and neere to mortification. But ſcarifications may be uſed when the part firſt begins to putrefie; for the greatneſſe of the remedy muſt anſwere in proportion to that of the diſeaſe. Wherefore if it penetrate to the bones, it will bee fit, to cut the skin and fleſh with many and deepe inciſions, with an inciſion knife made for that purpoſe; yet take heede of cutting the larger nerves and veſſels, unleſſe they be wholy putrified, for if they be not yet putrified, you ſhall make your inciſions in the ſpaces betweene them; if the Gangreene be leſſe, we muſt reſt ſatisfied with onely ſcarifying it. When the ſcarifications and inciſions are made, we muſt ſuffer much blood to flow forth, that ſo the conjunct matter may bee evacuated. Then muſt we apply and put upon it ſuch medicines as may by heating, drying, reſolving, clenſing and opening, amend and correct the putrefaction, and by peircing to the bottome may have power to overcome the virulencie already impact in the part. For this purpoſe Lotions made of the lye of the Aſhes of fig-tree or Oake wherein Lupines have bin throughly boyled are good. Or you may with leſſe trouble make a medicine with ſalt water, wherein you may diſſolve Aloes and *Ægyptiacum*, adding in the concluſion a little *Aqua vitæ*; for *aqua vitæ* and calcined vitrioll are ſingular medicines for a Gangreene. Or, ℞. *aceti opimi* ℔.j. *mel. roſ.* ℥iiij. *ſyrup. acetoſi* ℥iij. *ſalis com.* ℥v. *bulliant ſimul, adde aq. vitæ.* ℔ ſ. Let the part be frequently waſhed with this medicine, for it hath much force to repreſſe Gangreenes. After your Lotion, lay *Ægyptiacum* for a Liniment and put it into the inciſions; for there is no medicine, more powerfull againſt putrefaction, for by cauſing an *Eſchar*, it ſeparates the putride fleſh from the ſound. But we muſt not in this kinde of affect expect that the putride fleſh may of it ſelfe fall from the ſound; but rather cut off with your inciſion knife or ſiſſers, whatſoever thereof you can, & then put to it *Egyptiacum* as oft as neede ſhall require. The knowledge hereof may be acquired from the colour, ſmell, and ſenſibleneſſe of the fleſh its ſelfe. The deſcription of the *Egyptiacum*, whoſe wondrous effects I have often tryed in theſe cauſes, is this. ℞. *floris æris, aluminis roch. mellis com. an.* ℥iij. *aceti acerrimi* ℥v. *ſalis com.* ℥j. *vitrioli rom.* ℥ß. *ſublimati pul.* ʒij *bulliant omnia ſimul ad ignem, fiat unguent.* If the force of the putrefaction in the part be not ſo great, a weaker *Ægyptiacum* may ſerve. When you have put in the *Ægyptiacum*, then preſently lay the following Cataplaſme thereupon. For it hinders putrefaction, reſolves, cleanſes & dryes up the virulent *ſanies*, and by the dry ſubtlety of the parts penetrates into the member, ſtrengthens it, and aſſwages the paine. ℞. *farin. fabar. hordei, orobi, lent. lupin. an.* ℔ ſ. *ſal. com. mellis roſat. an.* ℥iiij. *ſucci abſinth. marrub. an.* ℥iiß. *aloes, maſtiches, myrrhæ, & aqua vit. an.* ℥ij, *oxymelitis ſimpl. quantum ſufficit; fiat Cataplaſma molle ſecundum artem;* Somewhat higher than the part affected, apply this following aſtringent, or defenſitive, to hinder the flowing down of the humors into the part, and the riſing up of the vapours from the putride part into the whole body. ℞. *olei roſati, & myrtill. an* ℥4. *ſucci plantag. ſolani, ſempervivi, an.* ℥ij. *album ovorum* 5. *boli armeni, terræ ſigillatæ ſubtiliter pulveriſatorum, an.* ℥j. *oxycrati quantum ſufficit, miſce ad uſum dictum.*

But theſe medicines muſt be often renewed. If the greeſe be ſo ſtubborne, that it will not yeeld to the deſcribed remedies, wee muſt come to ſtronger, to wit, Cauteries, after whoſe application, *Galen* bids to put upon it the juice of a Leeke with ſalt beaten and diſſolved therewith, for that this medicine hath a peircing and drying faculty, and conſequently to hinder putrifaction. But if you prevaile nothing with Cauteries, then muſt you come to the laſt remedy and refuge, that is, the amputation of the part; For according to *Hippocrates*, to extreame diſeaſes exquiſitly extreame remedies are beſt to be applyed. Yet firſt be certaine of the mortification of the part; for it is no little or ſmall matter to cut off a member without a cauſe.

Gal.2.ad Glauconem.

Aphor.6.ſect. 11.

Therefore I have thought it fit to ſet downe the ſignes, whereby you may know a perfect and abſolute mortification.

CHAP. XVII.

The ſignes of a perfect Necroſis *or Mortification.*

YOu ſhall certainly know that a Gangreene is turned into a Sphacell, or mortification, and that the part is wholly and throughly dead, if it looke of a blacke colour, and bee colder than ſtone to your touch, the cauſe of which coldneſſe is not occaſioned by the frigiditie of the aire; if there bee a great ſoftneſſe of the part, ſo that if you preſſe it with your finger it riſes not againe, but retaines the print of the impreſſion. If the skinne come from the fleſh lying under it; if ſo great and ſtrong a ſmell exhale (eſpecially in an ulcerated Sphacell) that the ſtanders by cannot endure or ſuffer it; if a ſanious moiſture, viſcide, greene or blackiſh flow from thence; if it bee quite deſtitute of ſenſe and motion, whether it be pulled, beaten, cruſhed, pricked, burnt, or cut off. Here I muſt admoniſh the young Chirurgion, that hee be not deceived concerning the loſſe or privation of the ſenſe of the part.

For I know very many deceived as thus; the patients pricked on that part would ſay they felt much paine there. But that feeling is oft deceiptfull, as that which proceeds rather from the ſtrong apprehenſion of great paine which formerly reigned in the part, than from any facultie of feeling as yet remaining. A moſt cleare and manifeſt argument of this falſe and deceitful ſenſe appeares after the amputation of the member; for a long while after they will complaine of the part which is cut away.

A note concerning the unſenſiblenes of the part.

Verily it is a thing wondrous ſtrange and prodigious, and which will ſcarſe be credited, unleſſe by ſuch as have ſeene with their eyes, and heard with their eares the patients who have many moneths after the cutting away of the Legge, grievouſly complained that they yet felt exceeding great paine of that Leg ſo cut of. Wherefore have a ſpeciall care leaſt this hinder your intended amputation, a thing pittifull, yet abſolutely neceſſary for to preſerve the life of the patient and all the reſt of his body, by cutting away of that member which hath all the ſignes of a Sphacell and perfect mortification; for otherwiſe the neglected fire will in a moment ſpread over all the body, and take away all hope of remedy; for thus *Hippocrates* wiſheth: That Sections, Vſtions, and Terebrations muſt bee performed as ſoone as neede requires.

A wondrous ſymptome.

Sect.7 Lib. 6. Epidem.

CHAP. XVIII.

Where Amputation muſt be made.

IT is not ſufficient to know that Amputation is neceſſary; but alſo you muſt learne in what place of the dead part, it muſt bee done, and herein the wiſedome and judgement of the Chirurgion is moſt apparent. Art bids

The controverſy decided.

to take hold of the quicke, and to cut off the member in the ſound fleſh; but the ſame art wiſheth us, to preſerve whole that which is ſound, as much as in us lies. I will ſhew thee by a familiar example how thou maiſt carry thy ſelfe in theſe difficulties. Let us ſuppoſe, that the foote is mortified even to the anckle; here you muſt attentively marke in what place you muſt cut it off. For unleſſe you take hold of the quicke fleſh in the amputation, or if you leave any putrefaction, you profit nothing by amputation, for it will creepe and ſpread over the reſt of the body. It befits Phyſicke ordained for the preſervation of mankind, to defend from the iron or inſtrument and all manner of injurie, that which enjoyes life and health. Wherefore you ſhall cut off as little of that which is ſound as you poſſibly can; yet ſo that you rather cut away that which is quicke, than leave behind any thing that is periſhed, according to the advice of *Celſus*. Yet oft times the commodity of the action of the reſt of the part, and as it were a certaine ornament thereof, changes this counſell. For if you take theſe two things into your conſideration they will induce you in this propounded caſe and example, to cut off the Legge ſome five fingers breadth under the knee. For ſo the patient may more fitly uſe the reſt of his Legge and with leſſe trouble, that is, he may the better goe on a woodden Legge; for otherwiſe, if according to the common rules of Art, you cut it off cloſe to that which is periſhed, the patient will be forced with trouble to uſe three Legges in ſtead of two.

Lib. 7. Cap: 33.

An obſervable Hiſtory.

For I ſo knew Captaine *Francis Clerke*, when as his foote was ſtrucken off with an iron bullet ſhot forth of a man of-warre, and afterwards recovered and healed up, hee was much troubled and wearied with the heavy and unprofitable burden of the reſt of his Legge, wherefore though whole and ſound he cauſed the reſt thereof to bee cut off, ſome five fingers breadth below his knee; and verily hee uſeth it with much more eaſe and facility than before in performance of any motion. Wee muſt doe otherwiſe if any ſuch thing happen in the Arme; that is, you muſt cut off as little of the ſound part as you can. For the actions of the Legges much differ from theſe of the armes, and chiefly in this that the body reſts not, neither is carried upon the armes, as it is upon the feete and Legges.

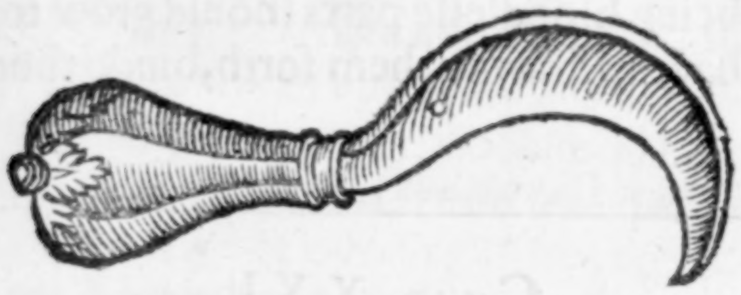
Chap. XIX.

How the ſection or amputation muſt be performed.

THe firſt care muſt be of the patients ſtrength, wherefore let him be nouriſhed with meats of good nutriment, eaſie digeſtion, and ſuch as generate many ſpirits; as with the yolkes of Egges, and bread toſted and dipped in Sacke or Muskedine. Then let him bee placed, as is fit, and drawing the muſcles upwards toward the ſound parts, let them be tyed with a ſtraite ligature a little above that place of the member which is to be cut off, with a ſtrong and broad fillet like that which women uſually bind up their haire withall; This ligature hath a threefold uſe; the firſt is, that it hold the muſcles drawne up together with the skin, ſo that retiring backe preſently after the performance of the worke, they may cover the ends of the cut bones, and ſerve them in ſtead of boulſters or pillowes when they are healed up, and ſo ſuffer with leſſe paine the compreſſion in ſuſteining the reſt of the body; beſides alſo by this meanes the wounds are the ſooner healed and cicatrized; for by how much more fleſh or skinne is left upon the ends of the bones, by ſo much they are the ſooner healed and cicatrized. The ſecond is, for that it prohibites the fluxe of blood by preſſing and ſhutting up the veines and arteries. The third is, for that it much dulls the ſenſe of the part by ſtupefying it; the animall ſpirits by the ſtraite compreſſion being hindred from paſſing in by the Nerves: Wherefore when you have made your ligature, cut the fleſh even to the bone with a ſharpe and well cutting inciſion knife, or with a crooked knife, ſuch as is here expreſſed.

The Ligature of the part.

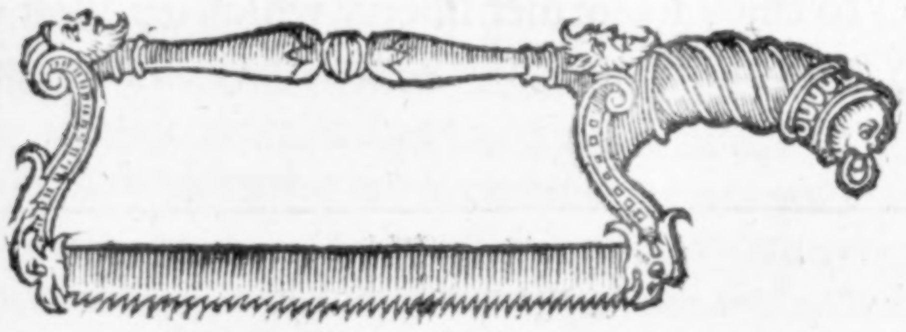
A crooked knife fit for diſmembring; or a diſmembring knife.



Now you muſt note, that there uſually lyes betweene the bones, a portion of certaine muſcles, which you cannot eaſily cut with a large inciſion or diſmembring knife; wherefore you muſt carefully divide it and ſeparate it wholly from the bone, with an inſtrument made neately like a crooked inciſion knife. I thought good to advertiſe thee hereof; for if thou ſhouldeſt leave any thing beſides the bone to bee divided by the ſaw, you would put the patient to exceſſive paine in the performance thereof; for ſoft things as fleſh tendons and membranes, cannot be eaſily cut with a ſaw. Therefore when you ſhall come to the bared bone, all the other parts being wholly cut aſunder and divided, you ſhall nimbly divide it with a little ſaw about ſome foote and three inches long, and that as neare to the ſound fleſh as you can. And then you muſt ſmooth the front of the bone which the ſaw hath made rough.

A caution to be obſerved.

The Figure of ſuch a Saw.

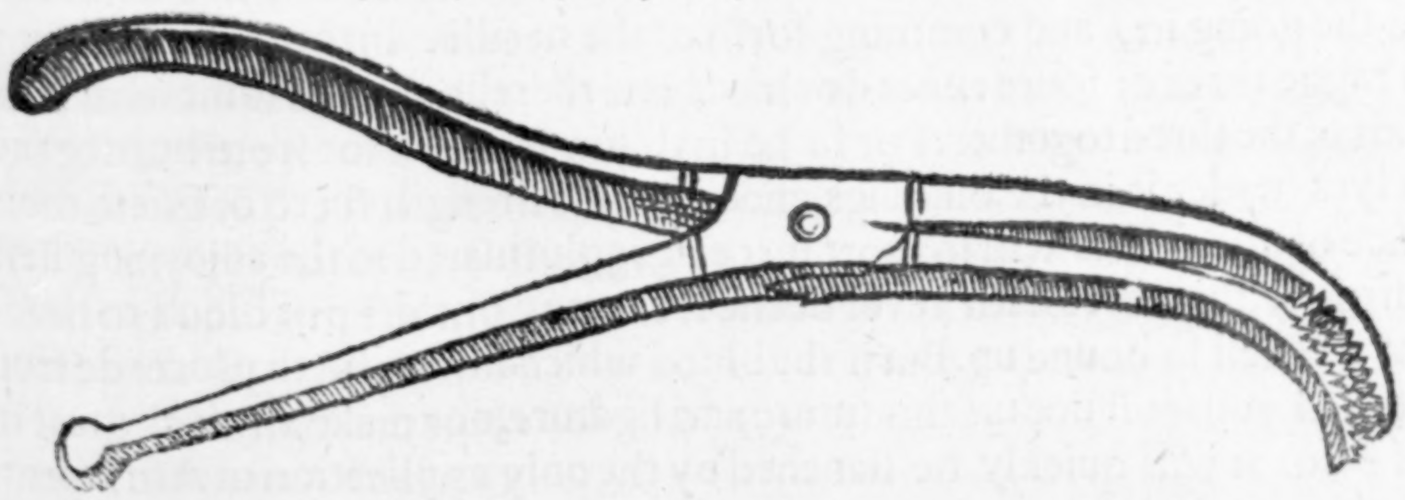


Chap. XX.

How to ſtanch the bleeding when the member is taken off.

When you have cut off and taken away the member, let it bleed a little according to the ſtrength of the patient, that ſo the reſt of the part may afterwards be leſſe obnoxious to inflammation and other ſymptomes; Then let the Veines and Arteries be bound up as ſpeedily and ſtreightly as you can; that ſo the courſe of the flowing blood may bee ſtopped and wholly ſtayed. Which may be done by taking hold of the veſſells with your Crowes beake, whereof this is the figure.

The Crowes beake fit for to draw the veſſells forth of the fleſh wherein they lye hid, that ſo they may be tyed or bound faſt.



How to draw forth the veſſells and binde them.

The ends of the veſſells lying hid in the fleſh, muſt be taken hold of & drawn with this inſtrument forth of the muſcles whereinto they preſently after the amputation withdrew themſelves, as all parts are ſtill uſed to withdraw themſelves towards their originalls. In performance of this worke, you neede take no great care, if you together with the veſſells comprehend ſome portion of the neighbouring parts,as of the fleſh, for hereof will enſue no harme; but the veſſells will ſo bee conſolidated with the more eaſe, than if they being bloodleſſe parts ſhould grow together by themſelves. To conclude,when you have ſo drawne them forth,binde them with a ſtrong double thred.

CHAP. XXI.

How after the blood is ſtanched, you muſt dreſſe the wounded member.

How the lips of the diſmembred part are to be joyned together.

WHen you have tyed the Veſſells, looſe you Ligature which you made above the place of amputation; then draw together the lippes of the wound with foure ſtitches made acroſſe, having taken good hold of the fleſh; for thus you ſhall draw over the bones that part of the skinne and cut muſcles drawne upwards before the amputation, and cover them as cloſe as you can, that ſo the ayre may the leſſe come at them, and that ſo the wound may bee the more ſpeedily agglutinated. But when wee ſay, draw together the lippes of the wound with foure ſtitches, you muſt not ſo underſtand it, as that you muſt endeavour, to draw them ſo cloſe as to touch each other, for that is impoſſible; for the ſtitches would ſooner breake out,and ſo the part would lye bare. Wherefore it will be ſufficient to draw them indifferent cloſe together,that ſo you may ſuffer the skinne and fleſh thereunder to enjoy its former liberty which it poſſeſt before the drawing up, and ſo in fine by natures aſſiſtance, the wound may be the more eaſily agglutinated.

CHAP. XXII.

How you muſt ſtoppe the bleeding, if any of the bound up veſſels chance to get looſe.

THe buſineſſe hitherto being performed as we ſaid, if peradventure it happen that any bandage of any of the veſſels be unlooſed, then muſt you againe binde the member with that kinde of Ligature which you did before the amputation thereof. Or elſe,which is better, more eaſily and leſſe painefull, let your ſervant taking hold of the member with both his hands,preſſing his fingers ſtrait, ſtoppe the paſſage of the looſed veſſell, for ſo hee may ſtanch the bleeding. Then let the worke-maſter take a needle ſome foure fingers long, ſquare, and having ſharpe edges, drawing after it a three or foure doubled ſtrong thred. With this let him binde the veſſell after the following manner. Let him thruſt his needle on the outſide into the fleſh, ſome halfe fingers breadth from the looſed veſſell untill he come to the end thereof, then let him put it about it,and bring it backe againe, but ſo that there be no more than the ſpace of a fingers bredth betweene the going in, and comming forth of the needle. In this ſpace let him put a linnen ragge three or foure times doubled, and thereupon bind ſomewhat ſtraite the two ends of the thred together. For ſo he ſhall hinder the knot from hurting the fleſh which lyes under it in the bindings,and alſo adde ſtrength thereto. For ſo the bound up orifice of the veſſell will in ſhort ſpace be agglutinated to the adjoyning fleſh,and that ſo firmely,that there hath never beene ſeene,any one drop of blood to have flowed from a veſſell ſo bound up. But if the blood which flowes forth proceede from any ſmall veſſell,you muſt not uſe this ſuture and ligature,nor make any ſuch great matter thereof; for it will quickly be ſtanched by the only application of Aſtringents preſently to be mentioned.

The Heamorrhagie of ſmall veſſels is not to be regarded

CHAP.

CHAP. XXIII.

How to performe the reſidue of the cure of the amputated member.

NOw muſt we ſhew what medicines are fitting to be applyed after the amputation of a member; which are Emplaſticks, as theſe which exceedingly conduce to greene wounds. As ℞.*boli arm.* ℥iiij *farin. vol.* ℥iij. *picis, reſinæ, an.* ℥ij.*pulveriſentur omnia ſubtiliſſ. & ſimul mixtis fiat pulvis*; herewith let the wound bee ſtrewed, and lay thereupon dry Lint; but let the following repercuſſive or defenſitive be applyed to the member.

An emplaſtick medicine.

℞.*Album ovorum* vj.*boli arm.ſang.drac.gypſi,terræ ſigill. aloës, maſtiches, gallar. combuſt.an.* ℥ij.*in pollinem redigantur omnia, & bene agitentur, addendo olei roſarum & myrtil.an.* ℥j.*fiat defenſitivum ad formam mellis.* This ointment muſt bee applyed upon ſtoopes dipped in Oxycrate, and that ſo that it may not onely cover the cut member, but alſo be ſpread further and cover the neighbouring parts; as when the Legge is cut off, it muſt bee laid upon the joynt, and ſpread higher than the knee, ſome foure fingers upon the thigh; for it hath not onely a repercuſſive facultie, but it alſo ſtrengthens the part, hinders defluxion by tempering the blood, aſwaging paine, and hindring inflammation. It will alſo be good to moiſten your double clothes and bandages in Oxycrate; then muſt you place the member in an indifferent poſture upon a pillow ſtuffed with oaten huskes or chaffe, Stagges haire, or wheate branne. It muſt not be ſtirred after the firſt dreſſing (unleſſe great neceſſity urge) for foure dayes in winter, but ſomewhat ſooner in ſummer. For the ligatures wherewith the veſſells are bound, they muſt not be looſed, or otherwiſe taken away, before the mouthes of the veſſells are covered with their glue or fleſh, leſt by too much haſte you cauſe a new flux of blood. This agglutination will be performed by applying refrigerating, aſtringent, and emplaſticke medicines, ſuch as this following powder.

A repercuſſive.

How to place the member and how often to dreſſe it.

℞.*boli arm.farin.hord.picis,reſ.gypſi, an* ℥iiij. *Aloës, nucum cup.cort.granat.an.* ℥j. *incorporentur omnia ſimul, fiat pulvis ſubtilis*: herewith let the whole ulcer be ſtrewed over for three or foure dayes ſpace; which being ended, let onely the ſeates of the veſſells be poudred therewith, and that for eight or ten dayes, ſo that wee neede no further doubt of the agglutination of the veſſells. In the meane ſpace let the digeſtive be applyed to the reſt of the Vlcer untill it bee come to ſuppuration; for then you ſhall give over your digeſtive, and betake you to deterſive and mundificative medicines: As

An emplaſticke pouder.

℞.*terebinth.ven. lotæ in aqua vitæ* ℥vj. *mellis roſ. colati* ℥iiij. *ſucci plantag. Apij, centaur, minoris, an.* ℥ij. *bulliant omnia ſimul uſque ad conſumptionem ſuccorum: auferantur ab igne, addendo farinæ fab. & hord.an.* ℥j.*theriac.Gal.* ℥ß.*aloes, myrrhæ, ariſtoloch. an.* ℥iij.*croci* ℈j.*fiat mundificativum.*

Deterſives.

But ſeeing the caſe ſtands ſo that the Patients imagine they have their members yet entire, and yet doe complaine thereof (which I imagine to come to paſſe, for that, the cut nerves retire themſelves towards their originall, and thereby cauſe a paine like to convulſions; for as *Galen* writes in his booke, *De motu muſculorum*, That contraction is the true and proper action of a nerve and muſcle: and againe, extenſion is not ſo much an action as a motion:) now wee muſt indeavour to give remedy to this ſymptome. Which may be done by annointing the ſpine of the backe and all the affected part with the following Liniment, which is very powerfull againſt Convulſions, the Palſie, numneſſe, and all cold affects of the nervous bodies.

Why after diſmembring the patients complaine of paine as if the part were yet remaining on.

℞ *ſalviæ, chamæpytheos, majoranæ, roriſmar.menth.rutæ, lavendulæ, an.m.*j.*flor.chamæmel. melilot.ſummit.aneth.& hyperici, an.p.*ij.*baccarum lauri & juniperi an.* ℥ij.*radicis pyrethri* ʒij,*maſtic.aſſæ odorat.an.* ℥iß.*terebinth.venet* ℔.j.*olei lumbr.aneth.catell.an.* ℥vj.*olei terebinth.*

An ointment for the ſpine of the backe againſt all affects of the nerves.

binth. ℥iij. *axung. hum.* ℥ij. *croci* ʒj. *vini albi odoriferi lib.*j. *ceræ quantum ſufficit, contundenda contundantur.pulveriſanda pulveriſentur, deinde macerentur omnia in vino per noctem, poſtea coquantur cum oleis & axungia prædictis in vaſe duplici, fiat linimentum ſecundum artem, in fine adde aquæ vitæ* ℥iiij. Beſides, in dreſſing theſe wounds, the Chirurgion muſt uſe diligence to procure the falling away of the ends or ſcalls of the bones, which the ſaw and the appulſe of the aire never before comming hereto, have tainted; which may be done by applying to their ends actuall cauteries, that is, hot irons, in uſing of which you muſt have a ſpeciall care that you touch not the ſenſible parts with fire; neither muſt the bones themſelves bee forcibly pluckt off, but gently mooved by little and little, ſo that you ſhall thinke you and the patient have exceedingly well performed your parts if they fall away at the thirtyeth day after the Amputation. All theſe things being performed, you ſhall hinder the growth of proud fleſh with the cathæreticks, ſuch as are burnt vitrioll, the pouder of Mercurie, and other things, amongſt which is Alome burnt and poudered, which is excellent in theſe kind of wounds whether by its ſelfe or mixed with others. You ſhall uſe theſe and ſuch like, even unto the perfect agglutination and cicatrization of the wound, and you may of your ſelfe deviſe other things, ſuch as theſe, as occaſion ſhall offer its ſelfe.

How to procure the falling away of the ends of the bones.

Cathæreticks.

CHAP. XXIIII.

What juſt occaſion moved the Author to deviſe this new forme of remedy, to ſtanch the blood after the amputation of a member; and to forſake the common way uſed almoſt by all Chirurgions; which is, by application of actuall cauteries.

VErily I confeſſe, I formerly have uſed to ſtanch the bleeding of members after amputation, after another manner than that I have a little before mentioned. Whereof I am aſhamed, and agreived; But what ſhould I doe? I had obſerved my maiſters whoſe method I entended to follow, alwaies to doe the like; who thought themſelves ſingularly well appointed to ſtanch a flux of blood, when they were furniſhed with various ſtore of hot Irons and cauſticke medicines, which they would uſe to the diſmembred part, now one, then another, as they themſelves thought meete. Which thing cannot be ſpoken, or but thought upon without great horror, much leſſe acted. For this kinde of remedy could not but bring great and tormenting paine to the patient, ſeeing ſuch freſh wounds made in the quicke and ſound fleſh are endewed with exquiſite ſenſe. Neither can any cauſticke be applyed to nervous bodies, but that this horrid impreſſion of the fire will be preſently communicated to the inward parts, whence horrid ſymptomes enſue, and oft times death it ſelfe. And verily of ſuch as were burnt, the third part ſcarſe ever recovered, and that with much adoe, for that combuſt wounds difficultly come to cicatrization; for by this burning are cauſed cruell paines, whence a Feaver, Convulſion, and oft times other accidents worſe than theſe. Adde hereunto, that when the eſchar fell away, oft times a new hæmorrhagye enſued, for ſtanching whereof they were forced to uſe other cauſticke and burning Inſtruments. Neither did theſe good men know any other courſe; ſo by this repetition there was great loſſe and waſte made of the fleſhy and nervous ſubſtance of the part. Through which occaſion the bones were laid bare, whence many were out of hope of cicatrization, being forced for the remainder of their wretched life to carry about an ulcer upon that part which was diſmembred; which alſo tooke away the oportunitie of fitting or putting too of an artificiall legge or arme in ſtead of that which was taken off.

Hot Irons not to be uſed.

Wherefore I muſt earneſtly entreate all Chirurgions, that leaving this old, and too too cruell way of healing, they would embrace this new, which I thinke was taught mee by the ſpeciall favour of the ſacred Deitie; for I learnt it not of my maiſters, nor of any other, neither have I at any time found it uſed by any. Onely I have read in *Galen*, that there was no ſpeedier remedy for ſtanching of blood, than to bind the veſſels through which it flowed towards their rootes, to wit, the Liver and Heart.

Lib.5.Meth.

This precept of *Galen*, of binding and ſowing the Veines and Arteries in the new wounds, when as I thought it might be drawne to theſe which are made by the amputation of members, I attempted it in many; yet ſo that at firſt in my budding practiſe thereof, I alwayes had my cauteries and hot Irons in a readineſſe, that if any thing happened otherwiſe then I expected in this my new worke, I might fetch ſuccour from the ancient practice, untill at length confirmed by the happy experience of almoſt an infinite number of particulars, I bid eternally adieu, to all hot Irons and cauteries which were commonly uſed in this worke. And I thinke it fit that Chirurgions doe the like. For antiquity and cuſtome in ſuch things as are performed by Art, ought not to have any ſway, authority or place contrary to reaſon, as they oft times have in civill affaires; wherefore let no man ſay unto us, that the Ancients have alway done thus.

Chap. XXV.

The practice of the former precepts is declared, together with a memorable hiſtory of a certaine ſoldier, whoſe arme was taken off at the Elbow.

A Hiſtory:

I Thinke it fit to confirme by an example the preſcribed method of curing a Gangreene and Mortification. Whileſt I was Chirurgion to the Marſhall of *Montejan* at *Turin*, a certaine common ſouldier received a wound on his wreſt with a musket bullet, by which the Bones and tendons being much broken, and the nervous bodyes cruelly torne, there followed a Gangreen,&at length a mortification even to the Elbow; beſides alſo an inflammation ſeazed upon the middle part of his Cheſt, and there was as it were a certaine diſpoſition to a Gangreene, whereby it followed that he was painefully and dangerouſly troubled with belchings, hickettings, watchings, unquietneſſe and frequent ſwoundings, which occaſioned many Chirurgions to leave him as deſperate. But it ſo it fell out, that I orecome by his friends intreaty, undertooke the cure of this wretched perſon, deſtitute of all humane helpe. Wherefore knowing the mortification by its ſignes, I cut off the arme by the elbow as ſpeedily as I could, making firſt the ligature, whereof I made mention; I ſay I tooke it off not with a ſaw, but onely with an inciſion knife, cutting in ſunder the ligaments which held the bones together, becauſe the ſphacell was not paſſed the joynt of the Elbow. Neither ought this ſection to be accounted ſtrange, which is made in a joynt; for *Hippocrates* much commends it, and ſaith that it is eaſily healed, and that there is nothing to be feared therein beſides ſwounding, by reaſon of the paine cauſed by cutting the common tendons and ligaments. But ſuch inciſion being made, the former Ligature could not hinder, but much blood muſt flow from thence, by reaſon of the large veſſels that run that way. Wherefore I let the blood to flow plentifully ſo to diſburden the part, and ſo afterwards to free it from the danger and feare of inflammation and a Gangreene; then preſently I ſtanched the blood with an hot Iron, for as yet I knew no other courſe. Then gently looſing the Ligature I ſcarifie that part of the brawn of the Arme which was Gangreenated, with many and deepe inciſions, ſhunning and not touching the inner part, by reaſon of the multitude of the large veſſels and Nerves which runne that way; then I preſently applyed a cautery to ſome of the inciſions, both to ſtanch the bleeding, and draw forth the virulent *ſanies* which

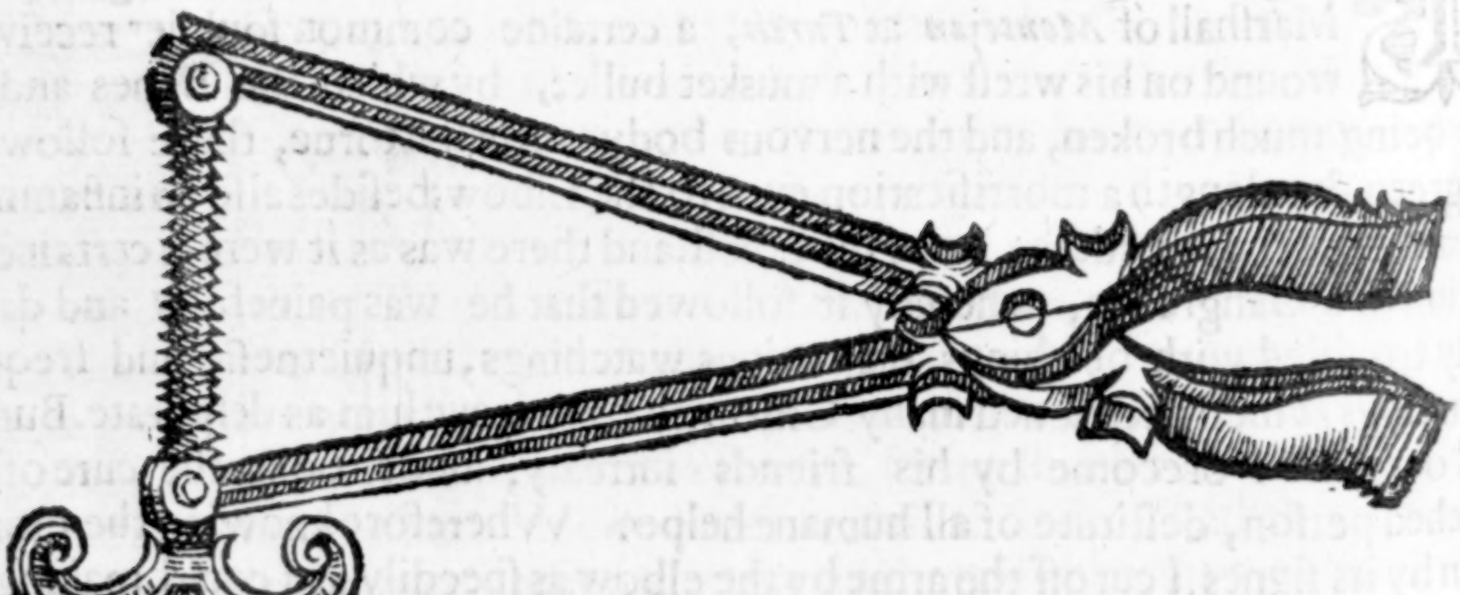
Diſmembring at a joynt.

Sect.4.lib. de Art.

which remained in the part. And then I aſſailed and overcame the ſpreading putrefaction by putting and applying the formerly preſcribed medicines; I uſed all ſorts of reſtrictive medicines, to ſtay the inflammation of the Cheſt; I alſo applyed Epithema's to the region of the heart, and gave him cordiall potions and boles, neither did I deſiſt from uſing them untill ſuch time as his belching, hicketting and ſwoundings had left him. Whileſt I more attentively intended theſe things, another miſcheife aſſailes my patient, to wit, Convulſions, and that not through any fault of him or me, but by the naughtineſſe of the place wherein hee lay, which was in a Barne every where full of chinkes and open on every ſide, and then alſo it was in the midſt of winter raging with froſt and ſnow and all ſorts of cold; neyther had he any fire or other thing neceſſary for preſervation of life, to leſſen theſe injuries of the Aire and place; Now his joints were contracted, his teeth ſet, and his mouth and face were drawne awry, when as I pittying his caſe made him to bee carried into the neighbouring Stable which ſmoaked with much horſe dung, and bringing in fire in two chafendiſhes, I preſently annointed his necke and all the ſpine of his backe, ſhunning the parts of the Cheſt, with liniments formerly deſcribed for convulſions; then ſtraight way I wrapped him in a warme linnen cloth, and buried him even to the necke in hot dung, putting a little freſh ſtraw about him; when hee had ſtayed there ſome three dayes, having at length a gentle ſcowring or flux of his belly, and plentifull ſweate, hee begun by little and little to open his mouth and teeth which before were ſet and cloſe ſhut. Having got by this meanes ſome opportunitie better to doe my buſineſſe, I opened his mouth as much as I pleaſed, by putting this following Inſtrument betweene his Teeth.

Burying in hot horſe dung helpes Convulſions,

A Dilater made for to open the mouth and Teeth by the meanes of a ſcrew in the end thereof.



Now drawing out the Inſtrument I kept his mouth open by putting in a willow ſticke on each ſide thereof, that ſo I might the more eaſily feede him with meats ſoone made, as with Cowes milke and reare egges, untill hee had recovered power to eate, the convulſion having left him. Hee by this meanes freed from the Convulſion, I then againe begun the cure of his arme, and with an actuall cautery ſeare the end of the bone, ſo to dry up the perpetuall affluxe of corrupt matter.

It is not altogether unworthy of your knowledge, that hee ſaid, how that hee was wondrouſly delighted by the application of ſuch actuall cauteries, a certaine tickling running the whole length of the arme by reaſon of the gentle diffuſion of the heate by applying the cauſticke; which ſame thing I have obſerved in many others; eſpecially in ſuch as lay upon the like occaſion in the Hoſpitall of *Paris*. After this cauterizing there fell away many and large ſcalles of the bone, the freer appulſe of the aire than was fit making much thereto; beſides when there was place for fomentation, with the decoction of red Roſe leaves, Wormewood, Sage, Bay leaves, flowers of Chamomile, Melilote, Dill; I ſo comforted the part that I alſo at the ſame time by the ſame meanes drew and tooke away the virulent *Sanies*, which firmely adhered to the fleſh and bones.

A fomentation for a Convulſion.

Laſtly, it came to paſſe, that by Gods aſſiſtance, theſe meanes I uſed, and my carefull diligence, he at length recovered. Wherefore I would admoniſh the young Chirurgion, that hee never account any ſo deſperate, as to give him for loſt, content to have let him goe with prognoſticks; for as an ancient Doctor writes; That as in Nature, ſo in diſeaſes there are alſo Monſters.

Monſters or miracles in diſeaſes.

CHAP. I.

Of the nature, cauſes, and differences of Vlcers.

The diverſe acceptions of an Vlcer.

Sent.34.ſect. 3 lib. de fract.

Sect.1.prog.

What an Vlcer properly is.

Lib. de conſtit. Artis cap.6.

The internall cauſes.

The externall cauſes.

HAving already handled and treated of the nature, differences, cauſes, ſignes and cure of freſh and blood wounds, reaſon & order ſeeme to require that we now ſpeake of Vlcers;taking our beginning from the ambiguity of the name. For according to *Hippocrates*, the name of Vlcer moſt generally taken may ſignifie all or any ſolution of Continuity; In which ſenſe it is read, that all paine is an Vlcer. Generally, for a wound and Vlcer properly ſo called; as appeares by his Booke, *de Vlceribus*. Properly, as when hee ſaith, it is a ſigne of death when an Vlcer is dryed up through an *Atrophia*, or defect of nouriſhment. Wee have here determined to ſpeake of an Vlcer in this laſt and proper ſignification, And according thereto wee define an Vlcer to bee the ſolution of Continuity in a ſoft part, and that not bloody, but ſordide and unpure, flowing with quitture, *Sanies* or any ſuch like corruption, aſſociated with one or more affects againſt nature, which hinder the healing and agglutination thereof; or that we may give you it in fewer words according to *Galens* opinion; An ulcer is a ſolution of Continuity, cauſed by Eroſion. The cauſes of Vlcers are either internall or externall. The internall are through the default of humors peccant in quality rather than in quantity, or elſe in both, and ſo making eroſion in the ſkinne and ſofter parts by their acrimonie and malignitie; Now theſe things happen eyther by naughty and irregular diet, or by the ill diſpoſition of the entrailes, ſending forth and emptying into the habite of the body this their ill diſpoſure. The externall cauſes are, the exceſſe of cold ſeazing upon any part, eſpecially more remote from the fountaine of heate, whence followes paine, whereunto ſucceeds an attraction of humors and ſpirits into the part, and the corruption of theſe ſo drawne thither by reaſon of the debility or extinction of the native heate in that part, whence laſtly ulceration proceeds. In this number of externall cauſes may be ranged, a ſtroake, contuſion, the application of ſharpe and acrid medicines, as cauſticks, burnes; as alſo impure contagion, as appeares by the virulent vlcers acquired by the filthy copulation or too familiar converſation of ſuch as have the French diſeaſe. How many and what the differences of Vlcers are, you may ſee here deſcribed in this following Scheme.

A Table of the differences of Vlcers.

An Vlcer is an impure ſolution of continuity in a ſoft part, flowing with filth and matter or other corruption, whereof there are two chiefe differẽces, for one

- *Is ſimple and ſolitary without complication of any other affect againſt nature; and this varies in differences, either*
  - *Proper which are uſually drawne from three things, to wit*
    - *figur. whence one Vlcer is called*
      - *Round or circular.*
      - *Sinuous, and variouſly ſpread.*
      - *Right or oblique.*
      - *Cornered, as triangular.*
    - *Quantity, & that eyther according to their*
      - *Length; whence an Vlcer is long, ſhort, indifferent.*
      - *Breadth; whence an Vlcer is broad, narrow indifferent.*
      - *Profundity; whence an Vlcer is deepe, ſuperficiary, indifferent.*
    - *Equalitie or inequality, which conſiſts,*
      - *In thoſe differences of dimenſions whereof we laſt treated, I ſay in length, breadth and profundity, wherein they are either alike or of the ſame manner, or elſe unlike and ſo of a different manner.*
  - *Or common and accidentall, & theſe drawne, either*
    - *From their time; whence an Vlcer is tearmed new, old, of ſhort or long cure and duration.*
    - *From their appearance; whence one is called an apparent Vlcer; another a hidden and occult Vlcer.*
    - *From their manner of generation; as if it be made by a heavy, bruſing, cutting, pricking or corroding thing; whence a cut, torne and mixt Vlcer.*
    - *From their ſite; whence an Vlcer before, behind, above, below, in the head, taile, or belly of a Muſcle.*
    - *From that part it ſeazes upon, whence an vlcer in the fleſh and skin, or feeding upon the griſtles or bones, ſuch as theſe of the noſe, the palate of the mouth, and eares.*
    - *From other common accidents; whence a Telephian Vlcer; that is, ſuch an Vlcer as Telephus had. A Chironian, which needs the hand and art of Chiron. A Canckrous which reſembles a* Cancer.
- *Is compound and many and various wayes complicated, as*
  - *With the cauſe, whence an Vlcer*
    - *Is Cacochymicke, Catarrhoicke or venenate, that is, with a* Cachochymia *or Repletion of ill humors, a Catarrhe, or poiſon cheriſhes or feeds.*
  - *With the diſeaſe, as from*
    - *Diſtemper, whether ſimple or compound, whence an Vlcer is,*
      - *Hot.*
      - *Cold.*
      - *Dry.*
      - *Moiſt.*
      - *Mixt.*
    - *Swelling or Tumor, whence a … Vlcer.*
      - *Phlegmonous,*
      - *Eryſipelous,*
      - *Oedematous.*
      - *Scirrhous,*
      - *Cancrous.*
    - *Solution of continuitie, or any other diſcommoditie, whence a rough, callous, fiſtulous, cavernous, ſinuous Vlcer, with luxation, facture, &c.*
  - *With the Symptome, whence, A corroding, eating, painefull, ſordid and virulent Vlcer.*
  - *With the cauſe and diſeaſe,*
  - *With the cauſe and Symptome,*
  - *With the diſeaſe and Symptome,*
  - *With the cauſe, diſeaſe and Symptome.*
    - *Examples whereof may be taken from that we have formerly delivered.*

CHAP. II.

Of the ſignes of Vlcers.

The ſignes of a putrid Vlcer.

THere are various ſignes of Vlcers according to their differences. For it is the ſigne of a putride Vlcer, if it exhale a noyſome, grievous, ſtinking and carion-like vapour, together with filthy matter. An eating Vlcer is knowne by the eating in, hollowneſſe and wearing away of the part wherein it reſides, together with the adjoyning parts. A ſordide Vlcer may be knowne by the groſſeneſſe and viſcidity of the excrements it ſends forth, and by the looſe and ſpongy ſoftneſſe, or the cruſted inequality of the fleſh which growes over it. A cavernous Vlcer, by the ſtreghtneſſe of the orifice, and largeneſſe and deepeneſſe of the windings within. A fiſtulous Vlcer, if to the laſt mentioned ſignes there accrew a callous hardneſſe of the lips or ſides of the Vlcer. A cancrous Vlcer is horrible to behold with the lips turned backe, hard and ſwollne, flowing with virulent and ſtincking corruption, and ſometimes alſo with bloody matter, together with the ſwelling and lifting up of the adjacent veines. An untemperate, or as they terme it, a diſtempered Vlcer, is ſuch as is nouriſhed by ſome great diſtemper whether hot or cold, moiſt or dry, or compounded of theſe. An ill* natured or maligne Vlcer is knowne by the difficulty of curing and rebellious contumacy to remedies appointed according to art and reaſon. Wee know a catarrhous Vlcer, if the matter which feeds it flow to it from ſome *varices* thereunto adjoyning, or dilated, ſwollne and broken veines, or from ſome entraile, or from the whole body being ill affected. An Apoſtumatous Vlcer is perceived by the preſence of any tumor againſt nature, whoſe kind may be found out by ſight and handling. *Telephian* Vlcers, are ſuch as affected *Telephus*, and *Chironian* (in whoſe cure *Chiron* excelled) are Vlcers which may be knowne by their magnitude not much putride, and conſequently not ſending forth any ill ſmell, not eating, not tormenting with paine, but having their lips ſwollne and hard, and therefore ill to bee healed. For although they may bee ſometimes cicatrized, yet it being but ſlender may eaſily bee broken, and the Vlcer renewed. They are almoſt like an ulcerated *Cancer*, but that they are accompanied with ſwelling in the adjacent parts; they are alſo worſe than theſe which are termed *Cacoëthe*, that is, ill natured or maligne; whence it is that *Fernelius* thought they had a hidden cauſe of malignitie, beſides the common default of the humour, and that ſuch as can ſcarce bee driven away; ſuch commonly are left after the plague. Wherefore *Galen* thinkes ſuch to bee maligne as will not ſuppurate or yeeld any quitture.

Gal.cap.5.lib. 4.Meth.

** Vlcus cacoethes.*

Com.ad aphor. 22.ſect.5.

CHAP. III.

Of the prognoſticks of Vlcers.

Aph.45.ſect.6.

THe bone muſt neceſſarily ſcaill, and hollow ſcarres be left by maligne Vlcers of a yeares continuance or longer, and rebellious to medicines fitly applyed. The bone muſt ſcaill by reaſon of the continuall affluxe, and wearing by the acrimony of the humour, which looſes the compoſure and glue by which the parts thereof are joyned together. But the ſcars muſt become hollow, for that the bone (whence all the fleſh takes its firſt originall) or ſome portion thereof, being taken from under the fleſh, as the foundation thereof, ſo much of the bulcke of the fleſh muſt neceſſarily ſinke downe, as the magnitude of the portion of the waſted bone comes unto.

Hip.progn. lib. .cap.8. Aph.65.ſect. 5.

You may know that death is at hand, when the Vlcers that ariſe in or before diſeaſes, are ſudainly either livid or dryed, or pale and withered. For ſuch drineſſe ſheweth the defect of nature, which is not able to ſend the familiar and accuſtomed nutriment to the part ulcerated. But the livid or pale colour is not onely an argument

ment of the overabundance of choler and melancholy, but alſo of the extinction of the native heate. In Vlcers where tumors appeare, the patients ſuffer no convulſions, neither are franticke; for the tumor being in the habite of the body poſſeſſed with an Vlcer, argues that the nervous parts and their originall are free from the noxious humors. But theſe tumors ſuddenly vaniſhing and without manifeſt cauſe, as without application of a diſcuſſing medicine, or bleeding, thoſe who have them on their backs have convulſions and diſtenſions, for that the ſpine of the backe is almoſt wholly nervous; but ſuch as have them on their fore parts, become eyther franticke, or have a ſharpe paine of their ſide, or pleuriſie, or elſe a dyſentery if the tumors be reddiſh; for the forepart of the body is repleniſhed and overſpread with many and large veſſells, into whoſe paſſages the morbificke matter being tranſlated, is preſently carryed to theſe parts which are the ſeats of ſuch diſeaſes.

Aph.67.ſect.5.

Soft and looſe tumors in Vlcers are good, for they ſhew a mildneſſe and gentleneſſe of the humors, but crude and hard ſwellings are naught; for all digeſtion in ſome meaſure reſembles elixation. Vlcers which are ſmooth and ſhining are ill, for they ſhew that there reſides an humour maligne by its acrimony, which frets aſunder the roots of the haires, and depraves the naturall conſtruction of the pores of the skin; whence it is that ſuch as are troubled with Quartaine agues, the Leproſie or *Lues venerea*, have their haire fall off.

Aph.4.ſect.6.

A livid fleſh is ill in Vlcers which cauſe a rottenneſſe or corruption of the bones lying under the fleſh; for it is an argument of the dying heate and corruption of the bone, whence the fleſh hath its originall and integrity.

Hip.lib.de ulc. Gal.cap.2. & 5.lib.Meth.4.

Theſe Vlcers which happen by occaſion of any diſeaſe, as a Dropſy, are hard to be cured; as alſo thoſe whereinto a *varix* or ſwolne veſſell continually caſts in matter; which a preſent diſtemper foments; which have ſwolne, hard and callous lips; and ſuch as are circular or round. An *Hyperſarcoſis*, or fleſhy excreſcence uſually happens to Vlcers not diligently mundified; and if they poſſeſſe the armes or Legs they cauſe a Phlegmon or ſome other tumor in the groines, chiefly if the body bee full of ill humors, as *Avicen* hath noted. For theſe parts by reaſon of their rarity and weakeneſſe are fit and ſubject to defluxions. *Albucraſis* writes that for nine cauſes Vlcers are difficultly repleniſhed with fleſh and cicatrized. The firſt for want of blood, in a bloodleſſe body; the ſecond by reaſon of ill humors and the impurity of the blood; the third by the unfit application of unconvenient medicines; the fourth by reaſon of the ſordidneſſe of the Vlcer; the fifth by the putrifaction of the ſoft and carionlike fleſh encompaſſing the Vlcer; the ſixth when they take their originall from a common cauſe which every where rages with fury, ſuch as are thoſe which are left by the peſtilence; the ſeaventh by reaſon of the callous hardneſſe of the lips of the Vlcer. The eighth when the heavens and aire are of ſuch condition as miniſters fuell to the continuance of the Vlcer, as at Sarogoza in Aragon; the ninth when the bones which lye under it are waiſted by rottenneſſe.

For what cauſes Vlcers are hard to heale.

An Vlcer that caſts forth white, ſmooth, equall quitture, and little or no ſtinking, is eaſily healed; for it argues the victory of the native heate, and the integrity of the ſolid parts. We terme that ſmooth quitture which is abſolutely concocted, neither yeelds any aſperity to the touch, whereby we might ſuſpect that as yet any portion of the humor remaines crude; we call that equall wherein you can note no diverſity of parts; and white not that which is perfectly ſo, but that which is of an aſh colour, as *Galen* obſerves. But it is ill, if when the cure is indifferently forward, a fluxe of blood ſuddainly breake forth in thoſe Vlcers which beate ſtrongly by reaſon of the great inflammation adjoyned therewith. For as *Hippocrates* obſerves, an effuſion of blood happening upon a ſtrong pulſation in Vlcers is evill; for the blood breaking out of an Artery cannot be ſtayed but by force; and alſo this blood is ſo furious by reaſon of the heate and inflammation the nouriſhers of this Vlcer, that it breakes its receptacles, and hence enſues the extinction of the native heate, whence the defect of ſuppuration and a Gangreene enſues. Now for that there flowes two ſorts of excrements from maligne Vlcers, the more thinne is tearmed *Ichor* or *ſanies*, but the more groſſe is named *ſordes*; that is virulent and flowes from pricked nerves, and the *Perioſtia* when they are evill affected; but the other uſually flowes from the

What *pus* or matter is ſmooth, equall and white.

Ad ſeutent. 32.ſect.2.de fract.

Aph.22.ſect.7.

Two ſorts of excrements flow from a maligne Vlcer.

Vlcers of the joynts, and it is the worſer if it be blacke, reddiſh, aſh-coloured, if muddy or unæquall like wine Lees, if it ſtinke. ***Sanies*** is like the water wherein fleſh hath beene waſhed, it argues the preternaturall heate of the part, but when it is pale coloured, it is ſaid to ſhew the extinction of the heate.

CHAP. IIII.

Of the generall cure of Vlcers.

The curing of a ſimple Vlcer conſiſts in exſiccation.

Gal. 7. Meth, cap. 12.

Gal Lib. 4. de comp. med. ſecund. gen.

AN Vlcer is eyther ſimple or compound. A ſimple Vlcer, as an Vlcer hath one and that a ſimple indication, that is, exſiccation; and that more than in a wound, by how much an Vlcer is moiſter than a wound. There are many indications propoſed for the cure of a compound Vlcer, in reſpect of wch *Galen* would have us to keepe this order, that wee have the firſt regard of the moſt urgent, then of the cauſe, then of that, which unleſſe it be taken away, the Vlcer cannot be healed. By giving you an example you may eaſily underſtand the meaning hereof. Imagine on the inſide of the Leg a little above the ancle, an Vlcer very painefull, hollow, putride, aſſociated with the rottenneſſe of the bone, circular, having hard and ſwolne Lips, and engirt with the inflammation and *varices* of the neighbouring parts. If you take this to cure before you doe any thing about the Vlcer, unleſſe you bee called upon by that which urges, as by vehemency of paine, you muſt firſt uſe generall meanes by calling and adviſing with a Phyſition; For in *Galens* opinion, if the whole body require a preparation, then muſt that be done in the firſt place; for in ſome Vlcers purgation onely will bee ſufficient; in ſome bloodletting; others are better by uſing both meanes, which is as the cauſe of the Vlcer proceedes from a repletion or illneſſe of humors. Now by theſe meanes having taken away the cauſe of the Vlcer, you muſt come to the particular cure thereof, beginning with that which is moſt urgent. Wherefore you muſt firſt aſſwage the paine by application of things contrary to the cauſe thereof, as if it proceede from a Phlegmonous diſtemper, which hath long poſſeſt, diſtended and hardned the part, it muſt bee eaſed by evacuation. Firſt, bathing it with warme water, to mollifie and relaxe the skinne, that ſo you may the more eaſily evacuate the contained humors; then ſhall you draw away portion of the matter cauſing the ſwelling and paine by ſcarrification, if the patient ſhall be of ſufficient courage, or elſe by application of hoſe-leaches if hee be more faint hearted; and then you ſhall temper the heate there of by applying *Vnguentum refrigerans Galeni.*

To conclude, you ſhall attempt all things which wee have formerly delivered (in our treatiſe of Tumors) to take away the ſwelling thereof. When you have brought this to that paſſe you deſire, you ſhall come to thoſe which are ſuch, that it cannot be taken away or healed without them, which ſhall be done by orderly helping the defects againſt nature which were conjoyned with the Vlcer, to wit, the rottenneſſe of the bone, which you ſhall helpe by actuall cauteries; and in the meane while you ſhall draw the Vlcer into another forme, to wit, cornered, and you ſhall cut away the callous hardneſſe, and helpe the rottenneſſe. Then muſt you procure the falling away of the Eſchar, and then provide for the ſcailing of the bone by the meanes formerly preſcribed, laſtly the mundified Vlcer muſt be filled with fleſh.

The things conducing to the generating of fleſh.

For generating of fleſh two cauſes muſt concurre, the efficient and materiall; The efficient is, the good temper both of the whole body, as alſo of the Vlcerated part. For this prevailing, there will be an attraction, digeſtion, appoſition and aſſimulation of the laudible juice to the part affected; verily the laudible temper is preſerved by like things, but the vicious is amended by contraries. The matter to bee ſpent upon fleſh, is laudible blood, which offends neither in quality, nor quantity. In this regeneration of the fleſh there appeare two kinds of excrements, the one more thinne and humide called *Sanies*, the other more groſſe termed *Sordes*. Both of theſe for that they are contrary to nature, doe therefore hinder the regeneration of fleſh, and therefore muſt be taken away by applying their contraryes, as by things drying in the firſt degree, and more ſtrongly or weakely detergent according to the complexion of the part and the whole body, and the plenty and quality of the excrementitious humor, and the uncleanneſſe of the Vlcer. For the part muſt bee preſerved by the uſe of the like, but the ulcer orecome by application of things contrary thereto. After that by natures endeavour and the Chirurgions helpe the Vlcer is replete with fleſh, it muſt be cicatrized, that is, covered with a callous skin in ſtead of the true and native skin. It may be cicatrized by ſtrewing of very drying pouders having very little or no acrimony. Thus Alume and vitrioll being burnt and made into pouder, and thinly ſtrewed upon the part doe quickly cicatrize the former fleſhy worke. To this purpoſe alſo ſerve, the roote of *Ariſtolochia*, Aloes, burnt Lead, Pomegranat pills burnt, Litharge, *Tutia*, and alſo plates of Lead beſmeared with quickſilver, whoſe efficacy for this purpoſe Chirurgions ſometimes finde more certaine and powerfull than any other remedies.

What a ſcarre is.

Things cauſing cicatrization.

Chap. V.

Of a diſtempered Vlcer.

Before we ſpeake of a diſtempered Vlcer, it is meete, leaſt that the Chirurgion take one diſtemper for another, briefly to relate the ſignes of each. You may know that an Vlcer is aſſociated with a dry diſtemper by your ſight, as if the Vlcer be as it were wrinckled, if it ſend forth little or no moiſture; alſo it is knowne by touch, if it feele rough and hard. You ſhall correct this diſtemper by humecting medicines, as fomenting it with warme water according to *Galens* opinion, or elſe with *Hydrælæum* (*i.*) Oile and water mixt, but alwayes you muſt firſt purge, if the body ſhall abound with ill humors, or uſe Phlebotomie if the body be plethoricke; otherwiſe you ſhall draw more humors into the part than it can beare. Now you ſhall ſo long foment it, untill the fleſh which is about it begin to looke red, waxe ſoft and moiſt, and the part it ſelfe be a little ſwollne. If you proceede further, you will reſolve all the humor which you have drawne thither, and ſo your labour is in vaine. After the fomentation apply ſuch a remedy to the ulcerated part.

Signes of a diſtempered Vlcer.

Remedies for a dry diſtempered Vlcer.

℞. *cremoris hordei* ℥ij. *fol. malvæ in aq, coct.* ℥j. *pingued. porci* ℥iß. *mellis com.* ℥ß. *miſce in mortario & fiat unguentum.*

You ſhall know a moiſt diſtemper aſſociates the Vlcer by the plenty of the excrementitious humor, which the Vlcer ſends forth; by the ſpongie and fungous ſoftneſſe and growth of the fleſh about it. You ſhall amend this by drying remedies, ſuch as theſe are, which we terme ſarcoticks, having alwayes regard to the plenty of the humour, the proper temper of the part, and other indications formerly mentioned. Amongſt other remedies *Galen* much commends Alume water; for it dries, clenſes and corroborates the affected part. Alſo this enſuing fomentation may be applyed ro good purpoſe. ℞ *roſar. rub. abſinth. beton. tapſi barbati, an. m.* j. *gallarum, nucum cupreſſi, an.* ℨij. *aluminis rochæ* ℨj. *fiat decoctio in vino auſtero, inſtituatur fotus*; Then let *Empl. de ceruſſa* or *De minio* be applyed to the Vlcer. Alſo I have found by experience that the pouder of burnt alome lightly ſtrewed upon the Vlcer is very effectuall in this caſe. You ſhall know that an hot diſtemper aſſociates the Vlcer by redneſſe, or yellowneſſe thereof, by the heate manifeſt to your touch, and the propriety of the paine. Then muſt you have recourſe to refrigerating things, ſuch as *vng. Roſatum Meſ. Refrigerans Gal. Populeon*; ſtoopes and cloathed dipped in plantaine water, Night-ſhade water, or Oxycrate. I have oft found by experience that ſcarrification, or Leaches being applyed, did more conduce than any other remedy. For ſo the chafed blood, which by that meanes is apt to corrupt, is drawne away, and the part its ſelfe is alſo freed of that burden.

Signes of too moiſt an Vlcer.

Gal. lib. 1. ſimp. cap. 7.

Signes of a hot diſtempered Vlcer.

We know a cold diſtemper by the whitiſh or pale colour, by the touch of the Chirurgion, and ſpeach of the patient complaining of the coldneſſe of the ulcerated part. You ſhall correct this by applying and putting bottles filled with water about the part, or elſe Swines bladders halfe filled with the following decoction.

Signes of a cold diſtempered Vlcer.

℞ *origani, pulegij, chamæm. meliloti, an. m.* j. *abſinth. majoranæ, ſalviæ, roriſmar. an. m.* ß.

fiat decoctio in vino generoſo, addendo aquæ vitæ quod ſufficit. Alſo the Vlcer may conveniently bee fomented with ſpunges dipped in the ſame decoction, and let there be applyed thereto *Empl. Oxycroceum*; *emp. de meliloto*; *de Vigo cum mercurio*, and *ſine mercurio*. But if a mixt and compound diſtemper be joyned to the Vlcer, the medicines muſt in like manner be mixt & compoſed. The reſidue of the Chirurgions care and paines muſt be ſpent upon the proper and peculiar cure of the Vlcer, as it is an Vlcer; which we ſaid in the former Chapter was conteined in deterſion, regenerating fleſh and cicatrization thereof.

Chap. VI.

Of an Vlcer with paine.

THere oft times ſo great paine accompanieth Vlcers, that it calls thereto the counſell of the Phyſition. Wherefore if it proceede from any diſtemper, it ſhall be taken away by remedies proper againſt that diſtemper, ſuch as we mentioned in the former Chapter. But if it doe not ſo ceaſe, wee muſt goe on to Narcoticks. Such are cataplaſmes of the leaves of Mandrakes, water lillies, Henbane, Nightſhade, Hemlocke, the ſeeds of Poppy and Oyles of the ſame; to which alſo may be added *Opium*, *Populeon*, and other things of like faculties. But if a maligne acrimonie and virulency of an humour corroding and eating the fleſh lying under it and the lips about it, cauſe and make the paine, you ſhall neither aſſwage it by anodynes, nor Narcoticks; for by application of gentle medicins it wil become worſe and worſe. Wherefore you muſt betake you to Cathæreticks; For ſtrong medicines are fitteſt for ſtrong diſeaſes. Wherefore let a pledget dipped in ſtrong and more than ordinarily powerfull *Ægyptiacum*, or in a little oyle of Vitrioll, be applyed to the Vlcer; for theſe have power to tame this raging paine, and virulent humors. In the meane ſeaſon let refrigerating things be put about the Vlcer, leaſt the vehemency of acrid medicines cauſe a defluxion.

The matter of Narcoticke cataplaſmes.

Catheræticks have power to aſſwage paine.

Chap. VII.

Of Vlcers with overgrowing or proudneſſe of fleſh.

VLcers have oft times proud or overgrowing fleſh in them, either by the negligence of the Chirurgion, or fault of the patient. Againſt this, drying and gently eating or conſuming medicines muſt be applyed; ſuch as are Galls, *cortex thuris*, Aloes, *Tutia*, Antimony, *Pompholix*, Vitrioll, Lead, all of them burnt and waſht if neede require. Of theſe pouders you may alſo make ointments with a little oyle and waxe; but if the proud fleſh, as that which is hard and denſe yeeld not to theſe remedies, we muſt come to cauſticks, or elſe to iron, ſo to cut it off. For in *Galens* opinion, the taking away of proud fleſh is no worke of nature, (as the generating, reſtoring and agglutinating of the fleſh is) but it is performed by medicines which dry vehemently, or elſe by the hand of the Chirurgion; wherefore amongſt the remedies fit for this operation, the pouder of mercury with ſome ſmall quantity of burnt Alume, or burnt Vitrioll alone, ſeeme very effectuall to me. Now for the hard and callous lips of the Vlcer, they muſt bee mollyfied with medicines which have ſuch a faculty, as with Calves, Gooſe, Capons or Ducks greaſe, the oiles of Lillies, ſweet Almonds, Wormes, Whelpes, *Oeſipus*, the mucilages of Marſh-mallowes, Lineſeede, fænugreeke ſeede, Gum *Ammoniacum*, *Galbanum*, *Bdellium*, of which being mixed may be made Emplaiſters, unguents, and liniments, or you ſhall uſe *Empl. Diachylon*, or *de Mucagipibus*, *De Vigo cum mercurio*. To conclude, after we have for ſome few dayes uſed ſuch like remedies, you may apply to the Vlcer a plate of Lead rubbed over with Quickſilver; for this is very effectual to ſmooth an Vlcer and depreſſe the lips; if you ſhall prevaile nothing by this meanes, you muſt come to the cauſticks, by which if you ſtill prevaile nothing, for that the lips of the Vlcer are ſo callous that the cauſtickes cannot peirce into them, you muſt cleave them with a gentle ſcarification, or elſe cut them to the quicke, ſo to make way,

Things waſting ſuperfluous fleſh.

Lib. 3. Meth. cap. 6.

For the callous lips of Vlcers.

or as it were open a window for the medicine to enter in, according to *Galen.* Neither in the interim muſt you omit *Hippocrates* his advice, which is, that by the ſame operation we reduce the ulcer if round, into another figure, to wit, long or triangular.

Lib 4. Meth. cap. 2.

CHAP. VIII.

Of an Vlcer putride and breeding Wormes.

Wormes are divers times bred in ulcers, whence they are called wormie ulcers; the cauſe hereof is the too great excrementitious humidity prepared to putreſie by unnaturall and immoderate heate. Which happens, either for that the ulcer is neglected, or elſe by reaſon of the diſtemper and depraved humors of all the body, or the affected part; or elſe for that the excrementitious humor collected in the ulcer, hath not open and free paſſage forth; as it happens to the ulcers of the eares, noſe, fundament, necke of the wombe, and laſtly to all ſinuous and cuniculous ulcers. Yet it doth not neceſſarily follow that all putrid ulcers muſt have wormes in them; as you may perceive by the definition of a putride ulcer which we gave you before. For the cure of ſuch ulcers after generall meanes, the wormes muſt firſt be taken forth, then the excrementitious humor muſt be drawne away, whence they take their originall. Therefore you ſhall foment the ulcer with the enſuing decoction, which is of force to kill them; for if any labour to take forth all that are quicke he will be much deceived; for they oft times doe ſo tenaciouſly adhere to the ulcerated part, that you cannot plucke them away without much force and paine.

The cauſe of wormes breeding in Vlcers.

℞. *abſinth. centaur. majoris, marrubij, an. M.* j. *fiat decoctio ad* ℔. *ſſ. in qua diſſolve aloes* ʒß. *unguenti ægyptiaci* ℥j. Let the ulcer be fomented and waſhed with this medicine, and let pledgets dipped herein be put into the ulcer; or elſe if the ulcer be cuniculous or full of windings, make injection therewith which may goe into all parts thereof.

A fomentation to kill the wormes.

Archigenes much commends this following medicine. ℞. *Ceruſæ, polij montani, an.* ʒß. *picis navalis liquidæ quantum ſufficit, miſce in mortario pro linimento.* If the putrefaction be ſuch that theſe medicines will not ſuffice for the amendment thereof, you muſt come to more powerfull, or to cauteries alſo, or hot Irons, or to ſection; yet you muſt ſtill beginne with the more gentle, ſuch as this of *Galens* deſcription.

Gal. 4. comp. med.

℞. *ceræ.* ℥ij. *ceruſæ* ℥j. *olei roſ.* ℥ij. *ſalis amnon.* ʒß *ſquam. æris* ʒij. *thur. alum. ærug. malicor. calcis vivæ, an.* ʒj. *fiat emplaſtrum.* Or ℞. *terebinth. lotæ* ℥ij. *ceræ albæ* ʒß *liqueſiant ſimul addendo ſublimati,* ʒß. *ſalis torrefacti, & vitrioli calcinati, an.* ℥j. *fiat mundificativum.* Or you muſt uſe our *Ægyptiacum* alone, which hath Sublimate entring into the compoſition thereof; but in the interim the circuit of the Vlcer muſt be defended with refrigerating, and defenſative things for feare of paine.

CHAP. IX.

Of a ſordide Vlcer.

A Sordide Vlcer after the cure of the body in generall, ſhall be healed with detergent medicines; the indication being drawne from the groſſe and tough excrement, which with the excrementious *Sanies*, as it were beſieging, and blocking up the ulcerated parts, weakens and as it were dulls the force of medicines though powerfull, which cauſeth us to beginne the cure with fomentations and lotions as thus.

℞. *Lixivij com.* ℔. j. *abſinth. marrub. appij. centaur. utriuſque, hypericonis, an. M. ſſ. coquantur, colaturæ, quæ ſufficiat, adde mellis roſati* ℥j. *unguenti ægyptiaci* ʒß. *fiat fotus.* Then uſe the following deterſive medicine: ℞. *ſucci appij, & plantag. an.* ℥ij. *mellis com.* ℥j. *terebinth.* ℥iß. *pul. Ireos Florent. & aloes. an.* ʒß. *fiat medicamentum.*

A detergent lotion.

The Chirurgion muſt wel conſider, at how many dreſſings he ſhall be able to waſh

Detergent medicines without acrimony.

A caution very obſervable in uſe of detergent things.

A diſtinction to be obſerved concerning the impurity of ulcers.

Diligent regard muſt be had of the patients bodies and the affected parts.

away the groſſe *ſordes* or filth ſticking cloſe to the Vlcer, and dry up the excrementitious *ſanies*. For oft times theſe things may be done at one dreſſing; but in others who have more quicke ſenſe or feeling, not ſo ſoone. But when the Vlcer is freed of ſuch groſſe *Sordes* or filth, you muſt forbeare to uſe more acride things for feare of paine, defluxion, inflammation, and eroſion, whereby the Vlcer would become more hollow. Wherefore then we ſhall bee content to apply remedies which dry and cleanſe without acrimony, that wee may ſo helpe natures endeavours in generating fleſh. Such remedies are the pouders of Aloes, Maſtich, Myrrhe, Orris, Litharge, Antimony, roots of Gentian, Barly flower, and the like, which being ſtrewed upon the Vlcer, you ſhall cover it with Lint, and put over that a plate of Lead, rubbed over with quickſilver; and you ſhall put on theſe deterſives and deſiccatives more or leſſe ſtrong, as you ſhall finde it requiſite and neceſſary. For the too plentifull uſe of drying and deterſive things, doth in time hollow the Vlcers, whereby it comes to paſſe that in ſhort time in like ſort, a greater quantity of *Sanies* flowes from the Vlcer, the proper ſubſtance of the fleſh being diſſolved by the force or acrimony of the deterſive medicine; as alſo the proper alimentary humor, which flowed to the part, being in like ſort, a greater quantity of *Sanies* flowed from the Vlcer, the proper ſubſtance of the fleſh being diſſolved by the force or acrimony of the deterſive medicine, as alſo the proper alimentary humor, which flowed to the part, being in like ſort defiled: which thing beguiles the unskilfull Chirurgion. For by how much he ſees the Vlcer flow more plentifully with *ſanies*, he endeavours by ſo much the more to exhauſt and dry up with more acrid medicines theſe humidities as if they were excrementitious; But *Galen* hath long agoe admoniſhed us to take heede hereof, ſetting forth a Hiſtory of a certaine Empericke who dreſſing a ſordide Vlcer with a greene, acrid and eating medicine, diſſolved the fleſh, and ſo conſequently made the Vlcer more hollow, and cauſed more paine and defluxion; whereby it happened that continually adding more acrid medicines, hee continually by his ignorance and unskilfulneſſe increaſed the colliquation of the fleſh, the largeneſſe of the ulcer and excrementitious humidity. Wherefore wee muſt take ſpeciall care, whether the ſordide Vlcer grow each day worſe, by its proper fault and the impurity of the whole body beſides, or elſe by the colliquation of the fleſh and corruption of the benigne and alimentary humor ſent thither for the nutrition of the part, by the too frequent and unskilfull uſe of too acrid a medicine. You may conjecture this by the increaſe of the paine without reaſon, and by the heate and redneſſe of the lips of the Vlcer. Therefore you muſt principally have regard to this, that you give each of your patients his fit meaſure, that is, a convenient and agreeable medicine to each of their ſtrengths, taking indication from the ſtrength, diſtemper, and conſiſtence of the whole body and affected part; for there is a great deale of difference whether you apply a medicine to a plowman or labourer, or to an Eunuch and woman, or whether to the Legge, or eyes. For theſe medicines which to a denſe and hard body and part are onely detergent and drying, the ſame are to delicate and tender bodies and parts cathæreticke and eating, by colliquation of the fleſh, and corruption of the nouriſhment, making an increaſe of *Sordes* or filth; on the contrary thoſe things which doe laudibly and ſufficiently clenſe the fleſh in a ſoft body and dryup the *ſanies*, theſe ſame things applyed to a hard body encreaſe the *ſordes* and *ſanies* by ſuffering them to breed, neither are they of ſufficient power to waſh away the tenacious impurity of a denſe body. Wherefore the skilfull Chirurgion will ſee when he muſt betake himſelfe from too ſtrongly cleanſing and eating medicines, to theſe which are more milde.

CHAP. X.

Of a virulent, eating & maligne Vlcer which is termed Cacoëthes, *& of a Chironian Vlcer.*

How virulent and eating ulcers differ.

VIrulent and eating Vlcers differ not unleſſe in *magis* and *minus*, for we tearme it a virulent Vlcer which ſends forth a virulent *ſanies*, which is properly called *Virus*. This *Virus*, or virulency, when it becomes more maligne, gnawes and feeds upon the parts which lye under, and are adjoyning to the Vlcer, and makes an eating Vlcer. Such Vlcers are by *Galen* called *Dyſepulotica*, that is, difficultly to be cicatrized; for, ſaith he, it happens that the Vlcer is Dyſepuloticke, either for that the part affected may be vitiated either in the habit or temper thereof, ſo that it may corrupt the humor which flowes thither; ſuch an Vlcer is by a particular name tearmed *Cacoethes*; or for that by reaſon of the evill quality of the blood flowing thither and eating the part, the part affected being too moiſt cannot heale up. He further addes that a Chironian Vlcer is farre more maligne than theſe Vlcers which are tearmed *Cacoethe*.

Gal.Lib.4 de comp. med. ſec. genera.

How a chironian ulcer differs from an eating, ſee before, Cap.2.

For the cure; by reaſon that all theſe Vlcers have a large extent, for ſome are more maligne and ill to be cicatrized than otherſome; it is alſo neceſſary to have divers medicines ready and at hand diſtinct both in their faculties and the degrees thereof; ſo that it is no marvaile if they oft faile of their purpoſe, who with the ſame medicine dreſſe and thinke they ſhall heale all maligne Vlcers. This following medicine deſcribed by *Aſclepiades* is much commended by *Galen*.

℞. *ſquamæ æris, æruginis raſæ, an.* ℥j. *ceræ* ℔. ß. *reſinæ laricis.* ℥jß. *quæ liquari poſſunt aridis affundantur*, and make an emplaiſter to bee laid onely upon the Vlcer; for you muſt lay a defenſative about the Vlcer for feare of inflammation. But *Galen* ſaith, that the following Epuloticke of *Primion* excells the reſt, as that which to deſperate Vlcers, (which many have taken in hand and left as uncurable,) was of certaine and approoved uſe.

Gal,lib,4,ſec, gen,Cap,5.

℞ *ſorcos* ℥iij *aluminis ſciſſilis, calcis vivæ, an* ℥ij. *thuris, gallarum, an.* ℥iij. *ceræ,* ℔.j & ℥iij. *ſevi vitulini* ℔. j. & ʒvij. *olei veteris quantum ſufficit, fiat emplaſtrum.*

Gal,lib,1,de comp, med, ſec, gen,Cap,6,

CHAP. XI.

An advertiſement to the young Chirurgion touching the diſtance of times wherein maligne Vlcers are to be dreſſed.

TO ſhew the uſe of *Aſclepiades* his medicine deſcribed in the former Chapter, and convince the errour of theſe Chirurgions, who thinke they doe well for their patients, if they twiſe or thrice on a day dreſſe maligne Vlcers, I have heere thought good to digreſſe a little from my purpoſe and to interpoſe *Galens* authority. Rightly (ſaith *Galen*) hath *Aſclepiades* added theſe words to the formerly deſcribed medicine: And looſe this after three dayes, and foment the Vlcer, and faſten the ſame emplaiſter being waſhed, and apply it againe; for unleſſe the medicine adhere long to the skin, it will doe no good. Which thing notwithſtanding many Phyſitions have beene ignorant of, thinking if they wiped away the *Sanies* from the Vlcer thrice on a day, they ſhould doe better than thoſe who did the ſame but twice a day. But thoſe who dreſſe it but once a day, are reprooved by the patients as negligent. But they are much miſtaken; for you muſt remember, as we have delivered in moſt of our writings, that the qualities of all neighbouring bodies do mutuall actuate and affect each other in ſome degree, although the one thereof bee much more powerfull; for by this reaſon in ſpace of time they become ſomewhat alike, though they otherwiſe differ much; But when the quality of the medicine ſhall bee like in *ſpecies* to the body to bee cured, there followes the better ſucceſſe. Wherefore he which moved by theſe reaſons firſt appointed to uſe the emplaſter formerly applyed, is worthy of commendations; and we ought to follow him much the rather, ſeeing that which he found out by reaſon, is approoved by experience. Neither did he unadviſedly command to foment the wound every third day, that is, at every dreſſing; for ſeeing it is a powerfull medicine, therefore it ſtands in neede of mitigation. Thus much *Galen*, whoſe opinion grounded on reaſon, he can againe confirme with another reaſon. It is already ſufficiently knowne, that medicines can doe nothing in us unleſſe by the force of the native heate, which ſtirres up the faculty of the medicine to operation. But in Vlcers which are abſolutely maligne, the native heate of the affected part is very languid, being broken

Gal,lib,4,de comp, med,ſec, gen:Cap,5.

Galens reaſon further explained.

broken and debilitated by the preſence of the preternaturall heate; ſo that it ſtands in need of a great ſpace of time to actuate the vertue and faculty of the medicine. Wherefore, if in that time, when as the native heate hath much moved and ſtirred up the faculty of the medicine, the ulcer be looſed or opened, and that emplaiſter caſt away which was layd upon the part, and a freſh one layd in ſteede thereof; the heate implanted in the part is either diſſipated by the contact of the ayre, or is weakned and driven in; and that endeavour which was made by the emplaiſter was to no purpoſe, being as it were ſtopped in the midſt of the courſe. But a new emplaiſter being layd on, the heate of the part muſt undergoe a new labour, ſo to ſtirre up the faculty to bring it to act.

Medicines are onely ſuch in faculty.

For all medicines are, what they are, in faculty. Equall to this is their errour, who by too oft renewing their emplaiſters on the ſame day, doe too powerfully clenſe; for ſo they doe not onely take away the excrementitious humors, both *Sordes* and *Sanies*, but alſo the alimentary juice; to wit, the *Rob*, *Cambium*, and *Gluten*, which are the next matter for procreating of laudible fleſh. Wherefore it is not good to dreſſe Vlcers ſo often in one day, and to looſe them to apply new emplaiſters, unleſſe ſome grievous ſymptome (as paine) force us to doe it, which requires to be aſſwaged and mittigated by the often changing and renewing of Anodyne medicines.

CHAP. XII.

How to binde up Vlcers.

The beginning of your binding muſt be at the Vlcer.

Hip. lib. de ulc.

Revulſion into contrary parts.

FOr the binding up of Vlcers, you muſt alwayes beginne your bandage at the Vlcer. Now the Rowler muſt be ſo large that it may not onely cover and comprehend the Vlcer, but alſo ſome portion of the adjacent parts above and below; and let it preſſe the Vlcer with that moderation, that it may only preſſe out the excrementitious humors. For ſo the ulcer wil become dry, and conſequently more neere to healing, as it is obſerved by *Hippocrates*. Let this be the meaſure of your binding, that it be neither too ſtraite for hence would enſue paine and defluxion; nor too laxe, for ſuch is of no uſe. You may moyſten your boulſters and Rowlers in oxycrate or in red and aſtringent wine, eſpecially in Summer; when you have bound it up the part muſt be kept quiet. For according to *Hippocrates*, thoſe who have an ulcer in the legge, ought neither to ſtand, nor ſit, but to lye on a bed. Wherefore when the legges are ulcerated the armes muſt be exerciſed, by handling, lifting up and caſting downe of divers things. But on the contrary if the armes be ulcerated, the legges muſt be exerciſed with walking, or frictions from above downewards, if the patient cannot endure to walke. So the humors and ſpirits which with more violence and greater plenty runne downe to the part affected, may be drawne backe and diverted.

CHAP. XIII.

Of the cure of particular ulcers, and firſt of thoſe of the eyes.

4. Methodi.

FOr that (in *Galens* opinion) the diverſe indication in curing diſeaſes is drawne from the condition of the part, to wit, the temper, complexion, ſite, figure, uſe, dull or quicke ſenſe; Therefore having breefely handled the generall cure both of ſimple and compound and implicite ulcers, I thinke it fit to treate of them now as they are diſtinguiſhed by the parts, beginning with theſe of the eyes. Theſe according to *Celſus*, are ſometimes cauſed by puſtules, or a ſharpe defluxion which frets or eates in ſunder the coates thereof, or elſe by a ſtroake.

Lib. 6. cap. 6. lib. 3. Botryon. Caloma.

Paulus ſets downe theſe differences of the ulcers of the eyes; If (ſaith he) a ſmall, little and hollow ulcer be upon the horny coate, it is by the Greekes termed *Botryon*; but if it be broader and leſſe deepe, it is termed *Caloma*; about the circle of the *Iris* or

Rainebow, it is called ***Argemon.*** If it be cruſty and ſordid, it is termed ***Epicauma.*** Theſe in generall require the ſame cure as the former, that is, to bee mundified, incarnated, dryed and cicatrized; but the part affected indicates more gentle medicines. Wherefore having purged the patient and taken ſome blood both from his arme, as alſo from his veines and temporall Arteries, and bathed him if it be needfull; to divert the defluxion you ſhall to his ſhoulders apply cupping glaſſes with ſcarrification; or elſe bread newly drawne out of the oven, and ſprinkled with *aqua vitæ* or ſome good wine ſhall be applyed to the originall of the ſpinall marrow. But you ſhall apply to the forehead and temples an aſtringent emplaiſter made of *emplaſtrum contra rupturam, ung Comitiſſæ, and Reſiccativum rubrum* mixed together. But this enſuing *Collyrium* deſcribed by *Celſus* and approved by *Hollerius*, ſhall be dropped into the eye. ℞. *æris uſti, cadmiæ uſtæ & lotæ, an.* ℥j. *ex aqua fingatur collyrium quod liquore ovi diſſolvatur.* But in the meane time you muſt diligently obſerve whether you put the eye to any great paine. Wherefore now and then by putting anodyne medicines thereto, it will be good to comfort it. Alſo you may make *collyria* of the decoction of Plantaine, fænugreeke, wormewood, with a little quantity of Sugar Candy, *tutia*, gumme *tragacanth*, myrrhe and vitrioll diſſolved therein. When the ulcer is mundifyed, the following ſarcoticke will be of good uſe.

Argemon.
Epicauma.
The cure.

℞. *ſarcocollæ in lacte muliebri nutritæ,* ʒiij. *pul. diaireos ſimplicis, gum. arabici, tragacanth. an.* ʒß. *mucilaginis fænugræci quantum ſufficit ut inde fiat collyrium.* But you muſt note that for moyſt Vlcers, powders are more convenient than *Collyria.*

A *Collyrium* to clenſe the Vlcers of the eyes.

A ſarcoticke *Collyrium.*

When the ulcer is playned or filled with its proper fleſh, it may bee cicatrized with the following *collyrium.* ℞. *tutiæ, cadmiæ ut decet præparatæ, ceruſæ, antimonÿ, olibani, an.* ʒß. *myrrhæ, ſarcocollæ, ſanguinis Draconis, aloes, opÿ, an.* ℈ß. *cum aqua plantaginis fiat collyrium*; or the powder onely may be conveniently ſtrewed thereon.

An epulotick *Collyrium.*

Celſus hath noted that the cicatrizing of the eyes is incident to two dangers, that is, leaſt they be too hollow, or elſe too thick. If too hollow, they muſt be filled by the following remedy, ℞. *Papaveris lachrimæ,* ʒß. *ſagapeni, opopanacis, an.* ʒß. *æruginis* ʒj. *cumini* ʒiij. *piperis* ʒij. *cadmiæ lotæ & ceruſæ, an.* ʒiß. *cum aqua pluviali fiat collirium.* But if the ſcars be thicke or groſſe, the following remedy will extenuate them. ℞ *cinamom. acaciæ, an.* ʒß. *cadmiæ elotæ, croci, myrrhæ, papaveris lachrymæ, gum. arabici, an.* ʒj *piperis albi, thuris, an.* ℥iß. *æris combuſti,* ʒiij. *cum aqua pluviali fiat collyrium.* But if the ſcarre be upon the *cornea* or horny coate, ſo that it cover the *pupilla* or ſight, the ſight will be intercepted by the denſeneſſe of the membrane. Here you muſt alſo obſerve, that the ſcarres that are on the *Cornea* are white, but theſe on the *Adnata* are red, becauſe this is ſpred over with more little veines than that.

Lib. 6. cap. 6.

A *Collyrium* for hallow ſcarres.

The ſcarres of the Horny coat are white and theſe of the *Adnata* red.

Chap. XIIII.

Of the Ozæna *and Vlcers of the Noſe.*

THe *Ozæna* is a deepe and ſtinking Vlcer in the inſide of the noſe, ſending forth many cruſty and ſtinking excrements. *Celſus* ſaith that ſuch ulcers can ſcarſely be healed. It is cauſed (as *Galen* ſaith) by the diſtillation of acride and putride humors from the head into the noſethrills about the mammillary proceſſes. For the cure, the patient muſt eate ſparingly, and his meate muſt neither be ſharpe nor ſtrong; the humor being prepared muſt be purged; the head dryed and ſtrengthened, that ſo it may neither admit the excrementitious humors, nor ſend them downe; then muſt we come to the part affected with the Vlcer. The Vlcer muſt be dryed with a repelling medicine, ſuch as is the juice of Pomegranats boyled to the halfe in a braſſe veſſell; the powder of Calamint, Creſſes, white Hellebore, the juyce of Creſſes with Alume and other things which you may reade in *Celſus.*

Lib. 6. cap. 8.
Ga. Lib. 3. de comp. med. ſecund. locos cap. 3.
The cure.

Galen out of *Archigenes* wiſhes, to draw up into the noſethrills the juyce of Calamint, or that the Calamint it ſelfe being dryed, and made into powder, may bee blowne with a quill into the noſe. Others uſe this following powder. ℞. *roſ. rub.*

mint. calam. arom. rad. angelicæ, gentian. macis, caryop. an. ʒß. *camph. ambræ, an. gr.* iiij. *moſch. gr.* vj. *fiat pulvis ſubtiliſsimus. Manardus* writes that the Vrine of an Aſſe, though a naſty medicine, is an excellent remedy in this affect. But if the inveterate and contumacious evill doe not yeeld to theſe remedies, then you muſt have recourſe to Coproſe, Verdigreece, *ſal ammoniacum*, and Alume with Vinegar. It divers times happens that the Vlcer ſpreading on, comes to take hold of the *Oſſa ethmoidea* or ſive-like bones; in which caſe you muſt not forcibly plucke them out; but referre the whole buſineſſe to nature, and expect when they ſhall come away of themſelves, making in the meane while injections into the noſethrils of *aqua vitæ*, wherein Cephalicke pouders have beene ſteeped for the greater drying.

Lib. 20. epiſt. 5.

An injection when the *Ozæna* ſhall come to the *Oſſa Ethmoidea.*

CHAP. XV.

Of the Vlcers of the mouth.

Aph. 24, ſect. 3 Celſus lib, 6, cap, 11. Gal. com, ad 3, lib. epidem:

OF this tribe are the *Aphthæ*, Vlcers familliar to little children, according to *Hippocrates*. They oft times beginne at the gums, and by the palate of the mouth creepe into the *uvula*, throtle, and over all the mouth, as *Celſus* ſaith. *Galen* makes two kinds of *Aphtha's*, the one of eaſie cure, ſuch as that which uſually troubles children by reaſon of the acrimony of the nurſes milke; the other is maligne by reaſon of an affluxe of an evill humor (that is, venenate and maligne) into the mouth.

The cure.

For the cure, it ſhall be good to abſtaine from all acride things, and if it be a ſucking child, it will not be amiſſe to temper the nurſes milke with refrigerating meates, bathing the whole body, and fomenting the dugges with warme water; for all the members in children are moſt tender, and as it were mucous, and their mouths are unaccuſtomed to meates and drinkes. For topicke medicines, you muſt make choiſe of ſuch which may quickely and readily worke the effect; for heere the condition of the affected part is ſuch, that they cannot long remaine and adheere thereto. Therefore if the Vlcer be maligne, it muſt be lightly touched with *aqua fortis* which hath beene uſed in ſeparating mettalls and which beſides is tempered with ſixe parts of common water. You may for the ſame purpoſe uſe the oyles of Vitrioll, Sulphur, Antimony, Mercury water and the like.

Aetius wiſhes you to touch and correct ſuch Vlcers with a locke of wooll dipped in ſcalding oyle, and ſo faſtened to the end of a probe, untill they waxe white and become ſmooth or plaine. For ſo their eating and ſpreading force will at length be bridled, and laudible fleſh grow up in place of that which is eaten. After ſuch burning it will be good to waſh the mouth with the following gargariſme, which alſo of its ſelfe alone will ſerve to cure Aphtha's, which are not maligne.

A gargariſme for the *Aphthæ.*

℞. *hordei integri p.* j. *plantag. ceterach, piloſellæ, agrimoniæ, an. M.* j. *fiat decoctio ad* ℔. j. *in qua diſſolve mellis roſati* ℥j. *diamoron*, ʒß. *fiat gargariſma.* You may alſo make other gargles, of Pomegranate pills, Balauſties, Sumach, Berberies, red roſes being boyled, and diſſolving in the ſtrayned liquor *Diamoron* and *Dianucum* with a little Alume. For *Galen* writes, that ſimple Vlcers of the mouth are healed with things which dry with moderation; now *Diamoron* and *Dianucum* are ſuch. But others ſtand in neede of ſtrong medicines, with ſuch like. If the palate be ſeazed upon, we muſt uſe the more diligence and care; for there is danger, leaſt being the part is hot and moyſt, the bone which lyes under which is rare and humide, may bee corrupted by the contagion and fall away, and the voyce or ſpeech be ſpoyled. If the Vlcer be pockie, omitting the common remedyes of Vlcers, you muſt ſpeedily betake your ſelfe to the proper antidote of that diſeaſe, to wit, quick-ſilver.

Lib. 6. meth. Cap. 10.

Vlcers of the palate muſt be quickely and carefully dreſſed.

Fiſtulous Vlcers often take hold on the Gummes, whence the roote of the next tooth becomes rotten, and ſo farre that the acrimonie of the *Sanies* oft times makes its ſelfe a paſſage forth on the outſide under the chinne; which thing puts many into a falſe conceite of the *ſcrophulæ* or Kings evill, and conſequently of an uncurable diſeaſe. In ſuch a caſe *Aëtius*, and *Celſus* counſell is, to take out the rotten tooth, for ſo

Aetius lib. 6. cap. 3. Celſus lib. 6. cap. 13.

the *Fiſtula* will be taken away, the Gum preſſing and thruſting its ſelfe into the place of the tooth which was taken forth; and ſo the cauſe nouriſhing the putrefaction being taken away, (that is, the tooth) the reſt of the cure will be more eaſy. The Vlcers of the tongue may be cured by the ſame remedies by which the reſt of the mouth; yet thoſe which breede on the ſide thereof endure very long, and you muſt looke whether or no there be not ſome ſharpe tooth over againſt it, which will not ſuffer the Vlcer in that place to heale; which if there be, then muſt you take it away with a file.

Chap. XVI.

Of the Vlcers of the Eares.

Their cauſes.

VLcers are bred in the auditory paſſage both by an externall cauſe, as a ſtroake, or fall, as alſo by an internall, as an abſceſſe there generated. They oft times flow with much matter, not there generated, for ſuch Vlcers are uſually but ſmall and beſides in a ſpermaticke part, but for that the braine doth that way disburden its ſelfe.

The cure.

For the cure, the cheefe regard muſt be had of the antecedent cauſe, which feedes the Vlcer, and it muſt be diverted by purging medicines, Maſticatories and Errhines. This is the forme of a Maſticatory. ℞. *Maſtic.* ʒj. *ſtaphiſagr. & pyreth. an.* ℈j. *cinam. & caryoph. an.* ʒß. *fiant Maſticatoria, utatur manè & veſperi.* But this is the forme of an Errhine. ℞ *ſucci betonic. mercurial: & meliſſæ, an* ℥ß. *vini albi* ℥j, *miſce & frequenter naribus attrahatur.* For topicke medicines we muſt ſhunne all fatty and oyly things, as *Galen* ſets downe *in Method. medendi*, where he findes fault with a certaine follower of *Theſſalus* who by uſing *Tetrapharmacum*, made the Vlcer in the eare grow each day more filthy than other, which *Galen* healed with the Trochiſces of *Andronius* diſſolved in Vinegar, whoſe compoſure is as followeth. ℞ *balauſt.* ʒij, *alumin.* ʒj, *atrament. ſutor.* ʒij, *myrrhæ.* ʒj, *thur. ariſtoloch. gallarum, an.* ʒj, *ſalis Ammon.* ʒj, *excipiantur omnia melicrato, & fiant trochiſci.* *Galen* in the ſame place witneſſeth, that he hath healed inveterate Vlcers and of two yeares old of this kind, with the ſcailes of Iron made into powder, and then boyled in ſharpe Vinegar untill it acquired the conſiſtence of Honey: Moreover an Oxes gall diſſolved in ſtrong Vinegar, and dropped in warme, amends and dryes up the putrefaction wherewith theſe Vlcers flow. Alſo the ſcailes of Iron made into powder boyled in ſharpe Vinegar, dryed and ſtrewed upon them. But if the ſtraitneſſe of the paſſages ſhould not give leave to the matter contained in the windings of the eares to paſſe forth, then muſt it bee drawne out with an Inſtrument thereupon called a *Pyoulcos*, or matter-drawer, whereof this is the figure.

A maſticatory.

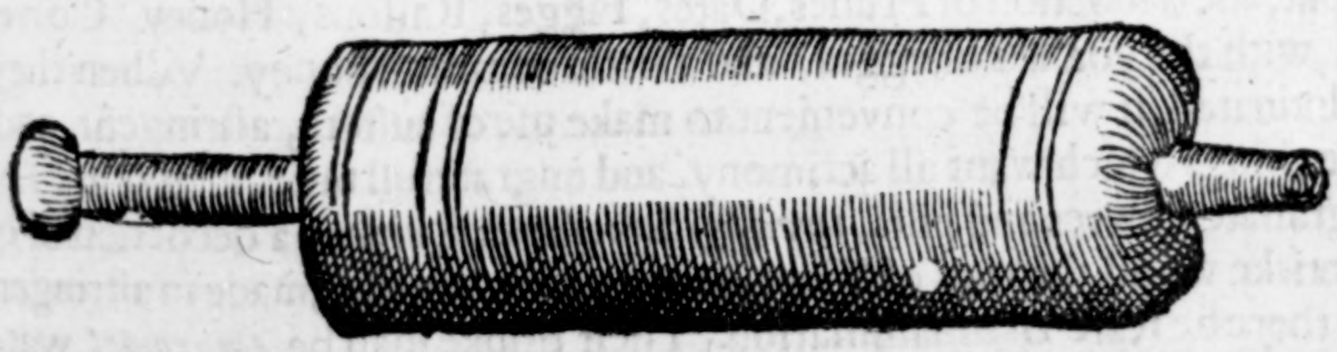
An Errhine.

The compoſition of *Andronius* his trochiſces.

Scailes of Iron.

Of the *Pyoulcos* *Galen* makes mention 2 *ad Glauconem*.

The figure of a Pyoulcos, *or matter-drawer.*



CHAP.

CHAP. XVII.

Of the Vlcers of the windpipe, weaſon, ſtomacke and Gutts.

The Cauſes.

THeſe parts are ulcerated either by an externall cauſe as an acride medicine, or poyſon ſwallowed downe; or by an internall cauſe, as a maligne fretting humor which may equall the force of poyſon generated in the body, and reſtrained in theſe parts.

Signes.

If the paine be encreaſed by ſwallowing or breathing, it is the ſigne of an Vlcer in the weazon, or windepipe joyning thereto; But the paine is moſt ſenſibly felt when as that which is ſwallowed is either ſoure or acride, or the ayre breathed in, is more hot or cold than ordinary. But if the cauſe of paine lye faſtened in the ſtomacke, more greevous ſymptomes urge; for ſometimes they ſwound, have a nauſeous diſpoſition and vomiting, convulſions, gnawings, and paine almoſt intollerable, and the coldneſſe of the extreame parts; all which when preſent at once, few ſcape unleſſe ſuch as are young, and have very ſtrong bodyes. The ſame affect may befall the whole ſtomacke, but becauſe both for the bitterneſſe of paine, and greatneſſe of danger, that Vlcer is farre more greevous which takes hold of the mouth of the Ventricle, honoured by the Ancients with the name of the heart;

Gal. lib. 5. de loc. affect. cap. 5.

therefore Phyſitions doe not make ſo great a reckoning of that which happens in the lower part of the ſtomacke. Now we know that the Guts are ulcerated if *Pus*, or much purulent matter come forth by ſtoole; if blood come that way with much griping; for by the *Pus* ſtaying and as it were gathered together in that place, there is as it were a certaine continuall *Teneſmus*, or deſire to goe to ſtoole, Now all ſuch Vlcers are cured by meates and drinkes, rather than by medicines, according to *Galen*.

Lib. 4. & 5. Method.

The cure.

Therefore you muſt make choyſe of all ſuch meates and drinkes as are gentle, and have a lenitive faculty, ſhunning acride things; for *Tutia*, Lytharge, Ceruſe, Verdigreece and the like, have no place heere, as they have in other Vlcers. But when as the Vlcer ſhall be in the Gullet or Weazon, you muſt have a care that ſuch things may have ſome viſcidity or toughneſſe, and be ſwallowed by little, and little, and at diverſe times; otherwiſe they will not much availe, becauſe they cannot make any ſtay, in theſe commune wayes of breath and meat; therefore they preſently ſlip downe and flow away;

How to take medicines for Vlcers of the throate.

wherefore all ſuch things ſhall be uſed in forme of an *Eglegma*, to be taken lying on the backe, and ſwallowed downe by little and little, opening the muſcles of the throate, leaſt the medicine paſſing downe ſodainely and in great quantity, cauſe a cough, a thing exceeding hurtfull to theſe kinds of Vlcers. When they muſt be clenſed, you ſhall have crude honey, which hath a ſingular faculty, above all other detergent things, in theſe kind of Vlcers. But when they can conveniently ſwallow, you ſhall mixe Gumme Tragacanth diſſolved in ſome aſtringent decoction.

Why acride things muſt be ſhunned in theſe Vlcers.

In Vlcers of the ſtomacke all acride things (as I have formerly adviſed) muſt be ſhunned, as thoſe which may cauſe paine, inflammation and vomite, and beſides hinder the digeſtion of the meate. Therefore let them frequently uſe a ptiſan, and ſugered gellyes wherein Gumme Tragacanth, and bole Armenicke have beene put, the decoction of Prunes, Dates, Figges, Raiſons, Honey, Cowes milke boyled with the yoalkes of egges, and a little common honey. When they are to be agglutinated, it will be convenient to make uſe of auſtere, aſtringent, and agglutinative things which want all acrimony, and ungratefull taſte, ſuch as are *Hypociſtis*, Pomegranate flowres and pills, *terra ſigillata, ſumach, acacia*, a decoction of quinces, the Lentiske wood, the tops of Vines, of brambles, myrtles, made in aſtringent wine, unleſſe there be feare of inflammation. Their drinke ſhall be *Hydromel* water with Sugar, ſyrupe of Violets and Iujubes.

How powerfull Honey is to cure ſuch kind of Vlcers.

Honey mixed with other medicines is a very fitting remedy for Vlcers of the guts and other parts more remote from the ſtomacke; for if you ſhall uſe aſtringent medicines alone of themſelves, they will ſticke to the ſtomacke; neither will they carry their ſtrength any further; but honey mixed with them, beſides that it diſtributes them to the reſt of the body, and helpes them forwards to the affected parts; alſo clenſes the Vlcers themſelves. Here alſo Aſſes milke may with good ſucceſſe be uſed in ſtead of Goates or Cowes milke. The uſe of a vulnerary potion is alſo commendable, if ſo bee that it bee made of ſuch hearbes and ſimples, as by a certaine tacite familiarity have reſpect to the parts affected. But the Vlcers of the Guts have this difference amongſt themſelves, that if the greater guts be affected, you may heale them with a Glyſter and injections, made alſo ſharpe to correct the putrefaction; ſuch as are thoſe which are made of Barly water, or wine with *Ægyptiacum*. But if the ſmall guts be ulcerated, they muſt bee rather healed by potions and other things taken at the mouth, for that (as *Galen* ſaith) theſe things which are put up into the body by the Fundament, doe not commonly aſcend to the ſmall or ſlender guts, but ſuch as are taken at the mouth cannot come unleſſe with the loſſe of their faculty, ſo farre as the great guts.

Egyptiacum good for the Vlcers of the greater guts. *Lib.5.meth.*

CHAP. XVIII.

Of the Vlcers of the Kidneyes and Bladder.

Cauſes.

VLcers are cauſed in the Kidnyes and Bladder, either by the uſe of acride meates, drinkes, or medicines, as *Cantharides*; or elſe by the collection of an acride humor bred in that place, ſent or falne thither; or elſe by the rupture of ſome veſſell, or an abſceſſe broken and degenerated into an Vlcer, as it ſometimes comes to paſſe. They are diſcerned by their ſite, for the paine and heavineſſe of Vlcers of the Reines comes to the Loynes, and the *Pus* or matter is evacuated well and throughly mixed with the Vrine.

Signes.

Hip Aphor.81 ſect.4.

Neither doth the *Pus* which flowes from the reines ſtinke ſo ill, as that which is caſt forth of the bladder; the reaſon is, for that the bladder being a bloodleſſe, fleſhleſſe & membranous part, hath not ſuch power to reſiſt putrefaction. That *pus* which flowes from the Kidneyes never flowes without water; and although by long keeping in an Vrinall, it at length ſubſides or falls to the bottome, and may be ſeene ſeparated; yet when it is firſt made, you may ſee it perfectly mixed with the Vrine; but that *Pus* w^{ch} flowes from the bladder is oft times made alone without Vrine; & uſually it comes to paſſe that the *Pus*, or matter which flowes from the ulcerated Kidnyes, hath in it certaine caruncles, or as it were haires, according to the rule of *Hippocrates*: Thoſe who in a thicke Vrine have little caruncles, and as it were haires come forth together therewith, they come from their Kidnyes; but on the contrarie thoſe who have certaine bran-like ſcailes come from them in a thicke Vrine, their bladder is ſcabby or troubled with a ſcabby Vlcer.

Aphor.76. ſect.4.

Aphor.77. ſect.4.

The cure.

For the cure; it is expedient that the belly be ſoluble either by nature or Art, and the uſe of mollifying Glyſters. And it is good to vomit ſometimes, ſo to draw backe the humors by whoſe confluxe into the affected part the Vlcer might bee fed and made more ſordide and filthy. You muſt beware of ſtrong purgations, leaſt the humors being moved and too much agitated, the matter fit to nouriſh the Vlcer may fall downe upon the Kidnyes or bladder. The enſuing potion is very effectuall to mundifie thoſe kind of Vlcers.

Why we muſt ſhunne ſtrong purges.

Things to clenſe theſe Vlcers.

℞. *Hordei integri, M.* ij. *glycyrrhizæ raſ. & contuſ.* ℥ß. *rad. acetoſæ & petroſel. an.* ʒvj. *fiat decoctio ad* ℔. j. *in colatura diſſolve mellis diſpum.* ℥ij. Let him take every morning the quantity of foure Ounces. *Gordonius* exceedingly commends the following Trochiſces. ℞. *quator ſem. frig. maj. mundatorum, ſem. papaveris albi, ſem. malva, portul. cydon. baccarum myrti, tragacanth. gum. arab. nucum pinearum mund. piſtach. glycyrrhizæ mund. mucaginis ſem. pſilij, amygd. dulc. hordei mund, an.* ʒij. *bol. armeni, ſang. drac. ſpodij, roſarum, myrrhæ an.* ℥ß. *excipiantur hydromelite, & fingantur trochiſci ſinguli ponderis* ʒij. Let him take one thereof in the morning diſſolved in Barly water or Goates milke. *Galen* bids to mixe honey and diureticke things with medicines made for the Vlcers of the Reines and bladder, for that they gently move Vrine, and are as vehicles to carry the medicines to the part affected. Vlcers of the bladder are either in the bottome thereof, or at the necke and urinary paſſage.

Trochiſces for the Vlcers of the Kidnyes and bladder.

4. Method.

If they be in the bottome, the paine is almoſt continuall; if in the necke, the paine then prickes and is moſt terrible when they make water and preſently after. The Vlcer which is is the bottome ſends forth certaine ſcaly or skinny excrements together with the Vrine; but that which is in the necke, cauſes almoſt a continuall *Tentigo*. Thoſe which are in the bottome are for the moſt part incurable, both by

Signes to know what part of the bladder is ulcerated.

Why ulcers in the bottome of the bladder are uncureable.

reaſon of the bloodleſſe and nervous nature of the part, as alſo for that the Vlcer is continually chaſed and troubled by the acrimony of the Vrine, ſo that it can hardly be cicatrized. For even after making of water ſome reliques of the Vrine alwayes remaine in the bottome of the bladder, which could not therefore paſſe forth together with the reſt of the Vrine, for that for the paſſing forth of the Vrine, the bladder being diſtended before, falls and is complicated in its ſelfe. Vlcers of the bladder are healed with the ſame medicines as thoſe of the reines are; but theſe not onely taken by the mouth but alſo injected by the urinary paſſage. Theſe injections may be made of *Gordonius* his Trochiſces formerly preſcribed, being diſſolved in ſome convenient liquor; but becauſe Vlcers of the bladder cauſe greater and more ſharpe paine than thoſe of the Kidnyes, therefore the Chirurgion muſt bee more diligent in uſing Anodynes. For this purpoſe, I have often by experience found, that the oyle of hen-bane made by expreſſion gives certaine helpe. Hee ſhall doe the ſame with Cataplaſmes and liniments applyed to the parts about the *Pecten* and all the lower belly and *perinæum*, as alſo by caſting in of Gliſters. If that they ſtinke, it will not be amiſſe to make injection of a little *Ægyptiacum* diſſolved in wine, plaintaine or roſe water. For I have often uſed this remedy in ſuch a caſe with very proſperous ſucceſſe.

Egyptiacum for the ulcers of the bladder.

Chap. XIX.

Of the Vlcers of the wombe.

The cauſes.

Lib. 3. ſect. 12. tract. 2, cap. 5.

Signes.

VLcers are bred in the wombe either by the confluxe of an acride, or biting humor, fretting the coates thereof, or by a tumor againſt nature degenerating into an Abſeſſe, or by a difficult and hard labour; they are knowne by paine at the *perinæum*, and the effluxe of *Pus* and Sanies by the privity All of them in the opinion of *Avicen* are either putride, when as the *Sanies* breaking forth is of a ſtinking ſmell, and in colour reſembles the water wherein fleſh hath beene waſhed; or elſe ſordide, when as they flow with many virulent and crude humors; or elſe are eating or ſpreading Vlcers, when as they caſt forth blacke *Sanies*, and have pulſation joyned with much paine. Beſides they differ amongſt themſelves in ſite, for either they poſſeſſe the necke and are known by the ſight, by putting in a *ſpeculum*; or elſe are in the bottome, and are manifeſted by the condition of the more liquid and ſerous excrements, and the ſite of the paine.

The cure.

Why ſtrongly drying things are good for Vlcers of the wombe.

An iniection for an Vlcer in the bottome of the wombe.

An injection hindring putrefaction.

They are cured with the ſame remedies wherewith the ulcers of the mouth to wit, with *aqua fortis*, the oyle of Vitrioll and antimony, and other things made ſomewhat more milde, and corrected with that moderation, that the ulcerated parts of the wombe may bee ſafely touched with them; it is requiſite that the remedies which are applyed to the Vlcers of the wombe, doe in a moment that which is expected of them, for they cannot long adhere or ſticke in the wombe, as neither to the mouth. *Galen* ſaith that very drying medicines are exceeding fit for the Vlcers of the wombe, that ſo the putrefaction may be hindred or reſtrained, whereto this part as being hot and moyſt is very ſubject; beſides that the whole body unto this part as unto a ſinke ſends downe its excrements. If an ulcer take hold of the bottome of the wombe, it ſhall be cleanſed and the part alſo ſtrengthened by making this following injection. ℞ *hordei integri p.* ij. *guajaci.* ℥j. *rad. Ireos.* ʒß. *abſinth. plant. centaur. utriuſque, an. M.* j *fiat decoct. in aqua fabrorum ad* ℔. ij. *in quibus diſſolve mellis roſati, & ſyrupi de abſinthio, an.* ℥iij. *fiat injectio.* For amending the ſtinking ſmell I have often had certaine experience of this enſuing remedy. ℞. *vini rub.* ℔. j. *unguent. ægyptiaci* ℥ij. *bulliant parum.* Thus the putrifaction may be corrected and the painefull maliciouſneſſe of the humor abated. Vlcers when they are clenſed muſt preſently be cicatrized; that may be done with Alume water, the water of plantaine wherein a little vitrioll or Alume have beene diſſolved. Laſtly, if remedies nothing availing, the Vlcer turne into a *Cancer*, it muſt be dreſſed with anodynes and remedies proper for a *Cancer*, which you may finde ſet downe in the proper treatiſe of *Cancers*. The cure of Vlcers of the fundament was to bee joyned to the cure of theſe of the wombe; but I have thought good to referre it to the treatiſe of *Fiſtula's*, as I doe the cure of theſe of the vrinary paſſage to the Treatiſe of the *Lues venerea*.

Chap.

Chap. XX.

Of the Varices *and their cure by cutting.*

A *Varix* is the dilatation of a Veine, ſome whiles of one and that a ſimple branch, otherwhiles of many. Every *Varix* is either ſtraight or crooked, and as it were infolded into certaine windings within its ſelfe. Many parts of the body are ſubject to *Varices*, as the temples, the region of the belly under the Navill, the teſticles, wombe, fundament, but principally the thighes and legges. The matter of them is uſually melancholy blood, for *Varices* often grow in men of a malancholy temper, and which uſually feed on groſſe meates, or ſuch as breed groſſe and melancholy humors. Alſo women with child, are commonly troubled with them, by reaſon of the heaping together of their ſuppreſſed menſtruall evacuation. The precedent cauſes are a vehement concuſſion of the body, leaping, running, a painefull journey on foote, a fall, the carrying of a heavy burden, torture or Racking. This kind of diſeaſe gives manifeſt ſignes thereof by the largeneſſe, thickneſſe, ſwelling and colour of the Veines.

What a *Varix* is and what be the differences thereof.

The matter;

The cauſes;

Signes,

It is beſt not to meddle with ſuch as are inveterate; for of ſuch being cured there is to be feared a refluxe of the melancholy blood to the noble parts, whence there may be imminent danger of maligne Vlcers, a Cancer, Madneſſe or ſuffocation.

The cure,

When as many *Varices* and diverſly implicite are in the legges, they often ſwell with congealed and dryed blood, and cauſe paine which is increaſed by going and compreſſion. Such like *Varices* are to be opened by dividing the veine with a Lancet, and then the blood muſt be preſſed out, and evacuated by preſſing it upwards and downewards; which I have oft times done, and that with happy ſucceſſe to the patients, whom I have made to reſt for ſome few dayes, and have applyed convenient medicines. A *Varix* is often cut in the inſide of the legge a little below the knee, in which place commonly the originall thereof is ſeene. He which goes about to intercept a *Varix* downewards from the firſt originall and as it were fountaine thereof, makes the cure far more difficult. For hence it is divided as it were into many rivelets, all which the Chirurgion is forced to follow.

The cutting of *Varices*

A *Varix* is therfore cut or taken away ſo to intercept the paſſage of the blood and humors mixed together therewith, flowing to an Vlcer ſeated beneath; or elſe leaſt that by the too great quantitie of blood, the veſſell ſhould be broken, and death bee occaſioned by a hæmorrhagie proceeding from thence. Now this is the manner of cutting it. Let the patient lye upon his backe on a bench or table, then make a ligature upon the legge in two places the diſtance of ſome foure fingers each from other, wherein the exciſion may be made, for ſo the Veine will ſwell up and come more in ſight, and beſides you may alſo marke it with inke; then taking the skin up betweene your fingers cut it longwayes according as you have marked it, then free the bared veine from the adjacent bodies; and put thereunder a blunt pointed needle (leaſt you pricke the veine) thred with a ſtrong double thred, and ſo binde it faſt; and then let it be opened with a Lancet, in the middle under the Ligature juſt as you open a veine, and draw as much therehence as ſhall be fit. Then ſtraight make a Ligature in the lower part of the forementioned Veine, and then cut away as much of the ſayd Veine as is convenient betweene the Ligatures, and ſo let the ends thereof withdraw themſelves into the fleſh above and below; let theſe ligatures alone untill ſuch time as they fall away of themſelves. The operation being performed, let an aſtringent medicine be applyed to the wound and the neighbouring parts; neither muſt you ſtirre the wound any more for the ſpace of three dayes. Then doe all other things as are fit to be done to other ſuch affects.

For what intention a *Varix* muſt be cut.

Paulus cap. 82. *lib.* 6.
The manner how to cut it.

Chap. XXI.

Of Fiſtula's.

What a Fiſtula is.

A Fiſtula is a ſinuous, white, narrow, callous and not ſeldome unperceivable Vlcer. It tooke its denomination from the ſimilitude of a reeden (Fiſtula) that is, a pipe, like whoſe hollownes it is. A Fiſtula is bred in ſundry parts of the body, and commonly followes upon Abſceſſes or Vlcers not well cured.

What a Callousus.

The differences of Fiſtula's.

The ſignes.

The ſigne that the bone is bare from the condition of the matter which is caſt forth.

Aëtius tetra. 4. ſect. 2 cap. 55.

Old Fiſtula's if cloſed prove mortall.

A *Callous* is a certaine fleſhy ſubſtance, white, ſolid, or denſe and hard, dry and without paine, generated by heaping up of dryed excrementitious phlegme, or elſe aduſt melancholy, encompaſſing the circuite of the Vlcer, and ſubſtituting its ſelfe into the place of laudible fleſh. The *Sinus* or cavity of a Fiſtula is ſometimes dry, and otherwhile drops with continuall moiſture: ſometimes the dropping of the matter ſodainly ceaſes, and the orifice thereof is ſhut up, that ſo it may deceive both the Chirurgion and the Patient with a falſe ſhew of an abſolute cure; for within a while after it will open againe and run as formerly it did. Some Fiſtula's are bred by the corruption of a bone, others of a nerve, others of membranes, and others of other parts of the body. Some run ſtraight in, others and that the greater part, have turnings and windings; ſome have one, others have more orifices and windings; ſome are at the Ioynts, others penetrate into ſome capacity of the body, as into the cheſt, belly, guts, womb, bladder; ſome are eaſily, others difficultly cured, and ſome wholly uncurable. There are divers ſignes of Fiſtula's according to the variety of the parts they poſſeſſe; for if that which you touch with the end of your probe make reſiſtance, and reſound, then you may know that it is come to the bone; and then if the end of the probe ſlip up and downe as on a ſmooth and polite ſuperficies, it is a ſigne that the bone is yet ſound; but if it ſtop and ſtay in any place as in a rough way, then know that the bone is eaten, rough and periſhed; ſometimes the bone lies bare, and then you neede not uſe the probe. Beſides alſo it is a ſigne that the bone is affected, if there be a purulent efflux of an unctuous or oily matter, not much unlike that marrow wherewith the bone is nouriſhed. For every excrement ſhewes the condition of the nouriſhment of the part whence it is ſent; in a Fiſtula which penetrates to a Nerve, the patient is troubled with a pricking paine, eſpecially when you come to ſearch it with a probe, eſpecially if the matter which flowes downe be more acrid. Oft times if it be cold, the member is ſtupified the motion being weakned; beſides alſo the matter which flowes from thence is more ſubtle, and ſomewhat like unto that which flowes from the bones, yet not oily nor fat, but ſanious and viſcous reſembling the condition of the alimentary humor of the Nerves. The ſame uſually appeares and happens in Fiſtula's which penetrate to the Tendons and thoſe membranes which involve the muſcles. If the Fiſtula bee within the fleſh, the matter flowing thence is more thicke and plentifull, ſmooth, white and equall. If it deſcend into the Veines or Arteries, the ſame happen as in thoſe of the Nerves; but that there is no ſuch great paine in ſearching with your probe, nor no offence or impediment in the uſe of any member: yet if the matter of the Fiſtulous Vlcer be ſo acrid, as that it corrode the veſſells, blood will flow forth; and that more thicke if it be from a veine, but more ſubtle and with ſome murmuring if from an Artery. Old Fiſtula's and ſuch as have run for many yeares, if ſuddainly ſhut up, cauſe death, eſpecially in an ancient and weake body.

Chap. XXII.

Of the cure of Fiſtula's.

How to finde out the windings and cavities of Fiſtula's.

FOr the cure; in the firſt place it wil be expedient to ſearch the Fiſtula; & that either with a waxe ſize, a probe of lead, gold or ſilver, to find out the depth and windings or corners thereof. But if the Fiſtula be hollowed with two

or more orifices, and thoſe cuniculous, ſo that you cannot poſſibly and certainly ſearch or finde them all out with your probe; then muſt you caſt an injection into ſome one of theſe holes, and ſo obſerve the places where it comes forth, for ſo you may learne how many, and how deepe or ſuperficiary cavities there be; then by making inciſions you muſt lay open and cut away the callous parts. You muſt make inciſions with an inciſion knife or razour, or elſe apply actuall or potentiall cauteries; for nature cannot unleſſe the Callous ſubſtance bee firſt taken away, reſtore or generate fleſh or agglutinate the diſtant bodies. For hard things cannot grow together, unleſſe by the interpoſition of glue, ſuch as is laudible blood; but a callous body on all ſides poſſeſſing the ſurface of the ulcerated fleſh, hinders the flowing of the blood out of the capillary veines for the reſtoring of the loſt ſubſtance and uniting of the disjoyned parts. If you at any time make cauſticke injections into the Fiſtula, you muſt preſently ſtop the orifice thereof, that ſo they may have time to worke the effect, for which they are intended. Which thing we may conjecture by the tumor of the part, the digeſture of the flowing matter, and its leſſer quantity. Then you muſt haſten the falling away of the Eſchar, and then the Vlcer muſt be dreſſed like other Vlcers. But oft times the *Callous* which poſſeſſes the ſinuous cavity of a Fiſtula, overcome by the power of acrid and eſcharoticke medicines comes whole forth, and falls out like a pipe, and ſo leaves a pure Vlcer underneath it. Which I obſerved in a certaine Gentleman, when I had waſhed with ſtrong *Ægyptiacum* divers times a Fiſtulous Vlcer in his thigh ſhot through with a bullet; then preſently by putting in my Balſame formerly deſcribed, he grew well in a ſhort time. Fiſtula's which are neare great veſſells, Nerves or principall intrailes, muſt not bee medled with, unleſſe with great caution. When a Fiſtula proceeds by the fault of a corrupt bone, it is to be conſidered whether that fault in your bone be ſuperficiary, or deeper in, or whether it is wholly rotten and periſhed. For if the default be ſuperficiary it may eaſily be taken away with a deſquammatory Trepan; but if it penetrate even to the marrow, it muſt be taken forth with cutting mullets, firſt having made way with a *Terebellum*. But if the bone be quite rotten and periſhed, it muſt bee wholly taken away, which may be fitly done, in the joynts of the fingers, the *radius* of the Cubite and Legge; but no ſuch thing may be attempted in the ſocket of the Huckle bone, the head of the Thigh bone, or any of the Rack bones when they are mortified, neither in thoſe Fiſtula's, which are of their owne nature uncurable; but you ſhall thinke you have diſcharged your duty and done ſufficiently for the Patient, if you leave it with a prognoſticke. Of this nature are Fiſtula's which penetrate even to the bowells, which come into the parts oreſpread with large veſſells or Nerves, which happen to effeminate and tender perſons, who had rather dye by much, than to ſuffer the paine and torment of the operation. Like caution muſt bee uſed, when by the cutting of a Fiſtula there is feare of greater danger, as of convulſion if the diſeaſe be in a nervous part. In theſe and the like caſes the Chirurgion ſhall not ſet upon the perfect cure of the diſeaſe, but ſhall thinke it better to prevent by all meanes poſſible that the diſeaſe by freſh ſupplies become no worſe, which may bee done if he prevent the falling downe of any new defluxion into the part; if by an artificiall diet hee have a care that excrementitious humors be not too plentifully generated in the body; or ſo order it, that being generated they may be evacuated at certaine times, or elſe diverted from the more noble to the baſe parts. But in the meane ſpace it ſhall be requiſite to waiſt the faulty fleſh, which growes up more than is fitting in the Vlcer, and to clenſe the *ſordes* or filth, with medicines, which may doe it without biting or acrimony and putrefaction.

Cauſticke injections.

A palliative cure of a Fiſtula.

CHAP. XXIII.

Of the Fiſtula's in the Fundament.

FIſtula's in the Fundament are bred of the ſame cauſes as other kinds of Fiſtula's are; to wit, of a wound or abſceſſe not well cured, or of a hæmorrhoide which is ſuppurated. Such as are occult, may be knowne by dropping downe of the *ſanious* and purulent humor by the Fundament and the

The cauſes.

Signes.

the paine of the adjacent parts. But ſuch as are manifeſt by the helpe of your probe you may finde whither they goe and how farre they reach. For this purpoſe the Chirurgion ſhall put his finger into the Fundament of the patient, and then put a Leaden probe into the orifice of the Fiſtula, which if it come to the finger without interpoſition of any *medium*, it is a ſigne it penetrats into the capacity of the Gut. Beſides alſo then there flowes not onely by the fundament but alſo by the orifice which the maligne humor hath opened by its acrimony, much matter, ſomewhiles ſanious, and oft times alſo breeding Wormes. Fiſtula's may be judged cuniculous, and running into many turnings and windings, if the probe doe not enter farre in, and yet notwithſtanding more matter flowes therehence than reaſon requires ſhould proceede from ſo ſmall an Vlcer.

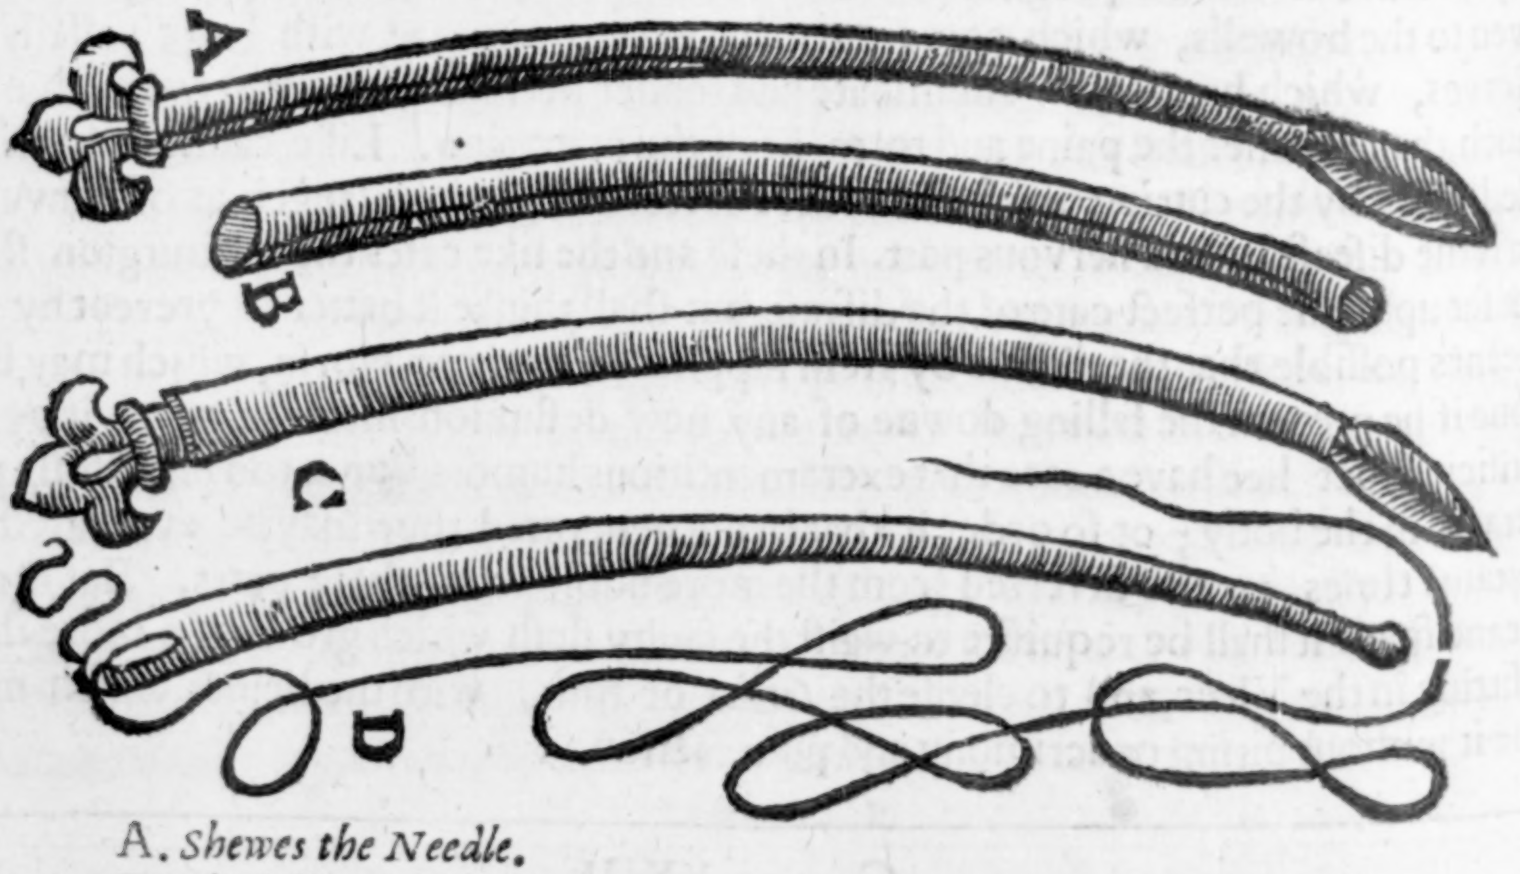
Symptomes.

The art of binding and cutting a Fiſtula of the Fundament.

You may in the orifices of all Fiſtula's, perceive a certaine callous wart, which the common Chirurgions tearme a Hens arſe. Many ſymptomes accompany Fiſtula's which are in the Fundament, as a *Teneſmus*, ſtrangury & falling downe of the Fundament. If the Fuſtula muſt be cured by manuall operation, let the patient lye ſo upon his backe, that lifting up his legges, his thighs may preſſe his belly, then let the Chirurgion, having his naile pared, put his finger beſmeared with ſome oyntment into the patients Fundament; then let him thruſt in at the orifice of the Fiſtula a thick Leaden needle drawing after it a thread conſiſting of thread and horſe haires woven together, and then with his finger taking hold thereof and ſomewhat crooking it, draw it forth at the Fundament, together with the end of the thread. Then let him knit the two ends of the thread with a draw or looſe knot, that ſo hee may ſtraiten them at his pleaſure. But before you bind them you ſhall draw the thread ſomewhat roughly towards you as though you meant to ſaw the fleſh therein conteined; that you may by this meanes cut the Fiſtula without any feare of an Hæmorrhagye, or flux of blood.

It ſometimes happens that ſuch Fiſtula's penetrate not into the Gut; ſo that the finger by interpoſition of ſome callous body cannot meete with the needle or probe. Then it is convenient to put in a hollow iron or ſilver probe ſo through the cavity thereof to thruſt a ſharp pointed needle, and that by pricking and cutting may deſtroy the *callous*; which thing you cannot performe with the formerly deſcribed leaden probe, which hath a blunt point, unleſſe with great paine.

The deſcription of a hollow Silver probe to be uſed with a needle, as alſo a Leaden probe.



A. *Shewes the Needle.*
B. *The hollow probe.*
C. *The needle with the probe.*
D. *The Leaden needle drawing a thread after it.*

The *Callus* being waiſted, the Fiſtula ſhall be bound as wee formerly mentioned That which is ſuperficiary needs no binding, onely it muſt be cut with a croked *ſcalprum*, and the *Callus* being conſumed, the reſt of the cure muſt bee performed afte the manner of other Vlcers. But you muſt note, that if any parcell of the Callous body remaine untoucht by the medicine or inſtrument, the Fiſtula reviving againe will cauſe a relapſe.

CHAP. XXIIII.

Of Hæmorrhoides.

What they are.

HÆmorrhoides, as the word is uſually taken, are tumors at the extremities of the veines encompaſſing the Fundament, cauſed by the defluxion of an humor commonly melancholicke, and repreſenting a certaine kind of *Varices.* Some of theſe run at an hole being opened, which ſometimes in ſpace of time contracts a *Callus*; others onely ſwell, and caſt forth no moiſture; ſome are manifeſt; others lye onely hidde within. Thoſe which runne, commonly caſt forth blood mixed with yellowiſh ſerous moiſture, which ſtimulates the blood to breake forth, and by its acrimony opens the mouthes of the veines. But ſuch as do not run, are eyther like bliſters, ſuch as happen in burnes, and by practitioners are uſually called *veſicales*, and are cauſed by the defluxion of a phlegmaticke and ſerous humor; or elſe repreſent a Grape, whence they are called *Vvales*, generated by the afflux of blood laudible in qualitie, but overaboundant in quantity; or elſe they expreſſe the manner of a diſeaſe, whence they are termed *morales*, proceeding from the ſuppreſſion of melancholicke blood; or elſe they repreſent warts, whence they are ſtiled *Verrucales*, enjoying the ſame materiall cauſe of the generation as the *morales* doe.

Their differences.

Symptomes.

This affect is cauſe of many accidents in men; for the perpetuall effluxe of blood extinguiſheth the vivide and lively colour of the face, calls on a dropſie, overthrowes the ſtrength of the whole body. The fluxe of Hæmorrhoides is commonly every moneth, ſometimes onely foure times in a yeare. Great paine, inflammation, an Abſceſſe which may at length end in a Fiſtula, unleſſe it be reſiſted by convenient remedies, doe oft times forerunne the evacuation of the Hæmorrhoides. But if the Hæmorrhoides flow in a moderate quantity, if the patients brooke it well, they ought not to be ſtayed, for that they free the patients from the feare of imminent evills, as melancholy, leproſie, ſtrangury and the like. Beſides, if they bee ſtopped without a cauſe, they by their refluxe into the Lungs cauſe their inflammation, or elſe breake the veſſells thereof, and by flowing to the Liver cauſe a dropſie by the ſuffocation of the native heate; they cauſe a dropſie and univerſall leaneneſſe on the contrary, if they flow immoderately, by refrigerating the Liver by loſſe of too much blood; wherefore when as they flow too immoderately, they muſt be ſtayed with a pledget of hares downe dipped in the enſuing medicine. ℞. *pul. aloes, thuris, balauſt. ſang. draconis, an* ℥ß. *incorporentur ſimul cum ovi albumine, fiat medicamentum ad uſum.* When they are ſtretched out and ſwollne without bleeding, it is convenient to beate an Onion roaſted in the embers with an Oxes gall, and apply this medicine to the ſwolne places, and renew it every five houres. This kind of remedy is very prevalent for internall Hæmorrhoides; but ſuch as are manifeſt may be opened with horſleaches, or a Lancet. The juyce or maſſe of the hearbe called commonly Dead-nettle or Arkeangell, applyed to the ſwolne Hæmorrhoides opens them, and makes the congealed blood flow there hence. The *Fungus* and *Thymus* being diſeaſes about the fundament are cured by the ſame remedy. If acrimony heate and paine doe too cruelly afflict the patient, you muſt make him enter into a bath, and preſently after apply to the ulcers (if any ſuch be) this following remedy. ℞. *Olei roſ.* ℥iiij. *ceruſſ.* ʒj. *Litharg.* ℥ß *ceræ novæ,* ʒvj. *opij* ℈j. *fiat unguent. ſecundum artem.* Or elſe. ℞ *thuris, myrrhæ, croci, an.* ʒj. *opij* ℈j. *fiat unguentum cum oleo roſarum & mucagine ſem. pſilij, addendo vitellum unius ovi.* You may eaſily proſequute the reſidue of the cure according to the generall rules of Art.

The end of the Thirteenth Booke.

OF BANDAGES, OR, LIGATURES.

THE FOURTEENTH BOOK.

CHAP. I.

Of the differences of Bandages.

BAndages, wherewith we uſe to binde, doe much differ amongſt themſelves. But their differences (in Galens opinion) are chiefly drawne from ſixe things; to wit, their matter, figure, length, breadth, making, and parts whereof they conſiſt. Now the matter of Bandages is threefold; Membranous or of skinnes, which is accommodated peculiarly to the fractured griſles of the Noſe; of Woollen, proper to inflamed parts, as thoſe which have neede of no aſtriction; of Linnen, as when anie thing is to be faſt bound: and of Linnen cloathes, ſome are made of flaxe, other-ſome of hempe, as Hippocrates obſerves. But Bandages doe thus differ amongſt themſelves in ſtructure, for that ſome thereof conſiſt of that matter which is ſufficiently cloſe and ſtrong of it ſelfe, ſuch are the membranous; others are woven, as the linnen ones. But that Linnen is to bee made choice of for this uſe, and judged the beſt, not which is new and never formerly uſed, but that which hath alreadie beene worne and ſerved for other uſes, that ſo the Bandages made thereof may be the more ſoft and pliable: yet muſt they bee of ſuch strength, that they may not breake with ſtretching, and that they may ſtraitly containe and repell the humour readie to flow downe, and ſo hinder it from entring the part. Theſe, beſides, muſt not bee hemmed nor ſtitched, muſt have no lace nor ſeame; for hems and ſeames by their hardneſſe preſſe into, and hurt the fleſh that lyes under them. Lace, whether in the midſt or edges of the rowler, makes the Ligature unequall. For the Member where it is touched with the Lace, as that which will not yeeld, is preſſed more hard; but with the cloth in the middle more gently, as that which is more laxe. Furthermore, theſe Ligatures muſt bee of cleane cloth, that if occaſion bee, they may bee moyſtened or ſteeped in liquour appropriate to the diſeaſe, and that they may not corrupt, or make worſe that liquour by their moiſtening therein. Now the Bandages which are made of Linnen cloathes muſt be cut long-waies, and not athwart, for ſo they ſhall keepe more firme and ſtrong that which they binde, and beſides, they will be alwaies alike, and not broader in one place than in another. But they thus differ in figure, for that ſome of them are rowled up, to which nothing muſt be ſowed, for that they ought to be of a due length to binde up the member: others are cut or divided, which truly conſiſt of one piece, but that divided in the end (ſuch are uſually taken to bind up the breaſts) or elſe in the midſt; others are ſowed together, which conſiſt of many branches ſowed together, and ending in divers heads, and repreſenting divers figures, ſuch are the Bandages appropriated

Lib. de faſciis.

Sect. 3. de Chir. offic.

What cloth beſt for rowlers.

to the head. But they thus differ in length, for that ſome of them are ſhorter, others longer: ſo in like ſort for breadth; for ſome are broader, others narrower. Yet wee cannot certainly define nor ſet downe neither the length, nor breadth of Rowlers, for that they muſt be various, according to the different length and thickneſſe of the members on parts. Generally they ought both in length and breadth to fit the parts, whereunto they are uſed. For theſe parts require a binding different each from other, the head, the necke, ſhoulders, armes, breaſts, groines, teſticles, fundament, hips, thighes, legs, feet and toes. For the parts of Bandages, wee terme one part their bodie, another their heads. By the bodie we mean their due length & breadth; but their ends, whether they run long-waies or a-croſſe, wee according to Galen, terme them their heads.

Com ad ſect. 22. ſect. 2. de offic. chir.

Chap. II.

Sheweth the indications and generall precepts of fitting of Bandages and Ligatures.

1. & 2. ſect. lib. de fract.

THere are, in Hippocrates opinion, two indications of fitting Bandages or Ligatures; the one whereof is taken from the part affected; the other from the affect it ſelfe. From the part affected: ſo the legge, if you at any time binde it up, muſt bee bound long-waies, for if you binde it overthwart, the binding will looſen as ſoone as the patient beginnes to goe, and put forth his legge, for then the muſcles take upon them another figure. On the contrarie the Arme or Elbow muſt be bound up, bending in and turned to the breaſt, for otherwiſe at the firſt bending, if it bee bound when it is ſtretched forth, the Ligature will be ſlacked, for that (as we formerly ſaid) the figure of the muſcles is perverted. Now for this indication, let each one perſwade himſelfe thus much, That the part muſt be bound up in that figure, wherein wee would have it remaine.

We muſt alwaies begin our ligatures at the bottome of a *ſinus*.

Now for that indication which is drawne from the diſeaſe, if there be a hollow ulcer, ſinuous and cuniculous, caſting forth great ſtore of *Sanies*, then muſt you begin the ligature and binding from the bottome of the *ſinus*, and end at the orifice of the ulcer; and this precept muſt you alwayes obſerve, whether the *ſinus* be ſealed in the top, bottome, middle, or ſides of the ulcer. For thus the filth therein contained ſhall bee emptied and caſt forth, and the lippes of the ulcer too farre ſeparated, ſhall bee joyned together; otherwiſe the contained filth will eate into all that lyes neare it, increaſe the ulcer, and make it uncurable by rotting the bones which lye under it with this acride *ſanies* or filth. But ſome Ligatures are remedies of themſelves, as thoſe which performe their duties of themſelves, and whereto the cure is committed, as are theſe which reſtore to their native unitie, thoſe parts which are diſ-joyned: others are not uſed for their owne ſakes, but only to ſerve to hold faſt ſuch medicines as have a curative facultie. This kinde of Ligature is eyther yet a doing, and is termed by Hippoc. *Deligatio operans*; or elſe done and finiſhed, and is called, *Deligatio operata*: for the firſt, that the Ligature may be well made, it is fit that it be cloſe rowled together, and beſides, that the Surgeon hold it ſtiffe and ſtrait in his hand, and not careleſly, for ſo he ſhall binde up the member the better. Alſo he muſt in the binding obſerve, that the ends of the Rowler, and conſequently their faſtning may not fall to bee on the affected or grieved part; for it is better that they come above or below, or elſe on the ſide: beſides alſo, he muſt have a ſpeciall care that there be no knot tyed upon the ſame place, or upon the region of the backe, buttocks, ſides, joynts, or backe part of the head, or to conclude in any other part upon which the Patient uſes to leane, reſt or lye. Alſo on that part where wee intend to ſow or faſten the Rowlers, you muſt double in their ends, that ſo the faſtning or ſuture may be the ſtronger, otherwiſe how cloſe ſoever they ſhall be wrapped or rowled about the member, yet will they not remaine firme, eſpecially if they be of a great breadth. For the ſecond kinde of Ligature, to wit, that which is already done and finiſhed; the Surgeon, the performer thereof, muſt conſider to what end

Hipp. ſent. 4. ſect. 2. offic.

Initio 2. ſect. off.

it was done, and whether he hath performed it well and fitly, as alſo neatly and elegantly, to the ſatisfaction both of himſelfe and the beholders. For it is the part of a ſkilfull Workeman everie where handſomely and rightly to performe that which may ſo be done.

Ligatures muſt not bee only lightly, but alſo neatly performed.

In fractures and luxations & all diſlocations of bones, as alſo in wounds and contuſions, you muſt beginne your bandage with two or three windings or wraps about upon the place, and that (if you can) more ſtraitly than in other places, that ſo the ſet bones may be the better kept in their places, and that the humors, if anie be alreadie fallen thither, may by this ſtrait compreſſion be preſſed forth, as alſo to hinder and prevent the entrance in of any other which may bee readie to fall down. But in fractures (as thoſe which never happen without contuſion) the blood flowes, and is preſſed forth of its proper veſſels, as thoſe which are violently battered and torne, which cauſes ſugillation in the neighbouring fleſh, which firſt lookes red, but afterwards black and blue by reaſon of the corruption of the blood poured forth under the skinne. Wherefore after theſe firſt windings, which I formerly mentioned, you muſt continue your rowling a great way from the broken or luxated part; he which does otherwiſe, will more and more draw the blood and humors into the affected part, and cauſe Impoſtumes, and other maligne accidents. Now the blood which flowes, goes but one way downwards, but that which is preſſed is carried as it were in two pathes, to wit, from above downwards, and from belowe upwards. Yet you muſt have a care that you rather drive it backe into the body and bowels, than towards the extremities thereof, as being parts which are uncapable of ſo much matter, and not furniſhed with ſufficient ſtrength to ſuffer that burden, which threatens to fall upon it, without danger and the increaſe of prenaturall accidents. But when this maſſe and burden of humors is thruſt backe into the bodie, it is then ruled and kept from doing harme by the ſtrength and benefit of the faculties remaining in the bowels and the native heat.

CHAP. III.

Of the three kindes of Bandages neceſſarie in fractures.

TWo ſorts of Ligatures are principally neceſſarie for the Surgeon, according to Hippocrates, by which the bones aſwell broken as diſlocated may be held firme when they are reſtored to their naturall place.

Sent.24.ſect.2. offic.

Of theſe ſome are called *Hypodeſmides*, that is, Under-binders: others, *Epideſmi*, that is, Over-binders. There are ſometimes but two under-binders uſed, but more commonly three. The firſt muſt firſt of all bee caſt over the fracture, and wrapped there ſome three or foure times about, then the Surgeon muſt marke and obſerve the figure of the fracture; for as that ſhall be, ſo muſt he vary the manner of his binding. For the ligature muſt be drawne ſtrait upon the ſide oppoſite to that whereto the luxation or fracture moſt inclines, that ſo the bone which ſtands forth may be forced into its ſeat, and ſo forced may be the more firmely there contained. Therefore if the right ſide be the more prominent or ſtanding forth, thence muſt you beginne your ligation, and ſo draw your ligature to the left ſide. On the contrarie, if the left ſide be more prominent, beginning there, you ſhall goe towards the oppoſite ſide in binding and rowling it. Here therefore would I require a Surgeon to be *Ambidexter*, (.i.) having both his hands at command, that ſo he may the more exquiſitly performe ſuch variety of ligations. But let him in rowling, bend or move this firſt ligature upwards, that is, towards the bodie, for the former reaſons. But neyther is this manner of ligation peculiar to fractures, but common to them with luxations: for, into what part ſoever the luxated bone flew, then when it is reſtored, that ſide muſt be bound the more looſely and gently whence it departed, and that on the contrary more hard unto which it went. Therefore the ligature muſt be drawne from the ſide whereunto the bone went; ſo that on this ſide it bee more looſe and ſoft, and not ſtraitly preſſed with boulſters or rowlers, that ſo it

Hypodeſmides.

may be more inclined to the ſide oppoſite to the luxation. If the ligation be otherwiſe performed, it ſucceeds not well, for the part is relaxed, and moved out of its naturall ſeat: wherefore there will be no ſmall danger, leſt the bone bee forced out againe, and removed from its place, whereinto it was reſtored by art and the hand. Which thing Hippocrates ſo much feared, that on the contrarie he willed that the ſet bone ſhould be drawne ſomewhat more unto the part contrary to that whereunto it was driven by force, than the naturall and proper ſite thereof ſhould require. But to returne to our former diſcourſe of the three Ligatures: The firſt under-binder being put on, wee then take the ſecond, with which wee in like ſort begin at the fracture, but having wrapped it once or twice about there, for that, as we formerly ſaid, wee muſt not force backe, and preſſe ſo much blood towards the extremities, as wee muſt doe towards the body and bowels. Wherefore this Ligature ſhall be drawne from above downe-wards, gently ſtraining it to preſſe forth the blood contained in the wounded part: When by rowling you ſhall come to the end of that part, then you ſhall carry back againe that which remaines thereof, to wit, upwards; But otherwiſe you may take the third under-binder, wherewith you may beginne to rowle, whereas you left with the ſecond, and you may carry it thus, rowling it from below upwards. Theſe under-bindings thus finiſhed, apply your boulſters, after them your over or upper-bindings, which are oft times two, but ſometimes three. The firſt hath two heads, and is wrapped both from the right hand and the left, for the preſervation of the firſt under-binder and the boulſters, and reſtoring the muſcles to their native figure. The two other which remaine, conſiſt of one head, & the one of them muſt be rowled from below upwards, the other from above downwards, after ſuch a manner, that they may bee directly contrary to the under-binders; as if they were rowled from the right hand, then theſe muſt be from the left. Now this is the manner of Hippocrates his Ligation, which, for that it is now growne out of uſe, we muſt here ſet downe that which is in common uſe. They doe not at this time uſe any over-binders, but that which we termed the third under-binder ſerves our Surgeons in ſtead of the three formentioned over-binders. Wherefore they carry this third under-binder, wrapped from below upwards (as we formerly ſaid) contrary to the firſt and ſecond under-binder; as if theſe begunne on the right ſide, this ſhall be rowled from the left, and ſhall end whereas the firſt under-binder ended. And you muſt not only draw it indifferently hard, but alſo make the ſpires and windings more rare. This third rowler is of this uſe in this manner of Ligation, that is, it reſtores the muſcles to their native figure, from whence they were ſomewhat altered by the drawing and rowling of the two former Ligatures. But you muſt alwaies have regard, that you obſerve that meaſure in wrapping your Ligatures, which reaſon, with the ſenſe of the patient, and eaſe in ſuffering, preſcribes; having regard that the tumor become not inflamed. Alſo the habit of the body ought to preſcribe a meaſure in Ligation: for tender bodies cannot away with ſo hard binding as hard. Verily, in fractures and luxations, the humors by too ſtrait binding are preſſed into the extreme parts of the body; whence grievous and oft times enormous Oedema's proceede: for healing whereof the Ligature muſt bee looſed, and then the tumified parts preſſed by a new rowling, which muſt bee performed from below upwards, and ſo, by forcing the matter of the Tumor thither, it may be helped; for there is no other hope or way to drive the humor backe againe. He which doth this, forſakes the proper cure of the diſeaſe, ſo to reſiſt the ſymptome, which the Surgeon ſhall never refuſe to doe, as often as any neceſſarie cauſe ſhall require it. For this cauſe Hippocrates bids, that the Bandages bee looſed everie three dayes, and then to foment the part with hote water, that ſo the humors, which (drawne thither by the vehemency of paine) have ſettled in the part, may be diſſolved and diſperſed; and itching and other ſuch like ſymptomes prevented. The feare of all accidents being paſt, let the Ligation bee ſooner or later looſed, and more ſlacked than it formerly was accuſtomed; that ſo the blood and laudible matter, wherof a *Callus* may enſue, may flow more freely to the affected part.

CHAP. IIII.

Of the binding up of Fractures aſſociated with a wound.

How to binde up a Fracture with a wound.

IT ſometimes happens, that a Fracture is aſſociated by a wound, and yet for all this it is fit to binde the part with a Ligature, otherwiſe there will be no ſmall danger of ſwelling, inflammation, and other ill accidents, by reaſon of the too plentifull affluxe of humors from the neighbouring parts. But it is not fit to endeavour to uſe that kinde of binding which is performed with manie circumvolutions or wrappings about. For, ſeeing the wound muſt bee dreſſed everie day, the part muſt each day neceſſarily be ſtirred, and the Ligature, conſiſting of ſo many windings, looſed; which thing will cauſe paine, and conſequently hinder the knitting and uniting which is performed by reſt. Therefore this kinde of binding may be performed by one onely rowling about the wound, and that with a rowler which conſiſts of a twice or thrice doubled cloth, made in manner of a boulſter, and ſewed with as much conveniencie as you can, that it may be ſo large as to encompaſſe and cover all the wound, for theſe reaſons; which ſhall bee delivered at large in our Treatiſe of Fractures. But if the wound runne long-wayes, let the boulſters and ſplints be applyed to the ſides of the wound, that ſo the lipps of the wound may bee preſſed together, and the contained filth preſſed forth. But if it be made over-thwart, we muſt abſtaine from boulſters and ſplints: for that, in Galens opinion, they would dilate the wound, and the purulent matter would be preſſed out, and caſt back into the wound.

Ad ſent. 12. ſect. de fract.

CHAP. V.

Certaine common precepts of the binding up of Fractures and Luxations.

IN everie Fracture and Luxation, the depreſſed, hollow and extenuated parts, ſuch as are neere unto the joynts, ought to be filled up with boulſters, or cloaths put about them, ſo to make the part equall, that ſo they may be equally and on every ſide preſſed by the ſplints, and the bones more firmely contained in their ſeates. So when the knee is bound up, you muſt fill the ham or that cavity which is there, that ſo the ligation may be the better and ſpeedilier performed. The ſame muſt be done under the armepits, above the heele, in the arme neer the wreſt; and, to conclude, in all other parts which have a conſpicuous inequalitie by reaſon of ſome manifeſt cavitie. When you have finiſhed your binding, then enquire of the patient, whether the member ſeeme not to be bound too ſtrait. For if he ſay, that he is unable to endure it ſo hard bound, then muſt the binding be ſomewhat ſlackned. For, too ſtrait binding cauſes paine, heate, defluxion, a gangrene, and laſtly, a ſphacell or mortification: but too looſe is unprofitable, for that it doth not contain the parts in that ſtate we deſire. It is a ſigne of a juſt ligation that is neyther too ſtrait nor too looſe, if the enſuing day the part be ſwolne with an œdematous tumor, cauſed by the blood preſſed forth of the broken place; but of too ſtrait ligation, if the part be hard ſwolne; and of too looſe, if it bee no whit ſwolne, as that which hath preſſed no blood out of the affected part. Now if a hard tumor, cauſed by too ſtrait binding, trouble the patient, it muſt preſently bee looſed, for feare of more grievous ſymptomes, and the part muſt be fomented with warme *Hydræleum,* and another indifferent, yea verily, more looſe ligature muſt be made in ſtead thereof, as long as the paine and inflammation ſhall continue; in which time and for which cauſe, you ſhall lay nothing upon the part which is any thing burdenſome. When the patient beginnes to recover, for three or foure dayes ſpace, eſpecially if you find him of a more compact habit and a ſtrong man, the ligature muſt be kept firme and not looſed. If on the third day, and ſo untill the ſeventh, the ſpires or windings

Hipp. ſent. 37. & 38. ſect. 1. de fract.

The ſignes of too ſtrait and looſe binding up.

Why we muſt make more ſtrait ligation on the broken part.

be found more looſe, and the part affected more ſlender; then wee muſt judge it to be for the better. For hence you may gather, that there is an expreſſion and digeſtion of the humors, cauſing the tumor made by force of the ligation. Verily, broken bones fitly bound up, are better ſet, and more firmely agglutinated, which is the cauſe, why in the place of the fracture the ligation muſt bee made the ſtraiter, in other places more looſely. If the fractured bone ſtand forth in any part, it muſt there be more ſtraitly preſſed with boulſters and ſplints. To conclude, the ſeventh day being paſt, we muſt binde the part more ſtraitly than before: for that then inflammation, paine, and the like accidents, are not to bee feared. But theſe things which we have hitherto ſpoken of the three kindes of Ligatures, cannot take place in each fractured part of the body, as in the chaps, collar-bones, head, noſe, ribs. For, ſeeing ſuch parts are not round and long, a Ligature cannot be wrapped about them, as it may on the armes, thighes, and legges, but only bee put on their outſides.

The ſecond.

The third.

The fourth.

The fifth.

The ſixth.

The ſeventh.

The eighth, the particular uſe of ligatures in the amputation of members.

BY that which wee have formerly delivered, you may underſtand that Ligatures are of uſe to reſtore thoſe things which are ſeparated and moved forth of their places, and joyne together thoſe which gape; as in fractures, wounds, contuſions, ſinewous ulcers, and other like affects againſt nature, in which the ſolution of continuitie ſtands in neede of the helpe of Bandages, for the reparation thereof. Beſides alſo, by the helpe of Bandages theſe things are kept aſunder or ſeparated, which otherwiſe would grow together, againſt nature; as in Burns, wherein the fingers and the hams would mutually grow together; as alſo the arme-pits to the cheſts, the chin to the breaſt, unleſſe they be hindered by due Ligation. Bandages doe alſo conduce to refreſh emaciated parts: wherefore if the right legge waſte for want of nouriſhment, the left legge, beginning at the foote, may bee conveniently rowled up even to the groine. If the right arme conſume, binde the left with a ſtrait Ligature, beginning at the hand, and ending at the arme-pit. For thus a great portion of blood from the bound-up part is ſent back into the *vena cava*, from whence it regurgitates into the almoſt emptie veſſels of the emaciated part. But I would have the ſound part to bee ſo bound, that thereby it become not painefull; for a dolorifick ligation cauſes a greater attractation of blood and ſpirits, as alſo exerciſe: wherefore I would have it during that time to bee at reſt, and keep holy-day. Ligatures alſo conduce to the ſtopping of bleedings: which you may perceive by this, that when you open a veine with your launcet, the blood is preſently ſtayed, laying on a boulſter and making a ligature. Alſo Ligatures are uſefull for women preſently after their delivery; for their womb being bound about with Ligatures, the blood wherewith their womb was too much moiſtened, is expelled, the ſtrength of the expulſive facultie being by this means ſtirred up to the expulſion thereof: and it alſo hinders the empty wombe from being ſwolne up with winde, which otherwiſe would preſently enter thereinto. This ſame Ligature is a helpe to ſuch as are with childe, for the more eaſie carrying of their burden; eſpecially thoſe whoſe Childe lyes ſo farre down-wards, that lying as it were in the den of the hippes, it hangs betweene the thighes, and ſo hinders the free going of the mother. Therefore the woman with childe is not only eaſed by this binding of her wombe with this Ligature, which is commonly termed, the navill Ligature; but alſo, her childe being held up higher in her wombe, ſhe hath freeer and more liberty to walke. Ligatures are in like ſort good for revulſion and derivation: as alſo for holding of medicines which are layd to a part, as the necke, breaſt or belly. Laſtly, there is a triple uſe of Ligatures in amputation of members, as armes and legges. The firſt to draw and hold upwards the ſkinne and muſcles lying under it, that the operation being performed, they may, by their falling downe againe, cover the ends of the cut-off bones; and ſo by that meanes helpe forwards the agglutination and cicatrization; and when it is healed up, cauſe the lame member to move more freely, and with leſſe paine; and alſo to performe the former actions, this, as it were, cuſhion or boulſter of muſculous fleſh lying thereunder. The ſecond is, they hinder the bleeding by preſſing together the veines and arteries. The third is, they by ſtrait binding intercept the free paſſage of the animall ſpirits, and ſo deprive the part which lyes thereunder of the ſenſe of feeling, by making it, as it were, ſtupid or num.

CHAP. VII.

Of Boulſters or Compreſſes.

The firſt uſe of Boulſters.

Boulſters have a double uſe; the firſt is to fill up the cavities and thoſe parts which are not of an equall thickneſſe to their ends. Wee have examples of cavities in the Arme-pits, Clavicles, Hams & Groines; and of parts which grow ſmall towards their ends, in the armes towards the wreſts, in the legges towards the feet, in the thighes towards the knees. Therefore you muſt fill theſe parts with boulſters and linnen cloathes, that ſo they may be all of one bigneſſe to their ends.

The ſecond uſe of them.

The ſecond uſe of boulſters, is to defend and preſerve the firſt two or three Rowlers or Under-binders, the which we ſayd before muſt be applyed immediately to the fractured part. Boulſters, according to this twofold uſe, differ amongſt themſelves, for that when they are uſed in the firſt mentioned kind, they muſt be applied athwart; but when in the latter, long-wayes or down-right.

The third uſe of them.

You may alſo uſe Boulſters, leſt the too ſtrait binding of the Ligatures cauſe paine and trouble to the new ſet bones. A three or foure times doubled cloth will ſerve for the thickneſſe of your Boulſters, but the length and breadth muſt bee more or leſſe, according to the condition of the parts and diſeaſe for which they muſt be applyed.

CHAP. VIII.

Of the uſe of Splints, Junks, and Caſes.

The matter of Splints.

Having delivered the uſes of Ligatures and Boulſters, it remaines that wee ſay ſomewhat of the other things, which ſerve to hold the bones in their places; as Splints, Junks, Caſes, and ſuch other like. Splints are made and compoſed of paſt-bord, of thin ſplinters of wood, of leather, ſuch as ſhoo-ſoales are made with; of the rindes of trees, or plates of Latin, or lead, and ſuch other like, which have a gentle and yeelding ſtiffeneſſe; yet would I have them made as light as may bee, leſt they by their weight become troubleſome to the affected part. But for their length, breadth, and number, let them be fitted agreeable to the part whereto they muſt bee uſed. Let alſo their figure be ſtraight or crooked according to the condition of the member whereto they muſt be applyed. You muſt have a ſpeciall care, that they runne not ſo farre as the ſwellings out, or eminencies of the bones; as the ancles, knees, elbowes, and the like, leſt they hurt them by their preſſure: alſo you muſt have a care, that they be ſmaller at their ends, and thicker in their middles, whereas they lye upon the broken bone. The uſe of ſplints is, to hold faſt and firme, that they may ſtir no way the broken and luxated bones, after they bee ſet and reſtored to their places. That they performe this uſe, it is fit there be no thicke boulſters under them, nor over many rowlers; for ſo through ſo thick a ſpace, they would not ſo ſtraitly preſſe the part. Junkes are made of ſtickes the bigneſſe of ones finger, wrapped about with ruſhes, and then with linnen cloth: they are principally uſed in fractures

Their uſes.

What Junks are.

of the thighes and legges. Caſes are made of plates of Latin, or elſe of ſome light wood; their uſe is, to containe the bones in their due figure, when the patient is to be carried out of one bed or chamber into another, or elſe hath neede to goe to ſtoole: laſtly, if wee muſt reſt ſomewhat more ſtrongly upon the broken or luxated members, theſe Caſes will hinder the bones from ſtirring or flying out on the right ſide or left, above or below, we ſleeping or waking, being willing or unwilling, and in like ſort leſt being not as yet well knit, or more looſely bound up for feare of paine, inflammation, or a gangrene, they hang downe, fall, or fly in ſunder by reaſon of the inequalities of the bed. Such Caſes, Junkes, and the like, which ſerve for reſtoring and faſt holding of broken and luxated bones, we may, according to Hippocrates his minde, call them in generall *Gloſſocomia.* All which things, the yong Surgeon, which is not as yet exerciſed in the workes of Art, can ſcarce tell what they are. But in the meane time, whileſt that hee may come to bee exerciſed therein, or ſee others performe theſe operations, I, as plainely as poſſibly I could, have in words given him their portraiture or ſhape.

The matter and uſe of Caſes.

Gloſſocomium, a generall name for ſuch things.

The end of the fourteenth Booke.

OF FRACTURES.

THE FIFTEENTH BOOKE.

CHAP. I.

What a Fracture is, and what the differences thereof are.

A Fracture, in Galens opinion, is the ſolution of continuitie in a bone, which by the Greeks is called *Catagma.* There are many ſorts of hurting or offending the bones: as the drawing them aſunder, luxation, or putting them out of joynt; their unnaturall growing together, their cutting or dividing a-ſunder; contuſion, abſceſſe, putrefaction, rottenneſſe, laying bare the *perioſtium* being violated or loſt; and laſtly, that whereof we now treate, a Fracture. Again, the varieties of Fractures are almoſt infinite. For one is complete and perfect, another imperfect; one runnes long-wiſe, another tranſverſe, another oblique; one while it is broken into great peeces, another while into little and ſmall ſcales, which have eyther a blunt, or elſe a ſharpe end, and pricke the adjacent bodies of the muſcles, nerves, veines or arteries. It ſomtimes happens, that the bone is not broken into ſplinters, that is, long-wayes, but together, and at once into two peeces overthwart, which Fracture is called *Raphanedon*, that is, after the maner of a Raddiſh.

Lib.6.method.

What it is for a bone to be broken *Raphanedon.*

A Fracture is made *Caryedon*, or like a nut, when as the bone flyes into many ſmall peeces, ſevered each from other, as when a Nut is broken with a hammer or mallet upon an Anvile: Which fracture is alſo termed *Alphitidon*, by reaſon of the reſemblance it hath to meale or floure; and ſuch is often ſeene in fractures made by bullets, ſhot out of guns and ſuch fiery engines. Contrary to theſe are thoſe fractures which are called *Schidacidon*, as rent into ſplinters, or after the manner of a boord or peece of timber, that is, right-downe, and alongſt the bone: and theſe fractures are eyther apparent to the eye, or elſe not apparent, and therefore called Capillarie, being ſo ſmall, as that they cannot be perceived by the eye, unleſſe you put inke upon them, and then ſhave them with your Scrapers. Sometimes the bone is only preſſed downe by the ſtroke, ſometimes on the contrarie it flyes up, as if it were vaulted. They call it attrition, when the bone is broken into many ſmall fragments, and as it were ſcales or chips. The fragments of fractured bones are ſomtimes ſmooth and poliſhed, otherwhiles unequall, and as it were ſharpe and rough with little teeth, or prickes. Some fractures touch onely the ſurface of the bone, fetching off only a ſcale; otherſome change not the ſite of fractured bones, but only cleaves them length-waies, without the plucking away of any fragment; otherſome penetrate even to their marrow.

What *Caryedon*, or *Alphitidon.*

What *Schidacidon.*

Furthermore ſome Fractures are ſimple and alone by themſelves; otherſome are accompanied with a troop of other affects and ſymptomes; as a wound, hæmorrhagye, inflammation, gangrene, and the like. Hereunto you may alſo adde the differences drawne from the parts which the Fractures poſſeſſe; as from the head, ribs, limbs, joynts, and other members of the bodie. Adde alſo theſe which are taken from the habit of bodies, aged, young, full of ill humors, well tempered; almoſt all which have their proper and peculiar indications for curing. Now the cauſes of Fractures, are the too violent aſſaults or ſtroaks of all externall things, which may cut, bruiſe, breake, or ſhake: in this number of cauſes may alſo be reckoned fals from high places, and infinite other things, which would be long and tedious to reckon up.

The cauſes of fractures.

Chap. II.

Of the ſignes of a Fracture.

WE may know by evident ſignes that a bone is broken: the firſt whereof, and moſt certaine, is, when by handling the part which we ſuſpect to be broken, wee feele peeces of the bone ſevered aſunder, and heare a certaine crackling of theſe peeces under our hands, cauſed by the attrition of the ſhattered bones. Another ſigne is taken from the impotencie of the part, which chiefly bewrayes its ſelfe, when both the bones, the legge, and brace-bones, the ell and wand are broken. For if onely the brace-bone or wand be broken, the Patient may goe on his legge, and ſtirre his arme: for the brace-bone ſerves for the ſuſtaining of the muſcles, and not of the bodie, as the legge bone doth. The third ſigne is drawne from the figure of the part changed beſides nature: for it is there hollow, from whence the bone is flowne or gone, but gibbous or bunching out whither it is runne. Great paine in the interim torments the patient by reaſon of the wronged *perioſtium*, and that membrane which involves the marrow and the ſympathie of the adjacent parts which are compreſſed or pricked.

The firſt ſigne of a broken bone.

Another.

A third.

Chap. III.

Of Prognoſticks to be made in Fractures.

WEe muſt prognoſticate in Fractures, whether they are to end in the deſtruction or welfare of the patient; or whether their cure ſhall be long or ſhort, eaſie, or elſe difficult and dangerous; and laſtly, what accidents and ſymptomes may happen thereupon. Hee ſhall eaſily attaine to the knowledge of all theſe things, who is not onely well ſeene in the anatomicall deſcription of the bones, but alſo in the temper, compoſition and complexion of the whole bodie. Wherefore in the firſt place, I thinke good to admoniſh the Surgeon of this, that in winter when all is ſtiffe with cold, by a little fall, or ſome ſuch ſleight occaſion, the bones may be quickly and readily broken. For then the bones, being dryed by the drineſſe of the ayre encompaſſing us, become more brittle; which everie one of the Vulgar uſually obſerve to happen both in waxen and tallow candles: but when the ſeaſon is moiſt, the bones are alſo more moiſt, and therefore more flexible and yeelding to the violence of the obvious and offending bodie. Wherefore alſo you may gather this to the framing of your Prognoſticks, That bones by reaſon of their naturall drineſſe are not ſo eaſily agglutinated and conſolidated as fleſh; though in Children, according to Galen, by reaſon of the abundance of their humiditie, the loſt ſubſtance may bee repaired, according (as they terme it) to the firſt intention, that is, by reſtoring of the ſame kinde of ſubſtance or matter. But in others, about the Fractures a certaine hard ſubſtance uſually concreats, of that nouriſhment of the broken bone which abounds, which glues together the fragments thereof, being fitly put together. This ſubſtance is then termed a *Callus*, and it is ſo hardened in time, that the bone thereafter in the broken

Why bones are more brittle in froſtie weather.

Why the ſolution of continuity in bones is not ſo eaſily repaired.
Gal. in arte par.

broken part is ſeene to be more firme and hard than it is in any other: therefore that uſuall ſaying in Phyſicke is not without reaſon; That reſt is neceſſarie for the uniting of broken bones. For the *Callus* is eaſily diſſolved, if they bee moved before their perfect and ſolid agglutination. The matter of a *Callus* ought to be indifferent and laudible in quantitie and qualitie, even as blood which flowes for the regeneration of the loſt fleſh in wounds. It is fit, that there may be ſufficient matter for ſuch a *Callus*, that the part have a laudible temper, otherwiſe there either wil be no *Callus*, or certainly it wil grow more ſlowly. Fractures are far more eaſily repaired in yong bodies than in old: for in theſe there is plentie of the primigenious and radicall moiſture, that is laudably holding and glutinous; and in the other there is ſtore of watriſh and excrementitious. By this you may eaſily conjecture, that you cannot certainely ſet downe a time neceſſarie for the generating a *Callus*: for in ſome it happens later, in ſome ſooner: the cauſe of which varietie is alſo to be referred to the conſtitution of the yeare and region, the temper and diet of the Patient, and maner of Ligation. For, thoſe Patients whoſe powers are weake, and blood watriſh and thin, in theſe the generation of a *Callus* uſes to be more ſlow: On the contrarie, ſtrong powers haſten to agglutinate the bones, if there be plentie of groſſe and viſcous matter; whereby it comes to paſſe, that meats of groſſer nutriment are to bee uſed, and medicines applyed which may helpe forwards the endeavour of nature, as we ſhall declare hereafter. When the bones are broken neare unto the joynts, the motion afterwards uſes to be more difficult, eſpecially if the *Callus*, which is ſubſtituted, be ſomewhat thicke and bunching forth. But if, together with the violence and force of the Fracture, the joynts ſhall bee broken and bruiſed, the motion will not only bee loſt, but the life brought in danger, by reaſon of the greatneſſe of the inflammation, which uſually happens in ſuch affects, and the exceſſe of paine in a tendinous body. Theſe fractures wherein both the bones of the arme or legge are broken, are more difficult to cure, than thoſe which happen but to one of them. For they are handled & kept in their places with more difficulty, becauſe that which remaines whole, ſerves the other for a reſt or ſtay to which it may leane. Moreover, there is longer time required to ſubſtitute a *Callus* to a great bone, than to a little one. Againe theſe bones which are more rare and ſpongie, are ſooner glued together by the interpoſition of a *Callus*, than theſe which are denſe and ſolid. A *Callus* ſooner growes in ſanguine, than in cholerick bodies. But broken bones cannot be ſo happily agglutinated, nor reſtored in any body, but that alwaies ſome aſperity or unequall protuberancie may bee ſeene on that part where the *Callus* is generated. Wherfore the Surgeon ought to make artificiall Ligations, that the *Callus* may not ſtand out too far, nor ſinke downe too low. That Fracture is leaſt troubleſome which is ſimple; on the contrarie, that is more troubleſome which is made into ſplinters; but that is moſt troubleſome and worſt of all which is in ſmall and ſharp fragments, becauſe there is danger of convulſion by pricking a nerve, or the *perioſtium*. Sometimes the fragments of a broken bone keep themſelves in their due place: they alſo oft times fly forth thereof, ſo that one of them gets above another; which when it happens, you may perceive an inequality by the depreſſion of the one part and the bunching forth of the other, as alſo paine by the pricking: beſides alſo the member is made ſhorter than it was, and than the ſound member on the oppoſite ſide is, and more ſwolne by the contraction of the muſcles towards their originall. Wherefore when a bone is broken, if you perceive anie thing ſo depreſſed, preſently putting your hand on both ſides above and below, ſtretch forth the bone as forcibly as you can; for otherwiſe, the muſcles and nerves, ſtretched and contracted, will never of their owne accord ſuffer the bones to be reſtored to their proper ſeat and themſelves. This extenſion muſt bee performed in the firſt dayes, for afterwards there will happen inflammation: which being preſent, it is dangerous to draw the nerves and tendons too violently; for hence would enſue an impoſtume, convulſion, gangrene and mortification. Therefore Hippocrates forbids you to defer ſuch extenſion untill the third, or fourth day. Fractures are thought dangerous, whoſe fragments are great, and fly out, eſpecially in theſe bones which are filled with marrow on the inſide. When broken or diſlocated bones cannot be

reſtored

reſtored to themſelves and their naturall place, the part waſts for want of nouriſhment; both for that the naturall ſite of the veines, arteries and nerves is perverted, as alſo becauſe the part it ſelfe lyes immoveable, or ſcarce moveable: whereby it commeth to paſſe, that the ſpirits doe not freely flow thereto, as neyther the nutritive juice commeth thither in ſufficient plentie. When the diſlocated or broken member is troubled with any great inflammation, it is doubtfull whether or no a convulſion will happen, if wee attempt to reſtore it, or the parts thereof to their ſeat: therefore it is better, if it may bee done, to deferre the reducing thereof ſo long, untill the humor which poſſeſſes the part be diſſolved, the tumor abated, and the bitterneſſe of paine mitigated.

In inflammations the reſtoring of the bone muſt not bee attempted.

CHAP. IV.

The generall cure of broken and diſlocated bones.

Three things to be performed in curing broken and diſlocated bones.

How to put the bones in their places.

Hipp. ſent. 60. ſect. 2. de fract.

Ad ſent. 1. ſect. 1. de fract.

When inſtruments or engins are neceſſary.

TO cure a broken and diſlocated bone, is to reſtore it to its former figure and ſite. For the performance whereof, the Surgeon muſt propoſe three things to himſelfe: The firſt is, to reſtore the bone to its place: The ſecond is, that he containe or ſtay it being ſo reſtored: The third is, that he hinder the increaſe of maligne ſymptomes and accidents; or elſe if they doe happen, that then he temper and correct their preſent malignitie. Such accidents are paine, inflammation, a feaver, abſceſſe, gangrene and ſphacell. For the firſt intention, you may eaſily reſtore a broken or diſlocated bone, if preſently, as ſoon as the miſchance is got, or elſe the ſame day, you endeavour to reſtore it: for the bitterneſſe of paine or inflammation, which may trouble the patient, is not as yet verie great, neyther is the contraction of the muſcles upwards as yet very much or ſtubborne. Therefore firſt of all, the Patient with his whole bodie, but eſpecially with the broken or diſlocated part, as alſo the Surgeon, muſt bee in ſome place which hath good and ſufficient light. Then let truſty and skilfull attendants be there, good ligatures, and alſo, if need ſo require, good engines. His friends which are preſent, let them ſee and hold their peace, neyther ſay, nor do any thing which may hinder the Worke of the Surgeon. Then putting one hand above, that is, towards the center of the body, and the other below, as neare as hee can to the part affected, let him ſtretch forth the member: for if you lay your hand any diſtance from the part affected, you wil hurt the ſound part by too much compreſſion, neyther will you much avayle your ſelfe by ſtretching it at ſuch a diſtance. But if you only endeavour below with your hand or ligature, aſſiſting to make extenſion thereof, it will be dangerous if there bee nothing above which may withſtand or hold, leſt that you draw the whole bodie to you. This being done, according as I have delivered, it is fit the Surgeon make a right or ſtraight extenſion of the part affected: for when the bone is eyther broken or out of joynt, there is a contraction of the muſcles towards their originall, and conſequently of the bones by them, as it is obſerved by Galen. Wherefore it is impoſſible to reſtore the bones to their former ſeat, without the extenſion of the muſcles. But the part being thus extended, the broken bones will ſooner and more eaſily be reſtored to their former ſeate. Which being reſtored, you ſhall preſently with your hand preſſe it downe, if there be any thing that bunches or ſtands out. And laſtly, you ſhall binde it up, by applying boulſters and ſplints as ſhall bee fit. But if the bone bee diſlocated or forth of joynt, then preſently after the extenſion thereof, it will be requiſite to bend it ſomwhat about, and ſo to draw it in. The Surgeon is ſometimes forced to uſe engines for this worke, eſpecially if the luxation be inveterate, if the broken or luxated bones be great; and that in ſtrong and ruſtick bodies, and ſuch as have large joynts: for that then there is need of greater ſtrength, than is in the hand of the Surgeon alone. For, by how much the muſcles of the Patient are the ſtronger, by ſo much will they bee contracted more powerfully upwards towards their originals. Yet have a care that you extend them not too violently, leſt by rending and breaking aſunder the muſcles and nerves, you cauſe the forementioned ſymptomes, paine, convulſion, a palſie and gangrene: all which ſooner happen to ſtrong and aged bodies, than to children, eunuches, women, youthes, and generally all moyſt bodies, for that they are leſſe hurt by violent extenſion and pulling, by reaſon of their native and much humiditie and ſoftneſſe.

What bodies are ſooner hurt by violent extenſion.

For thus skins of leather, moyſtened with any liquor, are eaſily retched and drawn out as one pleaſeth: but ſuch as are dry & hard, being leſſe tractable, will ſooner rend and teare, than ſtretch further out. Therefore the Surgeon ſhall uſe a meane in extending and drawing forth of members, as ſhall be moſt agreeable to the habits of the bodies.

Signes of a bone well ſet.

You may know the bone is ſet, and the ſetting performed as is fit, if the paine be aſſwaged; to wit, the fibres of the muſcles, and the other parts being reſtored to their former ſite, and all compreſſion, which the bones moved out of their places have made, being taken away; if, to your feeling there bee nothing bunching out, nor rugged, but the ſurface of the member remaine ſmooth and equall; and laſtly, if the broken or diſlocated member compares with its oppoſite in the compoſure of the joynts, as the knees and ancles anſwer juſtly and equally in length and thickneſſe. For which purpoſe it muſt not ſuffice the Surgeon to view it once, but even as often as he ſhall dreſſe it.

Cauſes and ſignes of the relapſe of a ſet bone.

For it may happen, that the bone which is well ſet, may by ſome chance, as by the Patients unconſiderate turning himſelfe in his bed, or as it were a convulſive twitching of the members or joynts whileſt he ſleepes, the muſcles of their owne accord contracting themſelves towards their originals, that the member may againe fall out; and it will give manifeſt ſignes thereof by renewing the paine, by preſſing or pricking the adjacent bodies: which paine will not ceaſe, before it bee reſtored to its place: and hereof the Surgeon ought to have diligent care. For if, whileſt the *Callus* is in growing, one bone ride over another, the bone it ſelfe will afterwards be ſo much the ſhorter, and conſequently the whole member; ſo that if this errour ſhall happen in a broken legge, the Patient will halt ever after, to his great griefe, and the Surgeons ſhame. Wherefore the Patient ſhall take heed, as much as in him lyes, that he ſtirre not the broken member, before that the *Callus* be hardened. Such diligent care needes not bee had in diſlocations. For theſe once ſet, and artificially bound up, doe not afterwards ſo eaſily fall forth as broken bones.

The ſecond ſcope is, that the bones which ſhall be reſtored may bee firmely kept in their ſtate and place. That ſhall be done by Bandages; as ligatures, boulſters, and other things, whereof hereafter we ſhall make particular mention. Hither tend proper and fit medicines, to wit, applying of oyle of Roſes with the whites of Egges, and the like repelling things; and then reſolving medicines, as the preſent neceſſity ſhall require. It will be convenient, to moyſten your rowlers and boulſters in oxycrate for this purpoſe, or elſe in Roſe vinegar, if the Fracture be ſimple, or with red wine, or the like liquor warme (in Galens opinion) if a wound bee joyned to the fracture; and it will be fit to moyſten fractures oftner in Summer: For ſo the part is ſtrengthened, the defluxion being repelled, whereby the inflammation and paine are hindred. You muſt deſiſt from humecting and watering the part when the ſymptomes are paſt, leſt you retard the generating of a *Callus*; for which you muſt labour by theſe meanes which wee ſhall hereafter declare. To this purpoſe alſo conduces the reſt and lying of the part in its proper figure and ſite accuſtomed in health, that ſo it may the longer remaine in the ſame place unſtirred. Beſides alſo, it is expedient then only to dreſſe the part, when it is needfull, & with thoſe things that are requiſite, ſhunning, as much as may be, inflammation and paine. That figure is thought the beſt, which is the middle, that is, which containes the muſcles in their ſite, which is without paine; ſo that the Patient may long endure it without labour or trouble. All theſe thing being performed, the Patient muſt be asked, Whether the member be bound up too ſtrait? If hee anſwer, No, (unleſſe peradventure a little upon the fracture or luxation, for there it is fit it ſhould bee more ſtraitly bound) then may you know that the binding is moderate. And this ſame firſt ligation is to bee kept in fractures without looſing for three or foure dayes ſpace, unleſſe peradventure paine urge you to the contrary. In diſlocations the ſame binding may bee kept for ſeven or eight daies, unleſſe by chance ſome ſymptome may happen, which may force us to open it before that time: for the

Ad ſent. 21 ſect. 1. de fract.

What the middle figure is, and why beſt.

Fit time for looſing of Ligatures in fractures and diſlocations.

the Surgeon muſt with all his art have a care to prohibite the happening of evill accidents and ſymptomes, which, how he may bring to paſſe, ſhall bee declared in the following Chapter.

Chap. V.

By what meanes you may performe the third intention in curing fractures and diſlocations, which is, the hindring and correction of accidents and ſymptomes.

Foure choice meanes to hinder accidents.

The cauſes and differences of itching.

Ad ſent.4.ſect. 1. de fract.

Remedies againſt the itching.

Hipp. ſent. 46. ſect.3.de fract.

THat we may attaine unto this third ſcope, it is requiſite we handle as gently and without paine, as we may, the broken or diſlocated member; we drive away the defluxion ready to fall downe upon the part by medicines, repelling the humour, and ſtrengthning the part; wee, by appointing a good diet, hinder the begetting of excrements in the bodie, and divert them by purging and phlebotomie. But if theſe accidents be already preſent, we muſt cure them according to the kinde and nature of each of them: for they are various. Amongſt which is reckoned itching, which in the beginning torments the Patient: this ariſeth from a collection and ſuppreſſion of ſubacride vapours, ariſing from the blood, and other humors under the skin. Whence a light biting, which cauſeth a ſimple itch, or elſe a more grievous and acride one, from whence (in Galens opinion) proceeds a painefull itching. Wherefore ſuch matter, as the cauſe, being evacuated, all itching ceaſeth. But this cannot eaſily and freely be evacuated and breathed out, becauſe the pores of the part are ſhut up, and as it were oppreſſed with the burden of the emplaiſters, boulſters, and ligatures, which are put about the part. Hereunto may be added, that the part its ſelfe doth not ſo perfectly performe and enjoy its wonted faculties and actions: by which it commeth to paſſe, that the heat thereof is more languide than may ſuffice to diſcuſſe the fuliginous matter there collected. Wherefore it will be convenient to looſe the ligatures everie third day, that, as by looſing their tyes, their ſanious and fuliginous excrements, ſhut up under the skinne, may freely paſſe forth, leſt in continuance they ſhould fret and ulcerate it; as it happens to moſt of thoſe who provide not for it by looſing their ligatures. Beſides alſo, the part muſt bee long fomented with hote water alone, or elſe with a decoction of ſage, chamomile, roſes, and melilote made in wine and water: for long fomenting attenuates and evacuates, but ſhorter fils and mollifies, as it is delivered by Hippocrates. Alſo gentle frictions, performed with your hand, or a warme linnen cloath upwards, to the right ſide and left, and circularly to everie ſide, are good. But if the skinne be already riſen into bliſters, they muſt be cut, leſt the matter contained thereunder may corrode and ulcerate the skinne: then muſt the skinne be annointed with ſome cooling and drying medicine; as, *Ung. album Camphoratum Rhaſis, Deſiccativum rubrum, unguentum roſatum ſine aceto*; adding thereto the pouder of a rotten poſte, or prepared *Tutia*, or the like. Other accidents more grievous than theſe, doe often happen, but we will treat of them hereafter. But if the ſcales of the bone underneath bee quite ſevered from the whole, then muſt they be preſently taken forth, eſpecially if they prick the muſcles: But if the bone be broken into ſplinters, and ſo prominent out of the wounded fleſh as that it cannot be reſtored into its ſeat, it muſt be cut off with your cutting mallets, or parrats beake, as occaſion ſhall offer its ſelfe. In the interim, you muſt have a care that the part enjoy perſpiration, and by change of place and riſing, now and then it may be as it were ventilated: alſo you muſt ſee that it be not over-burdened, neyther too ſtrait bound, otherwiſe it will be apt to inflammation. Thus much concerning fractures and diſlocations in generall: now we muſt deſcend to particulars, beginning with a fracture of the Noſe.

CHAP.

CHAP. VI.

Of the Fracture of the Noſe.

THe Noſe is griſtly in its lower part, but bony in the upper. Wherfore it ſuffers no fracture in the griſtly part (unleſs peradventure a *Sedes*) but only a depreſſion, diſtortion or contuſion. But a fracture often happens to the bony part, & ſo great a depreſſion to the inner ſide, that unleſſe it be provided for by diligent reſtoring it, the noſe will become flat, or wreſted aſide, whence there will be difficulty of breathing. That this kinde of fracture may be reſtored, that bone which ſtands too farre out muſt be preſſed downe; but that which is depreſt, muſt be lifted up with a ſpatherne, or little ſticke handſomely faſhioned and wrapped about with cotten or a linnen ragge, ſo to avoyd paine. Therefore you ſhall hold the ſpatherne in one hand, and reduce and order it with the other. The bone being reſtored, directories or tents of a convenient bigneſſe ſhall be put into the noſe; which tents ſhall bee made of ſponge, or flaxe, or a peece of a beaſts or ſheeps lungs. For theſe things are ſoft, and doe not onely hinder the bones of the Noſe that they fall no more, but alſo lift them up higher. And then the Noſe ſhall be in ſome ſort ſtayed with boulſters on each ſide, even untill the perfect agglutination of the bones, leſt the figure and ſtraitneſſe ſhould be vitiated and ſpoyled. I have oft times put golden, ſilver and leaden pipes into fractured noſes, and faſtned them with a thred to the Patients night cap, which, by one and the ſame means, kept the bones from being again depreſt, gave the matter free paſſage forth, and nothing hindred the breathing. In the mean time we muſt ſee, that we do not preſſe the Noſe with too ſtrait binding, unleſſe peradventure ſome other thing perſwade; leſt they become eyther too wide, too flat, or crooked. If any wound accompany the fracture, that ſhall bee cured after the ſame manner, as the wounds of the head. The fracture reſtored, the following medicine, which hath a facultie to repell and repreſſe the defluxion, to ſtrengthen and keep the part in its due poſture, and to dry up and waſte the matter which hath alreadie fallen downe, ſhall bee applyed to the Noſe, and all the other dry parts.

Hipp.ſent.46. ſect.2.de art.

How to reduce the noſe into its naturall figure.

℞. *thuris, maſtiches, boli armeniæ, ſanguinis draconis. an.* ℥ß. *aluminis rochæ, reſinæ pini. an.* ℥ ij. *pulveriſentur ſubtiliſsimè:* Or elſe, ℞. *farinæ volatilis* ℥ß. *albuminum ovorum quantum ſufficit, incorporentur ſimul, & fiat medicamentum.*

A fit aſtringent and drying medicine.

Neither ſhall you uſe any other art to cure the cartilagineous part of the noſe being fractured. Wherefore Hippocrates termes that ſolution of continuitie that there happens, A fracture, as if it were in a bone; becauſe hee could finde no other name more fitly to expreſſe it: for a griſtle, next to a bone, is the hardeſt of all the parts of our bodie. A *Callus* uſes to grow in fractured noſes, unleſſe ſomething hinder within the ſpace of twelve or fifteene dayes.

Sent.47. ſect.2. de art. & Gal. in Com.

CHAP. VII.

Of the Fracture of the lower Jaw.

THe lower Jaw runnes into two, as it were, horns or tops: the one whereof ends ſharpe, and receives a tendon from the temporall muſcle; the other ends blunt and round under the mammillarie proceſſe, and it is there implanted in a ſmall cavitie; it is joyned together in the middle of the chin by *Symphyſis*, and is marrowie within. The Fracture, which happens thereto, is reſtored by putting your fingers into the Patients mouth, and preſſing them on the inſide and outſide, that ſo the fractured bones put together may be ſmoothed and united. But if they be broken wholly athwart, ſo that the bones lye over each other, extenſion muſt be made on both ſides on contrary parts, upwards and downwards, whereby the bones may be compoſed and joy-

A deſcription of the lower Jaw.

The manner of reſtoring a broken Jaw.

ned more eaſily to one another. The teeth in the meane while, if they be eyther ſhaken or removed out of their ſockets, muſt be reſtored to their former places, and tyed with a gold or ſilver wyar, or elſe an ordinary threed, to the next firme teeth, untill ſuch time as they ſhall be faſtened, and the bones perfectly knit by a *Callus*. To which purpoſe the ordered fragments of the fractured bone ſhall bee ſtayed, by putting a ſplint on the outſide, made of ſuch leather as ſhoe ſoales are made; the midſt thereof being divided at the Chin, and of ſuch length and breadth as may ſerve the Jaw: then you ſhall make ligation with a ligature two fingers broad, and of ſuch length as ſhall be ſufficient, divided at both the ends, and cut longwaies in the midſt thereof; that ſo it may engirt the chin on both ſides. Then there will be foure heads of ſuch a ligature ſo divided at the ends; the two lower whereof being brought to the crown of the head, ſhall bee there faſtened and ſowed to the Patients night-cap. The two upper drawne athwart ſhall likewiſe be ſowed as artificially as may bee, to the cap in the nappe of the necke. It is a moſt certaine ſigne, that the Jaw is reſtored and well ſet, if the teeth faſtened therein ſtand in their due ranke and order. The patient ſhall not lye downe upon his broken jaw, leſt the fragments of the bones ſhould againe fall out, and cauſe a greater defluxion. Unleſſe inflammation, or ſome other grievous ſymptome, ſhall happen, it is ſtrengthned with a *Callus* within twentie dayes; for that it is ſpongious, hollow, and full of marrow, eſpecially in the midſt thereof: yet ſometimes, it heales more ſlowly, according as the temper of the patient is, which takes alſo place in other fractured bones. The agglutinating and repelling medicine, deſcribed in the former chapter, ſhall be uſed; as alſo others, as occaſion ſhall offer it ſelfe. The Patient muſt be fed with liquid meats, which ſtand not in need of chewing, untill ſuch time as the *Callus* ſhall grow hard, leſt the ſcarce or ill-joyned fragments ſhould fly inſunder with the labour of chewing. Therefore ſhall hee bee nouriſhed with water-grewell, ponadoes, cullaſſes, barley creames, gellies, brothes, reare egges, reſtaurative liquors, and other things of the like nature.

The deſcription of a fit ligature for the under Jaw.

In what time it may be healed.

CHAP. VIII.

Of the Fracture of the Clavicle or Collar-bone.

Hipp.ſent.63 ſect. 1.de art.

AS the nature and kinde of the fractured Clavicle ſhall bee, ſo muſt the cure and reſtoring thereof bee performed. But howſoever this bone ſhall be broken, alwaies the end faſtened to the ſhoulder and ſhoulder-blade, is lower than that which is joyned to the cheſt; for that the arme drawes it downe-wards. The collar-bone, if broken athwart, is more eaſily reſtored and healed, than if it be cloven long-wayes. For, everie bone broken athwart doth more eaſily returne into its former ſtate or ſeat, whiles you lift it up on this or that ſide with your fingers. But that which is broken *ſchidacidon*, or into ſplinters, or long-waies, is more difficultly joyned and united to the ends and fragments: for thoſe peeces, which were ſet, will be plucked aſunder, even by the leaſt motion of the armes; and that which was knit with the ſhoulder, will fall downe to the lower part of the breaſt. The reaſon of which is, the Collar-bone is not moved of its ſelfe, but conſents in motion with the arme. In reſtoring this or any other fracture, you muſt have a care that the bones ride not one over another, neyther be drawn nor depart too far in ſunder: therfore it will be here convenient, that one ſervant draw the arme backwards, and another pull the ſhoulder towards him the contrarie way; for ſo there will be made, as I may ſo terme it, a counter-extenſion. While which is in doing, the Surgeon with his fingers ſhall reſtore the fracture, preſſing downe that which ſtood up too high, and lifting up that which is preſſed downe too low. Some, that they may more eaſily reſtore this kinde of fracture, put a clew of yarne under the Patients arme-pit; ſo to fill up the cavity thereof: then they forcibly preſſe the elbow to the ribs, and then force the bone into its former ſeat. But if it happen, that the ends of the broken bones ſhall bee ſo

How to reſtore the fractured Clavicle. The firſt way.

The ſecond way.

The third way.

depreſt, that they cannot be drawn upwards by the forementioned means: then muſt the Patient be layd with his backe, juſt betweene the ſhoulders, upon a pillow hard ſtuffed, or a tray turned with the bottome upwards, and covered with a rugge or ſome ſuch thing. Then the ſervant ſhall ſo long preſſe downe the Patients ſhoulders with his hands, untill the ends of the bones, lying hid and preſſed downe, fly out and ſhew themſelves. Which being done, the Surgeon may eaſily reſtore or ſet the fractured bone. But if the bone be broken ſo into ſplinters that it cannot bee reſtored, and any of the ſplinters pricke and wound the fleſh, and ſo cauſe difficultie of breathing, you then muſt cut the ſkinne even againſt them, and with your inſtrument lift up all the depreſſed ſplinters, and cut off their ſharp points; ſo to prevent all deadly accidents, which thereupon may bee feared. If there be many fragments, they, after they are ſet, ſhall be covered with a knitting medicine made of wheat floure, frankincenſe, bole armenicke, *ſanguis draconis*, *reſina pini*, made into powder, and mixed with the whites of egges, putting upon it ſplints, covered with ſoft worne linnen raggs; covered over likewiſe with the ſame medicine, and then three boulſters dipped in the ſame; two whereof ſhall be layd upon the ſides, but the third and thickeſt upon the prominent fracture, ſo to repreſſe it and hold it in. For thus the fragments ſhall not be able to ſtirre or lift themſelves up further than they ſhould, eyther to the right ſide or left. Now theſe Boulſters muſt be of a convenient thickneſſe and breadth, ſufficient to fill up the cavities which are above and below that bone. Then ſhall you make fit ligation with a rowler, having a double head caſt croſſe-wiſe, of a hands breadth, and ſome two ells and a halfe long, more or leſs, according to the Patients bodie. Now hee ſhall be ſo rowled up, as it may draw his arme ſomewhat backwards, and in the interim his arme-pits ſhall be filled with boulſters, eſpecially that next the broken bone; for ſo the Patient may more eaſily ſuffer the binding. Alſo you ſhall wiſh the Patient, that he of himſelfe bend his arme backewards, and ſet his hand upon his hip, as the Countrey Clownes uſe to doe, when they play at leap-frogge. But how great diligence ſoever you uſe in curing this ſort of fracture, yet can it ſcarce be ſo performed, but that there will ſome deformity remaine in the part: for that a ligature cannot be rowled about the collar-bone, as it may about a legge or an arme. A *Callus* oft times growes on this bone, within the ſpace of twenty daies, becauſe it is rare and ſpongious.

How to binde up the fractured clavicle.

It is a difficult matter perfectly to reſtore a fractured clavicle.

CHAP. IX.

Of the fracture of the ſhoulder-blade.

THe Greeks call that *Omoplata*, which the Latines terme *Scapula*, or *Scapulæ patella*, that is, the ſhoulder-blade. It is faſtened on the backe to the ribs, nowle, the *Vertebræ* of the cheſt and necke; but not by articulation, but only by the interpoſition of muſcles, of which wee have ſpoken in our Anatomie. But on the forepart it is articulated after the manner of other bones with the collar-bone, the ſhoulder, or arme-bone: for with its proceſſe, which repreſents a pricke or thorne, and by ſome, for that it is more long and prominent, is called *Acromion*, (that is, as you would ſay, the top or ſpire of the ſaid ſhoulder-blade) it receives the Collar-bone. Therefore ſome Anatomiſts, according to Hippocrates as they ſuppoſe, call all this articulation of the Collar-bone with the hollowed proceſſe of the ſhoulder-blade, *Acromion*. There is another proceſſe of the ſaid Blade-bone, called *Cervix omoplatæ*, or the necke of the Shoulder-blade: this truely is very ſhort, but ending in a broad and ſinuated head, provided for the receiving of the Shoulder or arme-bone. Not farre from this proceſſe is another, called *Coracoides*, for that the end thereof is crooked like a Crowes beake. This keeps the ſhoulder bone in its place, and conduces to the ſtrength of that part. The ſhoulder-blade may be fractured in any part thereof, that is, eyther on the ridge, which runnes like a hill, alongſt the midſt thereof, for its ſafety, as wee ſee in the *Vertebræ* of the backe. So alſo in the broader part thereof it may bee thruſt in and

An anatomicall deſcription of the ſhoulder-blade.

How many waies the ſhoulder-blade may be broken.

depreſt; and alſo in that articulation, whereby the top of the ſhoulder is knit to it. According to this variety of theſe fractured parts, the happening accidents are more grievous or gentle.

Wee know the ſpine or ridge of the Shoulder-blade to be broken, when a dolorificke inequalitie is perceived by touching or feeling it. But you may know, that the broader or thinner part thereof is depreſſed, if you feele a cavity, and a pricking paine moleſt the part, and if a nnmneſſe trouble the arme, being ſtretched forth. The fragments, if they yet ſticke to their bone, and doe not pricke the fleſh, muſt be reſtored to their ſtate and place, and there kept with agglutinative medicines, and ſuch as generate a *Callus*, as alſo with boulſters and rowlers fitted to the place. But if they doe not adhere to the bone, or pricke the fleſh lying under them, then muſt you make inciſion in the fleſh over againſt them, that ſo you may take them out with your Crowes beake. But although they ſtirre up and downe, yet if they ſtill adhere to the *perioſtium* and ligaments, (if ſo be that they trouble not the muſcles by pricking them) then muſt they not bee taken forth: for I have oftner than once obſerved, that they have within ſome ſhort time after growne to the adjacent bones. But if they, being wholly ſeparated, doe not ſo much as adhere to the *perioſtium*, then muſt they neceſſarily be plucked away; otherwiſe within ſome ſhort ſpace after, they will be driven forth by the ſtrength of nature, for that they participate not any more in life with the whole. For that which is quicke, ſaith Hippocrates, uſes to expell that which is dead farre from it. The truth whereof was manifeſted in the Marques of Villars, who at the battell of Dreux was wounded in his ſhoulder with a piſtoll bullet, certaine ſplinters of the broken bone were plucked forth with the peeces of his harneſſe, and of the leaden bullet; and within ſome ſhort ſpace after, the wound was cicatrized, and fully and perfectly healed. But more than ſeven yeares after, a defluxion and inflammation ariſing in that place by reaſon of his labour in armes, and the heavineſſe of his armour at the battell of Mont-contour, the wound broke open againe; ſo that many ſhivers of the bone, with the reſidue of the leaden bullet, came forth of themſelves. But if the fracture ſhall happen in the necke of the ſhoulder blade or dearticulation of the ſhoulder, there is ſcarce any hope of recovery; as I have obſerved in Anthony of Burbon, King of Navarre; Francis of Lorraine, Duke of Guiſe; the Count Rhingrave Philibert, and many other in theſe late civill warrs. For there are many large veſſels about this dearticulation, to wit, the axillary veine and arterie, the nerves ariſing from the *Vertebræ* of the necke, which are thence diſſeminated into all the muſcles of the arme. Beſides, alſo inflammation and putrefaction ariſing there are eaſily communicated by reaſon of their neighbour-hood to the heart and other principall parts, whence grievous ſymptomes, and oft times death it ſelfe, enſues.

The cure.

Lib. de vuln. Capitis.
A hiſtorie.

Nature of its owne accord makes it ſelfe way to caſt forth ſtrange bodies and matters.

Why a fracture in the joynt of the ſhoulder is deadly.

Chap. X.

Of the fracture and depreſſion of the Sternon, *or Breaſt-bone.*

The *Sternum* is ſometimes broken, otherwiles onely thruſt in without a fracture. The inequality perceivable by your feeling, ſhews a fracture, as alſo the going in with a thruſt with your finger, and the ſound or noiſe of the bones crackling under your fingers. But a manifeſt cavity in the part, a cough, ſpitting of blood, and difficultie of breathing by compreſſion of the membrane inveſting the ribs and the lungs, argue the depreſſion thereof. For the reſtoring of this bone, whether broken or depreſt, the patient muſt be layd on his backe, with a cuſhion ſtuffed with tow or hay under the *vertebræ* of the backe, as we ſet downe in the ſetting of the Collar-bone. Then a ſervant ſhall lye ſtrongly with both his hands on his ſhoulders, as if he would preſſe them downe, whilſt the Surgeon, in the meane time preſſing the ribs on each ſide, ſhall reſtore and ſet the bone with his hand; and then the formerly deſcribed medicines ſhall bee applyed for to hinder inflammation, and aſſwage paine; boulſters ſhall bee fitted thereto,

Signes that the *ſternum* is broken.

Signes that it is depreſt.
